Face plates are to be stiffened by tripping brackets according to Ch 3, Sec 6. At girders of symmetrical section, they are to be arranged alternately on both sides of the web.

2.2.3 End attachment of superstructure frames

Superstructure frames are to be connected to the main frames below, or to the deck. The end attachment may be carried out in accordance with Fig 1.

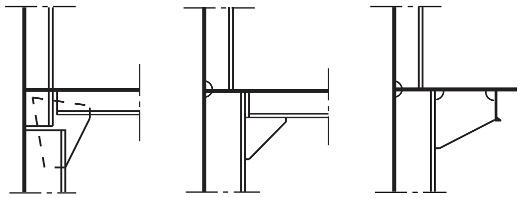

Figure 1: End attachment of superstructure frames

2.3 Transverse structure of superstructures and deckhouses

2.3.1

The transverse structure of superstructures and deckhouses is to be sufficiently dimensioned by a suitable arrangement of end bulkheads, web frames, steel walls of cabins and casings, or by other measures.

2.4 Openings in enclosed superstructures

2.4.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 12(1))

All access openings in bulkheads at ends of enclosed superstructures are to be fitted with weathertight doors permanently attached to the bulkhead, and framed, stiffened and fitted so that the whole structure is of equivalent strength to the un-pierced bulkhead. The doors are to be so arranged that they can be operated from both sides of the bulkhead.

2.4.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 12(3))

The height of the sills of access openings in bulkheads at ends of enclosed superstructures shall be at least 380 mm above the deck.

2.4.3

Any opening in a superstructure deck or in a deckhouse deck directly above the freeboard deck (deckhouse surrounding companionways), is to be protected by efficient weathertight closures.

3. Load model

3.1 Load calculation point

3.1.1

Unless otherwise specified, lateral pressure is to be calculated at load calculation points defined in:

- Ch 6, Sec 1, [1.5], for plating
- Ch 6, Sec2, [1.4] for ordinary stiffeners and primary supporting members.

3.2 Loads

3.2.1 Lateral pressure for decks

The lateral pressure for decks of superstructures and deckhouses, in kN/m^2, is to be taken equal to:

- the external pressure p_D defined in Ch 4, Sec 5, [2.1] for exposed decks,
- 5 kN/m^2 for unexposed decks.

RCN 2 to July 2008 version (effective from 1July 2010)

3.2.2 Lateral pressure for exposed wheel house top

The lateral pressure p for exposed wheel house tops, in kN/m^2, is to be obtained according to Ch 4, Sec 5, [3.2].

3.2.3 Lateral pressure for sides of superstructures

The lateral pressure p_{SI} for sides of superstructures, in kN/m^2, is to be obtained according to Ch 4, Sec 5, [3.3].

4. Scantlings

4.1 Side plating of non-effective superstructures

4.1.1

The gross thickness, in mm, of the side plating of non-effective superstructures is not to be less than the greater of the following values:

$t = 1.21s\sqrt{kp_{SI}} + 1.5$ *RCN 1 to July 2008 version (effective from 1July 2009)*

$t = 0.8\sqrt{kL}$

4.2 Deck plating of non-effective superstructures

4.2.1

The gross thickness, in mm, of deck plating of non-effective superstructures is not to be less than the greater of the following values:

$t = 1.21s\sqrt{kp_D} + 1.5$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

$t = (5.5 + 0,02L)\sqrt{k}$

where L is not to be taken greater than 200 m.

4.2.2

Where additional superstructures are arranged on non-effective superstructures located on the freeboard deck, the gross thickness required by [4.2.1] may be reduced by 10%. *RCN 1 to July 2008 version (effective from 1 July 2009)*

4.2.3

Where plated decks are protected by sheathing, the gross thickness of the deck plating according to [4.2.1] and [4.2.2] may be reduced by 1.5mm. *RCN 1 to July 2008 version (effective from 1 July 2009)* However, such deck plating is not to be less than 5 mm.

Where a sheathing other than wood is used, attention is to be paid that the sheathing does not affect the steel. The sheathing is to be effectively fitted to the deck.

4.3 Deck beams and supporting deck structure

4.3.1 Transverse deck beams and deck longitudinal ordinary stiffeners

The section modulus w, in cm^3, and the shear area A_{sh}, in cm^2, of transverse deck beams and of deck longitudinal ordinary stiffeners are not to be less than the values obtained from the following formulae:

$$w = ckp_D s\ell^2$$

$$A_{sh} = 0.05(1-0.817m_a)kp_D s\ell$$

4.3.2 Deck girders and transverses

The section modulus w, in cm^3, and the shear area A_{sh}, in cm^2, of deck girders and transverses are not to be less than the values obtained from the following formulae:

$$w = ckp_D e\ell^2$$

$$A_{sh} = 0.05kp_D e\ell$$

where:

e : Width of loaded area, in m, of the unsupported adjacent plate fields, measured from each mid of plate field to mid of opposite plate filed.

The girder depth is not to be less than $\ell/25$. The web depth of girders scalloped for continuous deck beams is to be at least 1.5 times the depth of the deck beams.

Where a girder does not have the same section modulus throughout all girder fields, the greater scantlings are to be maintained above the supports and are to be reduced gradually to the smaller scantlings.

4.4 Superstructure frames

4.4.1 Section modulus and shear area

The section modulus w, in cm^3, and the shear area A_{sh}, in cm^2, of the superstructure frames are not to be less than the values obtained from the following formulae:

$$w = 0.55kp_{SI} s\ell^2$$

$$A_{sh} = 0.05(1-0.817m_a)kp_{SI} s\ell$$

4.4.2

Where frames are supported by a longitudinally framed deck, the frames fitted between web frames are to be connected to the adjacent longitudinal ordinary stiffeners by brackets. The scantlings of the brackets are to be determined in accordance with Ch 3, Sec 6 on the basis of the section modulus of the frames.

4.4.3

Where further superstructures or deckhouses are arranged on the superstructures, strengthening of the frames of the space below may be required.

4.5 Decks of short deckhouses

4.5.1 Plating

The thickness, in mm, of weather deck of short deckhouses and is not to be less than:

$t = 8s\sqrt{k} + 1.5$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

For weather decks of short deckhouses protected by sheathing and for decks within deckhouses, the gross thickness may be reduced by 1.5mm. However, such deck plating is not to be less than 5 mm.

RCN 1 to July 2008 version (effective from 1 July 2009)

4.5.2 Deck beams

The scantlings of deck beams and supporting deck structure are to be determined according to [4.3].

5. End bulkheads of superstructure and deckhouse

(RCN 2, effective from 1 July 2008)

5.1 Application

5.1.1

The requirements in [5.2] and [5.3] apply to end bulkhead of superstructure and deckhouse forming the only protection for openings, as required by ILLC as amended, and for accommodations.

(RCN 2, effective from 1 July 2008)

5.2 Loads

5.2.1

The design load p_A, in kN/m², for determining the scantlings is to be obtained according to Ch 4, Sec 5, [3.4].

5.3 Scantlings

5.3.1 Stiffeners

The section modulus w, in cm^3, of the stiffeners is not to be less than the value obtained from the following formula:

$$w = 0.35kp_A s\ell^2$$

This requirement assume the webs of lowest tier stiffeners to be efficiently welded to the decks. Scantlings for other types of end connections may be specially considered.

The section modulus of deckhouse side stiffeners needs not to be greater than that of side frames on the deck situated directly below; taking account of spacing s and span ℓ.

(RCN 2, effective from 1 July 2008)

5.3.2 Plate thickness

The gross thickness of the plating, in mm, is not to be less than the greater of the values obtained from the following formulae:

$t = 0.9s\sqrt{kp_A} + 1.5$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

$t_{min} = \left(5.0 + \dfrac{L_2}{100}\right)\sqrt{k}$, for the lowest tier

$t_{min} = \left(4.0 + \dfrac{L_2}{100}\right)\sqrt{k}$, for the upper tiers, without being less than 5.0 mm.

Section 5 – HATCH COVERS

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

p_S : Still water pressure, in kN/m^2, defined in [4.1]

p_W : Wave pressure, in kN/m^2, defined in [4.1]

p_C : Pressure acting on the hatch coaming, in kN/m^2, defined in [6.2]

F_S, F_W : Coefficients taken equal to:

$F_S = 0$ and $F_W = 0.9$ for ballast water loads on hatch covers of the ballast hold

RCN 1 to July 2008 version (effective from 1 July 2009)

$F_S = 1.0$ and $F_W = 1.0$ in other cases

s : Length, in m, of the shorter side of the elementary plate panel

ℓ : Length, in m, of the longer side of the elementary plate panel

b_p : Effective width, in m, of the plating attached to the ordinary stiffener or primary supporting member, defined in [3]

w : Net section modulus, in cm^3, of the ordinary stiffener or primary supporting member, with an attached plating of width b_p

A_{sh} : Net shear sectional area, in cm^2, of the ordinary stiffener or primary supporting member

m : Boundary coefficient for ordinary stiffeners and primary supporting members, taken equal to:

$m = 8$, in the case of ordinary stiffeners and primary supporting members simply supported at both ends or supported at one end and clamped at the other end

$m = 12$, in the case of ordinary stiffeners and primary supporting members clamped at both ends

t_C : Total corrosion addition, in mm, defined in [1.4]

σ_a , τ_a : Allowable stresses, in N/mm^2, defined in [1.5]

1. General

1.1 Application

1.1.1

The requirements in [1] to [8] apply to steel hatch covers in positions 1 and 2 on weather decks, defined in Ch 1, Sec 4, [3.20].

The requirements in [9] apply to steel hatch covers of small hatches fitted on the exposed fore deck over the forward 0.25L.

1.2 Materials

1.2.1 Steel

The formulae for scantlings given in [5] are applicable to steel hatch covers.

Materials used for the construction of steel hatch covers are to comply with the applicable requirements of the Society.

1.2.2 Other materials

The use of materials other than steel is considered by the Society on a case by case basis, by checking that criteria adopted for scantlings are such as to ensure strength and stiffness equivalent to those of steel hatch covers.

1.3 Net scantlings

1.3.1

All scantlings referred to in this Section, except otherwise specified, are net, i.e. they do not include any margin for corrosion.

When calculating the stresses σ and τ in [5.3] and [5.4], the net scantlings are to be used.

The gross scantlings are obtained as specified in Ch 3, Sec 2.

The corrosion additions are given in [1.4].

1.4 Corrosion additions

1.4.1

The total corrosion addition for both sides to be considered for the plating and internal members of hatch covers is equal to the value specified in Tab 1.

The corrosion addition for hatch coamings and coaming stays is defined according to Ch 3, Sec 3.

Table 1: Corrosion addition t_C for hatch covers

Corrosion addition t_C, in mm, for both sides	
Plating and stiffeners of single skin hatch cover	2.0
Top and bottom plating of double skin hatch cover	2.0
Internal structures of double skin hatch cover	1.5

1.5 Allowable stresses

1.5.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15(6) and 16(5))

The allowable stresses σ_a and τ_a, in N/mm^2, are to be obtained from Tab 2.

Table 2: Allowable stresses, in N/mm^2

Members of	Subjected to	σ_a, in N/mm^2	τ_a, in N/mm^2
Weathertight hatch cover	External pressure, as defined in Ch 4, Sec 5, [5.2.1]	0.80 R_{eH}	0.46 R_{eH}
Pontoon hatch cover		0.68 R_{eH}	0.39 R_{eH}
Weathertight hatch cover and pontoon hatch cover	Other loads, as defined in Ch 4, Sec 5, [5.1.1] and Ch 4, Sec 6, [2]	0.90 R_{eH}	0.51 R_{eH}

RCN 1 to July 2008 version (effective from 1 July 2009)

2. Arrangements

2.1 Height of hatch coamings

2.1.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 14 (1, 1))

The height above the deck of hatch coamings is to be not less than:

- *600 mm in position 1*
- *450 mm in position 2.*

2.1.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 14 (1, 2))

The height of hatch coamings in positions 1 and 2 closed by steel covers provided with gaskets and securing devices may be reduced with respect to the above values or the coamings may be omitted entirely, on condition that the Administration is satisfied that the safety of the ship is not thereby impaired in any sea conditions.

In such cases the scantlings of the covers, their gasketing, their securing arrangements and the drainage of recesses in the deck are considered by the Society on a case by case basis.

2.1.3

Regardless of the type of closing arrangement adopted, the coamings may have reduced height or be omitted in way of openings in closed superstructures.

2.2 Hatch covers

2.2.1

Hatch covers on exposed decks are to be weathertight.

Hatch covers in closed superstructures need not be weathertight.

However, hatch covers fitted in way of ballast tanks, fuel oil tanks or other tanks are to be watertight.

2.2.2

The ordinary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

2.2.3

The spacing of primary supporting members parallel to the direction of ordinary stiffeners is to be not greater than 1/3 of the span of primary supporting members.

2.2.4

The breadth of the primary supporting member face plate is to be not less than 40% of their depth for laterally unsupported spans greater than 3 m. Tripping brackets attached to the face plate may be considered as a lateral support for primary supporting members.

The face plate outstand is not to exceed 15 times the gross face plate thickness.

2.2.5
Efficient retaining arrangements are to be provided to prevent translation of the hatch cover under the action of the longitudinal and transverse forces exerted by cargoes on the cover, if any. These retaining arrangements are to be located in way of the hatch coaming side brackets.

2.2.6
The width of each bearing surface for hatch covers is to be at least 65 mm.

2.3 Hatch coamings

2.3.1
Coamings, stiffeners and brackets are to be capable of withstanding the local forces in way of the clamping devices and handling facilities necessary for securing and moving the hatch covers as well as those due to cargo stowed on the latter.

2.3.2
Special attention is to be paid to the strength of the fore transverse coaming of the forward hatch and to the scantlings of the closing devices of the hatch cover on this coaming.

2.3.3
Longitudinal coamings are to be extended at least to the lower edge of deck beams.

- where they are not part of continuous deck girders, the lower edge of longitudinal coamings are to extend for at least two frame spaces beyond the end of the openings.
- where longitudinal coamings are part of deck girders, their scantlings are to be as required in Ch 6, Sec 4.

2.3.4
A web frame or a similar structure is to be provided below the deck in line with the transverse coaming. Transverse coamings are to extend below the deck and to be connected with the web frames.

2.4 Small hatchways

2.4.1
The height of small hatchway coamings is to be not less than 600 mm if located in position 1 and 450 mm if located in position 2.
Where the closing appliances are in the form of hinged steel covers secured weathertight by gaskets and swing bolts, the height of the coamings may be reduced or the coamings may be omitted altogether.

2.4.2
Small hatch covers are to have strength equivalent to that required for main hatchways and are to be of steel, weathertight and generally hinged.
Securing arrangements and stiffening of hatch cover edges are to be such that weathertightness can be maintained in any sea condition.

At least one securing device is to be fitted at each side. Circular hole hinges are considered equivalent to securing devices.

2.4.3
Hold accesses located on the weather deck are to be provided with weathertight metallic hatch covers, unless they are protected by a closed superstructure. The same applies to accesses located on the forecastle deck and leading directly to a dry cargo hold through a trunk.

2.4.4
Accesses to cofferdams and ballast tanks are to be manholes fitted with watertight covers fixed with bolts which are sufficiently closely spaced.

2.4.5
Hatchways of special design are considered by the Society on a case by case basis.

3. Width of attached plating

3.1 Ordinary stiffeners

3.1.1
The width of the attached plating to be considered for the check of ordinary stiffeners is to be obtained, in m, from the following formulae:

- where the attached plating extends on both sides of the stiffener:

  $b_p = s$

- where the attached plating extends on one side of the stiffener:

  $b_p = 0.5s$

3.2 Primary supporting members

3.2.1
The effective width of the attached plating to be considered for the yielding and buckling checks of primary supporting members analysed through isolated beam or grillage model is to be obtained, in m, from the following formulae:

- where the plating extends on both sides of the primary supporting member:

  $b_p = b_{p,1} + b_{p,2}$

- where the plating extends on one side of the primary supporting member:

  $b_p = b_{p,1}$

where:

$b_{p,1} = \min\left(0.165\ell_p\ ,\ S_{p,1}\right)$

$b_{p,2} = \min\left(0.165\ell_p\ ,\ S_{p,2}\right)$

ℓ_p : Span, in m, of the considered primary supporting member

$S_{p,1}$, $S_{p,2}$: Half distance, in m, between the considered primary supporting member and the adjacent ones, $S_{p,1}$ for one side, $S_{p,2}$ for the other side.

When a isolated beam or a grillage analysis is used, the areas of ordinary stiffeners are not to be included in the attached plating of the primary members.

4. Load model

4.1 Lateral pressures and forces

4.1.1 General

The lateral pressures and forces to be considered as acting on hatch covers are indicated in [4.1.2] to [4.1.6]. When two or more panels are connected by hinges, each individual panel is to be considered separately.

In any case, the sea pressures defined in [4.1.2] are to be considered for hatch covers located on exposed decks.

Additionally, when the hatch cover is intended to carry uniform cargoes, special cargoes or containers, the pressures and forces defined in [4.1.3] to [4.1.6] are to be considered independently from the sea pressures.

4.1.2 Sea pressures

The still water and wave lateral pressures are to be considered and are to be taken equal to:

- still water pressure: $p_S = 0$
- wave pressure p_W, as defined in Ch 4, Sec 5 [5.2].

4.1.3 Internal pressures due ballast water

If applicable, the static and dynamic lateral pressures are to be considered and are defined in Ch 4, Sec 6, [2].

4.1.4 Pressures due to uniform cargoes

If applicable, the static and dynamic pressures are to be considered and are defined in Ch 4, Sec 5, [2.4.1]

4.1.5 Pressures or forces due to special cargoes

In the case of carriage on the hatch covers of special cargoes (e.g. pipes, etc.) which may temporarily retain water during navigation, the lateral pressures or forces to be applied are considered by the Society on a case by case basis.

4.1.6 Forces due to containers

In the case of carriage of containers on the hatch covers, the concentrated forces under the containers corners are to be determined in accordance with the applicable requirements of the Society.

4.2 Load point

4.2.1 Sea pressures

The wave lateral pressure to be considered as acting on each hatch cover is to be calculated at a point located longitudinally, at the hatch cover mid-length.

RCN 1 to July 2010 version (effective from 1July 2012)

4.2.2 Other pressures

The lateral pressure is to be calculated:

- in way of the geometrical centre of gravity of the plate panel, for plating
- at mid-span, for ordinary stiffeners and primary supporting members.

Internal dynamic lateral pressure to be considered as acting on the bottom of a hatch cover is to be calculated at a point located:

- longitudinally, at the hatch cover mid-length
- transversely, at hatchway side
- Vertically, at the top of the hatch coaming for internal ballast water pressures

RCN 1 to July 2010 version (effective from 1July 2012)

5. Strength check

5.1 General

5.1.1 Application

The strength check is applicable to rectangular hatch covers subjected to a uniform pressure, designed with primary supporting members arranged in one direction or as a grillage of longitudinal and transverse primary supporting members.

In the latter case, the stresses in the primary supporting members are to be determined by a grillage or a finite element analysis.

It is to be checked that stresses induced by concentrated loads are in accordance with the criteria in [5.4.4].

5.1.2 Hatch covers supporting containers

The scantlings of hatch covers supporting containers are to comply with the applicable provisions of the Society.

5.1.3 Hatch covers subjected to special cargoes

For hatch covers supporting special cargoes, ordinary stiffeners and primary supporting members are generally to be checked by direct calculations, taking into account the stiffener arrangements and their relative inertia. It is to be checked that stresses induced by special cargoes are in accordance with the criteria in [5.4.4].

5.1.4 Covers of small hatchways

The gross thickness of covers is to be not less than 8 mm. This thickness is to be increased or an efficient stiffening fitted to the Society's satisfaction where the greatest horizontal dimension of the cover exceeds 0.6 m.

5.2 Plating

5.2.1 Net thickness

The net thickness of steel hatch cover top plating, in mm, is to be not less than the value obtained from the following formula:

$$t = 15.8 F_p s \sqrt{\frac{F_S p_S + F_W p_W}{0.95 R_{eH}}}$$

where:

F_p : Factor for combined membrane and bending response, equal to:

$F_p = 1.5$ in general

$F_p = 1.9\,\sigma/\sigma_a$, for $\sigma \geq 0.8\sigma_a$ for the attached plating of primary supporting members

σ : Normal stress, in N/mm^2, in the attached plating of primary supporting members, calculated according to [5.4.3] or determined through a grillage analysis or a finite element analysis, as the case may be.

5.2.2 Minimum net thickness

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 16 (5, c))

In addition to [5.2.1], *the net thickness, in mm, of the plating forming the top of the hatch cover is to be not less than the greater of the following values:*

$t = 10s$

$t = 6$

5.2.3 Critical buckling stress check

The compressive stress σ in the hatch cover plating, induced by the bending of primary supporting members, parallel to the direction of ordinary stiffeners is to comply with the following formula:

$$\sigma \leq \frac{0.88}{S}\sigma_{C1}$$

where:

S : Safety factor defined in Ch 6, Sec 3

σ_{C1} : Critical buckling stress, in N/mm^2, taken equal to:

$\sigma_{C1} = \sigma_{E1}$ for $\sigma_{E1} \leq \frac{R_{eH}}{2}$

$\sigma_{C1} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{E1}}\right)$ for $\sigma_{E1} > \frac{R_{eH}}{2}$

$$\sigma_{E1} = 3.6\,E\left(\frac{t}{1000s}\right)^2$$

t : Net thickness, in mm, of plate panel

The compressive stress σ in the hatch cover plating, induced by the bending of primary supporting members, perpendicular to the direction of ordinary stiffeners is to comply with the following formula:

$$\sigma \leq \frac{0.88}{S}\sigma_{C2}$$

where:

S : Safety factor defined in Ch 6, Sec 3

σ_{C2} : Critical buckling stress, in N/mm², taken equal to:

$$\sigma_{C2} = \sigma_{E2} \quad \text{for} \quad \sigma_{E2} \le \frac{R_{eH}}{2}$$

$$\sigma_{C2} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{E2}}\right) \quad \text{for} \quad \sigma_{E2} > \frac{R_{eH}}{2}$$

$$\sigma_{E2} = 0.9\, m\, E\left(\frac{t}{1000 s_s}\right)^2$$

m : Coefficient taken equal to:

$$m = c\left[1 + \left(\frac{s_s}{\ell_s}\right)^2\right]^2 \frac{2.1}{\psi + 1.1}$$

t : Net thickness, in mm, of plate panel

s_s : Length, in m, of the shorter side of the plate panel

ℓ_s : Length, in m, of the longer side of the plate panel

ψ : Ratio between smallest and largest compressive stress

c : Coefficient taken equal to:

c = 1.3 when plating is stiffened by primary supporting members

c = 1.21 when plating is stiffened by ordinary stiffeners of angle or T type

c = 1.1 when plating is stiffened by ordinary stiffeners of bulb type

c = 1.05 when plating is stiffened by flat bar.

c= 1.30 when plating is stiffened by ordinary stiffeners of U type. The higher c value but not greater than 2.0 may be taken if it is verified by buckling strength check of panel using non-linear FEA and deemed appropriate by the Society.

An averaged value of c is to be used for plate panels having different edge stiffeners.

The bi-axial compression stress in the hatch cover plating, when calculated by means of finite element analysis, is to comply with the requirements in Ch 6, Sec 3.

RCN 1 to July 2008 version (effective from 1July 2009)

5.3 Ordinary stiffeners

5.3.1

For flat bar ordinary stiffeners, the ratio h_w/t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{R_{eH}}}$$

5.3.2 Minimum net thickness of web

The web net thickness of the ordinary stiffener, in mm, is to be not less than 4mm.

RCN 1 to July 2008 version (effective from 1 July 2009)

5.3.3 Net section modulus and net shear sectional area

The net section modulus w, in cm^3, and the net shear sectional area A_{sh}, in cm^2, of an ordinary stiffener subject to lateral pressure are to be not less than the values obtained from the following formulae:

$$w = \frac{(F_S p_S + F_W p_W) s \ell_s^2}{m \sigma_a} 10^3$$

$$A_{sh} = \frac{5(F_S p_S + F_W p_W) s \ell_s}{\tau_a}$$

where:

ℓ_s : Ordinary stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all ordinary stiffener spans, the ordinary stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10% of the gross span, for each bracket.

5.3.4 Critical buckling stress check

The compressive stress σ in the face plate of ordinary stiffeners, induced by the bending of primary supporting members, parallel to the direction of ordinary stiffeners is to comply with the following formula:

$$\sigma \le \frac{0.88 \sigma_{CS}}{S}$$

where:

S : Safety factor defined in Ch 6, Sec 3

σ_{CS} : Critical buckling stress, in N/mm^2, taken equal to:

$$\sigma_{CS} = \sigma_{ES} \quad \text{for} \quad \sigma_{ES} \le \frac{R_{eH}}{2}$$

$$\sigma_{CS} = R_{eH}\left(1 - \frac{R_{eH}}{4\sigma_{ES}}\right) \quad \text{for} \quad \sigma_{ES} > \frac{R_{eH}}{2}$$

$$\sigma_{ES} = \min(\sigma_{E3}, \sigma_{E4})$$

$$\sigma_{E3} = 0.001 \frac{E I_a}{A \ell^2}$$

I_a : Moment of inertia, in cm^4, of the ordinary stiffener, including a face plate equal to spacing of ordinary stiffeners

A : Cross-sectional area, in cm^2, of the ordinary stiffener, including a face plate equal to spacing of ordinary stiffeners

ℓ : Span, in m, of the ordinary stiffener

$$\sigma_{E4} = \frac{\pi^2 E I_w}{10^4 I_p \ell^2}\left(m^2 + \frac{K}{m^2}\right) + 0.385 E \frac{I_t}{I_p}$$

$$K = \frac{C \ell^4}{\pi^4 E I_w} 10^6$$

m : Number of half waves, given in Tab 3.

Table 3: Number of half waves

	$0 < K < 4$	$4 < K < 36$	$36 < K < 144$	$(m-1)^2\, m^2 < K \le m^2\, (m+1)^2$
m	1	2	3	m

I_w : Sectorial moment of inertia, in cm^6, of the ordinary stiffener about its connection with the plating, taken equal to:

$$I_w = \frac{h_w^3\, t_w^3}{36} 10^{-6}$$ for flat bar ordinary stiffeners

$$I_w = \frac{t_f\, b_f^3\, h_w^2}{12} 10^{-6}$$ for "Tee" ordinary stiffeners

$$I_w = \frac{b_f^3\, h_w^2}{12\left(b_f + h_w\right)^2}\left[t_f\left(b_f^2 + 2\, b_f\, h_w + 4\, h_w^2\right) + 3\, t_w\, b_f\, h_w\right] 10^{-6}$$ for angles and bulb ordinary stiffeners

I_p : Polar moment of inertia, in cm^4, of the ordinary stiffener about its connection with the plating, taken equal to:

$$I_t = \frac{h_w^3\, t_w}{3} 10^{-4}$$ for flat bar ordinary stiffeners

$$I_p = \left(\frac{h_w^3\, t_w}{3} + h_w^2\, b_f\, t_f\right) 10^{-4}$$ for flanged ordinary stiffeners

I_t : St Venant's moment of inertia, in cm^4, of the ordinary stiffener without face plate, taken equal to:

$$I_t = \frac{h_w\, t_w^3}{3} 10^{-4}$$ for flat bar ordinary stiffeners

$$I_t = \frac{1}{3}\left[h_w\, t_w^3 + b_f\, t_f^3\left(1 - 0.63\frac{t_f}{b_f}\right)\right] 10^{-4}$$ for flanged ordinary stiffeners

C : Spring stiffness exerted by the hatch cover top plating, taken equal to:

$$C = \frac{k_p\, E\, t_p^3}{3\, s\left(1 + \frac{1.33\, k_p\, h_w\, t_p^3}{1000\, s\, t_w^3}\right)} 10^{-3}$$

$k_p = 1 - \eta_p$, to be taken not less than zero; for flanged ordinary stiffeners, k_p need not be taken less than 0.1

$$\eta_p = \frac{\sigma}{\sigma_{E1}}$$

σ_{E1} : As defined in [5.2.3]

t_p : Net thickness, in mm, of the hatch cover plate panel.

5.4 Primary supporting members

5.4.1 Application

The requirements in [5.4.3] to [5.4.5] apply to primary supporting members which may be analysed through isolated beam models.

Primary supporting members whose arrangement is of a grillage type and which cannot be analysed through isolated beam models are to be checked by direct calculations, using the checking criteria in [5.4.4].

5.4.2 Minimum net thickness of web

The web net thickness of primary supporting members, in mm, is to be not less than 6mm.

RCN 1 to July 2008 version (effective from 1 July 2009)

5.4.3 Normal and shear stress for isolated beam

In case that grillage analysis or finite element analysis are not carried out, according to the requirements in [5.1.1], the maximum normal stress σ and shear stress τ in the primary supporting members are to be obtained, in N/mm^2, from the following formulae:

$$\sigma = \frac{s(F_S p_S + F_W p_W)\ell_m^2}{mW} 10^3$$

$$\tau = \frac{5s(F_S p_S + F_W p_W)\ell_m}{A_{sh}}$$

where:

ℓ_m : Span of the primary supporting member.

5.4.4 Checking criteria

The normal stress σ and the shear stress τ, calculated according to [5.4.3] or determined through a grillage analysis or finite element analysis, as the case may be, are to comply with the following formulae:

$$\sigma \le \sigma_a$$

$$\tau \le \tau_a$$

5.4.5 Deflection limit

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15 (6) and 16 (5, b))

The net moment of inertia of a primary supporting member, when loaded by sea pressure, is to be such that the deflection does not exceed $\mu\ell_{\max}$*, where:*

μ : *Coefficient taken equal to:*

$\mu = 0.0056$ *for weathertight hatch covers*

$\mu = 0.0044$ *for pontoon hatch covers*

$\ell_{\max}$: *Greatest span, in m, of primary supporting members.*

5.4.6 Critical buckling stress check of the web panels of the primary supporting members.

The shear stress τ in the web panels of the primary supporting members, calculated according to [5.4.3] or determined through a grillage analysis or a finite element analysis, as the case may be, is to comply with the following formula:

$$\tau \le \frac{0.88\tau_C}{S}$$

where:

S : Safety factor defined in Ch 6, Sec 3

τ_C : Critical shear buckling stress, in N/mm^2, taken equal to:

$$\tau_C = \tau_E \qquad \text{for} \qquad \tau_E \le \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_C = \frac{R_{eH}}{\sqrt{3}}\left(1 - \frac{R_{eH}}{4\sqrt{3}\tau_E}\right) \quad \text{for} \qquad \tau_E > \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_E = 0.9k_t E\left(\frac{t_{pr,n}}{1000d}\right)^2$$

$$k_t = 5.35 + 4.0\left(\frac{a}{d}\right)^2$$

$t_{pr,n}$: Net thickness, in mm, of web of primary supporting member

a : Greater dimension, in m, of web panel of primary supporting member

d : Smaller dimension, in m, of web panel of primary supporting member.

For primary supporting members parallel to the direction of ordinary stiffeners, τ_C is to be calculated by considering the actual dimensions of the panels.

For primary supporting members perpendicular to the direction of ordinary stiffeners or for hatch covers built without ordinary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C, where d is the smaller dimension, in m, of web panel of the primary supporting member. the In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

5.4.7

For buckling stiffeners on webs of primary supporting members, the ratio h_w/t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{R_{eH}}}$$

5.5 Ordinary stiffeners and primary supporting members of variable cross-section

5.5.1

The net section modulus of ordinary stiffeners and primary supporting members with a variable cross-section is to be not less than the greater of the value obtained, in cm^3, from the following formulae:

$$w = w_{CS}$$

$$w = \left(1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}\right) w_{CS}$$

where:

w_{CS} : Net section modulus, in cm^3, for a constant cross-section, complying with the checking criteria in [5.4.4]

α : Coefficient taken equal to:

$$\alpha = \frac{\ell_1}{\ell_0}$$

ψ : Coefficient taken equal to:

$$\psi = \frac{w_1}{w_0}$$

ℓ_1 : Length of the variable section part, in m (see Fig 1)

ℓ_0 : Span measured, in m, between end supports (see Fig 1)

w_1 : Net section modulus at end, in cm^3 (see Fig 1)

w_0 : Net section modulus at mid-span, in cm^3 (see Fig 1).

Moreover, the net moment of inertia of ordinary stiffeners and primary supporting members with a variable cross-section is to be not less than the greater of the values obtained, in cm^4, from the following formulae:

$$I = I_{CS}$$

$$I = \left[1 + 8\alpha^3\left(\frac{1-\varphi}{0.2 + 3\sqrt{\varphi}}\right)\right] I_{CS}$$

where:

I_{CS} : Net moment of inertia with a constant cross-section, in cm^4, complying with [5.4.5]

φ : Coefficient taken equal to:

$$\varphi = \frac{I_1}{I_0}$$

I_1 : Net moment of inertia at end, in cm^4 (see Fig 1)

I_0 : Net moment of inertia at mid-span, in cm^4 (see Fig 1).

The use of these formulae is limited to the determination of the strength of ordinary stiffeners and primary supporting members in which abrupt changes in the cross-section do not occur along their length.

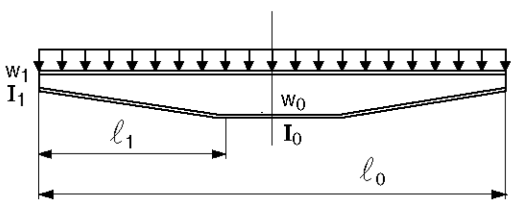

Figure 1: Variable cross-section stiffener

6. Hatch coamings

6.1 Stiffening

6.1.1

The ordinary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

6.1.2

Coamings are to be stiffened on their upper edges with a stiffener suitably shaped to fit the hatch cover closing appliances.

Moreover, when covers are fitted with tarpaulins, an angle or a bulb section is to be fitted all around coamings of more than 3 m in length or 600 mm in height; this stiffener is to be fitted at approximately 250 mm below the upper edge. The width of the horizontal flange of the angle is not to be less than 180 mm.

6.1.3

Where hatch covers are fitted with tarpaulins, coamings are to be strengthened by brackets or stays with a spacing not greater than 3 m.

Where the height of the coaming exceeds 900 mm, additional strengthening may be required.

However, reductions may be granted for transverse coamings in protected areas.

6.1.4

When two hatches are close to each other, underdeck stiffeners are to be fitted to connect the longitudinal coamings with a view to maintaining the continuity of their strength.

Similar stiffening is to be provided over 2 frame spacings at ends of hatches exceeding 9 frame spacings in length.

In some cases, the Society may require the continuity of coamings to be maintained above the deck.

6.1.5

Where watertight metallic hatch covers are fitted, other arrangements of equivalent strength may be adopted.

6.2 Load model

6.2.1

The lateral pressure p_C to be considered as acting on the hatch coamings is defined in [6.2.2] and [6.2.3].

6.2.2

The wave lateral pressure p_C, in kN/m^2, on the No 1 forward transverse hatch coaming is to be taken equal to:

- $p_C = 220$, when a forecastle is fitted in accordance with Sec 1, [7.1]
- $p_C = 290$, in the other cases.

6.2.3

The wave lateral pressure p_C, in kN/m^2, on the hatch coamings other than the No 1 forward transverse hatch coaming is to be taken equal to:

- $p_C = 220$

6.2.4

For cargo holds intended for the carriage of liquid cargoes, the liquid internal pressures applied on hatch coaming is also to be determined according to Ch 4, Sec 6.

6.3 Scantlings

6.3.1 Plating

The net thickness of the hatch coaming plate is to be not less than the greater value obtained, in mm, from the following formulae:

$$t = 15.98 s \sqrt{\frac{p_C}{0.95 R_{eH}}}$$

$t = 9.5$

6.3.2 Ordinary stiffeners

The net section modulus of the longitudinal or transverse ordinary stiffeners of hatch coamings is to be not less than the value obtained, in cm^3, from the following formula:

$$w = 1.21 \frac{p_C s \ell^2 10^3}{m c_p R_{eH}}$$

where:

m : Coefficient taken equal to:

$m = 16$ in general

$m = 12$ for the end span of stiffeners sniped at the coaming corners

c_p : Ratio of the plastic section modulus to the elastic section modulus of the ordinary stiffeners with an attached plate breadth, in mm, equal to $40t$, where t is the plate net thickness.

$c_p = 1.16$ in the absence of more precise evaluation.

6.3.3 Coaming stays

The net section modulus w, in cm^3, and the net thickness t_w, in mm, of the coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (examples shown in Fig 2 and Fig 3) are to be not less than the values obtained from the following formulae at the connection with deck:

$$w = \frac{s_C p_C H_C^2 10^3}{1.9 R_{eH}}$$

$$t_w = \frac{s_C p_C H_C 10^3}{0.5 h R_{eH}}$$

where:

H_C : Stay height, in m

s_C : Stay spacing, in m

h : Stay depth, in mm, at the connection with deck.

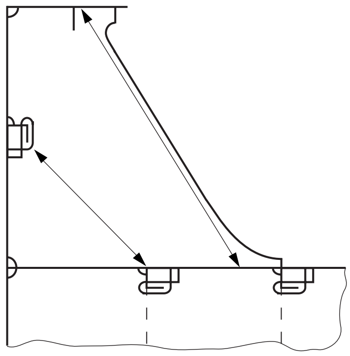

Figure 2: Coaming stay: example1

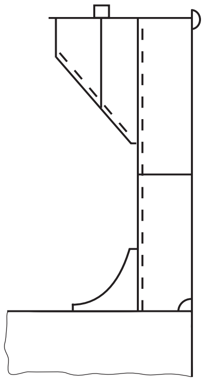

Figure 3: Coaming stay: example 2

For calculating the section modulus of coaming stays, their face plate area may be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.

For other designs of coaming stays, such as, for example, those shown in Fig 4 and Fig 5, the stress levels determined through a grillage analysis or finite element analysis, as the case may be, apply and are to be checked at the highest stressed locations. The stress levels are to comply with the following formulae:

$\sigma \leq 0.95 R_{eH}$

$\tau \leq 0.5 R_{eH}$

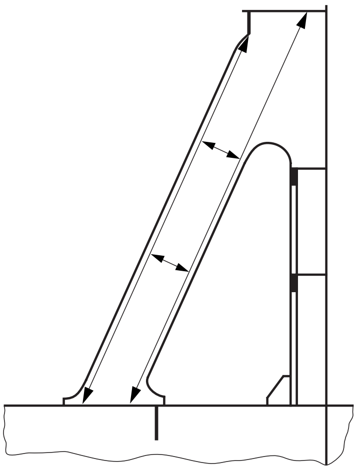

Figure 4: Coaming stay: example 3

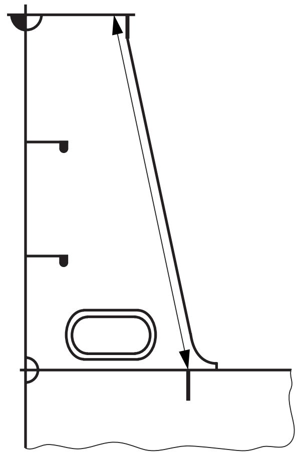

Figure 5: Coaming stay: example 4

6.3.4 Local details

The design of local details is to comply with the requirements in this section for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below.

Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

The normal stress σ and the shear stress τ, in N/mm^2, induced in the underdeck structures by the loads transmitted by stays are to comply with the following formulae:

$\sigma \leq 0.95R_{eH}$

$\tau \leq 0.5R_{eH}$

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society's requirements.

Double continuous fillet welding is to be adopted for the connections of stay webs with deck plating and the weld throat thickness is to be not less than $0.44t_w$, where t_w is the gross thickness of the stay web.

Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15% of the stay width.

6.3.5 Coamings of small hatchways

The gross thickness of coaming plate is to be not less than the lesser of the following values:

- the gross thickness for the deck inside line of openings calculated for that position, assuming as spacing of stiffeners the lesser of the values of the height of the coaming and the distance between its stiffeners, if any, or
- 10 mm.

Coamings are to be suitably strengthened where their height exceeds 0.8 m or their greatest horizontal dimension exceeds 1.2 m, unless their shape ensures an adequate rigidity.

7. Weathertightness, closing arrangement, securing devices and stoppers

7.1 Weathertightness

7.1.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 16 (1))

Where the hatchway is exposed, the weathertightness is to be ensured by gaskets and clamping devices sufficient in number and quality.

Weathertightness may also be ensured means of tarpaulins.

7.1.2

In general, a minimum of two securing devices or equivalent is to be provided on each side of the hatch cover.

7.2 Gaskets

7.2.1

The weight of hatch covers and any cargo stowed thereon, together with inertia forces generated by ship motions, are to be transmitted to the ship's structure through steel to steel contact.

This may be achieved by continuous steel to steel contact of the hatch cover skirt plate with the ship's structure or by means of defined bearing pads.

7.2.2

The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements.

Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and to be made of a corrosion-resistant material.

7.2.3

The gasket and the securing arrangements are to maintain their efficiency when subjected to large relative movements between the hatch cover and the ship's structure or between hatch cover elements.

If necessary, suitable devices are to be fitted to limit such movements.

7.2.4

The gasket material is to be of a quality suitable for all environmental conditions likely to be encountered by the ship, and is to be compatible with the cargoes transported.

The material and form of gasket selected are to be considered in conjunction with the type of hatch cover, the securing arrangement and the expected relative movement between the hatch cover and the ship's structure.

The gasket is to be effectively secured to the hatch cover.

7.2.5

Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

7.2.6

Metallic contact is required for an earthing connection between the hatch cover and the hull structures. If necessary, this is to be achieved by means of a special connection for the purpose.

7.3 Closing arrangement, securing devices and stoppers

7.3.1 General

Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

The securing and stop arrangements are to be fitted using appropriate means which cannot be easily removed.

In addition to the requirements above, all hatch covers, and in particular those carrying deck cargo, are to be effectively secured against horizontal shifting due to the horizontal forces resulting from ship motions.

Towards the ends of the ship, vertical acceleration forces may exceed the gravity force. The resulting lifting forces are to be considered when dimensioning the securing devices according to [7.3.5] to [7.3.7]. Lifting forces from cargo secured on the hatch cover during rolling are also to be taken into account.

Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers.

Hatch covers provided with special sealing devices, insulated hatch covers, flush hatch covers and those having coamings of a reduced height (see [2.1]) are considered by the Society on a case by case basis.
In the case of hatch covers carrying containers, the scantlings of the closing devices are to take into account the possible upward vertical forces transmitted by the containers.

7.3.2 Arrangements

The securing and stopping devices are to be arranged so as to ensure sufficient compression on gaskets between hatch covers and coamings and between adjacent hatch covers.
Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending on the type and the size of the hatch cover, as well as on the stiffness of the hatch cover edges between the securing devices.
At cross-joints of multipanel covers, (male/female) vertical guides are to be fitted to prevent excessive relative vertical deflections between loaded/unloaded panels.
The location of stoppers is to be compatible with the relative movements between hatch covers and the ship's structure in order to prevent damage to them. The number of stoppers is to be as small as possible.

7.3.3 Spacing

The spacing of the securing arrangements is to be generally not greater than 6 m.

7.3.4 Construction

Securing arrangements with reduced scantlings may be accepted provided it can be demonstrated that the possibility of water reaching the deck is negligible.
Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or hatch covers.
Individual securing devices on each hatch cover are to have approximately the same stiffness characteristics.

7.3.5 Area of securing devices

The net cross area of each securing device is to be not less than the value obtained, in cm², from the following formula:

$$A = 1.4 S_S \left(\frac{235}{R_{eH}} \right)^{\alpha}$$

where:

S_S : Spacing, in m, of securing devices

α : Coefficient taken equal to:

$\alpha = 0.75$ for $R_{eH} > 235$ N/mm^2

$\alpha = 1.0$ for $R_{eH} \le 235$ N/mm^2

In the above calculations, R_{eH} may not be taken greater than $0.7 R_m$.

RCN 2 to July 2008 version (effective from 1July 2010)

Between hatch cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by securing devices. For packing line pressures exceeding 5 N/mm, the net cross area *A* is to be increased in direct proportion. The packing line pressure is to be specified.
In the case of securing arrangements which are particularly stressed due to the unusual width of the hatchway, the net cross area *A* of the above securing arrangements is to be determined through direct calculations.

7.3.6 Inertia of edges elements

The hatch cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia of edge elements is to be not less than the value obtained, in cm^4, from the following formula:

$$I = 6 p_L S_S^4$$

where:

p_L : Packing line pressure, in N/mm, to be taken not less than 5

S_S : Spacing, in m, of securing devices.

7.3.7 Diameter of rods or bolts

Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

7.3.8 Stoppers

Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.
With the exclusion of No 1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.
No 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 if a forecastle is fitted in accordance with Sec 1, [7.1].
The equivalent stress in stoppers, their supporting structures and calculated in the throat of the stopper welds is to be equal to or less than the allowable value, equal to $0.8R_{eH}$.

7.4 Tarpaulins

7.4.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15 (11))
Where weathertightness of hatch covers is ensured by means of tarpaulins, at least two layers of tarpaulins are to be fitted.
Tarpaulins are to be free from jute and waterproof and are to have adequate characteristics of strength and resistance to atmospheric agents and high and low temperatures.
The mass per unit surface of tarpaulins made of vegetable fibres, before the waterproofing treatment, is to be not less than:

- 0.65 kg/m^2 for waterproofing by tarring
- 0.60 kg/m^2 for waterproofing by chemical dressing

- 0.55 kg/m^2 for waterproofing by dressing with black oil.

In addition to tarpaulins made of vegetable fibres, those of synthetic fabrics or plastic laminates may be accepted by the Society provided their qualities, as regards strength, waterproofing and resistance to high and low temperatures, are equivalent to those of tarpaulins made of vegetable fibres.

7.5 Cleats

7.5.1

Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

7.5.2

Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

7.6 Wedges

7.6.1 Wedges

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 15 (10))

Wedges are to be of tough wood, generally not more than 200 mm in length and 50 mm in width.

They are generally to be tapered not more than 1 in 6 and their thickness is to be not less than 13 mm.

8. Drainage

8.1 Arrangement

8.1.1

Drainage is to be arranged inside the line of gaskets by means of a gutter bar or vertical extension of the hatch side and end coaming.

8.1.2

Drain openings are to be arranged at the ends of drain channels and are to be provided with efficient means for preventing ingress of water from outside, such as non-return valves or equivalent.

8.1.3

Cross-joints of multi-panel hatch covers are to be arranged with drainage of water from the space above the gasket and a drainage channel below the gasket.

8.1.4

If a continuous outer steel contact is arranged between the cover and the ship's structure, drainage from the space between the steel contact and the gasket is also to be provided.

9. Small hatches fitted on the exposed fore deck

9.1 Application

9.1.1

The requirements of this article apply to steel covers of small hatches fitted on the exposed fore deck over the forward 0.25L, where the height of the exposed deck in way of the hatch is less than 0.1L or 22 m above the summer load waterline, whichever is the lesser.

Small hatches are hatches designed for access to spaces below the deck and are capable to be closed weather-tight or watertight, as applicable. Their opening is generally equal to or less than 2.5 m^2.

9.1.2

Small hatches designed for use of emergency escape are to comply with the requirements of this article with exception of [9.4.1] a) and b), [9.4.3] and [9.5.1].

9.2 Strength

9.2.1

For small rectangular steel hatch covers, the gross plate thickness, stiffener arrangement and scantlings are to be not less than those obtained, in mm, from Tab 4 and Fig 6.

Ordinary stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in [9.3.1] (see also Fig 6).

Primary stiffeners are to be continuous.

All stiffeners are to be welded to the inner edge stiffener (see Fig 7).

Table 4: Gross scantlings for small steel hatch covers on the fore deck

Nominal size (mm × mm)	Cover plate thickness (mm)	Primary stiffeners	Ordinary stiffeners
		Flat bar (mm × mm); number	
630 × 630	8	–	–
630 × 830	8	100 × 8 ; 1	–
830 × 630	8	100 × 8 ; 1	–
830 × 830	8	100 × 10 ; 1	–
1030 × 1030	8	120 × 12 ; 1	80 × 8 ; 2
1330 × 1330	8	150 × 12 ; 2	100 × 10 ; 2

9.2.2

The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, generally not more than 170 to 190 mm from the upper edge of the coamings.

9.2.3

For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement are to comply with [5.2].

9.2.4
For small hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

9.3 Weathertightness

9.3.1
The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Fig 6 and a sufficient capacity to withstand the bearing force.

9.4 Primary securing devices

9.4.1
Small hatches located on exposed fore deck are to be fitted with primary securing devices such their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:

a) butterfly nuts tightening onto forks (clamps)
b) quick acting cleats
c) central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

9.4.2
The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.

9.4.3
For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is to be not less than 16 mm. An example arrangement is shown in Fig 7.

9.4.4
For small hatch covers located on the exposed deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green seas will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

9.4.5
On small hatches located between the main hatches, for example between Nos. 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

9.5 Secondary securing devices

9.5.1

Small hatches on the fore deck are to be fitted with an independent secondary securing device e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

p : Lateral pressure for glasses, in kN/m^2, defined in [3.3.2].

1. General

1.1 Application

1.1.1

The requirements of this Section apply to the arrangement of hull and superstructure openings excluding hatchways, for which the requirements in Ch 9, Sec 5 apply.

1.2 Definitions

1.2.1 Standard height of superstructure

The standard height of superstructure is that defined in Ch 1, Sec 4.

1.2.2 Standard sheer

The standard sheer is that defined according to the International Load Line Convention, as amended.

1.2.3 Exposed zones

Exposed zones are the boundaries of superstructures or deckhouses set in from the ship's side at a distance equal to or less than 0.04*B*.

1.2.4 Unexposed zones

Unexposed zones are the boundaries of deckhouses set in from the ship's side at a distance greater than 0.04*B*.

2. External openings

2.1 General

2.1.1

Ref. SOLAS Reg.II-1/25-10 .1

All external openings leading to compartments assumed intact in the damage analysis, which are below the final damage waterline, are required to be watertight.

2.1.2

Ref. SOLAS Reg.II-1/25-10 .2

External openings required to be watertight in accordance with [2.1.1] are to be of sufficient strength and, except for cargo hatch covers, are to be fitted with indicators on the bridge.

2.1.3
No openings, be they permanent openings or temporary openings such as shell doors, windows or ports, are allowed on the side shell between the embarkation station of the marine evacuation system and the waterline in the lightest seagoing condition. Windows and side scuttles of the non-opening type are allowed if the Society's applicable criteria for fire integrity are complied with.

2.1.4
Ref. SOLAS Reg.II-1/25-10 .5

Other closing appliances which are kept permanently closed at sea to ensure the watertight integrity of external openings are to be provided with a notice affixed to each appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

2.2 Gangway, cargo and coaling ports

2.2.1
Ref. SOLAS Reg.II-1/17-1 & Reg.II-1/17 .10.1 & .10.2 and ILLC, as amended (Resolution MSC.143(77) Reg. 21(2))

Gangway, cargo and coaling ports fitted below the freeboard deck are to be of sufficient strength. They are to be effectively closed and secured watertight before the ship leaves port, and to be kept closed during navigation.

Such ports are in no case to be so fitted as to have their lowest point below the deepest subdivision load line.

Unless otherwise permitted by the Society, the lower edge of openings is not to be below a line drawn parallel to the freeboard deck at side, which is at its lowest point at least 230 mm above the upper edge of the uppermost load line.

3. Side scuttles, windows and skylights

3.1 General

3.1.1 Application
The requirements in [3.1] to [3.4] apply to side scuttles and rectangular windows providing light and air, located in positions which are exposed to the action of sea and/or bad weather.

3.1.2 Side scuttle definition
Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(2))

Side scuttles are round or oval openings with an area not exceeding 0.16 m^2. Round or oval openings having areas exceeding 0.16 m^2 are to be treated as windows.

3.1.3 Window definition
Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(3))

Windows are rectangular openings generally, having a radius at each corner relative to the window size in accordance with recognised national or international standards, and round or oval openings with an area exceeding 0.16 m^2.

3.1.4 Number of openings in the shell plating

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .1

The number of openings in the shell plating are to be reduced to the minimum compatible with the design and proper working of the ship.

3.1.5 Material and scantlings

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(1))

Side scuttles and windows together with their glasses, deadlights and storm covers, if fitted, are to be of approved design and substantial construction in accordance with, or equivalent to, recognised national or international standards.

Non-metallic frames are not acceptable. The use of ordinary cast iron is prohibited for side scuttles below the freeboard deck.

3.1.6 Means of closing and opening

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .2

The arrangement and efficiency of the means for closing any opening in the shell plating are to be consistent with its intended purpose and the position in which it is fitted is to be generally to the satisfaction of the Society.

3.1.7 Opening of side scuttles

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .3.2

All side scuttles, the sills of which are below the freeboard deck, are to be of such construction as to prevent effectively any person opening them without the consent of the Master of the ship.

3.2 Opening arrangement

3.2.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(5))

Side scuttles are not be fitted in such a position that their sills are below a line drawn parallel to the freeboard deck at side and having its lowest point 0.025B or 0.5 m, whichever is the greater distance, above the summer load waterline (or timber summer load waterline if assigned).

3.2.2 Side scuttles below (1.4 + 0.025*B*) m above the water

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .3.3.1 and .3.3.3

Where in 'tween decks the sills of any of the side scuttles are below a line drawn parallel to the freeboard deck at side and having its lowest point 1.4+0.025B m above the water when the ship departs from any port, all the side scuttles in that 'tween decks are to be closed watertight and locked before the ship leaves port, and they may not be opened before the ship arrives at the next port. In the application of this requirement, the appropriate allowance for fresh water may be made when applicable.

For any ship that has one or more side scuttles so placed that the above requirements apply when it is floating at its deepest subdivision load line, the Society may indicate the limiting mean draught at which these side scuttles are to have their sills above the line drawn parallel to the freeboard deck at side, and having its lowest point 1.4+0.025B above the waterline corresponding to the limiting mean draught, and at which it is therefore permissible to depart from port without previously closing and locking them and to open them at sea under the

responsibility of the Master during the voyage to the next port. In tropical zones as defined in the International Convention on Load Lines in force, this limiting draught may be increased by 0.3 m.

3.2.3 Cargo spaces

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .6.1 to .6.3

No side scuttles may be fitted in any spaces which are appropriated exclusively for the carriage of cargo or coal. Side scuttles may, however, be fitted in spaces appropriated alternatively for the carriage of cargo or passengers, but they are to be of such construction as to prevent effectively any person opening them or their deadlights without the consent of the Master.

If cargo is carried in such spaces, the side scuttles and their deadlights are to be closed watertight and locked before the cargo is shipped. The Society, at its discretion, may prescribe that the time of closing and locking is to be recorded in a log book.

3.2.4 Non-opening type side scuttles

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(6))

Side scuttles are to be of the non-opening type where they become immersed by any intermediate stage of flooding or the final equilibrium waterline in any required damage case for ships subject to damage stability regulations.

3.2.5 Manholes and flush scuttles

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18(1))

Manholes and flush scuttles in positions 1 or 2, or within superstructures other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight. Unless secured by closely spaced bolts, the covers are to be permanently attached.

3.2.6 Automatic ventilating scuttles

Ref. SOLAS Reg.II-1/17-1& Reg.II-1/17 .7

Automatic ventilating side scuttles, fitted in the shell plating below the freeboard deck, are considered by the Society on a case by case basis.

3.2.7 Window arrangement

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(7))

Windows are not to be fitted below the freeboard deck, in first tier end bulkheads or sides of enclosed superstructures and in first tier deckhouses considered buoyant in the stability calculations or protecting openings leading below.

3.2.8 Skylights

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(12))

Fixed or opening skylights are to have glass thickness appropriate to their size and position as required for side scuttles and windows. Skylight glasses in any position are to be protected from mechanical damage and, where fitted in positions 1 or 2, to be provided with permanently attached robust deadlights or storm covers.

3.3 Glasses

3.3.1 General

In general, toughened glasses with frames of special type are to be used in compliance with, or equivalent to, recognised national or international standards. The use of clear plate glasses is considered by the Society on a case by case basis.

3.3.2 Design loads

The design load is to be determined in accordance with the applicable requirements of Ch 9, Sec 4.

3.3.3 Materials

Toughened glasses are to be in accordance with ISO 1095 for side scuttles and ISO 3254 for windows.

3.3.4 Thickness of toughened glasses in side scuttles

The thickness of toughened glasses in side scuttles is to be not less than that obtained, in mm, from the following formula:

$$t = \frac{d}{358}\sqrt{p}$$

where:

d : Side scuttle diameter, in mm.

3.3.5 Thickness of toughened glasses in rectangular windows

The thickness of toughened glasses in rectangular windows is to be not less than that obtained, in mm, from the following formula:

$$t = \frac{b}{200}\sqrt{\beta\, p}$$

where:

β : Coefficient defined in Tab 1. β is to be obtained by linear interpolation for intermediate values of a/b

a : Length, in mm, of the longer side of the window

b : Length, in mm, of the shorter side of the window.

Table 1: Coefficient β

a/b	β
1.0	0.284
1.5	0.475
2.0	0.608
2.5	0.684
3.0	0.716
3.5	0.734
≥ 4.0	0.750

The Society may require both limitations on the size of rectangular windows and the use of glasses of increased thickness in way of front bulkheads which are particularly exposed to heavy sea.

3.4 Deadlight arrangement

3.4.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(4))

Side scuttles to the following spaces are to be fitted with hinged inside deadlights:

- *spaces below freeboard deck*
- *spaces within the first tier of enclosed superstructures*
- *first tier deckhouses on the freeboard deck protecting openings leading below or considered buoyant in stability calculations.*

Deadlights are to be capable of being closed and secured watertight if fitted below the freeboard deck and weathertight if fitted above.

3.4.2 Openings at the side shell in the second tier

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(8))

Side scuttles and windows at the side shell in the second tier are to be provided with efficient, hinged inside deadlights capable of being closed and secured weathertight, if the superstructure protects direct access to an opening leading below or is considered buoyant in the stability calculations.

3.4.3 Openings set inboard in the second tier

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(9) and .23(10))

Side scuttles and windows in side bulkheads set inboard from the side shell in the second tier which protect direct access below to spaces listed in [3.4.1], are to be provided with either hinged inside deadlights or, where they are accessible, permanently attached external storm covers of approved design and substantial construction *capable of being closed and secured weathertight.*

Cabin bulkheads and doors in the second tier and above separating side scuttles and windows from a direct access leading below or the second tier considered buoyant in the stability calculations may be accepted in place of deadlights or storm covers fitted to the side scuttles and windows.

Note 1: Deadlights in accordance with recognised standards are fitted to the inside of windows and side scuttles, while storm covers of comparable specifications to deadlights are fitted to the outside of windows, where accessible, and may be hinged or portable.

3.4.4 Deckhouses on superstructures of less than standard height

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 23(11))

Deckhouses situated on a raised quarter deck or on the deck of a superstructure of less than standard height may be regarded as being in the second tier as far as the requirements for deadlights are concerned, provided the height of the raised quarterdeck or superstructure is equal to or greater than the standard quarter deck height.

3.4.5 Openings protected by a deckhouse

Where an opening in a superstructure deck or in the top of a deckhouse on the freeboard deck which gives access to a space below the freeboard deck or to a space within an enclosed superstructure is protected by a deckhouse, then it is considered that only those side scuttles fitted in spaces which give direct access to an open stairway need to be fitted with deadlights.

4. Discharges

4.1 Arrangement of discharges

4.1.1 Inlets and discharges

Ref. SOLAS Reg.II-1/17-1 & Reg.II-1/17 .9.1

All inlets and discharges in the shell plating are to be fitted with efficient and accessible arrangements for preventing the accidental admission of water into the ship.

4.1.2 Inboard opening of ash-shoot, rubbish-shoot, etc.

Ref. SOLAS Reg.II-1/17-1 & Reg.II-1/17 .11.1 and .11.2

The inboard opening of each ash-shoot, rubbish-shoot, etc. is to be fitted with an efficient cover.

If the inboard opening is situated below the freeboard deck, the cover is to be watertight, and in addition an automatic non-return valve is to be fitted in the shoot in an easily accessible position above the deepest subdivision load line. When the shoot is not in use, both the cover and the valve are to be kept closed and secured.

4.2 Arrangement of garbage chutes

4.2.1 Inboard end above the waterline

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(1, b))

The inboard end is to be located above the waterline formed by an 8.5° heel, to port or starboard, at a draft corresponding to the assigned summer freeboard, but not less than 1000 mm above the summer load waterline.

Where the inboard end of the garbage chute exceeds 0.01L above the summer load waterline, valve control from the freeboard deck is not required, provided the inboard gate valve is always accessible under service conditions.

4.2.2 Inboard end below the waterline

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(4))

Where the inboard end of a garbage chute is below the waterline corresponding to the deepest draught after damage in a ship of more than 100 m in length, then:

- *the inboard end hinged cover/valve is to be watertight*
- *the valve is to be a screw-down non-return valve fitted in an easily accessible position above the deepest subdivision load line*
- *the screw-down non-return valve is to be controlled from a position above the freeboard deck and provided with open/shut indicators. The valve control is to be clearly marked: «Keep closed when not in use».*

4.2.3 Gate valves

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(1, a))

For garbage chutes, two gate valves controlled from the working deck of the chute may be accepted instead of a non-return valve with a positive means of closing it from a position above the freeboard deck. In addition, the lower gate valve is to be controlled from a position above the freeboard deck. An interlock system between the two valves is to be arranged.

The distance between the two gate valves is to be adequate to allow the smooth operation of the interlock system.

4.2.4 Hinged cover and discharge flap

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(1, c))

The upper and lower gate valves, as required in [4.2.3], may be replaced by a hinged weathertight cover at the inboard end of the chute together with a discharge flap.

The cover and discharge flap are to be arranged with an interlock so that the flap cannot be operated until the hopper cover is closed.

4.2.5 Marking of valve and hinged cover

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 22-1(3))

The controls for the gate valves and/or hinged covers are to be clearly marked: «Keep closed when not in use».

4.3 Scantlings of garbage chutes

4.3.1 Material

The chute is to be constructed of steel. Other equivalent materials are considered by the Society on a case by case basis.

4.3.2 Wall thickness

The wall thickness of the chute up to and including the cover is to be not less than that obtained, in mm, from Tab 2.

Table 2: Wall thickness of garbage chutes

External diameter d, in mm	Thickness, in mm
$d \leq 80$	7.0
$80 < d < 180$	$7.0 + 0.03(d - 80)$
$180 \leq d \leq 220$	$10.0 + 0.063(d - 180)$
$d > 220$	12.5

5. Freeing ports

5.1 General provisions

5.1.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, a) and Reg.3 (15))

Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of water and for draining them.

A well is any area on the deck exposed to the weather, where water may be entrapped. Wells are considered to be deck areas bounded on four sides by deck structures; however, depending on their configuration, deck areas bounded on three or even two sides by deck structures may be deemed wells.

5.1.2 Freeing port areas

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24)

The minimum required freeing port areas in bulwarks on the freeboard deck are specified in Tab 3.

Table 3: Freeing port area in bulwark located on freeboard deck

Ship types or ship particulars	Area A of freeing ports, in m^2	Applicable requirement
Type B-100	$0.33\ell_B h_B$	[5.5.2]
Type B-60	$0.25\ell_B h_B$	[5.5.1]
Ships fitted with a trunk included in freeboard calculation and/ or breadth ≥ 0.6B	$0.33\ell_B h_B$	[5.3.1]
Ships fitted with a trunk not included in freeboard calculation and/or continuous or substantially continuous hatch coamings	A_2	[5.3.1]
Ships fitted with non-continuous trunk and/ or hatch coamings	A_3	[5.3.2]
Ships fitted with open superstructure	A_S for superstructures	[5.4.2]
	A_W for wells	[5.4.3]
Other ships	A_1	[5.2.1]

where:

ℓ_B : Length, in m, of bulwark in a well at one side of the ship

h_B : Mean height, in m, of bulwark in a well of length ℓ_B.

5.1.3 Freeing port arrangement

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (5))

Where a sheer is provided, two thirds of the freeing port area required is to be provided in the half of the well nearer the lowest point of the sheer curve.

One third of the freeing port area required is to be evenly spread along the remaining length of the well. With zero or little sheer on the exposed freeboard deck or an exposed superstructure deck the freeing port area is to be evenly spread along the length of the well.

However, bulwarks may not have substantial openings or accesses near the breaks of superstructures, unless they are effectively detached from the superstructure sides.

5.1.4 Freeing port positioning

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (5) and 24 (6))

The lower edge of freeing ports is to be as near the deck as practicable.

All the openings in the bulwark are to be protected by rails or bars spaced approximately 230 mm apart.

5.1.5 Freeing port closures

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (6))

If shutters or closures are fitted to freeing ports, ample clearance is to be provided to prevent jamming. Hinges are to have pins or bearings of non-corrodible material. If shutters are fitted with securing appliances, these appliances are to be of approved construction.

5.2 Freeing port area in a well not adjacent to a trunk or hatchways

5.2.1 Freeing port area

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, b and c))

Where the sheer in way of the well is standard or greater than the standard, the freeing port area on each side of the ship for each well is to be not less than that obtained, in m², in Tab 4.
In ships with no sheer, the above area is to be increased by 50%. Where the sheer is less than the standard, the percentage of increase is to be obtained by linear interpolation.

Table 4: Freeing port area in a well not adjacent to a trunk or hatchways

Location	Area A_1 of freeing ports, in m²	
	$\ell_B \le 20$	$\ell_B > 20$
Freeboard deck and raised quarterdecks	$0.7 + 0.035\ell_B + A_C$	$0.07\ell_B + A_C$
Superstructure decks	$0.35 + 0.0175\ell_B + 0.5A_C$	$0.035\ell_B + 0.5A_C$

where:

ℓ_B : Length, in m, of bulwark in the well, but need in no case to be taken as greater than $0.7L_{LL}$

A_C : Area, in m², to be taken, with its sign, equal to:

$$A_C = \frac{\ell_B}{25}(h_B - 1.2) \quad \text{for} \quad h_B > 1.2$$
$$A_C = 0 \quad \text{for} \quad 0.9 \le h_B \le 1.2$$
$$A_C = \frac{\ell_B}{25}(h_B - 0.9) \quad \text{for} \quad h_B < 0.9$$

h_B : Mean height, in m, of the bulwark in a well of length ℓ_B.

5.2.2 Minimum freeing port area for a deckhouse having breadth not less than 0.8*B*

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, d))

Where a flush deck ship is fitted amidships with a deckhouse having breadth not less than 0.8 B and the width of the passageways along the side of the ship less than 1.5 m, the freeing port area is to be calculated for two separate wells, before and abaft the deckhouse. For each of these wells, the freeing port area is to be obtained from Tab 4, where ℓ_B is to be taken equal to the actual length of the well considered.

5.2.3 Minimum freeing port area for screen bulkhead

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (1, e))

Where a screen bulkhead is fitted across the full breadth of the ship at the fore end of a midship deckhouse, the weather deck is to be considered as divided into two wells, irrespective of the width of the deckhouse, and the freeing port area is to be obtained in accordance with [5.1.2].

5.3 Freeing port area in a well contiguous to a trunk or hatchways

5.3.1 Freeing area for continuous trunk or continuous hatchway coaming

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (2))

Where the ship is fitted with a continuous trunk not included in the calculation of freeboard or where continuous or substantially continuous hatchway side coamings are fitted between detached superstructures, the freeing port area is to be not less than that obtained, in m², from Tab 5.

Table 5: Freeing port area in a well contiguous to a continuous trunk or hatchway

Breadth B_H, in m, of hatchway or trunk	**Area A_2 of freeing ports, in m^2**
$B_H \leq 0.4B$	$0.2\ell_B h_B$
$0.4B < B_H < 0.75B$	$\left[0.2-0.286\left(\frac{B_H}{B}-0.4\right)\right]\ell_B h_B$
$B_H \geq 0.75B$	$0.1\ell_B h_B$

where:

ℓ_B : Length, in m, of bulwark in a well at one side of the ship

h_B : Mean height, in m, of bulwark in a well of length ℓ_B.

Where the ship is fitted with a continuous trunk having breadth not less than $0.6B$, included in the calculation of freeboard, and where open rails on the weather parts of the freeboard deck in way of the trunk for at least half the length of these exposed parts are not fitted, the freeing port area in the well contiguous to the trunk is to be not less than 33% of the total area of the bulwarks.

5.3.2 Freeing area for non-continuous trunk or hatchway coaming

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (3))

Where the free flow of water across the deck of the ship is impeded due to the presence of a non-continuous trunk, hatchway coaming or deckhouse in the whole length of the well considered, the freeing port area in the bulwark of this well is to be not less than that obtained, in m^2, from Tab 6.

Table 6: Freeing port area in a well contiguous to a non-continuous trunk or hatchway

Free flow area f_P, in m^2	**Freeing port area A_3, in m^2**
$f_P \leq A_1$	A_2
$A_1 < f_P < A_2$	$A_1 + A_2 - f_P$
$f_P \geq A_2$	A_1

where:

f_P : Free flow area on deck, equal to the net area of gaps between hatchways, and between hatchways and superstructures and deckhouses up to the actual height of the bulwark

A_1 : Area of freeing ports, in m^2, to be obtained from Tab 4

A_2 : Area of freeing ports, in m^2, to be obtained from Tab 5.

5.4 Freeing port area in an open space within superstructures

5.4.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (4))

In ships having superstructures on the freeboard or superstructure decks, which are open at either or both ends to wells formed by bulwarks on the open decks, adequate provision for freeing the open spaces within the superstructures is to be provided.

5.4.2 Freeing port area for open superstructures

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (4))

The freeing port area on each side of the ship for the open superstructure is to be not less than that obtained, in m², from the following formula:

$$A_S = A_1 C_{SH}\left[1-\left(\frac{\ell_W}{\ell_T}\right)^2\right]\left(\frac{b_0 h_s}{2\ell_T h_W}\right)$$

where:

ℓ_T : *Total well length, in m, to be taken equal to:*

$$\ell_T = \ell_W + \ell_S$$

ℓ_W : *Length, in m, of the open deck enclosed by bulwarks*

ℓ_S : *Length, in m, of the common space within the open superstructures*

A_1 : *Freeing port area, in m^2, required for an open well of length ℓ_T, in accordance with Tab 4, where A_C is to be taken equal to zero*

C_{SH} : *Coefficient which accounts for the absence of sheer, if applicable, to be taken equal to:*

C_{SH} = 1.0 in the case of standard sheer or sheer greater than standard sheer

C_{SH} = 1.5 in the case of no sheer

b_0 : *Breadth, in m, of the openings in the end bulkhead of enclosed superstructures*

h_S : *Standard superstructure height, in m, defined in [1.2.1]*

h_W : *Distance, in m, of the well deck above the freeboard deck.*

5.4.3 Freeing port area for open well

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 24 (4))

The freeing port area on each side of the ship for the open well is to be not less than that obtained, in m^2, from the following formula:

$$A_W = A_1 c_{SH}\left(\frac{h_S}{2h_W}\right)$$

A_1 : *Freeing port area, in m^2, required for an open well of length ℓ_W, in accordance with Tab 4*

c_{SH}, h_S, h_W, ℓ_W: *Defined in [5.4.2].*

The resulting freeing port areas for the open superstructure A_S and for the open well A_W are to be provided along each side of the open space covered by the open superstructure and each side of the open well, respectively.

5.5 Freeing port area in bulwarks of the freeboard deck for ships of types B-100 and B-60

5.5.1 Freeing arrangement for type B-60

For type B-60 ships, the freeing port area in the lower part of the bulwarks of the freeboard deck is to be not less than 25% of the total area of the bulwarks in the well considered.

The upper edge of the sheer strake is to be kept as low as possible.

5.5.2 Freeing arrangement for type B-100 ships with trunks

For type B-100 ships, open rails are to be fitted on the weather parts of the freeboard deck in way of the trunk for at least half the length of these exposed parts.

Alternatively, if a continuous bulwark is fitted, the freeing port area in the lower part of the bulwarks of the freeboard deck is to be not less than 33% of the total area of the bulwarks in the well considered.

6. Machinery space openings

6.1 Engine room skylights

6.1.1

Engine room skylights in positions 1 or 2 are to be properly framed, securely attached to the deck and efficiently enclosed by steel casings of suitable strength. Where the casings are not protected by other structures, their strength will be considered by the Society on a case by case basis.

6.2 Closing devices

6.2.1 Machinery casings

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (1)and 12 (1))

Openings in machinery space casings in positions 1 or 2 are to be fitted with doors of steel or other equivalent materials, permanently and strongly attached to the bulkhead, and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead and weathertight when closed. The doors are to be capable of being operated from both sides and generally to open outwards to give additional protection against wave impact.

Other openings in such casings are to be fitted with equivalent covers, permanently attached in their proper position.

6.2.2 Height of the sill of the door

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (1 and 2))

The height of the sill of the door is to be not less than:

- *600 mm above the deck if in position 1*
- *380 mm above the deck if in position 2*
- *230 mm in all other cases.*

6.2.3 Double doors

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (1 and 2))

Where casings are not protected by other structures, double doors (i.e. inner and outer doors) are required for ships assigned freeboard less than that based on Table B of the International Load Line Convention, as amended. An inner sill of 230 mm in conjunction with the outer sill of 600 mm is to be provided.

6.2.4 Fiddly openings

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (5))

Fiddly openings are to be fitted with strong covers of steel or other equivalent material permanently attached in their proper positions and capable of being secured weathertight.

6.3 Coamings

6.3.1

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (3))

Coamings of any fiddly, funnel or machinery space ventilator in an exposed position on the freeboard deck or superstructure deck are to be as high above the deck as is reasonable and practicable.

In general, ventilators necessary to continuously supply the machinery space and, on demand, the emergency generator room are to have coamings whose height is in compliance with [8.1.3], but need not be fitted with weathertight closing appliances.

6.3.2

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 17 (4))

Where, due to the ship's size and arrangement, this is not practicable, lesser heights for machinery space and emergency generator room ventilator coamings, fitted with weathertight closing appliances in accordance with [8.1.2], may be permitted by the Society in combination with other suitable arrangements to ensure an uninterrupted, adequate supply of ventilation to these spaces.

7. Companionway

7.1 General

7.1.1 Openings in freeboard deck

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (2))

Openings in freeboard deck other than hatchways, machinery space openings, manholes and flush scuttles are to be protected by an enclosed superstructure or by a deckhouse or companionway of equivalent strength and weathertightness.

7.1.2 Openings in superstructures

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (2))

Openings in an exposed superstructure deck or in the top of a deckhouse on the freeboard deck which give access to a space below the freeboard deck or a space within an enclosed superstructure are to be protected by an efficient deckhouse or companionway.

7.1.3 Openings in superstructures having height less than standard height

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (3))

Openings in the top of a deckhouse on a raised quarterdeck or superstructure of less than standard height, having a height equal to or greater than the standard quarterdeck height are to be provided with an acceptable means of closing but need not be protected by an efficient deckhouse or companionway provided the height of the deckhouse is at least the height of the superstructure. Openings in the top of the deckhouse on a deckhouse of less than a standard superstructure height may be treated in a similar manner.

7.2 Scantlings

7.2.1

Companionways on exposed decks protecting openings leading into enclosed spaces are to be of steel and strongly attached to the deck and are to have adequate scantlings.

7.3 Closing devices

7.3.1 Doors

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (2))

Doorways in deckhouses or companionways leading to or giving access to spaces below the freeboard deck or to enclosed superstructures are to be fitted with weathertight doors. The doors are to be made of steel, to be capable of being operated from both sides and generally to open outwards to give additional protection against wave impact.

Alternatively, if stairways within a deckhouse are enclosed within properly constructed companionways fitted with weathertight doors, the external door need not be weathertight.

Where the closing appliances of access openings in superstructures and deckhouses are not weathertight, interior deck openings are to be considered exposed, i.e. situated in the open deck.

7.3.2 Height of sills

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 18 (4 to 6))

The height above the deck of sills to the doorways in companionways is to be not less than:

- *600 mm in position 1*
- *380 mm in position 2.*

Where access is provided from the deck above as an alternative to access from the freeboard deck, the height of the sills into the bridge or poop is to be 380 mm. This also applies to deckhouses on the freeboard deck.

Where access is not provided from above, the height of the sills to doorways in deckhouses on the freeboard deck is to be 600 mm.

8. Ventilators

8.1 Closing appliances

8.1.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (4))

Ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material.

8.1.2 Closing appliance exemption

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (3))

Ventilators need not be fitted with closing appliances, unless specifically required by the Society, if the coamings extend for more than:

- *4.5 m above the deck in position 1*

- *2.3 m above the deck in position 2.*

8.1.3 Closing appliances for ships of not more than 100 m in length

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (4))

In ships of not more than 100 m in length, the closing appliances are to be permanently attached to the ventilator coamings.

8.1.4 Closing appliances for ships of more than 100 m in length

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (4))

Where, in ships of more than 100 m in length, the closing appliances are not permanently attached, they are to be conveniently stowed near the ventilators to which they are to be fitted.

8.1.5 Ventilation of machinery spaces and emergency generator room

In order to satisfactorily ensure, in all weather conditions:

- the continuous ventilation of machinery spaces,
- and, when necessary, the immediate ventilation of the emergency generator room,

the ventilators serving such spaces are to comply with [8.1.2], i.e. their openings are to be so located that they do not require closing appliances.

8.1.6 Reduced height of ventilator coamings for machinery spaces and emergency generator room

Where, due to the ship's size and arrangement, the requirements in [8.1.5] are not practicable, lesser heights may be accepted for machinery space and emergency generator room ventilator coamings fitted with weathertight closing appliances in accordance with [8.1.1], [8.1.3] and [8.1.4] in combination with other suitable arrangements, such as separators fitted with drains, to ensure an uninterrupted, adequate supply of ventilation to these spaces.

8.1.7 Closing arrangements of ventilators led overboard or through enclosed superstructures

Closing arrangements of ventilators led overboard to the ship side or through enclosed superstructures are considered by the Society on a case by case basis. If such ventilators are led overboard more than 4.5 m above the freeboard deck, closing appliances may be omitted provided that satisfactory baffles and drainage arrangements are fitted.

8.2 Coamings

8.2.1 General

Ref. ILLC, as amended (Resolution MSC.143(77) Reg. 19 (1 and 2))

Ventilators in positions 1 or 2 to spaces below freeboard decks or decks of enclosed superstructures are to have coamings of steel or other equivalent material, substantially constructed and efficiently connected to the deck.

Ventilators passing through superstructures other than enclosed superstructures are to have substantially constructed coamings of steel or other equivalent material at the freeboard deck.

8.2.2 Scantlings

The scantlings of ventilator coamings exposed to the weather are to be not less than those obtained from Tab 7.

In exposed locations or for the purpose of compliance with buoyancy calculations, the height of coamings may be required to be increased to the satisfaction of the Society.

Table 7: Scantlings of ventilator coamings

Feature	Scantlings
Height of the coaming, in mm, above the deck	$h = 900$ in position 1 $h = 760$ in position 2
Thickness of the coaming, in mm (1)	$t = 5.5 + 0.01\ d_V$ with $7.5 \le t \le 10$
Support	If $h > 900$ mm, the coaming is to be suitably stiffened or supported by stays.
where: d_V : External diameter of the ventilator, in mm. (1) Where the height of the ventilator exceeds the height h, the thickness of the coaming may be gradually reduced, above that height, to a minimum of 6.5 mm.	

9. Tank cleaning openings

9.1 General

9.1.1

Ullage plugs, sighting ports and tank cleaning openings may not be arranged in enclosed spaces.

Chapter 10

Hull Outfitting

Section 1 – RUDDER AND MANOEUVRING ARRANGEMENT

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

C_R : Rudder force, in N

Q_R : Rudder torque, in N.m

A : Total movable area of the rudder, in m^2, measured at the mid-plane of the rudder

For nozzle rudders, A is not to be taken less than 1.35 times the projected area of the nozzle.

A_t : Area equal to A + area of a rudder horn, if any, in m^2

A_f : Portion of rudder area located ahead of the rudder stock axis, in m^2

b : Mean height of rudder area, in m

c : Mean breadth of rudder area, in m, see Fig 1

Λ : Aspect ratio of rudder area A_t, taken equal to:

$$\Lambda = \frac{b^2}{A_t}$$

V_0 : Maximum ahead speed, in knots, as defined in Ch 1, Sec 4. If this speed is less than 10, V_0 is to be replaced by:

$$V_{\min} = \frac{(V_0 + 20)}{3}$$

V_a : Maximum astern speed, in knots, to be taken not less than $0.5V_0$. For greater astern speeds special evaluation of rudder force and torque as a function of the rudder angle may be required. If no limitations for the rudder angle at astern condition is stipulated, the factor κ_2 is not to be taken less than given in Tab 1 for astern condition.

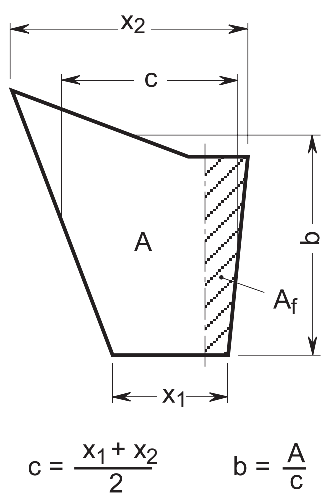

Figure 1: Dimensions of rudder

1. General

1.1 Manoeuvring arrangement

1.1.1

The manoeuvring arrangement includes all parts from the rudder and steering gear to the steering position necessary for steering the ship.

RCN 2 to July 2008 version (effective from 1July 2010)

1.1.2

Rudder stock, rudder coupling, rudder bearings and the rudder body are dealt with in this Section. The steering gear is to comply with the appropriate Rules of the Society.

1.1.3

The steering gear compartment shall be readily accessible and, as far as practicable, separated from the machinery space.

Note: Concerning the use of non-magnetisable material in the wheel house in way of a magnetic compass, the requirements of the national Administration concerned are to be observed.

1.2 Structural details

1.2.1

Effective means are to be provided for supporting the weight of the rudder body without excessive bearing pressure, e.g. by a rudder carrier attached to the upper part of the rudder stock. The hull structure in way of the rudder carrier is to be suitably strengthened.

1.2.2

Suitable arrangements are to be provided to prevent the rudder from lifting.

1.2.3

Connections of rudder blade structure with solid parts in forged or cast steel, which are used as rudder stock housing, are to be suitably designed to avoid any excessive stress concentration at these areas.

1.2.4

The rudder stock is to be carried through the hull either enclosed in a watertight trunk, or glands are to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest waterline two separate stuffing boxes are to be provided.

1.3 (void)

(void)

RCN 2 to July 2008 version (effective from 1July 2010)

1.4 Materials

1.4.1

For materials for rudder stock, pintles, coupling bolts etc. refer to the Society's Rules for Materials.

1.4.2

In general, materials having R_{eH} of less than 200 N/mm^2 and R_m of less than 400 N/mm^2 or more than 900 N/mm^2 are not to be used for rudder stocks, pintles, keys and bolts. The requirements of this Section are based on a with R_{eH} of 235 N/mm^2. If material is used having a R_{eH} differing from 235 N/mm^2, the material factor k_r is to be determined as follows:

$$k_r = \left(\frac{235}{R_{eH}}\right)^{0.75} \quad \text{for } R_{eH} > 235$$

$$k_r = \frac{235}{R_{eH}} \quad \text{for } R_{eH} \le 235$$

where:

R_{eH} : Minimum yield stress of material used, in N/mm^2. R_{eH} is not to be taken greater than $0.7R_m$ or 450 N/mm^2, whichever is less.

1.4.3

Before significant reductions in rudder stock diameter due to the application of steels with R_{eH} exceeding 235 N/mm^2 are accepted, the Society may require the evaluation of the elastic rudder stock deflections. Large deflections should be avoided in order to avoid excessive edge pressures in way of bearings.

1.4.4

The permissible stresses given in [5.1] are applicable for normal strength steel. When higher strength steels are used, higher values may be used for the permissible stresses, on a case by case basis.

2. Rudder force and torque

2.1 Rudder force and torque for normal rudders

2.1.1

The rudder force is to be determined, in N, according to the following formula:

$$C_R = 132\, A V^2 \kappa_1\, \kappa_2\, \kappa_3\, \kappa_t$$

where:

V : V_0 for ahead condition

V_a for astern condition

κ_1 : Coefficient, depending on the aspect ratio Λ, taken equal to:

$\kappa_1 = (\Lambda + 2)/3$, where Λ need not be taken greater than 2

κ_2 : Coefficient, depending on the type of the rudder and the rudder profile according to Tab 1

Table 1: Coefficient κ_2

Profile / type of rudder	κ_2	
	Ahead	**Astern**
NACA-00 series Göttingen profiles	1.10	0.80
Flat side profiles	1.10	0.90
Mixed profiles (e. g. HSVA)	1.21	0.90
Hollow profiles	1.35	0.90
High lift rudders	1.70	to be specially considered; if not known: 1.30
Fish tail	1.40	0.80
Single plate	1.00	1.00

κ_3 : Coefficient, depending on the location of the rudder, taken equal to:

$\kappa_3 = 0.80$ for rudders outside the propeller jet

$\kappa_3 = 1.00$ elsewhere, including also rudders within the propeller jet

$\kappa_3 = 1.15$ for rudders aft of the propeller nozzle

κ_t : Coefficient equal to 1.0 for rudders behind propeller. Where a thrust coefficient $C_{Th} > 1.0$, the Society may consider a coefficient κ_t different from 1.0, on a case by case basis.

2.1.2

The rudder torque, in Nm, is to be determined by the following formula:

$Q_R = C_R\, r$

where:

r : Lever of the force C_R, in m, taken equal to:

$r = c(\alpha - k_{bc})$, without being less than $0.1c$ for ahead condition

α : Coefficient taken equal to:

$\alpha = 0.33$ for ahead condition

$\alpha = 0.66$ for astern condition (general)

$\alpha = 0.75$ for astern condition (hollow profiles)

For parts of a rudder behind a fixed structure such as a rudder horn:

$\alpha = 0.25$ for ahead condition

$\alpha = 0.55$ for astern condition

For high lift rudders α is to be specially considered. If not known, $\alpha = 0.40$ may be used for the ahead condition

k_{bc} : Balance factor as follows:

$$k_{bc} = \frac{A_f}{A}$$

$k_{bc} = 0.08$ for unbalanced rudders

2.1.3

Effects of the provided type of rudder/profile on choice and operation of the steering gear are to be observed.

2.2 Rudder force and torque for rudder blades with cut-outs (semi-spade rudders)

2.2.1

The total rudder force C_R is to be calculated according to [2.1.1]. The pressure distribution over the rudder area, upon which the determination of rudder torque and rudder blade strength are to be based, is to be obtained as follows:

- the rudder area may be divided into two rectangular or trapezoidal parts with areas A_1 and A_2, see Fig 2.
- the resulting force, in N, of each part may be taken as:

$$C_{R1} = C_R \frac{A_1}{A}$$

$$C_{R2} = C_R \frac{A_2}{A}$$

2.2.2

The resulting torque, in N.m, of each part is to be taken as:

$$Q_{R1} = C_{R1}\, r_1$$

$$Q_{R2} = C_{R2}\, r_2$$

where:

$r_1 = c_1(\alpha - k_{b1})$, in m

$r_2 = c_2(\alpha - k_{b2})$, in m

$$k_{b1} = \frac{A_{1f}}{A_1}$$

$$k_{b2} = \frac{A_{2f}}{A_2}$$

A_{1f}, A_{2f} : As defined in Fig 2

$$c_1 = \frac{A_1}{b_1}$$

$$c_2 = \frac{A_2}{b_2}$$

b_1, b_2 : Mean heights of the partial rudder areas A_1 and A_2 (see Fig 2).

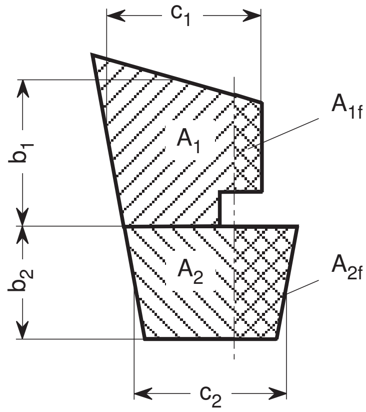

Figure 2: Areas A_1 and A_2

2.2.3

The total rudder torque, in N.m, is to be determined according to the following formulae:

$Q_R = Q_{R1} + Q_{R2}$, without being less than $Q_{R\min} = C_R \, r_{1,2\min}$

where:

$r_{1,2\min} = \frac{0.1}{A}(c_1 A_1 + c_2 A_2)$, in m.

3. Scantlings of the rudder stock

3.1 Rudder stock diameter

3.1.1

The diameter of the rudder stock, in mm, for transmitting the rudder torque is not to be less than:

$D_t = 4.2 \sqrt[3]{Q_R \, k_r}$

where:

Q_R : As defined in [2.1.2], [2.2.2] and [2.2.3]

The related torsional stress, in N/mm², is:

$\tau_t = \frac{68}{k_r}$

where:

k_r : As defined in [1.4.2] an[1.4.3].

3.1.2

The diameter of the rudder stock determined according to [3.1.1] is decisive for the steering gear, the stopper and the locking device.

3.1.3

In case of mechanical steering gear the diameter of the rudder stock in its upper part which is only intended for transmission of the torsional moment from the auxiliary steering gear may be $0.9D_t$. The length of the edge of the quadrangle for the auxiliary tiller must not be less than $0.77D_t$ and the height not less than $0.8D_t$.

3.1.4

The rudder stock is to be secured against axial sliding. The degree of the permissible axial clearance depends on the construction of the steering engine and on the bearing.

3.2 Strengthening of rudder stock

3.2.1

If the rudder is so arranged that additional bending stresses occur in the rudder stock, the stock diameter has to be suitably increased. The increased diameter is, where applicable, decisive for the scantlings of the coupling.

For the increased rudder stock diameter the equivalent stress of bending and torsion, in N/mm^2, is not to exceed the following value:

$$\sigma_v = \sqrt{\sigma_b^2 + 3\tau^2} \leq \frac{118}{k_r}$$

where:

σ_b : Bending stress, in N/mm^2, equal to:

$$\sigma_b = \frac{10.2 M_b}{D_1^3}$$

M_b : Bending moment at the neck bearing, in N.m

τ : Torsional stress, in N/mm^2, equal to:

$$\tau = \frac{5.1 Q_R}{D_1^3}$$

D_1 : Increased rudder stock diameter, in cm, equal to:

$$D_1 = 0.1 D_t \sqrt[6]{1 + \frac{4}{3}\left(\frac{M_b}{Q_R}\right)^2}$$

Q_R : As defined in [2.1.2], [2.2.2] and [2.2.3]

D_t : As defined in [3.1.1].

Note: Where a double-piston steering gear is fitted, additional bending moments may be transmitted from the steering gear into the rudder stock. These additional bending moments are to be taken into account for determining the rudder stock diameter.

3.3 Analysis

3.3.1 General

The bending moments, shear forces and support forces for the system rudder - rudder stock are to be obtained from [3.3.2] and [3.3.3], for rudder types as shown in Fig 3 to Fig 7.

3.3.2 Data for the analysis

ℓ_{10} ,.., ℓ_{50} : Lengths, in m, of the individual girders of the system

I_{10} ,.., I_{50} : Moments of inertia of these girders, in cm^4

For rudders supported by a sole piece the length ℓ_{20} is the distance between lower edge of rudder body and centre of sole piece, and I_{20} is the moment of inertia of the pintle in the sole piece.

Load on rudder body, in kN/m, (general):

$$p_R = \frac{C_R}{\ell_{10} \cdot 10^3}$$

Load on semi-spade rudders, in kN/m:

$$p_{R10} = \frac{C_{R2}}{\ell_{10} \cdot 10^3}$$

$$p_{R20} = \frac{C_{R1}}{\ell_{20} \cdot 10^3}$$

C_R, C_{R1}, C_{R2} : As defined in [2.1] and [2.2]

Z : Spring constant, in kN/m, of support in the sole piece or rudder horn respectively:

for the support in the sole piece (see Fig 3):

$$Z = \frac{6.18\, I_{50}}{\ell_{50}^3}$$

for the support in the rudder horn (see Fig 4):

$$Z = \frac{1}{f_b + f_t}$$

f_b : Unit displacement of rudder horn, in m/kN, due to a unit force of 1 kN acting in the centre of support

$$f_b = \frac{1.3\, d^3\, 10^8}{3\, E\, I_n}$$

$$f_b = 0.21 \frac{d^3}{I_n} \quad \text{(guidance value for steel)}$$

I_n : Moment of inertia of rudder horn, in cm^4, around the x-axis at $d/2$ (see Fig 4)

f_t : Unit displacement due to a torsional moment of the amount 1, in m/kN

$$f_t = \frac{d\, e^2}{G\, J_t}$$

$$f_t = \frac{d e^2 \sum u_i / t_i}{3.14 \cdot 10^8\, F_T^2} \qquad \text{for steel}$$

G : Modulus of rigity, kN/m^2:

$G = 7.92 \cdot 10^7$ for steel

J_t : Torsional moment of inertia, in m^4

F_T : Mean sectional area of rudder horn, in m^2

u_i : Breadth, in mm, of the individual plates forming the mean horn sectional area

t_i : Plate thickness of individual plate having breadth u_i, in mm

e, d : Distances, in m, according to Fig 4

K_{11}, K_{22}, K_{12} : Rudder horn compliance constants calculated for rudder horn with 2-conjugate elastic supports (Fig 5).The 2-conjugate elastic supports are defined in terms of horizontal displacements, y_i, by the following equations:

at the lower rudder horn bearing:

$y_1 = - K_{12}\, B_2 - K_{22}\, B_1$

at the upper rudder horn bearing:

$y_2 = - K_{11}\, B_2 - K_{12}\, B_1$

where

y_1, y_2 : Horizontal displacements, in m, at the lower and upper rudder horn bearings, respectively

B_1, B_2 : Horizontal support forces, in kN, at the lower and upper rudder horn bearings, respectively

K_{11}, K_{22}, K_{12} : Obtained, in m/kN, from the following formulae:

$$K_{11} = 1.3 \frac{\lambda^3}{3EJ_{1h}} + \frac{e^2 \lambda}{GJ_{th}}$$

$$K_{12} = 1.3 \left[\frac{\lambda^3}{3EJ_{1h}} + \frac{\lambda^2 (d - \lambda)}{2EJ_{1h}} \right] + \frac{e^2 \lambda}{GJ_{th}}$$

$$K_{22} = 1.3 \left[\frac{\lambda^3}{3EJ_{1h}} + \frac{\lambda^2 (d - \lambda)}{EJ_{1h}} + \frac{\lambda (d - \lambda)^2}{EJ_{1h}} + \frac{(d - \lambda)^3}{3EJ_{2h}} \right] + \frac{e^2 d}{GJ_{th}}$$

d : Height of the rudder horn, in m, defined in Fig 5. This value is measured downwards from the upper rudder horn end, at the point of curvature transition, till the mid-line of the lower rudder horn pintle

λ : Length, in m, as defined in Fig 5. This length is measured downwards from the upper rudder horn end, at the point of curvature transition, till the mid-line of the upper rudder horn bearing. For $\lambda = 0$, the above formulae converge to those of spring constant Z for a rudder horn with 1-elastic support, and assuming a hollow cross section for this part

e : Rudder-horn torsion lever, in m, as defined in Fig 5 (value taken at $z = d/2$)

J_{1h} : Moment of inertia of rudder horn about the x axis, in m^4, for the region above the upper rudder horn bearing. Note that J_{1h} is an average value over the length λ (see Fig 5)

J_{2h} : Moment of inertia of rudder horn about the x axis, in m^4, for the region between the upper and lower rudder horn bearings. Note that J_{2h} is an average value over the length $d - \lambda$ (see Fig 5)

J_{th} : Torsional stiffness factor of the rudder horn, in m^4

For any thin wall closed section

$$J_{th} = \frac{4F_T^2}{\sum_i \frac{u_i}{t_i}}$$

F_T : Mean of areas enclosed by outer and inner boundaries of the thin walled section of rudder horn, in m^2

u_i : Length, in mm, of the individual plates forming the mean horn sectional area

t_i : Thickness, in mm, of the individual plates mentioned above.

Note that the J_{th} value is taken as an average value, valid over the rudder horn height.

3.3.3 Moments and forces to be evaluated

a) The bending moment M_R and the shear force Q_1 in the rudder body, the bending moment M_b in the neck bearing and the support forces B_1, B_2, B_3 are to be evaluated.

The so evaluated moments and forces are to be used for the stress analyses required by [3.2], [5], [9.1] and [9.2]

b) For spade rudders (see Fig 6) the moments, in N.m, and forces, in N, may be determined by the following formulae:

$$M_b = C_R\left(\ell_{20} + \frac{\ell_{10}(2x_1 + x_2)}{3(x_1 + x_2)}\right)$$

$$B_3 = \frac{M_b}{\ell_{30}}$$

$$B_2 = C_R + B_3$$

c) For spade rudders with rudders trunks (see Fig 7) the moments, in N.m, and forces, in N, may be determined by the following formulae:

M_R is the greatest of the following values:

$M_R = C_{R2}\ (\ell_{10} - CG_{2Z})$

$M_R = C_{R1}\ (CG_{1Z} - \ell_{10})$

where :

C_{R1} : Rudder force over the rudder blade area A_1

C_{R2} : Rudder force over the rudder blade area A_2

CG_{1Z} : Vertical position of the centre of gravity of the rudder blade area A_1

CG_{2Z} : Vertical position of the centre of gravity of the rudder blade area A_2

$M_B = C_{R2}\ (\ell_{10} - CG_{2Z})$

$B_3 = (M_B + M_{CR1})\ /\ (\ell_{20} + \ell_{30})$

$B_2 = C_R + B_3$

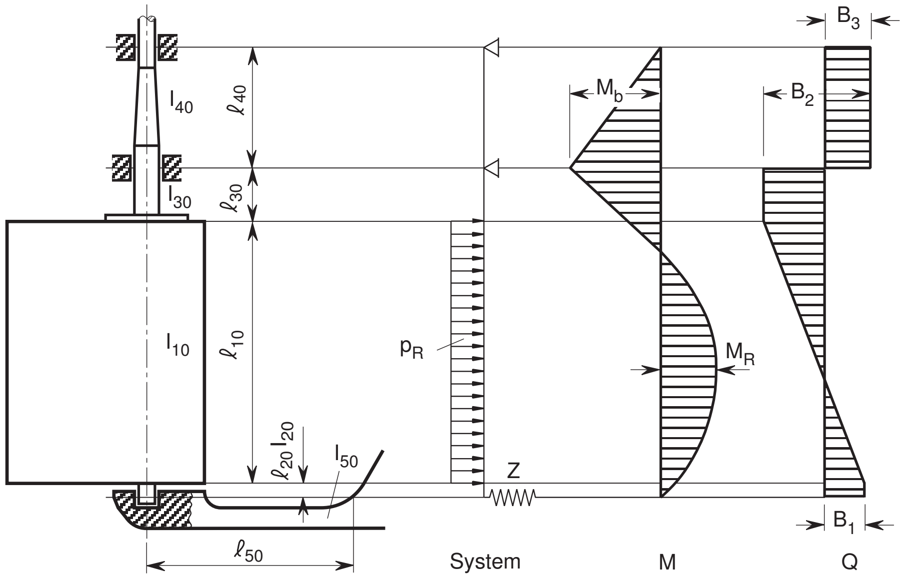

Figure 3: Rudder supported by sole piece

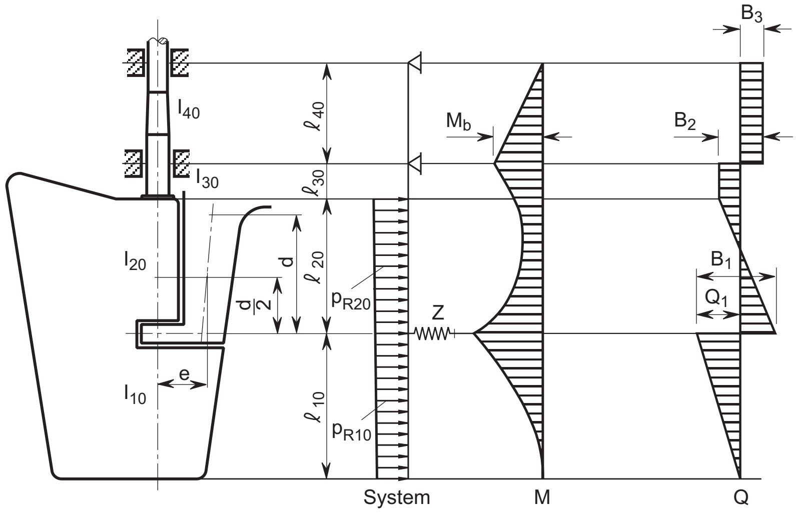

Figure 4: Semi-spade rudder (with 1-elastic support)

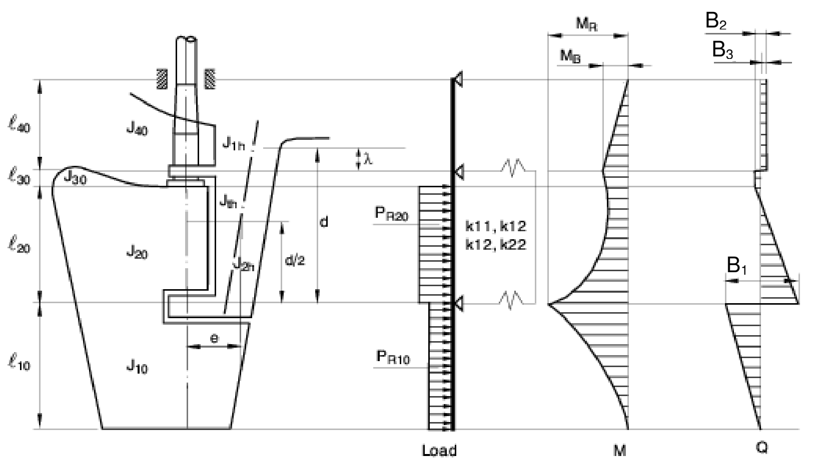

Figure 5: Semi-spade rudder (with 2-conjugate elastic supports)

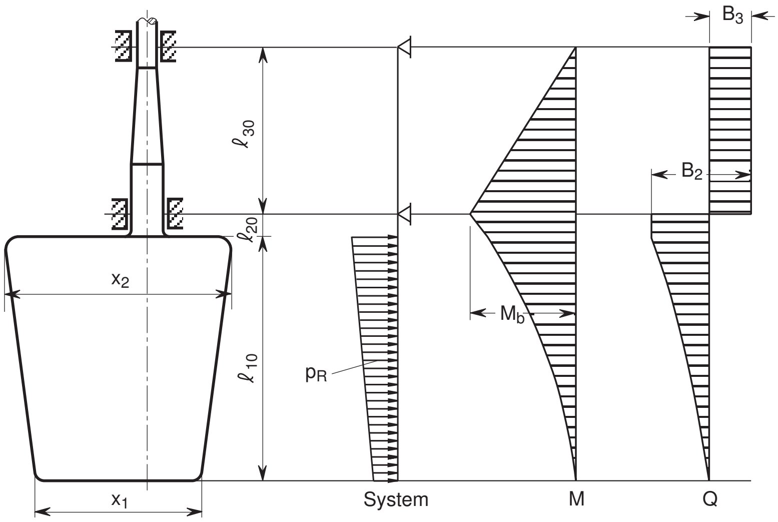

Figure 6: Spade rudder

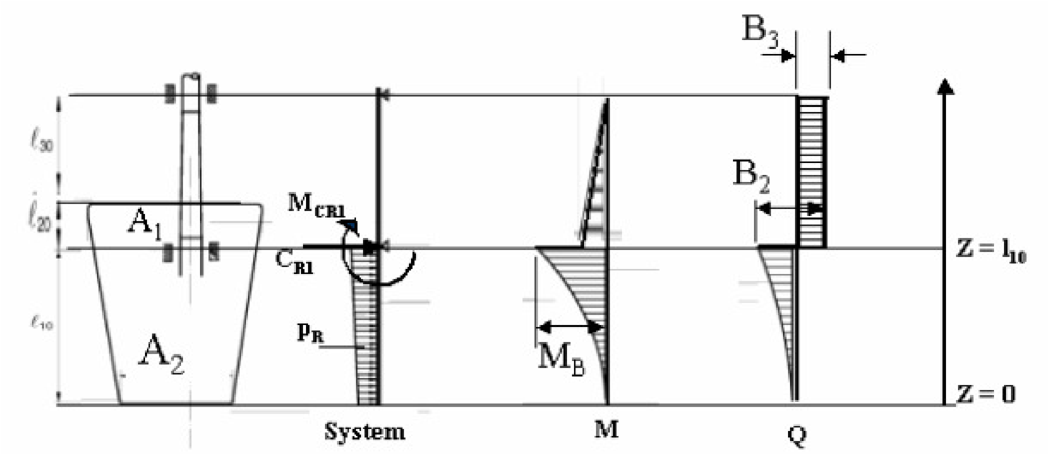

Figure 7: Spade rudders with rudder trunks

3.4 Rudder trunk

3.4.1

Where the rudder stock is arranged in a trunk in such a way that the trunk is stressed by forces due to rudder action, the scantlings of the trunk are to be as such that the equivalent stress due to bending and shear does not exceed $0.35\,R_{eH}$ of the material used.

3.4.2

In case where the rudder stock is fitted with a rudder trunk welded in such a way the rudder trunk is loaded by the pressure induced on the rudder blade, as given in [2.1.1], the bending stress in the rudder trunk, in N/mm^2, is to be in compliance with the following formula:

$\sigma \leq 80 / k$

where the material factor k for the rudder trunk is not to be taken less than 0.7.

For the calculation of the bending stress, the span to be considered is the distance between the mid-height of the lower rudder stock bearing and the point where the trunk is clamped into the shell or the bottom of the skeg.

3.4.3
The steel used for the rudder trunk is to be of weldable quality, with a carbon content not exceeding 0.23% on ladle analysis and a carbon equivalent CEQ not exceeding 0.41.

3.4.4
The weld at the connection between the rudder trunk and the shell or the bottom of the skeg is to be full penetration.

The fillet shoulder radius r, in mm, is to be as large as practicable and to comply with the following formulae:

$r = 60$ when $\sigma \geq 40 / k$ N/mm^2

$r = 0.1D_1$, without being less than 30, when $\sigma < 40 / k$ N/mm^2

where D_1 is defined in [3.2.1].

The radius may be obtained by grinding. If disk grinding is carried out, score marks are to be avoided in the direction of the weld.

The radius is to be checked with a template for accuracy. Four profiles at least are to be checked. A report is to be submitted to the Surveyor.

3.4.5
Before welding is started, a detailed welding procedure specification is to be submitted to the Society covering the weld preparation, welding positions, welding parameters, welding consumables, preheating, post weld heat treatment and inspection procedures. This welding procedure is to be supported by approval tests in accordance with the applicable requirements of materials and welding sections of the rules.

The manufacturer is to maintain records of welding, subsequent heat treatment and inspections traceable to the welds. These records are to be submitted to the Surveyor.

3.4.6
Non destructive tests are to be conducted at least 24 hours after completion of the welding. The welds are to be 100% magnetic particle tested and 100% ultrasonic tested. The welds are to be free from cracks, lack of fusion and incomplete penetration. The non destructive tests reports are to be handed over to the Surveyor.

3.4.7
Rudder trunks in materials other than steel are to be specially considered by the Society.

3.4.8
The thickness of the shell or of the bottom plate is to be compatible with the trunk thickness.

4. Rudder couplings

4.1 General

4.1.1
The couplings are to be designed in such a way as to enable them to transmit the full torque of the rudder stock.

4.1.2
The distance of the bolt axis from the edges of the flange is not to be less than 1.2 times the diameter of the bolt. In horizontal couplings, at least 2 bolts are to be arranged forward of the stock axis.

4.1.3
The coupling bolts are to be fitted bolts. The bolts and nuts are to be effectively secured against loosening.

4.1.4
For spade rudders, horizontal couplings according to [4.2] are permitted only where the required thickness of the coupling flanges t_f is less than 50 mm, otherwise cone coupling according to [4.4] or [4.5], as applicable, is to be applied. For spade rudders of the high lift type, only cone coupling according to [4.4] or [4.5], as applicable, is permitted.

4.2 Horizontal couplings

4.2.1
The diameter of coupling bolts, in mm, is not to be less than:

$$d_b = 0.62\sqrt{\frac{D^3 k_b}{k_r\, n\, e}}$$

where:

D : Rudder stock diameter according to [6], in mm

n : Total number of bolts, which is not to be less than 6

e : Mean distance of the bolt axes from the centre of bolt system, in mm

k_r : Material factor for the rudder stock as defined in [1.4.2]

k_b : Material factor for the bolts, obtained according to [1.4.2].

4.2.2
The thickness of the coupling flanges, in mm, is not to be less than determined by the following formulae:

$$t_f = 0.62\sqrt{\frac{D^3 k_f}{k_r\, n e}}$$, without being less than $0.9 d_b$

where:

k_f : Material factor for the coupling flanges, obtained according to [1.4.2]

The thickness of the coupling flanges clear of the bolt holes is not to be less than $0.65 t_f$.

The width of material outside the bolt holes is not to be less than $0.67 d_b$.

4.2.3
The coupling flanges are to be equipped with a fitted key according to DIN 6885 or equivalent standard for relieving the bolts.

The fitted key may be dispensed with if the diameter of the bolts is increased by 10%.

4.2.4

Horizontal coupling flanges are to be either forged together with the rudder stock or welded to the rudder stock, according to [10.1.3].

4.2.5

For the connection of the coupling flanges with the rudder body, see also [10].

4.3 Vertical couplings

4.3.1

The diameter of the coupling bolts, in mm, is not to be less than:

$$d_b = \frac{0.81D}{\sqrt{n}}\sqrt{\frac{k_b}{k_r}}$$

where:

D, k_b, k_r, n are defined in [4.2.1], where n is not to be less than 8.

4.3.2

The first moment of area of the bolts, in cm^3, about the centre of the coupling is not to be less than:

$$S = 0.00043D^3$$

4.3.2

The thickness of the coupling flanges, in mm, is not to be less than $t_f = d_b$

The width of material outside the bolt holes is not to be less than $0.67d_b$.

4.4 Cone couplings with key

4.4.1

Cone couplings should have a taper c on diameter of $1:8$ to $1:12$, where $c = (d_0 - d_u)/\ell$ (see Fig 8).

The cone shapes are to fit very exact. The nut is to be carefully secured, e.g. by a securing plate as shown in Fig 8.

4.4.2

The coupling length ℓ is to be, in general, not less than $1.5d_0$.

4.4.3

For couplings between stock and rudder a key is to be provided, the shear area of which, in cm^2, is not to be less than:

$$a_s = \frac{17.55Q_F}{d_k R_{eH1}}$$

where:

Q_F : Design yield moment of rudder stock, in Nm according to [6]

d_k : Diameter of the conical part of the rudder stock, in mm, at the key

R_{eH1} : Minimum yield stress of the key material, in N/mm^2

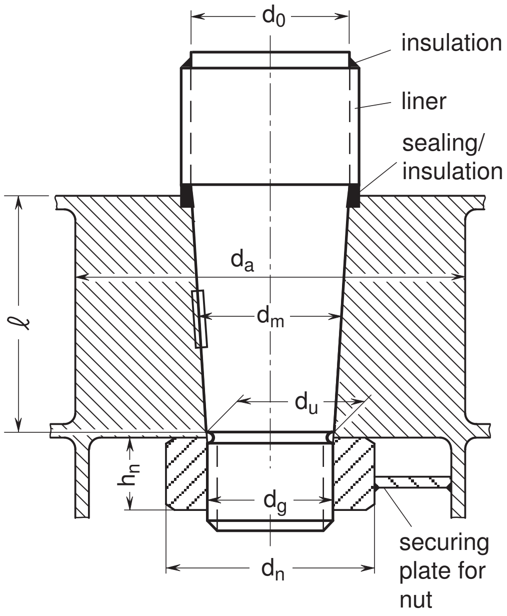

Figure 8: Cone coupling with key

4.4.4

The effective surface area, in cm^2, of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_k = \frac{5Q_F}{d_k R_{eH2}}$$

where:

R_{eH2} : Minimum yield stress of the key, stock or coupling material, in N/mm^2, whichever is less.

4.4.5

The dimensions of the slugging nut are to be as follows (see Fig 8):

- height: $h_n = 0.6 d_g$
- outer diameter, the greater value of: $d_n = 1.2\ d_u$ or $d_n = 1.5\ d_g$
- external thread diameter: $d_g = 0.65\ d_0$

4.4.6

It is to be proved that 50% of the design yield moment will be solely transmitted by friction in the cone couplings. This can be done by calculating the required push-up pressure and push-up length according to [0] for a torsional moment $Q'_F = 0.5 Q_F$.

4.5 Cone couplings with special arrangements for mounting and dismounting the couplings

4.5.1

Where the stock diameter exceeds 200 mm, the press fit is recommended to be effected by a hydraulic pressure connection. In such cases the cone is to be more slender, $c \approx 1:12$ to $\approx 1:20$.

4.5.2

In case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle. A securing plate for securing the nut against the rudder body is not to be provided (see Fig 9).

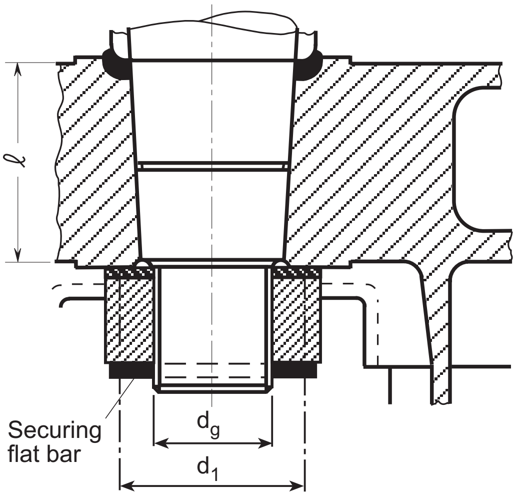

Figure 9: Cone coupling without key

Note: A securing flat bar will be regarded as an effective securing device of the nut, if its shear area, in mm², is not less than:

$$A_s = \frac{P_s \cdot \sqrt{3}}{R_{eH}}$$

where:

Ps : Shear force, in N, as follows:

$$P_S = \frac{P_e}{2}\mu_1\left(\frac{d_1}{d_g} - 0.6\right)$$

P_e : Push-up force according to [4.5.3], in N

μ_1 : Frictional coefficient between nut and rudder body, normally $\mu_1 = 0.3$

d_1 : Mean diameter of the frictional area between nut and rudder body

d_g : Thread diameter of the nut

R_{eH} : Minimum yield stress, in N/mm², of the securing flat bar material.

4.5.3 Push-up pressure and push-up length

For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up length and the push-up pressure are to be determined according to [4.5.4] and [4.5.5].

4.5.4 Push-up pressure

The push-up pressure is not to be less than the greater of the two following values:

$$p_{req1} = \frac{2Q_F}{d_m^2\,\ell\,\pi\,\mu_0}10^3$$

$$p_{req2} = \frac{6 \cdot M_b}{\ell^2\,d_m}10^3$$

where:

Q_F : Design yield moment of rudder stock according to [6], in N.m

d_m : Mean cone diameter, in mm

ℓ : Cone length, in mm

μ_0 : Frictional coefficient, equal to about 0.15

M_b : Bending moment in the cone coupling (e.g. in case of spade rudders), in N.m

It has to be proved that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure is to be determined by the following formula:

$$p_{perm} = \frac{0.8 R_{eH} \left(1 - \alpha^2\right)}{\sqrt{3 + \alpha^4}}$$

where:

R_{eH} : Minimum yield stress, in N/mm^2, of the material of the gudgeon

$$\alpha = \frac{d_m}{d_a}$$

d_m : Diameter, in mm, as defined in Fig 8

d_a : Outer diameter of the gudgeon (see Fig 8), in mm, to be not less than $1.5 d_m$.

4.5.5 Push-up length

The push-up length, in mm, is not to be less than:

$$\Delta\ell_1 = \frac{p_{req} d_m}{E\left(\frac{1 - \alpha^2}{2}\right)c} + \frac{0.8 R_{tm}}{c}$$

where:

R_{tm} : Mean roughness, in mm , taken equal to about 0.01

c : Taper on diameter according to [4.5.1]

The push-up length, in mm, is, however, not to be taken greater than:

$$\Delta\ell_2 = \frac{1.6\, R_{eH}\; d_m}{E\, c \sqrt{3 + \alpha^4}} + \frac{0.8 R_{tm}}{c}$$

Note: In case of hydraulic pressure connections the required push-up force P_e for the cone, in N, may be determined by the following formula:

$$P_e = p_{req}\; d_m \pi\, \ell \left(\frac{c}{2} + 0.02\right)$$

The value 0.02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed.

Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by the Society.

4.5.6 Push-up pressure for pintle bearings

The required push-up pressure for pintle bearings, in N/mm^2, is to be determined by the following formula:

$$p_{req} = 0.4 \frac{B_1 d_0}{d_m^2\, \ell}$$

where:

B_1 : Supporting force in the pintle bearing, in N (see Fig 4)

d_m, ℓ : As defined in [4.5.3]

d_0 : Pintle diameter, in mm, according to Fig 8.

5. Rudder body, rudder bearings

5.1 Strength of rudder body

5.1.1

The rudder body is to be stiffened by horizontal and vertical webs in such a manner that the rudder body will be effective as a beam. The rudder should be additionally stiffened at the aft edge.

5.1.2

The strength of the rudder body is to be proved by direct calculation according to [3.3]

5.1.3

For rudder bodies without cut-outs the permissible stress are limited to:

- bending stress, in N/mm^2, due to M_R defined in [3.3.3]:

  $\sigma_b = 110$

- shear stress, in N, due to Q_1 defined in [3.3.3]:

  $\tau_t = 50$

- equivalent stress due to bending and shear:

  $\sigma_v = \sqrt{\sigma_b{}^2 + 3\tau^2} = 120$

In case of openings in the rudder plating for access to cone coupling or pintle nut the permissible stresses according to [5.1.4] apply. Smaller permissible stress values may be required if the corner radii are less than $0.15h_o$, where h_o is the height of opening.

5.1.4

In rudder bodies with cut-outs (semi-spade rudders) the following stress values are not to be exceeded:

- bending stress, N/mm^2, due to M_R:

  $\sigma_b = 75$

RCN 1 to July 2010 version (effective from 1July 2012)

- shear stress, N/mm^2, due to Q_1:

  $\tau = 50$

- torsional stress, N/mm^2,due to M_t:

  $\tau_t = 50$

- equivalent stress, in N/mm^2, due to bending and shear and equivalent stress due to bending and torsion:

  $\sigma_{v1} = \sqrt{\sigma_b^2 + 3\tau^2} = 100$

  $\sigma_{v2} = \sqrt{\sigma_b^2 + 3\tau_t^2} = 100$

RCN 1 to July 2010 version (effective from 1July 2012)

where:

$M_R = C_{R2} f_1 + B_1 \dfrac{f_2}{2}$, in N.m

$Q_1 = C_{R2}$, in N

f_1, f_2 : As defined in Fig 10

τ_t : Torsional stress, in N/mm^2, taken equal to:

$$\tau_t = \frac{M_t}{2 \ell h t}$$

$M_t = C_{R2}\, e$, in N.m

C_{R2} : Partial rudder force, in N, of the partial rudder area A_2 below the cross section under consideration

e : Lever for torsional moment, in m (horizontal distance between the centre of pressure of area A_2 and the centre line a-a of the effective cross sectional area under consideration, see Fig 10. The centre of pressure is to be assumed at $0.33c_2$ aft of the forward edge of area A_2, where c_2 is the mean breadth of area A_2).

h, ℓ, t : Dimensions, in cm, as defined in Fig 10.

The distance ℓ between the vertical webs should not exceed $1.2h$.

The radii in the rudder plating are not to be less than 4 to 5 times the plate thickness, but in no case less than 50 mm.

Note: It is recommended to keep the natural frequency of the fully immersed rudder and of local structural components at least 10 % above the exciting frequency of the propeller (number of revolutions × number of blades) or if relevant above higher order.

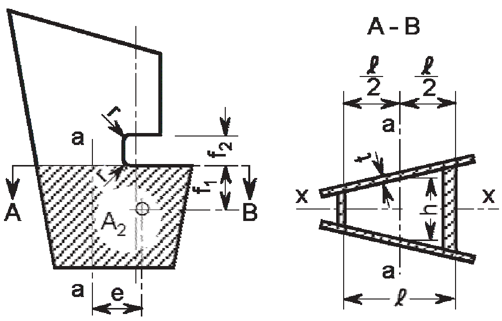

Figure 10: Geometry of rudder

5.2 Rudder plating

5.2.1

The thickness of the rudder plating, in mm, is to be determined according to the following formula:

$t_P = 1.74 a \beta \sqrt{p_R\, k} + 2.5$

where:

$p_R = 10T + \dfrac{C_R}{10^3 A}$, in kN/m^2

a : Smaller unsupported width of a plate panel, in m.

$\beta = \sqrt{1.1 - 0.5\left(\frac{a}{b}\right)^2}$ max, 1.00, if $\frac{b}{a} \geq 2.5$

b : greatest unsupported width of a plate panel, in m.

However, the thickness is to be not less than the thickness of the shell plating at aft part according to Ch 9, Sec 2. Regarding dimensions and welding, [10.1.1] is to be comply with.

5.2.2

For connecting the side plating of the rudder to the webs tenon welding is not to be used. Where application of fillet welding is not practicable, the side plating is to be connected by means of slot welding to flat bars which are welded to the webs.

5.2.3

The thickness of the webs, in mm, is not to be less than 70 % of the thickness of the rudder plating according to [5.2.1], but not less than:

$$t_{min} = 8\sqrt{k}$$

Webs exposed to seawater are to be dimensioned according to [5.2.1].

5.3 Connections of rudder blade structure with solid parts in forged or cast steel

5.3.1 General

Solid parts in forged or cast steel which ensure the housing of the rudder stock or of the pintle are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates.

5.3.2 Minimum section modulus of the connection with the rudder stock housing

The section modulus of the cross-section of the structure of the rudder blade which is connected with the solid part where the rudder stock is housed, which is made by vertical web plates and rudder plating, is to be not less than that obtained, in cm^3, from the following formula:

$$w_S = c_S\, d_1^3 \left(\frac{H_E - H_X}{H_E}\right)^2 \frac{k}{k_1} 10^{-4}$$

where:

c_S : Coefficient, to be taken equal to:

c_S = 1.0 if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate

c_S = 1.5 if there is an opening in the considered cross-section of the rudder

D_1 : Rudder stock diameter, in mm, defined in [3.2.1]

H_E : Vertical distance, in m, between the lower edge of the rudder blade and the upper edge of the solid part

H_X : Vertical distance, in m, between the considered cross-section and the upper edge of the solid part

k, k_1 : Material factors, defined for the rudder blade plating and the rudder stock, respectively.

5.3.3 Calculation of the actual section modulus of the connection with the rudder stock housing

The actual section modulus of the cross-section of the structure of the rudder blade which is connected with the solid part where the rudder stock is housed is to be calculated with respect to the symmetrical axis of the rudder.

The breadth of the rudder plating to be considered for the calculation of this actual section modulus is to be not greater than that obtained, in m, from the following formula:

$$b = s_V + 2\frac{H_X}{m}$$

where:

s_V : Spacing, in m, between the two vertical webs (see Fig 11)

H_X : Distance defined in [5.3.2]

m : Coefficient to be taken, in general, equal to 3.

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are to be deducted (see Fig 11).

5.3.4 Thickness of horizontal web plates

In the vicinity of the solid parts, the thickness of the horizontal web plates, as well as that of the rudder blade plating between these webs, is to be not less than the greater of the values obtained, in mm, from the following formulae:

$t_H = 1.2\, t_P$

$$t_H = 0.045\frac{d_S^2}{s_H}$$

where:

t_P : Defined in [5.2.1]

d_S : Diameter, in mm, to be taken equal to:

$d_S = D_1$ for the solid part connected to the rudder stock

$d_S = d_a$ for the solid part connected to the pintle

D_1 : Rudder stock diameter, in mm, defined in [3.2.1]

d_a : Pintle diameter, in mm, defined in [5.5.1]

s_H : Spacing, in mm, between the two horizontal web plates.

Different thickness may be accepted when justified on the basis of direct calculations submitted to the Society for approval.

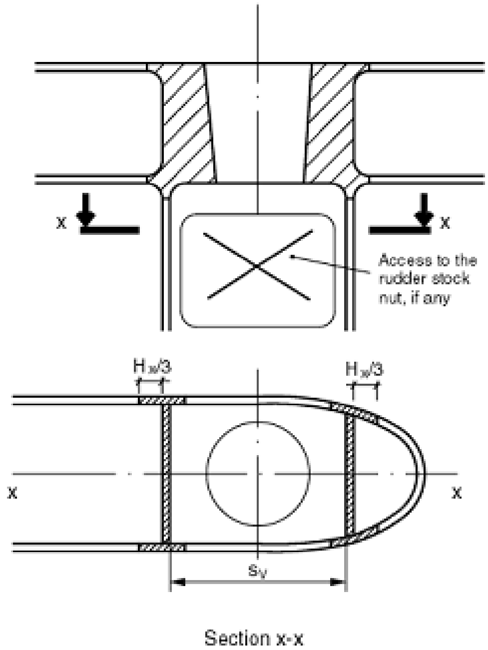

Figure 11: Cross-section of the connection between rudder blade structure and rudder stock housing

5.3.5 Thickness of side plating and vertical web plates welded to the solid part

The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating under this solid part is to be not less than the values obtained, in mm, from Tab 2.

Table 2: Thickness of side plating and vertical web plates

Type of rudder	Thickness of vertical web plates, in mm		Thickness of rudder plating, in mm	
	Rudder blade without opening	At opening boundary	Rudder blade without opening	Area with opening
Rudder supported by sole piece (Fig 3)	$1.2t_P$	$1.6t_P$	$1.2t_P$	$1.4t_P$
Semi-spade and spade rudders (Fig 4 to Fig 7)	$1.4t_P$	$2.0t_P$	$1.3t_P$	$1.6t_P$
t_P : Defined in [5.2.1]				

5.3.6 Solid part protrusions

The solid parts are to be provided with protrusions. Vertical and horizontal web plates of the rudder are to be butt welded to these protrusions.

These protrusions are not required when the web plate thickness is less than:

- 10 mm for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders
- 20 mm for the other web plates.

5.3.7

If the torque is transmitted by a prolonged shaft extended into the rudder, the latter must have the diameter D_t or D_1, whichever is greater, at the upper 10 % of the intersection length. Downwards it may be tapered to $0.6D_t$, in spade rudders to 0.4 times the strengthened diameter, if sufficient support is provided for.

5.4 Rudder bearings

5.4.1

In way of bearings liners and bushes are to be fitted.

Their minimum thickness is equal to:

- t_{min} = 8 mm for metallic materials and synthetic material
- t_{min} = 22 mm for lignum material

Where in case of small ships bushes are not fitted, the rudder stock is to be suitably increased in diameter in way of bearings enabling the stock to be re-machined later.

5.4.2

An adequate lubrication is to be provided.

5.4.3

The bearing forces result from the direct calculation mentioned in [3.3]. As a first approximation the bearing force may be determined without taking account of the elastic supports. This can be done as follows:

- normal rudder with two supports:

  The rudder force C_R is to be distributed to the supports according to their vertical distances from the centre of gravity of the rudder area.
- semi-spade rudders:

  support force in the rudder horn, in N:

  $$B_1 = C_R \frac{b}{c}$$

  support force in the neck bearing, in N:

  $$B_2 = C_R - B_1$$

For b and c see Fig 14.

5.4.4

The projected bearing surface A_b (“bearing height” × “external diameter of liner”), in mm^2, is not to be less than

$$A_b = \frac{B}{q}$$

where:

B : Support force, in N

q : Permissible surface pressure according to Tab 3.

5.4.5

Stainless and wear resistant steels, bronze and hot-pressed bronze-graphit materials have a considerable difference in potential to non-alloyed steel. Respective preventive measures are required.

5.4.6
The bearing height is to be equal to the bearing diameter, however, is not to exceed 1.2 times the bearing diameter. Where the bearing depth is less than the bearing diameter, higher specific surface pressures may be allowed.

Table 3: Surface pressure *q* of bearing materials

Bearing material	q, in N/mm^2
Lignum vitae	2.5
White metal, oil lubricated	4.5
Synthetic material (1)	5.5
Steel (2), bronze and hot-pressed bronze-graphite materials	7.0

(1) Synthetic materials to be of approved type.
Surface pressures exceeding 5.5 N/mm^2 may be accepted in accordance with bearing manufacturer's specification and tests, but in no case more than 10 N/mm^2.
(2) Stainless and wear resistant steel in an approved combination with stock liner. Higher surface pressures than 7 N/mm^2 may be accepted if verified by tests.

The wall thickness of pintle bearings in sole piece and rudder horn is to be approximately equal to one fourth of the pintle diameter.

5.5 Pintles

5.5.1
Pintles are to have scantlings complying with the conditions given in [4.4] and [4.6]. The pintle diameter, in mm, is not to be less than:

$$d_a = 0.35\sqrt{B_1 k_r}$$

where:

B_1 : Support force, in N

k_r : Material factor defined in [1.4.2].

5.5.2
The thickness of any liner or bush, in mm, is neither to be less than:

$$t = 0.01\sqrt{B_1}$$

nor than the minimum thickness defined in [5.4.1].

5.5.3
Where pintles are of conical shape, the taper on diameter is to comply with the following:

- $1:8$ to $1:12$, if keyed by slugging nut
- $1:12$ to $1:20$, if mounted with oil injection and hydraulic nut

5.5.4
The pintles are to be arranged in such a manner as to prevent unintentional loosening and falling out.

For nuts and threads the requirements of [4.4.5] and [4.5.2] apply accordingly.

5.6 Criteria for bearing clearances

5.6.1

For metallic bearing material the bearing clearance, in mm, is to be not less:

$$\frac{d_b}{1000} + 1.0$$

where:

d_b : Inner diameter of bush, in mm.

5.6.2

If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties.

5.6.3

The clearance is not to be taken less than 1.5 mm on diameter. In case of self lubricating bushes going down below this value can be agreed to on the basis of the manufacturer's specification.

6. Design yield moment of rudder stock

6.1 General

6.1.1

The design yield moment of the rudder stock is to be determined by the following formula:

$$Q_F = 0.02664 \frac{D_t^3}{k_r}$$

D_t : Stock diameter, in mm, according to [3.1].

Where the actual diameter D_{ta} is greater than the calculated diameter D_t, the diameter D_{ta} is to be used. However, D_{ta} applied to the above formula need not be taken greater than $1.145 D_t$.

7. Stopper, locking device

7.1 Stopper

7.1.1

The motions of quadrants or tillers are to be limited on either side by stoppers. The stoppers and their foundations connected to the ship's hull are to be of strong construction so that the yield point of the applied materials is not exceeded at the design yield moment of the rudder stock.

7.2 Locking device

7.2.1

Each steering gear is to be provided with a locking device in order to keep the rudder fixed at any position. This device as well as the foundation in the ship's hull are to be of strong construction so that the yield point of the applied materials is not exceeded at the design yield moment of the rudder stock as specified in [6]. Where the

ship's speed exceeds 12 knots, the design yield moment need only be calculated for a stock diameter based on a speed V_0 = 12 knots.

7.3

7.3.1

Regarding stopper and locking device see also the applicable requirements of the Society’s Rules for Machinery Installations.

8. Propeller nozzles

8.1 General

8.1.1

The following requirements are applicable to propeller nozzles having an inner diameter of up to 5 m. Nozzles with larger diameters will be specially considered.

8.1.2

Special attention is to be given to the support of fixed nozzles at the hull structure.

8.2 Design pressure

8.2.1

The design pressure for propeller nozzles, in kN/m^2, is to be determined by the following formula:

$$p_d = c\, p_{d0}$$

$$p_{d0} = \varepsilon \frac{N}{Ap}$$

where:

N : Maximum shaft power, in kW

A_p : Propeller disc area, in m^2, taken equal to:

$$A_p = D^2 \frac{\pi}{4}$$

D : Propeller diameter, in m

ε : Factor obtained from the following formula:

$$\varepsilon = 0.21 - 2 \cdot 10^{-4} \frac{N}{A_p}$$, without being taken less than 0.1

c : Coefficient taken equal to (see Fig 12):

c = 1.0 in zone 2 (propeller zone)

c = 0.5 in zones 1 and 3

c = 0.35 in zone 4.

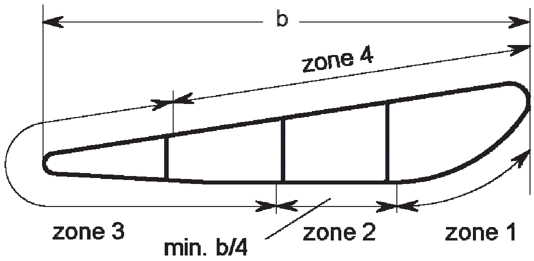

Figure 11: Zones of propeller nozzle

8.3 Plate thickness

8.3.1

The thickness of the nozzle shell plating, in mm, is not to be less than:

$t = t_0 + t_k$, without being taken less than 7.5

where:

t_0 : Thickness, in mm, obtained from the following formula:

$$t_0 = 5a\sqrt{p_d}$$

a : Spacing of ring stiffeners, in m

t_k : Corrosion allowance, in mm, taken equal to:

$$t_k = 1.5 \qquad \text{if } t_0 \le 10$$

$$t_k = \min\left[0.1\left(\frac{t_0}{\sqrt{k}} + 0.5\right), 3.0\right] \qquad \text{if } t_0 > 10$$

8.3.2

The web thickness of the internal stiffening rings is not to be less than the nozzle plating for zone 3, however, in no case be less than 7.5 mm.

8.4 Section modulus

8.4.1

The section modulus of the cross section shown in Fig 12 around its neutral axis, in cm^3, is not to be less than:

$w = n\,d^2\,b\,V_0^2$

where:

d : Inner diameter of nozzle, in m

b : Length of nozzle, in m

n : Coefficient taken equal to:

$n = 1.0$, for rudder nozzles

$n = 0.7$, for fixed nozzles.

8.5 Welding

8.5.1

The inner and outer nozzle shell plating is to be welded to the internal stiffening rings as far as practicable by double continuous welds. Plug welding is only permissible for the outer nozzle plating.

9. Rudder horn and sole piece scantlings

9.1 Sole piece

9.1.1

The section modulus of the sole piece related to the z-axis, in cm^3, is not to be less than:

$$W_z = \frac{B_1\, x\, k}{80}$$

where:

B_1 : As defined in [3.3]. For rudders with two supports the support force is approximately $B_1 = C_R/2$, when the elasticity of the sole piece is ignored.

x : Distance, in m, of the respective cross section from the rudder axis, with:

$x_{min} = 0.5\,\ell_{50}$

$x_{max} = \ell_{50}$

ℓ_{50} : As defined in Fig 13 and [3.3.2].

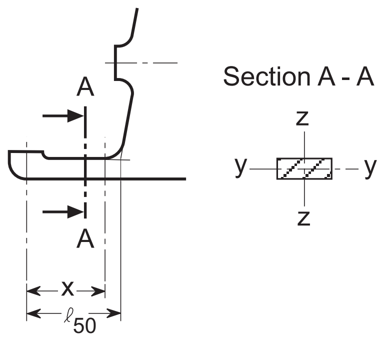

Figure 13: Sole piece

9.1.2

The section modulus related to the y-axis is not to be less than:

- where no rudder post or rudder axle is fitted

$$W_y = \frac{W_z}{2}$$

- where a rudder post or rudder axle is fitted

$$W_y = \frac{W_z}{3}$$

9.1.3

The sectional area, in mm^2, at the location $x = \ell_{50}$ is not to be less than:

$$A_s = \frac{B_1}{48} k$$

9.1.4

The equivalent stress taking into account bending and shear stresses, in N/mm^2, at any location within the length ℓ_{50} is not to exceed:

$$\sigma_v = \sqrt{\sigma_b^2 + 3\tau^2} = \frac{115}{k}$$

where:

$$\sigma_b = \frac{B_1 x}{W_z}$$

$$\tau = \frac{B_1}{A_s}$$

9.2 Rudder horn of semi spade rudders (case of 1-elastic support)

9.2.1

The distribution of the bending moment, in N.m, shear force, in N, and torsional moment, in N.m, is to be determined according to the following formulae:

- bending moment: $M_b = B_1 z$

  $M_{b\max} = B_1 d$
- shear force: $Q = B_1$
- torsional moment: $M_T = B_1 \, e_{(z)}$

For determining preliminary scantlings the flexibility of the rudder horn may be ignored and the supporting force B_1, in N, be calculated according to the following formula:

$$B_1 = C_R \frac{b}{c}$$

where b, c, d, $e_{(z)}$ and z are defined in Fig 14 and Fig 15.

b results from the position of the centre of gravity of the rudder area.

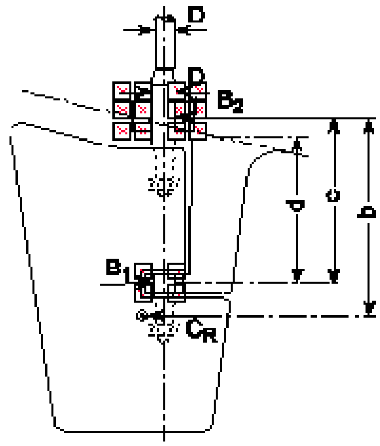

Figure 14: Dimensions of rudder horn

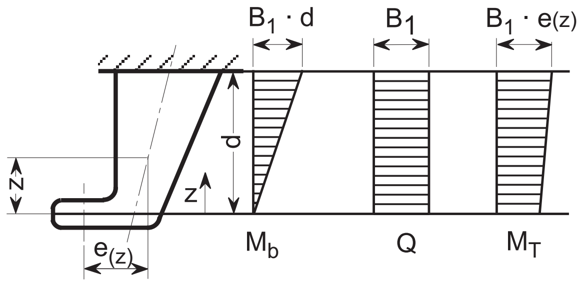

Figure 15: Rudder horn loads

9.2.2

The section modulus of the rudder horn in transverse direction related to the horizontal x-axis is at any location z, in cm^3, not to be less than:

$$W_x = \frac{M_b\,k}{67}$$

9.2.3

At no cross section of the rudder horn the shear stress, in N/mm^2, due to the shear force Q is to exceed the value:

$$\tau = \frac{48}{k}$$

The shear stress, in N/mm^2, is to be determined by the following formula:

$$\tau = \frac{B_1}{A_h}$$

where:

A_h : Effective shear area of the rudder horn, in mm^2, in y-direction

9.2.4

The equivalent stress, in N/mm^2, at any location z of the rudder horn is not to exceed the following value:

$$\sigma_v = \sqrt{\sigma_b^2 + 3\left(\tau^2 + \tau_T^2\right)} = \frac{120}{k}$$

where:

$$\sigma_b = \frac{M_b}{W_x}$$

$$\tau_T = \frac{M_T}{2A_T t_h} 10^3$$

A_T : Sectional area, in mm^2, enclosed by the rudder horn at the location considered

t_h : Thickness of the rudder horn plating, in mm.

9.2.5

When determining the thickness of the rudder horn plating the provisions of [5.2] to [5.4] are to be complied with. The thickness, in mm, is, however, not to be less than $2.4\sqrt{LK}$.

9.2.6

The rudder horn plating is to be effectively connected to the aft ship structure, e.g. by connecting the plating to longitudinal girders, in order to achieve a proper transmission of forces, see Fig 16.

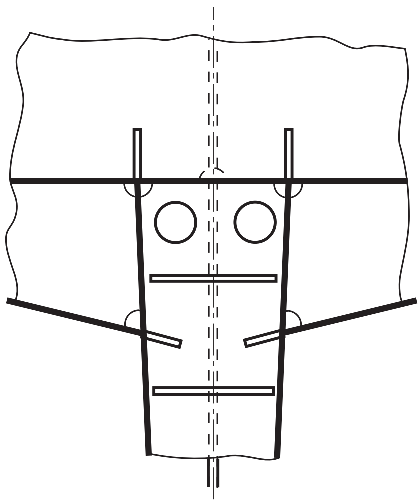

Figure 16: Connection of rudder horn to aft ship structure

9.2.7

Transverse webs of the rudder horn are to be led into the hull up to the next deck in a sufficient number and must be of adequate thickness.

9.2.8

Strengthened plate floors are to be fitted in line with the transverse webs in order to achieve a sufficient connection with the hull. The thickness of these plate floors is to be increased by 50% above the bottom thickness determined according to Ch 6, Sec 1 or Ch 9, Sec 2.

9.2.9

The centre line bulkhead (wash-bulkhead) in the after peak is to be connected to the rudder horn.

9.2.10

Where the transition between rudder horn and shell is curved, about 50% of the required total section modulus of the rudder horn is to be formed by the webs in a section A - A located in the centre of the transition zone, i.e. 0.7r above the beginning of the transition zone (See Fig. 17).

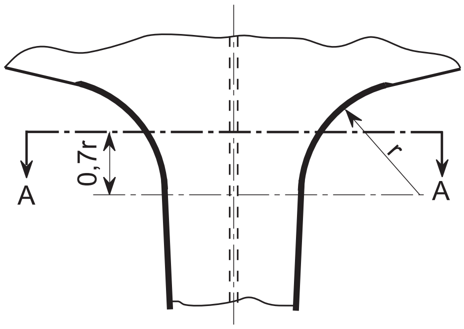

Figure 17: Transition between rudder horn and shell

9.3 Rudder horn of semi spade rudders (case of 2-conjugate elastic supports)

9.3.1 Bending moment

The bending moment acting on the generic section of the rudder horn is to be obtained, in N.m, from the following formulae:

- between the lower and upper supports provided by the rudder horn:

  $M_H = F_{A1}\, z$

- above the rudder horn upper-support:

  $M_H = F_{A1}\, z + F_{A2}\, (z - d_{lu})$

where:

F_{A1} : Support force at the rudder horn lower-support, in N, to be obtained according to Fig 5, and taken equal to B_1

F_{A2} : Support force at the rudder horn upper-support, in N, to be obtained according to Fig 5, and taken equal to B_2

z : Distance, in m, defined in Fig 19, to be taken less than the distance d, in m, defined in the same figure

d_{lu} : Distance, in m, between the rudder-horn lower and upper bearings (according to Fig 18, $d_{lu} = d - \lambda$).

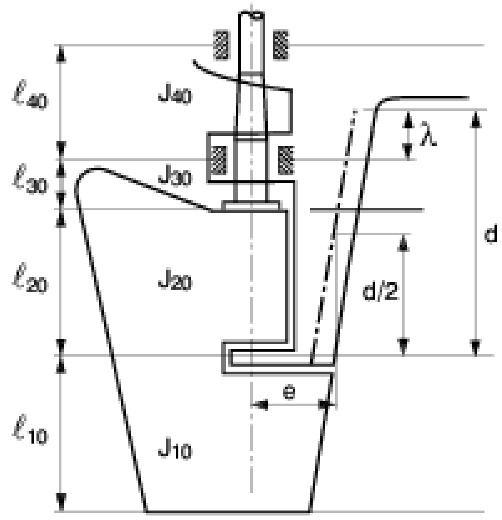

Figure 18: Geometrical parameters for the calculation of the bending moment in rudder horn

9.3.2 Shear force

The shear force Q_H acting on the generic section of the rudder horn is to be obtained, in N, from the following formulae:

- between the lower and upper rudder horn bearings:

  $Q_H = F_{A1}$

- above the rudder horn upper-bearing:

  $Q_H = F_{A1} + F_{A2}$

where:

F_{A1}, F_{A2} : Support forces, in N.

9.3.3 Torque

The torque acting on the generic section of the rudder horn is to be obtained, in N.m, from the following formulae:

- between the lower and upper rudder horn bearings:

  $M_T = F_{A1}\, e_{(z)}$

- above the rudder horn upper-bearing:

  $M_T = F_{A1}\, e_{(z)} + F_{A2}\, e_{(z)}$

where:

F_{A1}, F_{A2} : Support forces, in N

$e_{(z)}$: Torsion lever, in m, defined in Fig 19.

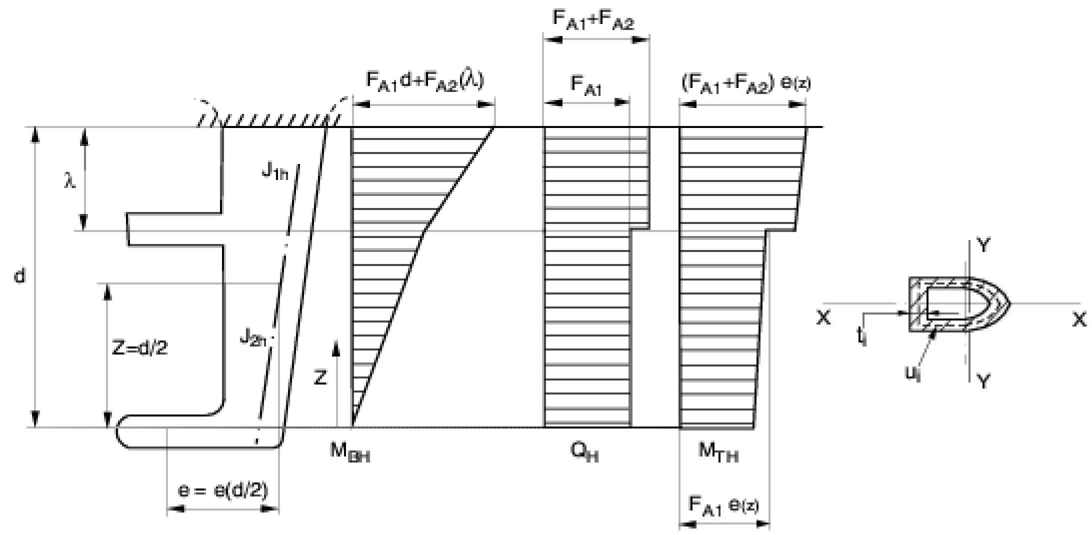

Figure 19: Geometry of rudder horn

9.3.4 Shear stress calculation

a) For a generic section of the rudder horn, located between its lower and upper bearings, the following stresses are to be calculated:

τ_S : Shear stress, in N/mm^2, to be obtained from the following formula:

$$\tau_S = \frac{F_{A1}}{A_H}$$

τ_T : Torsional stress, in N/mm^2, to be obtained for hollow rudder horn from the following formula:

$$\tau_T = \frac{M_T 10^3}{2 F_T t_H}$$

For solid rudder horn, τ_T is to be considered by the Society on a case by case basis

b) For a generic section of the rudder horn, located in the region above its upper bearing, the following stresses are to be calculated:

τ_S : Shear stress, in N/mm^2, to be obtained from the following formula:

$$\tau_S = \frac{F_{A1} + F_{A2}}{A_H}$$

τ_T : Torsional stress, in N/mm^2, to be obtained for hollow rudder horn from the following formula:

$$\tau_T = \frac{M_T 10^3}{2 F_T t_H}$$

For solid rudder horn, τ_T is to be considered by the Society on a case by case basis

where:

F_{A1}, F_{A2} : Support forces, in N

A_H : Effective shear sectional area of the rudder horn, in mm^2, in y-direction

M_T : Torque, in N.m

F_T : Mean of areas enclosed by outer and inner boundaries of the thin walled section of rudder horn, in m^2

t_H : Plate thickness of rudder horn, in mm. For a given cross section of the rudder horn, the maximum value of τ_T is obtained at the minimum value of t_H.

9.3.5 Bending stress calculation

For the generic section of the rudder horn within the length *d*, defined in Fig 14, the following stresses are to be calculated:

σ_B : Bending stress, in N/mm^2, to be obtained from the following formula:

$$\sigma_B = \frac{M_H}{W_X}$$

M_H : Bending moment at the section considered, in N.m

W_X : Section modulus, in cm^3, around the X-axis (see Fig 19).

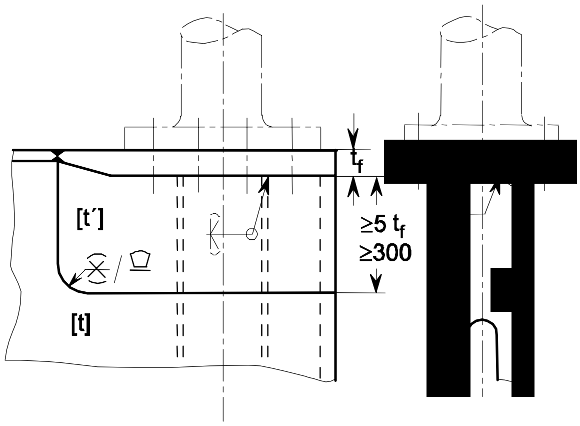
9.3.6 General remarks

Requirements [9.2.5] to [9.2.10] also apply to rudder horn with 2-conjugate elastic supports.

10. Rudder coupling flanges

10.1.1

Unless forged or cast steel flanges with integrally forged or cast welding flanges are used, horizontal rudder coupling flanges are to be joined to the rudder body by plates of graduated thickness and full penetration single or double-bevel welds as prescribed in Ch 11, Sec 1 (see Fig 20).



t = thickness of rudder plating, in mm

t_f = actual flange thickness in [mm]

$t' = \frac{t_f}{3} + 5$ [mm] where $t_f < 50$mm

$t' = 3\sqrt{t_f}$ [mm] where $t_f \geq 50$mm

Figure 20: Horizontal rudder coupling flanges

10.1.2

Allowance is to be made for the reduced strength of the coupling flange in the thickness direction. In case of doubt, proof by calculation of the adequacy of the welded connection shall be produced.

10.1.3
The welded joint between the rudder stock (with thickened collar, see Ch 11, Sec 2) and the flange is to be made in accordance with Fig 21.

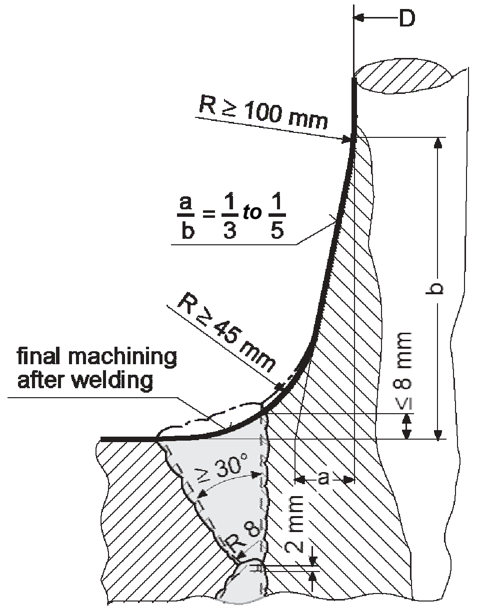


Figure 20: Welded joint between rudder stock and coupling flange

11. Azimuth propulsion system

11.1 General

11.1.1 Arrangement
The azimuth propulsion system is constituted by the following sub-systems (see Fig 22):

- the steering unit
- the bearing
- the hull supports
- the rudder part of the system
- the pod, which contains the electric motor in the case of a podded propulsion system.

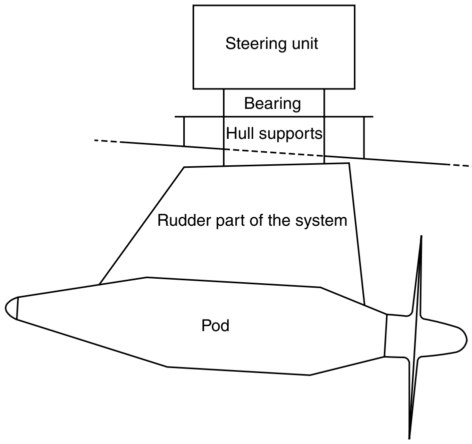

Figure 22: Azimuth propulsion system

11.1.2 Application

The requirements of this Article apply to the scantlings of the hull supports, the rudder part and the pod.

The steering unit and the bearing are to comply with the relevant requirements of the Society's Rules.

11.1.3 Operating conditions

The maximum angle at which the azimuth propulsion system can be oriented on each side when the ship navigates at its maximum speed is to be specified by the Designer. Such maximum angle is generally to be less than 35° on each side.

In general, orientations greater than this maximum angle may be considered by the Society for azimuth propulsion systems during manoeuvres, provided that the orientation values together with the relevant speed values are submitted to the Society for approval.

11.2 Arrangement

11.2.1 Plans to be submitted

In addition to the plans showing the structural arrangement of the pod and the rudder part of the system, the plans showing the arrangement of the azimuth propulsion system supports are to be submitted to the Society for approval. The scantlings of the supports and the maximum loads which act on the supports are to be specified in these drawings.

11.2.2 Locking device

The azimuth propulsion system is to be mechanically lockable in a fixed position, in order to avoid rotations of the system and propulsion in undesirable directions in the event of damage.

11.3 Design loads

11.3.1

The lateral pressure to be considered for scantling of plating and ordinary stiffeners of the azimuth propulsion system is to be determined for an orientation of the system equal to the maximum angle at which the azimuth propulsion system can be oriented on each side when the ship navigates at its maximum speed.

- The total force which acts on the azimuth propulsion system is to be obtained by integrating the lateral pressure on the external surface of the system.
- The calculations of lateral pressure and total force are to be submitted to the Society for information.

11.4 Plating

11.4.1 Plating of the rudder part of the azimuth propulsion system

The thickness of plating of the rudder part of the azimuth propulsion system is to be not less than that obtained, in mm, from the formulae in [5.2.1], in which the term C_R/A is to be replaced by the lateral pressure calculated according to [11.3].

11.4.2 Plating of the pod

The thickness of plating of the pod is to be not less than that obtained, in mm, from the formulae in Ch 6, Sec 1 or Ch 9, Sec 2, where the lateral pressure is to be calculated according to [11.3].

11.4.3 Webs

The thickness of webs of the rudder part of the azimuth propulsion system is to be determined according to [5.2.3], where the lateral pressure is to be calculated according to [11.3].

11.5 Ordinary stiffeners

11.5.1 Ordinary stiffeners of the pod

The scantlings of ordinary stiffeners of the pod are to be not less than those obtained from the formulae in Ch 6, Sec 2 or Ch 9, Sec 2, where the lateral pressure is to be calculated according to [11.3].

11.6 Primary supporting members

11.6.1 Analysis criteria

The scantlings of primary supporting members of the azimuth propulsion system are to be obtained by the Designer through direct calculations, to be carried out according to the following requirements:

- the structural model is to include the pod, the rudder part of the azimuth propulsion system, the bearing and the hull supports
- the boundary conditions are to represent the connections of the azimuth propulsion system to the hull structures
- the loads to be applied are those defined in [11.6.2].
- The direct calculation analyses (structural model, load and stress calculation, strength checks) carried out by the Designer are to be submitted to the Society for information.

11.6.2 Loads

The following loads are to be considered by the Designer in the direct calculation of the primary supporting members of the azimuth propulsion system:

- gravity loads
- buoyancy
- maximum loads calculated for an orientation of the system equal to the maximum angle at which the azimuth propulsion system can be oriented on each side when the ship navigates at its maximum speed
- maximum loads calculated for the possible orientations of the system greater than the maximum angle at the relevant speed (see [11.1.3])
- maximum loads calculated for the crash stop of the ship obtained through inversion of the propeller rotation
- maximum loads calculated for the crash stop of the ship obtained through a 180° rotation of the pod.

11.6.3 Strength check

It is to be checked that the Von Mises equivalent stress σ_E in primary supporting members, calculated, in N/mm^2, for the load cases defined in [11.6.2], is in compliance with the following formula:

$$\sigma_E \le \sigma_{ALL}$$

where:

σ_{ALL} : Allowable stress, in N/mm^2, to be taken equal to the lesser of the following values:

$$\sigma_{ALL} = 0.275 R_m$$

$$\sigma_{ALL} = 0.55 R_{eH}$$

11.7 Hull supports of the azimuth propulsion system

11.7.1 Analysis criteria

The scantlings of hull supports of the azimuth propulsion system are to be obtained by the Designer through direct calculations, to be carried out in accordance with the requirements in [11.6.1].

11.7.2 Loads

The loads to be considered in the direct calculation of the hull supports of the azimuth propulsion system are those specified in [11.6.2].

11.7.3 Strength check

It is to be checked that the Von Mises equivalent stress σ_E in hull supports, in N/mm^2, calculated for the load cases defined in [11.6.2], is in compliance with the following formula:

$$\sigma_E \le \sigma_{ALL}$$

where:

σ_{ALL} : Allowable stress, in N/mm^2, equal to 65 / k_r

k_r : Material factor, defined in [1.4.2]

Values of σ_E greater than σ_{ALL} may be accepted by the Society on a case by case basis, depending on the localisation of σ_E and on the type of direct calculation analysis.

Section 2 – BULWARKS AND GUARD RAILS

1. General

1.1 Introduction

1.1.1

The requirements of this Section apply to the arrangement of bulwarks and guard rails provided at boundaries of the freeboard deck, superstructure decks and tops of the first tier of deckhouses located on the freeboard deck.

1.2 General

1.2.1

Efficient bulwarks or guard rails are to be fitted at the boundaries of all exposed parts of the freeboard deck and superstructure decks directly attached to the freeboard deck, as well as the first tier of deckhouses fitted on the freeboard deck and the superstructure ends.

1.2.2

The height of the bulwarks or guard rails is to be at least 1 m from the deck. However, where their height would interfere with the normal operation of the ship, a lesser height may be accepted, if adequate protection is provided and subject to any applicable statutory requirement.

1.2.3

Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

1.2.4

In type B-100 ships, open rails on the weather parts of the freeboard deck for at least half the length of the exposed parts are to be fitted.

Alternatively, freeing ports complying with Ch 9, Sec 6, [5.5.2] are to be fitted.

1.2.5

In ships with bulwarks and trunks of breadth not less than $0.6B$, which are included in the calculation of freeboard, open rails on the weather parts of the freeboard deck in way of the trunk for at least half the length of the exposed parts are to be fitted.

Alternatively, freeing ports complying with Ch 9, Sec 6, [5.3.1] are to be fitted.

1.2.6

In ships having superstructures which are open at either or both ends, adequate provision for freeing the space within such superstructures is to be provided.

1.2.7

The freeing port area in the lower part of the bulwarks is to be in compliance with the applicable requirements of Ch 9, Sec 6, [5].

2. Bulwarks

2.1 General

2.1.1
As a rule, plate bulwarks are to be stiffened at the upper edge by a suitable bar and supported either by stays or plate brackets spaced not more than 2.0 m apart.

The free edge of the stay or the plate bracket is to be stiffened.

Stay and brackets of bulwarks are to be aligned with the beams located below or are to be connected to them by means of local transverse stiffeners.

As an alternative, the lower end of the stay and bracket may be supported by a longitudinal stiffener.

2.1.2
In type B-60 and B-100 ships, the spacing forward of 0.07L from the fore end of brackets and stays is to be not greater than 1.2 m.

2.1.3
Where bulwarks are cut completely, the scantlings of stays or brackets are to be increased with respect to those given in [2.2].

2.1.4
As a rule, bulwarks are not to be connected either to the upper edge of the sheerstrake plate or to the stringer plate.

Failing this, the detail of the connection will be examined by the Society.

2.2 Scantlings

2.2.1
The gross thickness of bulwarks on the freeboard deck not exceeding 1 m in height is to be not less than 6.5 mm.

Where the height of the bulwark is equal to or greater than 1.8 m, its thickness is to be equal to that calculated for the side of a superstructure situated in the same location as the bulwark.

For bulwarks between 1 m and 1.8 m in height, their thickness is to be calculated by linear interpolation.

2.2.2
Bulwark plating and stays are to be adequately strengthened in way of eye plates used for shrouds or other tackles in use for cargo gear operation, as well as in way of hawser holes or fairleads provided for mooring or towing.

2.2.3
At the ends of partial superstructures and for the distance over which their side plating is tapered into the bulwark, the latter is to have the same thickness as the side plating. Where openings are cut in the bulwark at these positions, adequate compensation is to be provided either by increasing the thickness of the plating or by other suitable means.

2.2.4
The gross section modulus of stays in way of the lower part of the bulwark is to be not less than the value obtained, in cm^3, from the following formula:

$$w = 77 s h_B^2$$

where:

s : Spacing of stays, in m

h_B : Height of bulwark, in m, measured from the top of the deck plating to the upper edge.

The actual section of the connection between stays and deck structures is to be taken into account when calculating the above section modulus.

To this end, the bulb or face plate of the stay may be taken into account only where welded to the deck; in this case the beam located below is to be connected by double continuous welding.

For stays with strengthening members not connected to the deck, the calculation of the required section modulus is considered by the Society on a case by case basis.

At the ends of the ship, where the bulwark is connected to the sheerstrake, an attached plating having a width not exceeding 600 mm may also be included in the calculation of the actual gross section modulus of stays.

2.2.5
Openings in bulwarks are to be arranged so that the protection of the crew is to be at least equivalent to that provided by the horizontal courses in [3.1.2].

For this purpose, vertical rails or bars spaced approximately 230 mm apart may be accepted in lieu of rails or bars arranged horizontally.

2.2.6
In the case of ships intended for the carriage of timber deck cargoes, the specific provisions of the freeboard regulations are to be complied with.

3. Guard rails

3.1 General

3.1.1
Where guard rails are provided, the upper edge of sheerstrake is to be kept as low as possible.

3.1.2
The opening below the lowest course is to be not more than 230 mm. The other courses are to be not more than 380 mm apart.

3.1.3
In the case of ships with rounded gunwales or sheerstrake, the stanchions are to be placed on the flat part of the deck.

3.1.4
Fixed, removable or hinged stanchions are to be fitted about 1.5 m apart. At least every third stanchion is to be supported by a bracket or stay.

Removable or hinged stanchions are to be capable of being locked in the upright position.

3.1.5

Wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths. Wires are to be made taut by means of turnbuckles.

3.1.6

Chains may only be accepted in short lengths in lieu of guard rails if they are fitted between two fixed stanchions and/or bulwarks.

Section 3 - EQUIPMENT

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

EN : Equipment number defined in [2.1]

1. General

1.1 General

1.1.1

The requirements in this Section apply to temporary mooring of a ship within or near harbour, or in a sheltered area, when the ship is awaiting a berth, the tide, etc..

Therefore, the equipment complying with the requirements in this Section is not intended for holding a ship off fully exposed coasts in rough weather or for stopping a ship which is moving or drifting.

1.1.2

The equipment complying with the requirements in this Section is intended for holding a ship in good holding ground, where the conditions are such as to avoid dragging of the anchor. In poor holding ground the holding power of the anchors is to be significantly reduced.

1.1.3

The equipment number *EN* formula for anchoring equipment required here under is based on an assumed current speed of 2.5 m/s, wind speed of 25 m/s and a scope of chain cable between 6 and 10, the scope being the ratio between length of chain paid out and water depth.

1.1.4

It is assumed that under normal circumstances a ship will use one anchor only.

2. Equipment number

2.1 Equipment number

2.1.1 General

All ships are to be provided with equipment in anchors and chain cables (or ropes according to [3.3.5]), to be obtained from Tab 1, based on their equipment number *EN*.

In general, stockless anchors are to be adopted.

For ships with *EN* greater than 16000, the determination of the equipment will be considered by the Society on a case by case basis.

Table 1: Equipment

Equipment number EN $A < EN \le B$		Stockless anchors		Stud link chain cables for anchors			
		N (1)	Mass per anchor, in kg	Total length, in m	Diameter, in mm		
A	B				Grade 1	Grade 2	Grade 3

2.1.2 Equipment number

The equipment number *EN* is to be obtained from the following formula:

$EN = \Delta^{2/3} + 2\, h\, B + 0.1\, A$

where:.

Δ : Moulded displacement of the ship, in t, to the summer load waterline

h : Effective height, in m, from the summer load waterline to the top of the uppermost house, to be obtained in accordance with the following formula:

$h = a + \Sigma\, h_n$

When calculating h, sheer and trim are to be disregarded

a : Freeboard amidships from the summer load waterline to the upper deck, in m

h_n : Height, in m, at the centreline of tier "*n*" of superstructures or deckhouses having a breadth greater than $B/4$. Where a house having a breadth greater than $B/4$ is above a house with a breadth of $B/4$ or less, the upper house is to be included and the lower ignored

A : Area, in m^2, in profile view, of the parts of the hull, superstructures and houses above the summer load waterline which are within the length L and also have a breadth greater than $B/4$

Fixed screens or bulwarks 1.5 m or more in height are to be regarded as parts of houses when determining h and A. In particular, the hatched area shown in Fig 1 is to be included.

The height of hatch coamings and that of any deck cargo, such as containers, may be disregarded when determining h and A.

3. Equipment

3.1 General

3.1.1

All anchoring equipment, towing bitts, mooring bollards, fairlead cleats and eyebolts are to be so constructed and attached to the hull that, in use up to design loads, the integrity of the ship will not be impaired.

3.1.2

The anchoring arrangement is to be such as to prevent the cable from being damaged and fouled. Adequate arrangement is to be provided to secure the anchor under all operational conditions.

3.2 Anchors

3.2.1 General

The scantlings of anchors are to be in compliance with the following requirements.

Anchors are to be constructed and tested in compliance with approved plans.

3.2.2 Ordinary anchors

The required mass for each anchor is to be obtained from Tab 1.

The individual mass of a main anchor may differ by ±7% from the mass required for each anchor, provided that the total mass of anchors is not less than the total mass required in Tab 1.

The mass of the head of an ordinary stockless anchor, including pins and accessories, is to be not less than 60% of the total mass of the anchor.

Where a stock anchor is provided, the mass of the anchor, excluding the stock, is to be not less than 80% of the mass required in Tab 1 for a stockless anchor. The mass of the stock is to be not less than 25% of the mass of the anchor without the stock but including the connecting shackle.

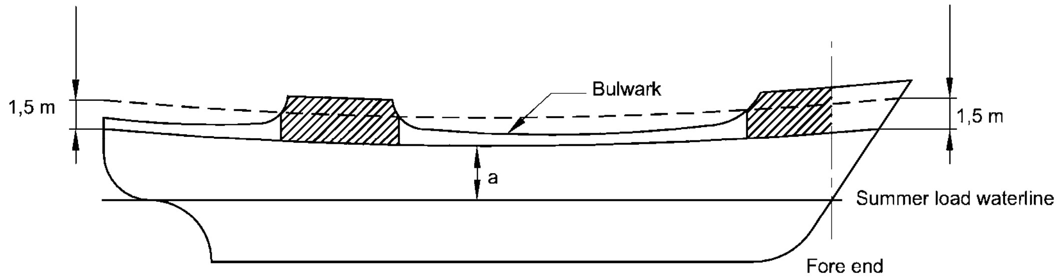

Figure 1: Effective area of bulwarks or fixed screen to be included in the equipment number

3.2.3 High and very high holding power anchors

High holding power (HHP) and very high holding power (VHHP) anchors, i.e. anchors for which a holding power higher than that of ordinary anchors has been proved according to the applicable requirements of the Society's Rules for Materials, do not require prior adjustment or special placement on the sea bottom.

Where HHP or VHHP anchors are used as bower anchors, the mass of each anchor is to be not less than 75% or 50%, respectively, of that required for ordinary stockless anchors in Tab 1.

The mass of VHHP anchors is to be, in general, less than or equal to 1500 kg.

3.2.4 Third anchor

Where three anchors are provided, two are to be connected to their own chain cables and positioned on board always ready for use.

The third anchor is intended as a spare and is not required for the purpose of classification.

3.2.5 Test for high holding power anchors approval

For approval and/or acceptance as a HHP anchor, comparative tests are to be performed on various types of sea bottom.

Such tests are to show that the holding power of the HHP anchor is at least twice the holding power of an ordinary stockless anchor of the same mass.

For approval and/or acceptance as a HHP anchor of a whole range of mass, such tests are to be carried out on anchors whose sizes are, as far as possible, representative of the full range of masses proposed. In this case, at least two anchors of different sizes are to be tested. The mass of the maximum size to be approved is to be not greater than 10 times the maximum size tested. The mass of the smallest is to be not less than 0.1 times the minimum size tested.

3.2.6 Test for very high holding power anchors approval

For approval and/or acceptance as a VHHP anchor, comparative tests are to be performed at least on three types of sea bottom: soft mud or silt, sand or gravel and hard clay or similar compounded material. Such tests are to show that the holding power of the VHHP anchor is to be at least four times the holding power of an ordinary stockless anchor of the same mass or at least twice the holding power of a previously approved HHP anchor of the same mass. The holding power test load is to be less than or equal to the proof load of the anchor, specified in the applicable requirements of the Society's Rules for Materials.

For approval and/or acceptance as a VHHP anchor of a whole range of mass, such tests are to be carried out on anchors whose sizes are, as far as possible, representative of the full range of masses proposed. In this case, at least three anchors of different sizes are to be tested, relevant to the bottom, middle and top of the mass range.

3.2.7 Specification for test on high holding power and very high holding power anchors

Tests are generally to be carried out from a tug. Shore based tests may be accepted by the Society on a case by case basis.

Alternatively, sea trials by comparison with a previous approved anchor of the same type (HHP or VHHP) of the one to be tested may be accepted by the Society on a case by case basis.

For each series of sizes, the two anchors selected for testing (ordinary stockless and HHP anchors for testing HHP anchors, ordinary stockless and VHHP anchors or, when ordinary stockless anchors are not available, HHP and VHHP anchors for testing VHHP anchors) are to have the same mass.

The length of chain cable connected to each anchor, having a diameter appropriate to its mass, is to be such that the pull on the shank remains practically horizontal. For this purpose a value of the ratio between the length of the chain cable paid out and the water depth equal to 10 is considered normal. A lower value of this ratio may be accepted by the Society on a case by case basis.

Three tests are to be carried out for each anchor and type of sea bottom.

The pull is to be measured by dynamometer; measurements based on the RPM/bollard pull curve of tug may, however, be accepted instead of dynamometer readings.

Note is to be taken where possible of the stability of the anchor and its ease of breaking out.

3.3 Chain cables for anchors

3.3.1 Material

The chain cables are classified as grade 1, 2 or 3 depending on the type of steel used and its manufacture.

The characteristics of the steel used and the method of manufacture of chain cables are to be approved by the Society for each manufacturer. The material from which chain cables are manufactured and the completed chain cables themselves are to be tested in accordance with the applicable requirements of the Society's Rules for Materials.

Chain cables made of grade 1 may not be used with high holding power and very high holding power anchors.

3.3.2 Scantlings of stud link chain cables

The mass and geometry of stud link chain cables, including the links, are to be in compliance with the requirements in the applicable requirements of the Society's Rules for Materials.

The diameter of stud link chain cables is to be not less than the value in Tab 1.

3.3.3 Studless link chain cables

For ships with *EN* less than 90, studless short link chain cables may be accepted by the Society as an alternative to stud link chain cables, provided that the equivalence in strength is based on proof load, defined in the applicable requirements of the Society's Rules for Materials and that the steel grade of the studless chain is equivalent to the steel grade of the stud chains it replaces, as defined in [3.3.1].

3.3.4 Chain cable arrangement

Chain cables are to be made by lengths of 27.5 m each, joined together by Dee or lugless shackles.

The total length of chain cable, required in Tab 1, is to be divided in approximately equal parts between the two anchors ready for use.

Where different arrangements are provided, they are considered by the Society on a case by case basis.

Where the ship may anchor in areas with current speed greater than 2.5 m/s, the Society may require a length of heavier chain cable to be fitted between the anchor and the rest of the chain in order to enhance anchor bedding.

3.3.5 Wire ropes

As an alternative to the stud link or short link chain cables mentioned, wire ropes may be used in the following cases:

- wire ropes for both the anchors, for ship length less than 30 m
- wire rope for one of the two anchors, for ship length between 30 m and 40 m.

The wire ropes above are to have a total length equal to 1.5 times the corresponding required length of stud link chain cables, obtained from Tab 1, and a minimum breaking load equal to that given for the corresponding stud link chain cable (see [3.3.2]).

A short length of chain cable is to be fitted between the wire rope and the anchor, having a length equal to 12.5m or the distance from the anchor in the stowed position to the winch, whichever is the lesser.

3.4 Attachment pieces

3.4.1 General

Where the lengths of chain cable are joined to each other by means of shackles of the ordinary Dee type, the anchor may be attached directly to the end link of the first length of chain cable by a Dee type end shackle.

A detachable open link in two parts riveted together may be used in lieu of the ordinary Dee type end shackle; in such case the open end link with increased diameter, defined in [3.4.2], is to be omitted.

Where the various lengths of chain cable are joined by means of lugless shackles and therefore no special end and increased diameter links are provided, the anchor may be attached to the first length of chain cable by a special pear-shaped lugless end shackle or by fitting an attachment piece.

3.4.2 Scantlings

The diameters of the attachment pieces, in mm, are to be not less than the values indicated in Tab 2.

Attachment pieces may incorporate the following items between the increased diameter stud link and the open end link:

- swivel, having a diameter equal to $1.2d$
- increased stud link, having a diameter equal to $1.1d$

Where different compositions are provided, they will be considered by the Society on a case by case basis.

Table 2: Diameters of attachment pieces

Attachment piece	Diameter, in mm
End shackle	1.4d
Open end link	1.2d
Increased stud link	1.1d
Common stud link	d
Lugless shackle	d
where: d : Diameter, in mm, of the common link.	

3.4.3 Material

Attachment pieces, joining shackles and end shackles are to be of such material and design as to provide strength equivalent to that of the attached chain cable, and are to be tested in accordance with the applicable requirements of the applicable requirements of the Society's Rules for Materials.

3.4.4 Spare attachment pieces

A spare pear-shaped lugless end shackle or a spare attachment piece is to be provided for use when the spare anchor is fitted in place.

3.5 Towlines and mooring lines

3.5.1 General

The towlines having the characteristics defined in Tab 3 are intended as those belonging to the ship to be towed by a tug or another ship.

3.5.2 Materials

Towlines and mooring lines may be of wire, natural or synthetic fibre or a mixture of wire and fibre.

The breaking loads defined in Tab 3 refer to steel wires or natural fibre ropes.

Steel wires and fibre ropes are to be tested in accordance with the applicable requirements in the applicable requirements of the Society's Rules for Materials.

3.5.3 Steel wires

Steel wires are to be made of flexible galvanised steel and are to be of types defined in Tab 4.

Where the wire is wound on the winch drum, steel wires to be used with mooring winches may be constructed with an independent metal core instead of a fibre core. In general such wires are to have not less than 186 threads in addition to the metallic core.

Table 3: Towlines and mooring lines

(1) The towline is not compulsory. It is recommended for ships having length not greater than 180 m.
(2) See [3.5.4].

Table 4: Steel wire composition

Breaking load *BL*, in kN	Steel wire components		
	Number of threads	Ultimate tensile strength of threads, in N/mm^2	Composition of wire
BL< 216	72	1420 ÷ 1570	6 strands with 7-fibre core
216 < *BL*< 490	144	1570 ÷ 1770	6 strands with 7-fibre core
BL > 490	216 or 222	1770 ÷ 1960	6 strands with 1-fibre core

3.5.4 Number of mooring lines

When the breaking load of each mooring line is greater than 490 kN, either a greater number of mooring lines than those required in Tab 3 having lower strength, or a lower number of mooring lines than those required in

Tab 3 having greater strength may be used, provided the total breaking load of all lines aboard the ship is greater than the value defined in Tab 3.

In any case, the number of lines is to be not less than 6 and the breaking load of each line is to be greater than 490 kN.

3.5.5 Length of mooring lines

The length of individual mooring lines may be reduced by up to 7% of the length defined in Tab 3, provided that the total length of mooring lines is greater than that obtained by adding the lengths of the individual lines defined in Tab 3.

3.5.6 Equivalence between the breaking loads of synthetic and natural fibre ropes

Generally, fibre ropes are to be made of polyamide or other equivalent synthetic fibres.

The equivalence between the breaking loads of synthetic fibre ropes B_{LS} and of natural fibre ropes B_{LN} is to be obtained, in kN, from the following formula:

$$B_{LS} = 7.4\,\delta\left(B_{LN}\right)^{8/9}$$

where:

δ : Elongation to breaking of the synthetic fibre rope, to be assumed not less than 30%.

3.6 Hawse pipes

3.6.1

Hawse pipes are to be built according to sound marine practice.

Their position and slope are to be so arranged as to create an easy lead for the chain cables and efficient housing for the anchors, where the latter are of the retractable type, avoiding damage to the hull during these operations.

For this purpose chafing lips of suitable form with ample lay-up and radius adequate to the size of the chain cable are to be provided at the shell and deck. The shell plating in way of the hawse pipes is to be reinforced as necessary.

3.6.2

In order to obtain an easy lead of the chain cables, the hawse pipes may be provided with rollers. These rollers are to have a nominal diameter not less than 10 times the size of the chain cable where they are provided with full imprints, and not less than 12 times its size where provided with partial imprints only.

3.6.3

All mooring units and accessories, such as timbler, riding and trip stoppers are to be securely fastened to the Surveyor's satisfaction.

3.7 Windlass

3.7.1 General

The windlass, which is generally single, is to be power driven and suitable for the size of chain cable and the mass of the anchors.

The windlass is to be fitted in a suitable position in order to ensure an easy lead of the chain cables to and through the hawse pipes. The deck in way of the windlass is to be suitably reinforced.

3.7.2 Assumptions for the calculation of the continuous duty pull

The calculation of the continuous duty pull P_C that the windlass unit prime mover is to be able to supply is based on the following assumptions:

- ordinary stockless anchors
- wind force equal to 6 on Beaufort Scale
- water current velocity 3 knots
- anchorage depth 100 m
- P_C includes the influences of buoyancy and hawse pipe efficiency; the latter is assumed equal to 70%
- the anchor masses assumed are those defined in the applicable requirements of the Society's Rules for Materials, excluding tolerances
- only one anchor is assumed to be raised at a time.

Owing to the buoyancy, the chain masses assumed are smaller than those defined in the applicable requirements of the Society's Rules for Materials, and are obtained, per unit length of the chain cable, in kg/m, from the following formula:

$m_L = 0.0218\ d^2$

where d is the chain cable diameter, in mm.

3.7.3 Calculation of the continuous duty pull

According to the assumptions in [3.7.2], the windlass unit prime mover is to be able to supply for a least 30 minutes a continuous duty pull P_C to be obtained, in kN, from Tab 5.

Table 5: Continuous duty pull

Material of chain cables	Continuous duty pull, in kN
Mild steel	$P_C = 0.0375\ d^2$
High tensile strength steel	$P_C = 0.0425\ d^2$
Very high tensile strength steel	$P_C = 0.0475\ d^2$
where: d : Chain cable diameter, in mm.	

3.7.4 Temporary overload capacity

The windlass unit prime mover is to provide the necessary temporary overload capacity for breaking out the anchor.

The temporary overload capacity, or short term pull, is to be not less than 1,5 times the continuous duty pull P_C and it is to be provided for at least two minutes.

The speed in this overload period may be lower than the nominal speed specified in [3.7.5].

3.7.5 Nominal hoisting speed

The nominal speed of the chain cable when hoisting the anchor and cable, to be assumed as an average speed, is to be not less than 0.15 m/s.

The speed is to be measured over two shots of chain cable during the entire trip; the trial is to commence with 3 shots (82.5 m) of chain fully submerged.

3.7.6 Windlass brake

A windlass brake is to be provided having sufficient capacity to stop the anchor and chain cable when paying out the latter with safety, in the event of failure of the power supply to the prime mover. Windlasses not actuated by steam are also to be provided with a non-return device.

A windlass with brakes applied and the cable lifter declutched is to be able to withstand a pull of 45% of the breaking load of the chain without any permanent deformation of the stressed parts or brake slip.

3.7.7 Chain stoppers

Where a chain stopper is fitted, it is to be able to withstand a pull of 80% of the breaking load of the chain.

Where a chain stopper is not fitted, the windlass is to be able to withstand a pull of 80% of the breaking load of the chain without any permanent deformation of the stressed part or brake slip.

3.7.8 Green sea loads

Where the height of the exposed deck in way of the item is less than $0.1L$ or 22 m above the summer load waterline, whichever is the lesser, the securing devices of windlasses located within the forward quarter length of the ship are to resist green sea forces.

The green sea pressure and associated areas are to be taken equal to (see Fig 2):

- 200 kN/m^2 normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction
- 150 kN/m^2 parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction,

where:

f : Coefficient taken equal to

$$f = 1 + \frac{B}{H} \text{, but not greater than 2.5}$$

B : Width of windlass measured parallel to the shaft axis,

H : Overall height of windlass.

Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.

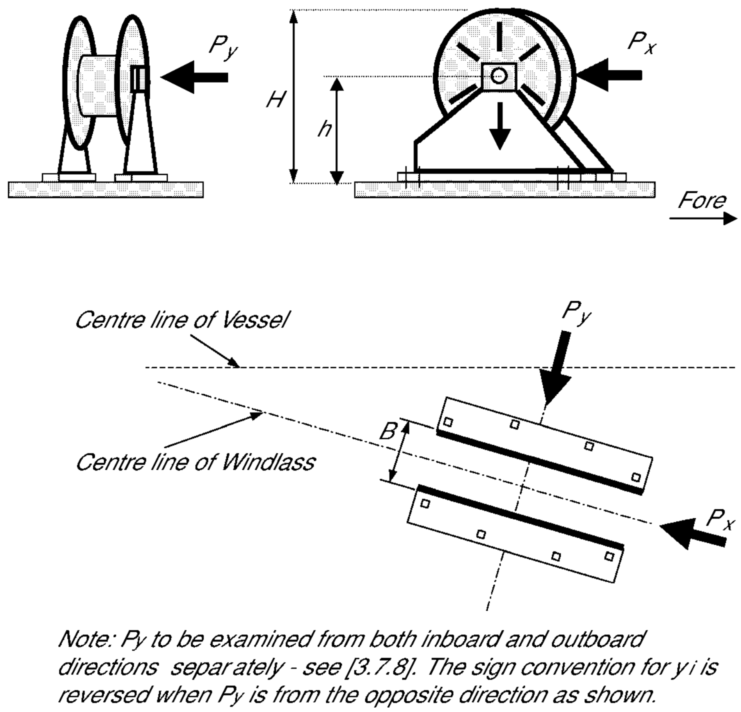

Figure 2: Direction of forces and weight

3.7.9 Forces in the securing devices of windlasses due to green sea loads

Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated by considering the green sea loads specified in [3.7.8].

The windlass is supported by *N* bolt groups, each containing one or more bolts (see also Fig 3).

The axial force R_i in bolt group (or bolt) *i*, positive in tension, is to be obtained, in kN, from the following formulae:

- $R_{xi} = P_x \, h x_i \, A_i / I_x$
- $R_{yi} = P_y \, h y_i \, A_i / I_y$
- $R_i = R_{xi} + R_{yi} - R_{si}$

where:

Px : Force, in kN, acting normal to the shaft axis

Py : Force, in kN, acting parallel to the shaft axis, either inboard or outboard, whichever gives the greater force in bolt group *i*

h : Shaft height, in cm, above the windlass mounting

x_i, y_i : *X* and *Y* co-ordinates, in cm, of bolt group *i* from the centroid of all *N* bolt groups, positive in the direction opposite to that of the applied force

A_i : Cross-sectional area, in cm^2, of all bolts in group *I*

I_x, I_y : Inertias, for *N* bolt groups, equal to:

$I_x = \Sigma A_i \, x_i^2$

$I_y = \Sigma A_i \, y_i^2$

R_{si} : Static reaction force, in kN, at bolt group *i*, due to weight of windlass.

Shear forces F_{xi} , F_{yi} applied to the bolt group i, and the resultant combined force F_i are to be obtained, in kN, from the following formulae:

- $F_{xi} = (P_x - \alpha\, g\, M) / N$
- $F_{yi} = (P_y - \alpha\, g\, M) / N$
- $F_i = (F_{xi}^2 + F_{yi}^2)^{0,5}$

where:

α : Coefficient of friction, to be taken equal to 0.5

M : Mass, in t, of windlass

N : Number of bolt groups.

Axial tensile and compressive forces and lateral forces calculated according to these requirements are also to be considered in the design of the supporting structure.

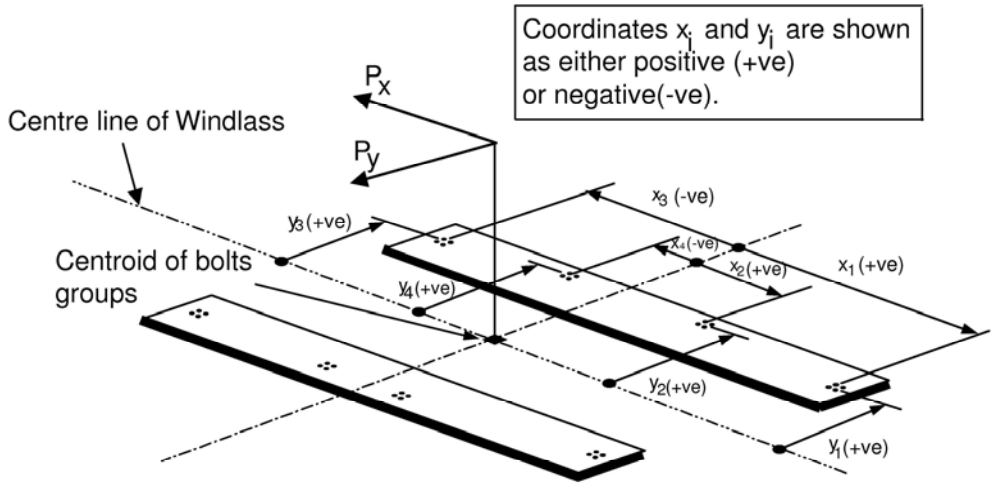

Figure 3: Sign convention

3.7.10 Strength criteria for windlass subject to anchor and chain loads

The stresses on the parts of the windlass, its frame and stopper are to be less than the yield stress of the material used.

For the calculation of the above stresses, special attention is to be paid to:

- stress concentrations in keyways and other stress raisers
- dynamic effects due to sudden starting or stopping of the prime mover or anchor chain
- calculation methods and approximation.

3.7.11 Strength criteria for securing devices of windlass

Tensile axial stresses in the individual bolts in each bolt group i are to be calculated according to the requirements specified in [3.7.9]. The horizontal forces F_{xi} and F_{yi}, to be calculated according to the requirements specified in [3.7.9], are normally to be reacted by shear chocks.

Where "fitted" bolts are designed to support these shear forces in one or both directions, the equivalent Von Mises stress σ, in N/mm^2, in the individual bolt is to comply with following formula:

$\sigma \leq 0.5\ \sigma_{BPL}$

where σ_{BPL} is the stress in the bolt considered as being loaded by the proof load.

Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.

3.7.12 Connection with deck

The windlass, its frame and the stoppers are to be efficiently bedded to the deck.

3.8 Chain stoppers

3.8.1

A chain stopper is generally to be fitted between the windlass and the hawse pipe in order to relieve the windlass of the pull of the chain cable when the ship is at anchor. A chain stopper is to be capable of withstanding a pull of 80% of the breaking load of the chain cable. The deck at the chain stopper is to be suitably reinforced.

For the same purpose, a piece of chain cable may be used with a rigging screw capable of supporting the weight of the anchor when housed in the hawse pipe or a chain tensioner. Such arrangements are not to be considered as chain stoppers.

3.8.2

Where the windlass is at a distance from the hawse pipes and no chain stoppers are fitted, suitable arrangements are to be provided to lead the chain cables to the windlass.

3.9 Chain locker

3.9.1

The capacity of the chain locker is to be adequate to stow all chain cable equipment and provide an easy direct lead to the windlass.

3.9.2

Where two chains are used, the chain lockers are to be divided into two compartments, each capable of housing the full length of one line.

3.9.3

The inboard ends of chain cables are to be secured to suitably reinforced attachments in the structure by means of end shackles, whether or not associated with attachment pieces.

Generally, such attachments are to be able to withstand a force not less than 15% of the breaking load of the chain cable.

In an emergency, the attachments are to be easily released from outside the chain locker.

3.9.4

Where the chain locker is arranged aft of the collision bulkhead, its boundary bulkheads are to be watertight and a drainage system is to be provided.

3.10 Fairleads and bollards

3.10.1

Fairleads and bollards of suitable size and design are to be fitted for towing, mooring and warping operations.

Chapter 11

Construction and Testing

Section 1 - CONSTRUCTION

1. Structural details

1.1 Cut-outs, plate edges

1.1.1

The free edges (cut surfaces) of cut-outs, hatch corners, etc. are to be properly prepared and are to be free from notches. As a general rule, cutting draglines, etc. are not to be welded out, but are to be smoothly ground. All edges are to be broken or in cases of highly stressed parts, be rounded off.

Free edges on flame or machine cut plates or flanges are not to be sharp cornered and are to be finished off as laid down in above. This also applies to cutting drag lines, etc., in particular to the upper edge of shear strake and analogously to weld joints, changes in sectional areas or similar discontinuities.

1.1.2

The hatch opening corners are to be machine cut.

1.2 Cold forming

1.2.1

For cold forming (bending, flanging, beading) of corrugated bulkhead the inside bending radius is to be not less than $2t$ (t = as-built thickness).

RCN 2 to July 2008 version (effective from 1 July 2010)

In order to prevent cracking, flame cutting flash or sheering burrs are to be removed before cold forming. After cold forming all structural components and, in particular, the ends of bends (plate edges) are to be examined for cracks. Except in cases where edge cracks are negligible, all cracked components are to be rejected. Repair welding is not permissible.

1.3 Assembly, alignment

1.3.1

The use of excessive force is to be avoided during the assembly of individual structural components or during the erection of sections. As far as possible, major distortions of individual structural components are to be corrected before further assembly.

Structural members are to be aligned following the IACS recommendation No.47 provisions given in Tab 1 or according to the requirements of a recognised fabrication standard that has been accepted by the Classification Society. In the case of critical components, control drillings are to be made where necessary, which are then to be welded up again on completion.

After completion of welding, straightening and aligning are to be carried out in such a manner that the material properties are not influenced significantly. In case of doubt, the Society may require a procedure test or a working test to be carried out.

Table 1: **Alignment** (t, t_1 and t_2: as-built thickness)

Detail	Standard	Limit	Remarks
Alignment of butt welds 		$a \le 0.15t$ strength member $a \le 0.2t$ other but maximum 4.0 mm	t is the lesser plate thickness
Alignment of fillet welds 		Strength member and higher stress member: $a \le t_1/3$ Other: $a \le t_1/2$	Alternatively, heel line can be used to check the alignment. Where t_3 is less than t_1, then t_3 should be substituted for t_1.
Alignment of fillet welds 		Strength member and higher stress member: $a \le t_1/3$ Other: $a \le t_1/2$	Alternatively, heel line can be used to check the alignment. Where t_3 is less than t_1, then t_3 should be substitute for t_1.
Note: "strength" means the following elements: strength deck, inner bottom, bottom, lower stool, lower part of transverse bulkhead, bilge hopper and side frames of single side bulk carriers.			

Detail	Standard	Limit	Remarks
Alignment of face plates of T longitudinal 	Strength member $a \leq 0.04b$	$a = 8.0$ mm	
Alignment of height of T-bar, L-angle bar or bulb 	Strength member $a \leq 0.15\ t$ Other $a \leq 0.2\ t$	$a = 3.0$ mm	
Alignment of panel stiffener 	$d \leq L\ /\ 50$		
Note: "strength" means the following elements: strength deck, inner bottom, bottom, lower stool, lower part of transverse bulkhead, bilge hopper and side frames of single side bulk carriers.			

RCN 2 to July 2008 version (effective from 1 July 2010)

Section 2 – WELDING

1. General

1.1 Application

1.1.1
The requirements of this Section apply to the preparation, execution and inspection of welded connections in hull structures.

1.1.2
Welding of hull parts is to be carried out by approved welders only.

1.1.3
Welding procedures and welding consumables approved for the types of connection and parent material in question are to be used.

1.1.4
Welding of connections is to be executed according to the approved plans.

1.1.5
The quality standard adopted by the shipyard is to be submitted to the Society and it applies to all welded connections unless otherwise specified on a case by case basis.

1.1.6
Completed weld joints are to be to the satisfaction of the attending Surveyor.

1.1.7
Non destructive examination (NDE) for weld is to be carried out at the position indicated by the test plan in order to ensure that the welds are free from cracks and internal harmful imperfections and defects.

1.2 Welding consumables and procedures

1.2.1
Welding consumables adopted are to be approved by the Society. The requirements for the approval of welding consumables are given in the Society's Rules or guide for welding.

1.2.2
The welding procedures adopted are to be approved by the Society. The requirements for the approval of welding procedures are given in the Society's Rules or guide for welding.

1.2.3
Suitable welding consumables are to be selected depending on the kind and grade of materials. The requirements of the selection of welding consumables are given in the Society's Rules or guide for welding.

1.3 Welders and NDE operators

1.3.1 Welders

Manual and semi-automatic welding is to be performed by welders certified by the Society as specified in the Society's Rules or guide for welding.

1.3.2 Automatic welding operators

Personnel manning automatic welding machines and equipment are to be competent and sufficiently trained and certified by the Society as specified in the Society's Rules or guide for welding.

1.3.3 NDE operator

NDE is to be carried out by qualified personnel certified by the Society or by recognized bodies in compliance with appropriate standards.

1.4 Documentation to be submitted

1.4.1

The welding application plan to be submitted for approval has to contain the necessary data relevant to the fabrication by welding of the structures, kinds of welding procedure applied, welding position, etc.

1.4.2

The NDE plan to be submitted for approval has to contain the necessary data relevant to the locations and number of examinations, welding procedure(s) applied, method of NDE applied, etc.

2. Types of welded connections

2.1 General

2.1.1

The type of welded connections and the edge preparation are to be appropriate to the welding procedure adopted.

2.2 Butt welding

2.2.1 General

Butt connections of plating are to be full penetration, welded on both sides except where special welding procedures approved by the Society is applied.

2.2.2 Welding of plates with different thicknesses

In the case of welding of plates with a difference in as-built thickness greater than 4 mm, the thicker plate is normally to be tapered. The taper has to have a length of not less than 3 times the difference in as-built thickness.

RCN 1 to July 2010 version (effective from 1July 2012)

2.2.3 Edge preparation, root gap

Edge preparations and root gaps are to be in accordance with the adopted welding procedure and relevant bevel preparation.

2.3 Tee or cross joints

2.3.1 General

The connections of primary supporting members and stiffener webs to plating as well as plating abutting on another plating, are to be made by fillet welding or deep penetration weld, as shown in Fig 1.

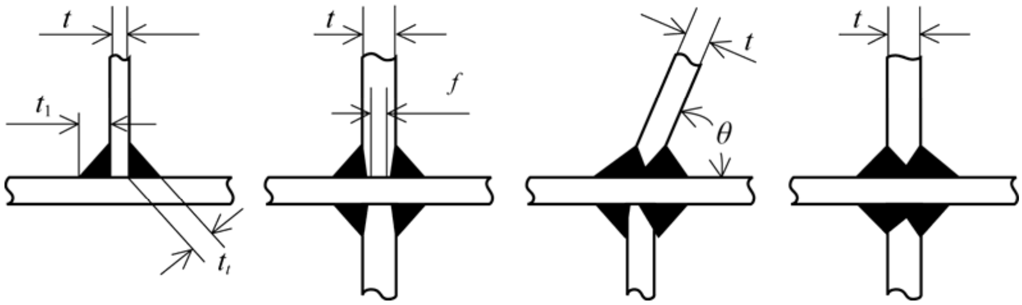

Figure 1: Tee or cross joints

t : As-built thickness of abutting plate, in mm

f : Unwelded root face, in mm, taken as $f \le t/3$

t_ℓ : Leg length of the fillet weld, in mm

t_t : Throat thickness, in mm.

2.4 Full penetration welds

2.4.1 Application

Full penetration welds are to be used in the following connections:

- rudder horns and shaft brackets to shell structure
- rudder side plating to rudder stock connection areas
- vertical corrugated bulkhead to inner bottom plating that are situated in the cargo area and arranged without transverse lower stool
- vertical corrugated bulkhead to top plating of transverse lower stool
- pillars to plating member, in case the stress acting on the pillar is tension (i.e. engine room, fore peak and deckhouses)
- edge reinforcement or pipe penetrations both to strength deck, sheer strake and bottom plating within 0.6L amidships, when the dimension of the opening exceeds 300 mm
- abutting plate panels with as-built thickness less than or equal to 12mm, forming boundaries to the sea below the summer load water line. For as-built thickness greater than 12mm, deep penetration weld with a maximum root face length f = T/3 is acceptable (see Fig.2).

RCN 1 to July 2010 version (effective from 1July 2012)

2.4.2

In case where shedder plates are fitted at the lower end of corrugated bulkhead, the shedder plates are to be welded to the corrugation and the top plate of the transverse lower stool by one side penetration welds or equivalent.

2.4.3

The transverse lower stool side plating is to be connected to the transverse lower stool top plating and the inner bottom plating by full penetration welds. Deep penetration welds may be accepted.

2.4.4

The supporting floors are to be connected to the inner bottom plating by full penetration welds. Deep penetration welds may be accepted.

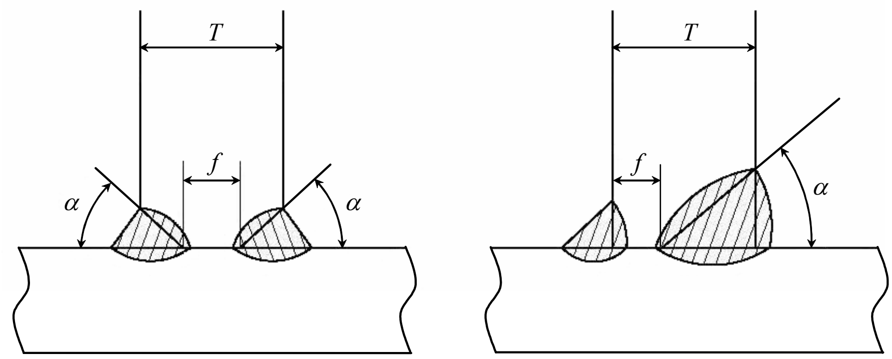
2.4.5

Generally, adequate groove angle between 40 and 60 degrees and root opening is to be taken and if necessary back gouging for both side welding is required.

2.5 Deep penetration weld

2.5.1

Deep penetration weld is defined as Fig 2.



- Root face (f) : 3 mm to T/3 mm
- Groove angle (α) : 40º to 60º

Figure 2: Deep penetration weld

2.6 Fillet welds

2.6.1 Kinds and size of fillet welds and their applications

Kinds and size of fillet welds for as-built thickness of abutting plating up to 50 mm are classed into 5 categories as given in Tab 1 and their application to hull construction is to be as required by Tab 2.

In addition, for zones "*a*" and "*b*" of side frames as shown in Ch 3, Sec 6, Fig 19, the weld throats are to be respectively 0.44t and 0.4t, where t is as-built thickness of the thinner of two connected members.

Table 1: Categories of fillet welds

Category	Kinds of fillet welds	As-built thickness of abutting plate, t, in mm [(1)]	Leg length of fillet weld, in mm [(2)]	Length of fillet welds, in mm	Pitch, in mm
F0	Double continuous weld	t	$0.7t$	-	-
F1	Double continuous weld	$t \le 10$	$0.5t + 1.0$	-	-
		$10 \le t < 20$	$0.4t + 2.0$	-	-
		$20 \le t$	$0.3t + 4.0$	-	-
F2	Double continuous weld	$t \le 10$	$0.4t + 1.0$	-	-
		$10 \le t < 20$	$0.3t + 2.0$	-	-
		$20 \le t$	$0.2t + 4.0$	-	-
F3	Double continuous weld	$t \le 10$	$0.3t + 1.0$	-	-
		$10 \le t < 20$	$0.2t + 2.0$		
		$20 \le t$	$0.1t + 4.0$		
F4	Intermittent weld	$t \le 10$	$0.5t + 1.0$	75	300
		$10 \le t < 20$	$0.4t + 2.0$		
		$20 \le t$	$0.3t + 4.0$		

(1) t is as-built thickness of the abutting plate, in mm. In case of cross joint as specified in Fig 1, t is the thinner thickness of the continuous member and the abutting plate, to be considered independently for each abutting plate.

(2) Leg length of fillet welds is made fine adjustments corresponding to the corrosion addition t_C specified in Ch 3, Sec 3, Tab 1 as follows:

+ 1.0 mm for $t_C > 5$

+ 0.5 mm for $5 \ge t_C > 4$

+ 0.0 mm for $4 \ge t_C > 3$

- 0.5 mm for $t_C \le 3$

(3) Leg length is rounded to the nearest half millimetre.

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 2: Application of fillet welds

Hull area	Connection: Of		Connection: To		Category
General, unless otherwise specified in the table(1)	Watertight plate		Boundary plating		F1
	Brackets at ends of members				F1
	Ordinary stiffener and collar plates		Deep tank bulkheads		F3
			Web of primary supporting members and collar plates		F2
	Web of ordinary stiffener		Plating (Except deep tank bulkhead)		F4
			Face plates of built-up stiffeners	At ends (15% of span)	F2
				Elsewhere	F4
	End of primary supporting members and ordinary stiffeners without brackets		Deck plate, shell plate, inner bottom plate, bulkhead plate		F0
	End of primary supporting members and ordinary stiffeners with brackets		Deck plate, shell plate, inner bottom plate, bulkhead plate		F1
Bottom and double bottom	Ordinary stiffener		Bottom and inner bottom plating		F3
	Center girder		Shell plates in strengthened bottom forward		F1
			Inner bottom plate and shell plate except the above		F2
	Side girder including intercostal plate		Bottom and inner bottom plating		F3
	Floor		Shell plates and inner bottom plates	At ends, on a length equal to two frame spaces	F2
			Center girder and side girders in way of hopper tanks		F2
			Elsewhere		F3
	Bracket on center girder		Center girder, inner bottom and shell plates		F2
	Web stiffener		Floor and girder		F3
Side and inner side in double side structure	Web of primary supporting members		Side plating, inner side plating and web of primary supporting members		F2
Side frame of single side structure	Side frame and end bracket		Side shell plate		See Ch.3 Sec 6 Fig.19
	Tripping bracket		Side shell plate and side frame		F1
Deck	Strength deck	$t \geq 13$	Side shell plating within 0.6L midship		Deep penetration
			Elsewhere		F1
		$t < 13$	Side shell plating		F1
	Other deck		Side shell plating		F2
			Ordinary stiffeners		F4
	Ordinary stiffener and intercostal girder		Deck plating		F3
	Hatch coamings		Deck plating	At corners of hatchways for 15% of the hatch length	F1
				Elsewhere	F2
	Web stiffeners		Coaming webs		F4

Hull area	**Connection**			**Category**
	Of	**To**		
Bulkheads	Non-watertight bulkhead structure	Boundaries	Swash bulkheads	F3
	Ordinary stiffener	Bulkhead plating	At ends (25% of span), where no end brackets are fitted	F1
Primary supporting members[(1)]	Web plate	Shell plating, deck plating, inner bottom plating, bulkhead	At end (15% of span)	F1
			Elsewhere	F2
		Face plate	In tanks, and located within $0.125L$ from fore peak	F2
			Face area exceeds 65 cm^2	F2
			Elsewhere	F3
After peak	Internal members	Boundaries and each other		F2
Seating	Girder and bracket	Bed plate	In way of main engine, thrust bearing, boiler bearers and main generator engines	F1
		Girder plate	In way of main engine and thrust bearing	F1
		Inner bottom plate and shell	In way of main engine and thrust bearing	F2
Super-structure and deck houses	External bulkhead	Deck		F1
	Ordinary stiffeners	Side wall and deck plate	At end (15% of span)	F3
			Elsewhere	F4[(2)]
	End section of ordinary stiffener and Primary supporting member	Without brackets	Side wall and web of primary supporting members	F1
		With bracket		F2
Pillar	Pillar	Heel and head		F1
Ventilator	Coaming	Deck		F1
Rudder	Rudder frame	Vertical frames forming main piece		F1
		Rudder plate		F3
		Rudder frames except above		F2

(1) For Hatch cover, weld sizes F1, F2 and F3 instead of F0, F1 and F2, respectively, are to be used.

(2) Where the one side continuous welding is applied, the weld size F3 is to be applied.

(3) The interior bulkheads are not included in this category. The welding of the interior bulkheads is to be subjected to the discretion of the Society.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.6.2 Intermittent welds

Where double continuous fillet welds in lieu of intermittent welds are applied, leg length of fillet welds is to be of category F3.

2.6.3 Size of fillet weld for abutting plating with small angle

Where the angle between an abutting plate and the connected plate is not 90 degrees as shown in Fig 3, the size of fillet welds for the side of larger angle is to be increased in accordance with the following formula:

$$t_\ell{}' = t_\ell \frac{1}{\sqrt{2}\sin\left(\frac{\varphi}{2}\right)}$$

where:

t_ℓ : Leg length of the fillet weld, in mm, as defined in [2.3.1]

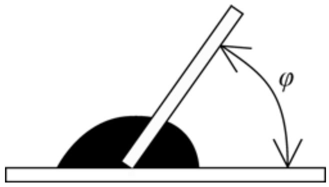


Figure 3: Connecting angle

2.6.4 Deep penetration welds

The leg length of fillet welds of deep penetration type may be reduced by 15% of that required in Tab 1, depending on the welding procedure test.

2.7 Lap joint welds

2.7.1 General

Lap joint welds may be adopted in very specific cases subject to the approval of the Society. Lap joint welds may be adopted for the followings:

- peripheral connections of doublers
- internal structural elements subject to very low stresses.

2.7.2 Fillet welds

Lap joints are to have the fillet size of category F1.

2.8 Slot welds

2.8.1 General

Slot welds may be adopted in very specific cases subject to the approval of the Society. However, slot welds of doublers on the outer shell and strength deck are not permitted within 0.6*L* amidships.

2.8.2 Size of fillet welds

The slot welds are to have adequate shape to permit a thoroughly fused bead to be applied all around the bottom edge of the opening. The size of fillet welds is to be category F1 and spacing of slots is to be as determined by the Society on a case by case basis.

3. Connection details

3.1 Bilge keel connection

3.1.1

The intermediate flat, through which the bilge keel is connected to the shell, according to Ch 3, Sec 6, [6.5.2], is to be welded to bilge plating and bilge keel.

3.1.2

The butt welds of the intermediate flat and bilge keel are to be full penetration and shifted from the shell butts.

The butt welds of the bilge plating and those of the intermediate flat are to be flush in way of crossing, respectively, with the intermediate flat and with the bilge keel.

3.1.3

Along the longitudinal edges, the intermediate flat is to be continuously fillet welded with a throat thickness "*a*" of 0.3 times its thickness. At the ends of intermediate flat, the throat thickness "*a*" at the end faces is to be increased to 0.5 times the intermediate flat thickness but is to be less than the bilge plating thickness (see Fig 4). The welded transition at the end faces of the doubling plates to the plating should form with the latter an angle of 45° or less.

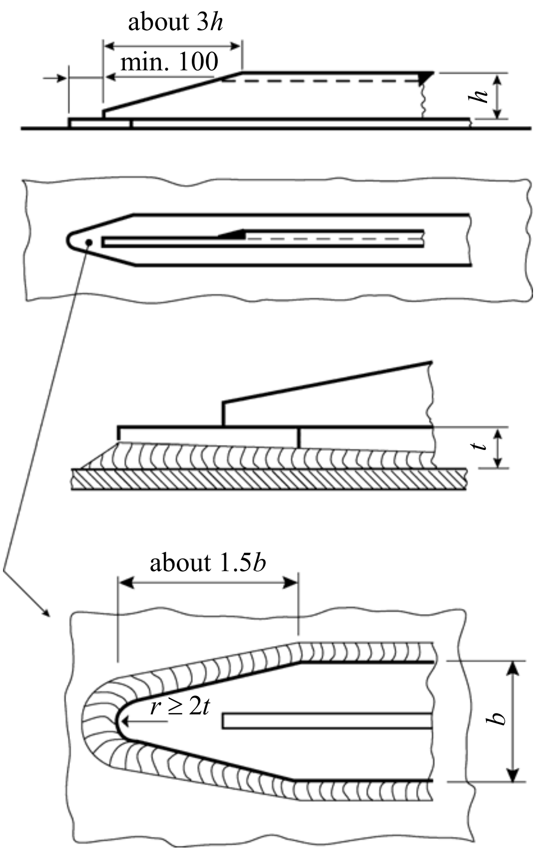

Figure 4: Bilge keel welding arrangement

Section 3 – TESTING OF COMPARTMENTS

1. General

1.1 Definitions

1.1.1 Shop primer
Shop primer is a thin coating applied after surface preparations and prior to fabrication as a protection against corrosion during fabrication.

1.1.2 Protective coating
Protective coating is a final coating protecting the structure from corrosion.

1.1.3 Structural testing
Structural testing is a hydrostatic test carried out to demonstrate the tightness of the tanks and the structural adequacy of the design. Where practical limitations prevail and hydrostatic testing is not feasible (for example when it is difficult, in practice, to apply the required head at the top of tank), hydropneumatic testing may be carried out instead. When hydropneumatic testing is performed, the conditions should simulate, as far as practicable, the actual loading of the tank.

1.1.4 Hydropneumatic testing
Hydropneumatic testing is a combination of hydrostatic and air testing, consisting in filling the tank with water up to its top and applying an additional air pressure. The value of additional air pressure is at the discretion of the Society, but is to be at least as defined in [2.2].

1.1.5 Leak testing
Leak testing is an air or other medium test carried out to demonstrate the tightness of the structure.

1.1.6 Hose testing
Hose testing is carried out to demonstrate the tightness of structural items not subjected to hydrostatic or leak testing and to other compartments which contribute to the watertight integrity of the hull.

1.2 Application

1.2.1
The following requirements determine the testing conditions for:

- tanks, including independent tanks,
- watertight or weathertight structures.

1.2.2
The purpose of these tests is to check the tightness and/or the strength of structural elements at time of ship construction and on the occasion of major repairs.

1.2.3
Tests are to be carried out in the presence of the Surveyor at a stage sufficiently close to completion so that any subsequent work not impair the strength and tightness of the structure.

2. Testing methods

2.1 Structural testing

2.1.1
Structural testing may be carried out after application of the shop primer.

2.1.2
Structural testing may be carried out after the protective coating has been applied, provided that one of the following two conditions is satisfied:

- all the welds are completed and carefully inspected visually to the satisfaction of the Surveyor prior to the application of the protective coating,
- leak testing is carried out prior to the application of the protective coating.

2.1.3
In absence of leak testing, protective coating should be applied after the structural testing of:

- all erection welds, both manual and automatic,
- all manual fillet weld connections on tank boundaries and manual penetration welds.

2.2 Leak testing

2.2.1
Where leak testing is carried out, in accordance with Tab 1, an air pressure of $0.15 \cdot 10^5$ Pa is to be applied during the test.

2.2.2
Prior to inspection, it is recommended that the air pressure in the tank is raised to $0.20 \cdot 10^5$ Pa and kept at this level for about 1 hour to reach a stabilized state, with a minimum number of personnel in the vicinity of the tank, and then lowered to the test pressure.

2.2.3
The Society may accept that the test is conducted after the pressure has reached a stabilized state at $0.20 \cdot 10^5$ Pa, without lowering pressure, provided they are satisfied of the safety of the personnel involved in the test.

2.2.4
Welds are to be coated with an efficient indicating liquid.

2.2.5
A U-tube filled with water up to a height corresponding to the test pressure is to be fitted to avoid overpressure of the compartment tested and verify the test pressure. The U-tube should have a cross section larger than that of the pipe supplying air.
In addition, test pressure is also to be verified by means of one master pressure gauge. The Society may accept alternative means which are considered to equivalently reliable.

2.2.6
Leak testing is to be carried out, prior to the application of protective coating, on all fillet weld connections on tank boundaries, penetrations and erection welds on tank boundaries excepting welds may be automatic processes. Selected locations of automatic erection welds and pre-erection manual or automatic welds may be required to be similarly tested at the discretion of the Surveyor taking account of the quality control procedures operating in the shipyard. For other welds, leak testing may be carried out, after the protective coating has been applied, provided that these welds were carefully inspected visually to the satisfaction of the Surveyor.

2.2.7
Any other recognized method may be accepted to the satisfaction of the Surveyor.

2.3 Hose testing

2.3.1
When hose testing is required to verify the tightness of the structures, as defined in Tab 1, the minimum pressure in the hose, at least equal to $2 \cdot 10^5$ Pa, is to be applied at a maximum distance of 1.5 m. The nozzle diameter is not to be less than 12 mm.
Corrigenda 1 to July 2012 version (effective from 1July 2012)

2.4 Hydropneumatic testing

2.4.1
When hydropneumatic testing is performed, the same safety precautions as for leak testing are to be adopted.

2.5 Other testing methods

2.5.1
Other testing methods may be accepted, at the discretion of the Society, based upon equivalency considerations.

3. Testing requirements

3.1 General

3.1.1
General testing requirements for testing are given in Tab 1.

Table 1: General testing requirements

Item number	Structural to be tested	Type of testing	Structural test pressure	Remarks
1	Double bottom tanks	Structural testing [(1)]	The greater of the following: • head of water up to the top of overflow • head of water up to the bulkhead deck	Tank boundaries tested from at least one side
2	Double side tanks	Structural testing [(1)]	The greater of the following: • head of water up to the top of overflow • 2.4 m head of water above highest point of tank	Tank boundaries tested from at least one side
3	Tank bulkheads, deep tanks	Structural testing [(1)]	The greater of the following: [(2)] • head of water up to the top of overflow • 2.4 m head of water above highest point of tank • setting pressure of the safety relief valves, where relevant	Tank boundaries tested from at least one side
	Fuel oil tanks	Structural testing		
4	Ballast holds	Structural testing [(1)]	The greater of: • top of overflow, or • top of hatch coaming	
5	Fore peak and after peak used as tank	Structural testing	The greater of the following: • head of water up to the top of overflow • 2.4 m head of water above highest point of tank	Tank of the after peak carried out after the stern tube has been fitted
	Fore peak not used as tank	Refer to SOLAS Ch II.1 Reg.14		
	Aft peak not used as tank	Leak testing		
6	Cofferdams	Structural testing [(3)]	The greater of the following: • head of water up to the top of overflow • 2.4 m head of water above highest point of tank	

Item number	Structural to be tested	Type of testing	Structural test pressure	Remarks
7	Watertight bulkheads	Refer to SOLAS Ch II.1 Reg.14 [(4)]		
8	Watertight doors below freeboard or bulkhead deck	Refer to SOLAS Ch II.1 Reg.18		
9	Double plate rudder	Leak testing		
10	Shaft tunnel clear of deep tanks	Hose testing		
11	Shell doors	Hose testing		
12	Watertight hatchcovers of tanks	Hose testing		
13	Watertight hatchcovers and closing appliances	Hose testing		
14	Chain locker, located aft of collision bulkhead	Structural testing	Head of water up to the top	
15	Independent tanks	Structural testing	Head of water up to the top of overflow, but not less than 0.9 m	
16	Ballast ducts	Structural testing	Ballast pump maximum pressure	

[(1)] Leak or hydropneumatic testing may be accepted under the conditions specified in [2.2], provided that at least one tank for each type is structurally tested, to be selected in connection with the approval of the design. In general, structural testing need not be repeated for subsequent vessels of series of identical newbuildings. This relaxation does not apply to cargo space boundaries in tankers and combination carriers and tanks for segregated cargoes or pollutants. If the structural test reveals weakness or severe faults not detected by the leak test, all tanks are to be structurally tested.

[(2)] Where applicable, the highest point of tank is to be measured to the deck and excluding hatches. In holds for liquid cargo or ballast with large hatch covers, the highest point of tanks is to be taken at the top of hatch.

[(3)] Leak or hydropneumatic testing may be accepted under the conditions specified in [2.2] when, at the Society discretion, the latter is considered significant also in relation to the construction techniques and the welding procedures adopted.

[(4)] When hose test cannot be performed without damaging possible outfitting (machinery, cables, switchboards, insulation, etc.) already installed, it may be replaced, at the Society discretion, by a careful visual inspection of all the crossings and weld joints; where necessary, dye penetrant test or ultrasonic test may be required.

RCN 1 to July 2010 version (effective from 1July 2012)

Chapter 12

Additional Class Notations

Section 1 GRAB Additional Class Notation

Section 1 – GRAB ADDITIONAL CLASS NOTATION

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

M_{GR} : Mass of unladen grab, in tons

s : Spacing, in m, of ordinary stiffeners, measured at mid-span

1. Basic concepts

1.1 Application

1.1.1

The additional class notation GRAB [X] is assigned, in accordance with Ch 1, Sec 1, [3.2], to ships with holds designed for loading/unloading by grabs having a maximum specific weight up to [X] tons, in compliance with the requirements of this Section.

1.1.2

It is to be noted that this additional class notation does not negate the use of heavier grabs, but the owner and operators are to be made aware of the increased risk of local damage and possible early renewal of inner bottom plating if heavier grabs are used regularly or occasionally to discharge cargo.

2. Scantlings

2.1 Plating

2.1.1

The net thickness of plating of inner bottom, hopper tank sloping plate, transverse lower stool, transverse bulkhead plating and inner hull up to a height of 3.0m above the lowest point of the inner bottom, excluding bilge wells, is to be taken as the greater of the following values:

- t , as obtained according to requirements in Ch 6 and Ch 7
- t_{GR} , as defined in [2.1.2] and [2.1.3].

RCN 1 to July 2008 version (effective from 1 July 2009)

2.1.2

The net thickness t_{GR}, in mm, of the inner bottom plating is to be obtained from the following formula:

$$t_{GR} = 0.28(M_{GR} + 50)\sqrt{sk}$$

2.1.3

The net thickness t_{GR}, in mm, of hopper tank sloping plate, transverse lower stool, transverse bulkhead plating and inner hull up to a height of 3.0m above the lowest point of the inner bottom, excluding bilge wells, is to be obtained from the following formula:

$$t_{GR} = 0.28(M_{GR} + 42)\sqrt{sk}$$ *RCN 1 to July 2008 version (effective from 1 July 2009)*

Chapter 13

Ships in Operation, Renewal Criteria

Section 1 - MAINTENANCE OF CLASS

1. General

1.1 Application

1.1.1

The survey requirements for the maintenance of class of bulk carriers are given in UR Z10.2 for single side skin bulk carriers and UR Z10.5 for double side skin bulk carriers.

Thickness measurements are a major part of surveys to be carried out for the maintenance of class, and the analysis of these measurements is a prominent factor in the determination and extent of the repairs and renewals of the ship's structure.

1.1.2

(Void)

Corrigenda 1 to July 2012 version (effective from 1July 2012)

1.1.3

(Void)

Corrigenda 1 to July 2012 version (effective from 1July 2012)

1.2 Definitions

1.2.1 Local corrosion

Local corrosion is pitting corrosion, grooving, edge corrosion, necking effect or other corrosions of very local aspect.

1.2.2 Substantial corrosion

Substantial corrosion is an extent of corrosion such that assessment of the corrosion pattern indicates gauged (or measured) thickness between $t_{renewal}$ and $t_{renewal} + t_{reserve}$.

(RCN 2, effective from 1 July 2008)

1.2.3 Deck zone

The deck zone includes all the following items contributing to the hull girder strength above the horizontal strake of the topside tank or above the level corresponding to 0.9D above the base line if there is no topside tank:

- strength deck plating
- deck stringer
- sheer strake
- side shell plating
- top side tank sloped plating, including horizontal and vertical strakes
- longitudinal stiffeners connected to the above mentioned platings.

Corrigenda 1 to July 2012 version (effective from 1July 2012)

1.2.4 Bottom zone

The bottom zone includes the following items contributing to the hull girder strength up to the upper level of the hopper sloping plating or up to the inner bottom plating if there is no hopper tank:

- keel plate
- bottom plating
- bilge plate
- bottom girders
- inner bottom plating
- hopper tank sloping plating
- side shell plating
- longitudinal stiffeners connected to the above mentioned platings.

Corrigenda 1 to July 2012 version (effective from 1July 2012)

1.2.5 Neutral axis zone

The neutral axis zone includes the plating only of the items between the deck zone and the bottom zone, as for example:

- side shell plating
- inner hull plating, if any.

Corrigenda 1 to July 2012 version (effective from 1July 2012)

Section 2 - Acceptance criteria

Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 4.

$t_{renewal}$: Renewal thickness; Minimum allowable thickness, in mm, below which renewal of structural members is to be carried out

$t_{renewal} = t_{as\_built} - t_C - t_{voluntary\_addition}$

$t_{reserve}$: Reserve thickness; Thickness, in mm, to account for anticipated thickness diminution that may occur during a survey interval of 2.5 year. ($t_{reserve}$ = 0.5 mm)

t_C : Corrosion addition, in mm, defined in Ch 3, Sec3

t_{as_built} : As built thickness, in mm, including $t_{voluntary\_addition}$, if any

$t_{voluntary\_addition}$: Voluntary thickness addition; Thickness, in mm, voluntarily added as the Owner's extra margin for corrosion wastage in addition to t_C

t_{gauged} : Gauged thickness, in mm, on one item, i.e average thickness on one item using the various measurements taken on this same item during periodical ship's in service surveys.

1. Local strength criteria

1.1 Application

1.1.1

The items to be considered for the local strength criteria are those defined in UR Z10.2 for single side skin bulk carriers and UR Z10.5 for double side skin bulk carriers.

1.2 Renewal thickness for corrosion other than local corrosion

1.2.1

For each item, steel renewal is required when the gauged thickness t_{gauged} is less than the renewal thickness, as specified in the following formula:

$t_{gauged} < t_{renewal,}$

Where the gauged thickness t_{gauged} is such as:

$t_{renewal} < t_{gauged} < t_{renewal} + t_{reserve}$

coating applied in accordance with the coating manufacturer's requirements or annual gauging may be adopted as an alternative to the steel renewal. The coating is to be maintained in good condition.

1.3 Renewal thickness for local corrosion

1.3.1

If pitting intensity in an area where coating is required, according to Ch 3, Sec 5, is higher than 15% (see Fig 1), thickness measurements are to be performed to check the extent of pitting corrosion. The 15% is based on pitting or grooving on only one side of a plate.

In cases where pitting is exceeding 15%, as defined above, an area of 300 mm or more, at the most pitted part of the plate, is to be cleaned to bare metal and the thickness is to be measured in way of the five deepest pits within the cleaned area. The least thickness measured in way of any of these pits is to be taken as the thickness to be recorded.

The minimum remaining thickness in pits, grooves or other local areas as defined in Ch 13, Sec1, [1.2.1] is to be greater than:

- 75% of the as-built thickness, in the frame and end brackets webs and flanges
- 70% of the as-built thickness, in the side shell, hopper tank and topside tank plating attached to the each side frame, over a width up to 30 mm from each side of it,

without being greater than $t_{renewal}$.

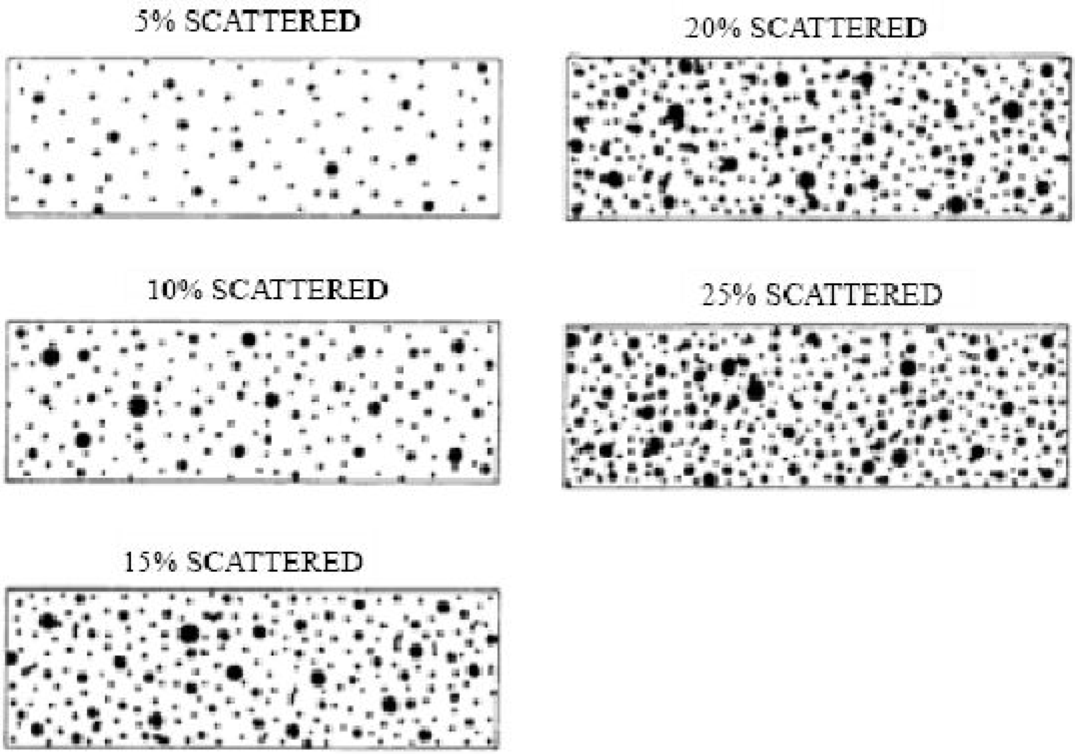

Figure 1: Pitting intensity diagrams (from 5% to 25% intensity)

1.4 Global strength criteria

1.4.1 Items for the global strength criteria

The items to be considered for the global strength criteria are those of the deck zone, the bottom zone and the neutral axis zone, as defined in Ch 13, Sec 1, [1.2].

1.4.2 Renewal thickness

The global strength criteria is defined by the assessment of the bottom zone, deck zone and neutral axis zone, as detailed below.

a) bottom zone and deck zone:

The current hull girder section modulus determined with the thickness measurements is not to be less than 90% of the section modulus calculated according to Ch 5, Sec 1 with the gross offered thicknesses.

Alternatively, the current sectional areas of the bottom zone and of the deck zone which are the sum of the gauged items area of the considered zones, are not to be less than 90% of the sectional area of the corresponding zones determined with the gross offered thicknesses.

b) neutral axis zone:

The current sectional area of the neutral axis zone, which is the sum of the gauged platings area of this zone, is not to be less than 85% of the gross offered sectional area of the neutral axis zone.

If the actual wastage of all items, of a given transverse section, which contribute to the hull girder strength is less than 10% for the deck and bottom zones and 15% for the neutral axis zone, the global strength criteria of this transverse section is automatically satisfied and its checking is no more required.

Common Structural Rules for Double Hull Oil Tankers

Sections 1 to 7

July 2013

Lloyd's Register

COMMON STRUCTURAL RULES FOR DOUBLE HULL OIL TANKERS

Foreword

1. This version of the Rules is effective as of 1st July 2012.

2. This version incorporates changes made to the 1 July 2010 consolidated edition.

3. The Rules contain two parts, one part that is for information and does not constitute specific requirements and one part giving structural rules for double hull oil tankers of 150m or greater.

Subjects for information are given in *Section 1 – Introduction* and *Section 2 – Rule Principles*.

Specific rule requirements are given in *Sections 3* to *12* and the Appendices.

4. The following table provides a revision history of the Rules.

	Amendment Type / No.	**Approval Date**	**Effective Date ***	**Reference Rule Edition**
1	Corrigenda 1	7 Apr 2006	1 Apr 2006	1 Jan 2006 edition
2	Corrigenda 2	27 July 2006	1 Apr 2006	1 Jan 2006 edition
3	Rule Change Notice 1	29 Sept 2006	1 Apr 2007	1 Jan 2006 edition
4	Corrigenda 3	19 Nov 2007	1 Apr 2006	1 Jan 2006 edition
5	Rule Change Notice 2	25 Feb 2008	1 July 2008	1 Jan 2006 edition
6	Corrigenda 1 (1 July 2008 consolidated edition)	2 July 2008	1 July 2008	1 July 2008 consolidated edition
7	Rule Change Notice 1 (1 July 2008 consolidated edition)	11 Nov 2009 (Amended version) 1)	1 Feb 2010	1 July 2008 consolidated edition
8	Rule Change Notice 1 (1 July 2008 consolidated edition)	12 Apr 2010	1 July 2010	1 July 2008 consolidated edition

	Amendment Type / No.	Approval Date	Effective Date *	Reference Rule Edition
9	Rule Change Notice 1 (1 July 2010 consolidated edition)	30 Dec 2011	1 July 2012	1 July 2010 consolidated edition

* For effective date, refer to the implementation statements of relevant Corrigenda / Rule Changes.

1) RCN 1 to July 2008 edition was originally approved on 28 January 2009, however following input from industry, IACS Council decided to postpone the original implementation date of 1 July 2009 until such time as a technical study was completed.
In November 2009, following further technical review, IACS Council agreed an amended version of RCN 1 to enter into force on 1 February 2010.

Note: When the word '(void)' appears in the text, it means that the concerned part has been deleted. This is to keep the numbering of the remainder unchanged.

APPENDIX B STRUCTURAL STRENGTH ASSESSMENT

APPENDIX C FATIGUE STRENGTH ASSESSMENT

APPENDIX D BUCKLING STRENGTH ASSESSMENT

SECTION 1

INTRODUCTION

1 INTRODUCTION TO COMMON STRUCTURAL RULES FOR OIL TANKERS

1.1 General

1.1.1 Applicability

1.1.1.1 These Rules apply to double hull oil tankers of 150m length, *L*, and upward classed with the Society and contracted for construction(1) on or after 1 April 2006. The definition of the rule length, *L*, is given in *Section 4/1.1.1.1*.

1.1.1.2 Generally, for double hull tankers of less than 150m in length, *L*, the Rules of the individual Classification Society are to be applied.

1.1.1.3 Ships contracted for construction before the effective date of these Rules are to comply with the Rules of the individual Classification Society.

Note

The "contracted for construction" date means the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. For further details regarding the date of "contracted for construction", see *IACS Procedural Requirement (PR) No. 29*.

1.2 Application of Individual Classification Rules

1.2.1 Regions of the ship which these Rules do not cover

1.2.1.1 For regions of the structure which these Rules do not cover, the relevant requirements of the individual Classification Society's Rules are to be applied.

1.3 Guidance on Rule Structure

1.3.1 Framework

1.3.1.1 The Rules are structured in Sections giving instructions for detailed application and requirements which are applied in order to satisfy the Rule objectives. The acceptable procedures for the structural analysis required by the Rules are given in the Appendices.

1.3.2 Numbering and cross-references

1.3.2.1 The system for numbering of Sections and Sub-Sections is given in *Table 1.1.1*.

Table 1.1.1
Section Numbering

Order	Levels	Example
1	Section name (displayed in the header)	SECTION 1 - INTRODUCTION
2	Sub-Section	1 INTRODUCTION TO THE COMMON STRUCTURAL…
3	Sub-Section 2	1.1 General
4	Sub-Section 3	1.1.1 Development of the rules
5	Paragraph number	1.1.1.1 An important part of the classification process is the development of rule…

1.3.2.2 The system for the numbering of Tables and Figures is given in *Table 1.1.2*.

SECTION 2

RULE PRINCIPLES

1 INTRODUCTION

1.1 Rule Principles

1.1.1 Rule objectives

1.1.1.1 The objectives of the Rules are to establish requirements to reduce the risks of structural failure in order to help improve the safety of life, environment and property and to provide adequate durability of the hull structure for the design life.

1.1.2 General

1.1.2.1 The sub-sections contain:

(a) the General Assumptions; pertaining to the design, construction and operation of the ship and gives information on the responsibilities of Classification Societies, builders and owners

(b) the Design Basis; which specifies the premises that the design principles of the Rules are based on, in terms of design parameters and assumptions about the ship operation

(c) the Design Principles; which define the fundamental principles used for the structural requirements in the Rules with respect to loads, structural capacity and assessment criteria

(d) the Application of the Design Principles; which describes how the design principles and methods are applied and what criteria are used to demonstrate that the structure meets the objective.

2 GENERAL ASSUMPTIONS

2.1 General

2.1.1 International and national regulations

2.1.1.1 Ships are to be designed, constructed and operated in compliance with the regulatory framework prescribed internationally by the International Maritime Organisation and implemented by National Administrations.

2.1.1.2 The Rules are based on the assumptions that all applicable statutory requirements are complied with.

2.1.1.3 The Rules incorporate the IACS unified requirements as shown in *Table 2.2.1*.

2.1.2 Classification Societies

2.1.2.1 Classification Societies develop and publish the standards for the hull structure and essential engineering systems. Classification Societies verify compliance with the classification requirements and the applicable international regulations when authorised by a National Administration during design, construction and operation of a ship.

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 2.2.1

S14	*Testing procedures of Watertight Compartments*
S26	*Strength and securing of Small Hatches on the Exposed Fore Deck*
S27	*Strength Requirements for Fore Deck Fittings and Arrangements*

2.1.3 Responsibilities of Classification Societies, builders and owners

2.1.3.1 These Rules address the hull structural aspects of classification and do not include requirements related to the verification of compliance with the Rules during construction and operation. The verification of compliance with these Rules is the

responsibility of all parties and requires that proper care and conduct is shown by all parties involved in its implementation. These responsibilities include:

(a) general aspects:

- relevant information and documentation involved in the design, construction and operation is to be communicated between all parties in a clear and efficient manner. The builder is responsible for providing design documentation according to requirements specified in the Rules. Other requirements for information and documentation are specified by the requirements and approval procedures of the individual Classification Societies
- quality systems are applied to the design, construction, operation and maintenance activities to assist compliance with the requirements of the Rules.

(b) design aspects:

- it is the responsibility of the owner to specify the intended use of the ship, and the responsibility of the builder to ensure that the operational capability of the design fulfils the owner's requirements as well as the structural requirements given in the Rules
- the builder shall identify and document the operational limits for the ship so that the ship can be safely and efficiently operated within these limits
- verification of the design is performed by the builder to check compliance with provisions contained in the Rules in addition to national and international regulations
- the design is performed by appropriately qualified, competent and experienced personnel
- the classification society is responsible for a technical appraisal of the design plans and related documents for a ship to verify compliance with the appropriate classification rules.

  RCN 2 to July 2008 version (effective from 1 July 2010)

(c) construction aspects:

- the builder is responsible for ensuring that adequate supervision and quality control is provided during the construction
- construction is to be carried out by qualified and experienced personnel
- workmanship, including alignment and tolerances, is to be in accordance with acceptable shipbuilding standards
- the Classification Society is responsible for surveying to verify that the construction and quality control are in accordance with the plans and procedures.

(d) operational aspects:

- the owner is to ensure that the operations personnel are aware of, and comply with, the operational limitations of the ship
- the owner is to provide operations personnel with sufficient training such that the ship is properly handled to ensure that the loads and resulting stresses imposed on the structure are minimised
- the owner is to ensure that the ship is maintained in good condition and in accordance with the Classification Society survey scheme and also in accordance with the international and national regulations and requirements

- the Classification Society is responsible for surveying to verify that the vessel maintains its condition of class in accordance with the Classification Society survey scheme.

3 DESIGN BASIS

3.1 General

3.1.1 The design basis

3.1.1.1 This Sub-Section specifies the design parameters and the assumptions about the ship operation that are used as the basis of the design principles of the Rules.

3.1.1.2 The Rules are applicable for ships in compliance with the specified design basis. Special consideration will be given to deviations from this design basis.

3.1.1.3 The design basis used for the design of each ship is to be documented and submitted to the Classification Society as part of the design review and approval. All deviations from the design basis are to be formally advised to the Classification Society.

3.1.2 Arrangement and layout

3.1.2.1 The Rules cover typical double hull tankers of greater than or equal to 150m in length and with arrangements as follows:

(a) engine room and deck house located aft of the cargo tank region, and
(b) in addition to the inner skin two longitudinal oil-tight bulkheads with no centreline longitudinal bulkhead, or
(c) in addition to the inner skin one centreline longitudinal oil-tight bulkhead.

3.1.2.2 The ship's structure is assumed to be:

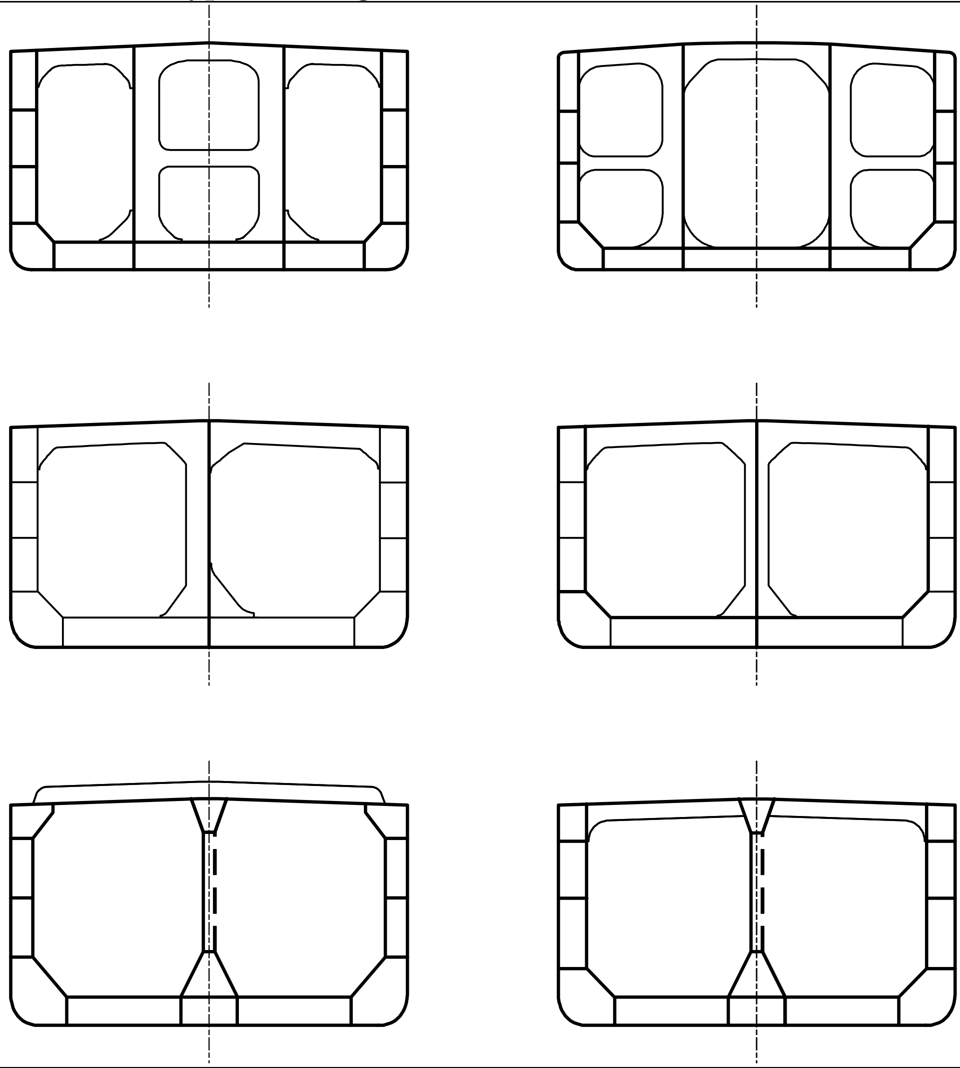
(a) constructed of welded steel structures
(b) composed of stiffened plate panels
(c) longitudinally framed with full transverse bulkheads and intermediate web frames.

3.1.2.3 The typical arrangements covered by the Rules are shown in *Figure 2.3.1* and assume that the structural arrangements include:

(a) narrow double side structure and double bottom structure with breadth/depth in accordance with statutory requirements
(b) single deck ships
(c) side longitudinal, centreline longitudinal or transverse bulkheads of plane, corrugated or double skin construction
(d) the number and location of bulkheads are arranged to comply with the statutory requirements.

The cross sections shown in *Figure 2.3.1* are typical examples only and other variations of cross tie and web frame arrangements are also covered

Figure 2.3.1
Typical Arrangements of Double Hull Tankers



3.1.2.4 The Rules assume the following hull form with respect to environmental loading:

(a) full form ship with block coefficient (C_b) greater than 0.7

(b) the ship length breadth ratio (L/B) greater than 5

(c) ship breadth depth ratio (B/D) less than 2.5

(d) the metacentric height (GM) not greater than 0.12B for homogeneously full load conditions, and 0.33B for ballast conditions.

3.1.3 Design life

3.1.3.1 A nominal design life of 25 years is assumed for selecting appropriate ship design parameters. The specified design life is the nominal period that the ship is assumed to be exposed to operating conditions. However, the ship's actual service life may be longer or shorter depending on the actual operating conditions and maintenance of the ship throughout its life cycle.

3.1.4 Design speed

3.1.4.1 The design maximum service speed is to be specified by the designer. The Rules assume that the ship is able to operate at this service speed on a continuous basis, but this does not relieve the responsibilities of the owner and personnel to properly

handle the ship and reduce speed or change heading in severe weather, see *2.1.3.1(d)*.

3.1.5 Operating conditions

3.1.5.1 The ship is to be capable of carrying the intended cargo with the necessary flexibility in operation to fulfil its design role. Specification of cargo loading conditions as required by the Rules and any additional cargo loading conditions required by the owner are the responsibility of the designer.

3.1.5.2 The Rules assume the following:

(a) a minimum set of specified loading conditions as defined in the Rules are examined. These are to include both seagoing and harbour loading conditions

(b) in addition to the minimum set of specified loading conditions, all relevant additional loading conditions covering the intended ship's service which result in increased still water shear force, bending moments or increased local static loadings are to be submitted for review

(c) the Trim and Stability Booklet, Loading Manual and loading computer systems specify the operational limitations to the ship and these comply with the appropriate statutory and classification requirements

(d) all cargo tanks are from a local strength point of view including sloshing designed for unrestricted filling for a cargo density as specified in *3.1.8*. Limitations to loading patterns resulting in full or empty adjacent tanks as specified in the Rules and the Loading Manual do however apply for primary support members and hull girder shear force and bending moments.

3.1.6 Operating draughts

3.1.6.1 The design operating draughts are to be specified by the designer and are to be used to derive the appropriate structural scantlings. All operational loading conditions in the Loading Manual are to comply with the specified design operating draughts. The following design operating draughts are as a minimum to be considered:

(a) the maximum and minimum mean operational draughts

(b) maximum scantling draught for the assessment of structure

(c) minimum draughts forward for the assessment of bottom slamming, with and without ballast tanks in way filled

(d) maximum mean draught for a condition with all cargo tanks abreast empty

(e) maximum mean draught for a condition with empty centre or wing cargo tank.

3.1.7 External environment

3.1.7.1 To cover worldwide trading operations and also to deal with the uncertainty in the future trading pattern of the ship and the corresponding wave conditions that will be encountered, a severe wave environment is used for the design assessment. The rule requirements are based on a ship trading in the North Atlantic wave environment for its entire design life.

3.1.7.2 The effects of wind and current on the structure are considered to be negligible and hence are not explicitly included.

3.1.7.3 The Rules do not include the effects of ice.

3.1.7.4 The Rules assume that the structural assessment of hull strength members is valid for the following design temperatures:

(a) lowest daily mean temperature in air is -10 ˚C

(b) lowest daily mean temperature in sea water is 0 ˚C

Ships operating for long periods in areas with lower daily mean air temperature may be subject to additional requirements as specified by the individual Classification Society.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.8 Internal environment (cargo and water ballast tanks)

3.1.8.1 A specific gravity (SG) of 1.025, or a higher value if specified by the designer, is to be used for oil cargoes for the strength assessment of cargo tank structures.

3.1.8.2 For the fatigue assessment of cargo tank structures, a representative mean cargo density throughout the ship's life is to be used. The representative mean density is to be taken as 0.9 tonnes/m^3 or the cargo density from the homogeneous full load condition at the full load design draught T_{full}, if this is higher.

(RCN 2, effective from 1 July 2008)

3.1.8.3 A SG of 1.025 is to be used for water ballast.

3.1.8.4 The Rules are based on the following design temperatures for the cargo:

(a) maximum cargo temperature is 80 ˚C

(b) minimum cargo temperature is 0 ˚C.

3.1.8.5 The design aspects and assumption upon which corrosion additions in the Rules are specified are as follows:

(a) the corrosion additions are based on a combination of experience and a statistical evaluation of historical corrosion measurements. The corrosion additions are based on the carriage of a mixture of crude and other oil products with various degrees of corrosive properties

(b) the corrosion additions are based on the design life, see *3.1.3.1*

(c) ballast tanks are coated. Requirements for coating application and maintenance are excluded from the Rules.

3.1.8.6 The values for corrosion additions and wastage allowance are specified in *Section 6/3* and *Section 12* respectively.

3.1.9 Structural construction and inspection

3.1.9.1 The structural requirements included in the Rules are developed with the assumption that construction and repair will follow acceptable shipbuilding and repair standards and tolerances. The Rules may require that additional attention is paid during construction and repair of critical areas of the structure.

3.1.9.2 Tank strength and tightness testing are to be carried out as a part of the verification scheme.

3.1.9.3 The Rules define the renewal criteria for the individual structural items. The structural requirements included are developed on the assumption that the structure will be subject to periodical survey in accordance with individual Classification Society Rules and Regulations. All structural elements are to be arranged to allow access for inspection, see *Section 5/5*. It is assumed that close-up inspection of the critical areas will be carried out on a regular basis.

3.1.10 Owner's extras

3.1.10.1 Owner's specification of requirements above the general classification or statutory requirements may affect the structural design. Owner's extras may include requirements for:

(a) vibration analysis

(b) maximum percentage of high strength steel

(c) additional scantling dimensions above that required by the Rules

(d) additional design margin on the loads specified by the Rules, etc

(e) improved fatigue resistance, in the form of a specified increase in design fatigue life or equivalent

(f) combinations of cargo loading patterns and draughts exceeding the Rule specified conditions

(g) higher cargo density for fatigue evaluation for ships intended to carry high density cargo in part load conditions on a regular basis.

Owner's extras are not covered by these Rules. Owner's extras that may affect the structural design are to be clearly specified in the design documentation.

4 DESIGN PRINCIPLES

4.1 Overall Principles

4.1.1 Introduction

4.1.1.1 This Sub-Section defines the underlying design principles of the Rules in terms of loads, structural capacity models and assessment criteria and also construction and in-service aspects.

4.1.2 General

4.1.2.1 The Rules are based on the following overall principles:

(a) the safety of the structure can be demonstrated by addressing the potential structural failure mode(s) when the vessel is subjected to operational loads and environmental loads/conditions

(b) the design complies with the design basis, see *Sub-Section 3*

(c) the structural requirements are based on a consistent set of loads that represent typical worst possible loading scenarios

(d) the structural requirements with respect to loads, capacity models and assessment criteria are presented in a modular format so that each component of the requirement is clearly identified.

4.1.2.2 The ship's structure is designed such that:

(a) it has inherent redundancy. The ship's structure works in a hierarchical manner and, as such, failure of structural elements lower down in the hierarchy should not result in immediate consequential failure of elements higher up in the hierarchy

(b) permanent deformations are minimised. Permanent deformations of local panel or individual stiffened plate members may be acceptable provided that this does not affect the structural integrity, containment integrity or the performance of structural or other systems

(c) the incidence of in-service cracking is minimised, particularly in locations which; affect the structural integrity or containment integrity, affect the performance of structural or other systems or are difficult to inspect and repair

(d) it has adequate structural redundancy to survive in the event that the structure is accidentally damaged; for example, minor impact leading to flooding of any compartment.

4.2 Loads

4.2.1 Load scenarios

4.2.1.1 The loads used for assessment of the structure covers the load scenarios encountered by the ship during operation at sea and in harbour.

4.2.2 Design load combinations

4.2.2.1 Design load combinations combine local and global load components to represent identified load scenarios. The design load combinations should be sufficiently severe and varied so as to encompass all scenarios that can reasonably occur during normal operation.

4.2.2.2 The design load combinations for the hull and structural members consider the most unfavourable combination of load effects in order to maintain a consistent safety level for all combinations.

4.2.2.3 The design load combinations are based on one of the following combinations of static and dynamic loads depending on the type of load and the load scenario being considered:

(a) Static design load combinations (S)
covers application of all relevant static loads and typically covers load scenarios in harbour, tank testing or similar operations

(b) Static plus Dynamic design load combination (S+D)
covers application of all relevant static loads plus a realistic combination of simultaneously occurring dynamic load components and typically covers load scenarios for seagoing operations

(c) Impact design load combination
covers application of impact loads such as bottom slamming and bow impact encountered during seagoing operation. It is usually sufficient to ignore other static and dynamic load components in association with an impact load event.

(d) Sloshing design load combination
covers application of sloshing loads encountered during seagoing operations

(e) Fatigue design load
covers application of all relevant dynamic loads

(f) Accidental design load combination (A)
covers application of accidental loads where these loads are not considered as occurring during normal operations

4.2.3 Load categorisation

4.2.3.1 The design load combinations are composed of many different types of loads, which are categorised as shown in *Table 2.4.1.*

Table 2.4.1
Load Categorisations

Operational Loads	Lightship weight	Steel weight and outfit Machinery and permanent equipment
	Buoyancy loads	Buoyancy of the ship
	Variable loads	Cargo Ballast water Stores and consumables Personnel Temporary equipment
	Other loads	Tug and berthing loads Towing loads Anchor and mooring loads Lifting appliance loads
Environmental loads	Cyclic loading due to wave action including inertia loads	Dynamic wave pressures
		Dynamic loads and dynamic tank pressures due to ship accelerations
	Impact loads or resonant loads	Wave impacts Bottom slamming Liquid sloshing in tanks Green sea loads
Accidental loads		Flooding of compartments
Deformation loads		Thermal loads Deformations due to construction

4.2.3.2 Operational loads generally are static loads. They are grouped into lightship weight, buoyancy loads, variable loads and other loads. The operational loads occur as a consequence of the operation and handling of the ship.

4.2.3.3 Environmental loads are dynamic loads due to external influences. The environmental loads covered by the Rules are loads due to wave action.

4.2.3.4 Accidental loads include loads that result as a consequence of an accident or operational mishandling of the ship. The accidental loads covered by the Rules are increased tank pressures due to flooding of compartments.

4.2.3.5 Deformation loads are caused by thermal loads and residual stresses. The load effects from deformation loads are not covered by the Rules.

4.2.4 Characteristic load values

4.2.4.1 The characteristic values of the load components that are applied in the Rules are dependant on the design load combination being considered. The characteristic loads are typical values and are given by:

(a) for operational loads the characteristic loads are the expected or specified values

(b) for environmental loads the characteristic load is typically a load value which has a low probability of occurrence, i.e. an 'extreme' value.

4.2.5 Operational loads

4.2.5.1 The characteristic values of the static sea pressure on the hull due to the buoyancy are based on the draught at the loading condition under consideration.

4.2.5.2 The characteristic values of the static tank pressure are based on the filling height and the specific gravity of the cargo/ballast, and include allowances for possible overpressure due to the height of air pipes, pressure relief valve settings and capacity of pumps.

4.2.5.3 The characteristic values of the loads due to personnel, stores and consumables, temporary equipment and permanent equipment are based on specified values.

4.2.5.4 The characteristic values for tug, berthing, towing and mooring loads are based on specified values.

4.2.6 Environmental loads

4.2.6.1 The Rule formulations for wave loads, as given in *Section 7/3*, are based on the envelope values calculated in accordance with *4.2.6.2* and calibrated with feedback from service experience and model tests.

4.2.6.2 The general principles for the derivation of the wave load values are:

(a) the application of load values is consistent for all similar load scenarios

(b) the characteristic load value is selected to suit the purpose of the application of the load and the selected structural assessment method, e.g. for strength assessment the expected lifetime maximum load is applied while for fatigue assessment an average value representing the expected load history is applied

(c) load calculations are performed using 3-D linear hydrodynamic computational tools. The effects of speed are considered

(d) the derivation of characteristic wave loads is based on a long term statistical approach which includes representation of the wave environment (North Atlantic scatter diagram), probability of ship/wave heading and probability of load value exceedance based on IACS Rec. 34. All of which result in envelope values

(e) non-linear effects are considered for the expected lifetime maximum loads.

4.2.6.3 The combination of dynamic loads considers all simultaneously occurring dynamic load components. In deriving the simultaneously occurring loads, one particular load component is maximised or minimised and the relative magnitude of all simultaneously occurring dynamic load components is specified by the application of dynamic load combination factors (DLCF) based on the envelope load value. These dynamic load combination factors are based on the application of the equivalent design wave approach and are given as tabulated values.

4.2.6.4 The formulations of the load values for bottom slamming, bow impact loads and green sea loads take account of the following factors:

(a) vessel draught

(b) hull form

(c) heading

(d) forward speed

(e) location of deck houses/superstructure

(f) geometry of structural elements.

4.2.6.5 A slamming impact load results in a transient dynamic response in the structure. The formulation of the impact loads considers the impact load as an equivalent static load acting on the associated exposed hull surface.

4.2.6.6 The effect of green water on the deck structure along the entire vessel's length is considered. The green water loads on fore and parallel mid bodies of a ship are

determined based on model tests, ship motion analysis and service experience. The green sea loads for the aft body are consistent with the derivation for the fore and mid body green sea loads.

4.2.7 Accidental loads

4.2.7.1 The accidental load scenarios cover loads acting on local structure as a consequence of flooding in accordance with the assumptions made in IMO regulations. This relates to the assessment of the watertight subdivision boundaries.

4.2.7.2 Only static loads corresponding to the draught in the flooded condition are considered.

4.2.8 Deformation loads

4.2.8.1 Thermal loads within the limits specified by the design basis are considered negligible. It is assumed that care is taken to account for, and allow for, expected thermal expansion.

4.3 Structural Capacity Assessment

4.3.1 General

4.3.1.1 The basic principle in structural design is to apply the defined design loads, identify possible failure modes and employ appropriate capacity models to determine the required structural scantlings.

4.3.2 Capacity models for strength

4.3.2.1 The strength assessment method is to be capable of analysing the failure mode in question to the required degree of accuracy. Several assessment methods may be applicable, even for the same failure modes.

4.3.2.2 The following aspects are the basis for selection of strength capacity models:

(a) whether the structural member is also assessed at a higher level in the hierarchy and/or at a later stage by more accurate methods or by more accurate response calculations

(b) simplified capacity models where some of the stress components are neglected are to always give conservative results

(c) appropriate methodology to assess the failure mode

(d) probability level of the load

(e) capability of response calculations to represent the physical behaviour of the structure up to the given load level

(f) complexity of structure

(g) complexity of loads

(h) criticality of the structural member. This will primarily have an impact on the assessment criteria, but needs to be considered in conjunction with selection of the appropriate methodology for structural assessment.

4.3.2.3 The structural capacity assessment methods are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods.

4.3.2.4 The formulae used to determine stresses, deformations and capacity are appropriate for the selected capacity assessment method and the type and magnitude of the design load set.

4.3.3 Capacity models for fatigue

4.3.3.1 The fatigue assessment method provides Rule requirements to safeguard structural details against fatigue failure.

4.3.3.2 The fatigue capacity model is based on a linear cumulative damage summation (Palmgren-Miner's rule) in combination with S-N curves, a characteristic stress range and an assumed long-term stress distribution curve.

4.3.3.3 The fatigue capacity assessment models are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads.

4.3.4 Net thickness approach

4.3.4.1 The philosophy behind the net thickness approach is to:

(a) provide a direct link between the thickness used for strength calculations during the new building stage and the minimum thickness accepted during the operational phase

(b) enable the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

4.3.4.2 The net thickness approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the overall average corrosion of larger areas such as primary support members and the hull girder. Both the local and overall corrosion are used as a basis for the new building review and are to be confirmed during operation of the vessel.

4.3.4.3 The net thickness approach for the local corrosion is shown in *Figure 2.4.1 (a)* and is in terms of new building thicknesses, given by:

(a) the local strength requirements are given by the net thickness ($t_{net\text{-}req}$) after rounding

(b) the required gross thickness ($t_{grs\text{-}req}$) is given by adding the corrosion addition (t_{corr}) to the required rounded net thickness ($t_{net\text{-}req}$)

(c) the gross thickness (t_{grs}) is the actual thickness selected by the designer to fulfil the gross required thickness($t_{grs\text{-}req}$) and is to be equal or greater than the required gross thickness ($t_{grs\text{-}req}$)

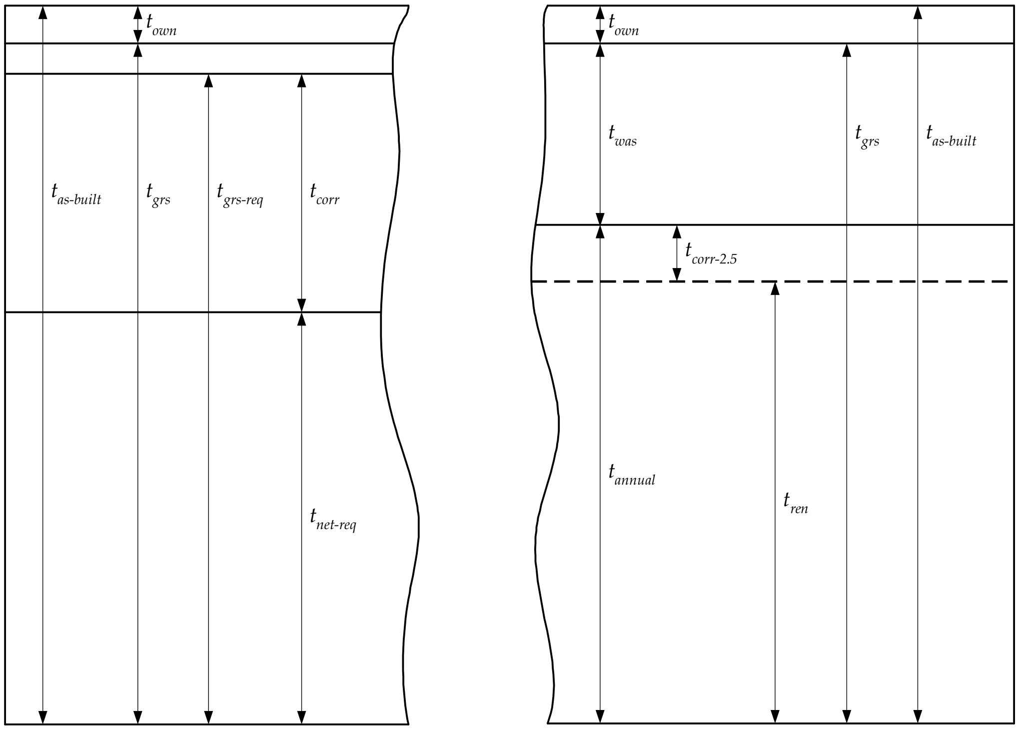
(d) the as built thickness is equal to the gross thickness (t_{grs}) plus any additional owners extra margin (t_{own})

(e) any additional thicknesses specified by the owner, as owners extra margin (t_{own}) are not to be included in the assessment of the required gross thickness ($t_{grs\text{-}req}$).

Figure 2.4.1
Net Thickness Approach for Local Wastage

(a) application to scanting requirements

(b) application to ship in operation requirements



4.3.4.4 The net thickness approach for determining the local renewal thickness during the ship in operation phase is shown in *Figure 2.4.1 (b)* and is given by:

(a) the thickness at which annual surveys are required, t_{annual}, is obtained by subtracting the total wastage allowance (t_{was}) and the owners extra margin (t_{own}) from the as-built thickness ($t_{as\text{-}built}$)

(b) thickness at which renewal is required, t_{ren}, is obtained by subtracting the total wastage allowance (t_{was}), the thickness $t_{corr\text{-}2.5}$ and the owners extra margin (t_{own}) from the as-built thickness ($t_{as\text{-}built}$). Where $t_{corr\text{-}2.5}$ is the wastage allowance in reserve for corrosion occurring in the two and half years between Intermediate and Special surveys

(c) the total wastage allowance given is the rule specified wastage allowance (t_{was}) plus the wastage allowance in reserve ($t_{corr\text{-}2.5}$) plus any additional owners extra margin (t_{own})

(d) the rule specified wastage allowance (t_{was}) available before annual surveys are required is obtained by deducting the thickness $t_{corr\text{-}2.5}$ from the corrosion addition (t_{corr}).

The approach calls for a general 2.5 year survey interval when the gauged thickness is greater than the “thickness at which annual surveys are required” (t_{annual}), and a 1 year survey interval when the gauged thickness is less than the “thickness at which annual surveys are required” (t_{annual}).

4.3.4.5 The overall average corrosion for primary support members and the hull girder cross-section is given by deducting half the local corrosion addition ($0.5t_{corr}$) from all structural elements comprising the respective cross-sections.

4.3.4.6 The assessment of local scantlings is performed based on the hull girder stresses given by the net hull girder properties, e.g. based on a global overall average

corrosion of the hull girder, and the local stresses based on the net thickness of the local member under consideration, e.g. based on full local corrosion. It is assumed that the structure may corrode locally to the maximum allowed and that the hull girder may reduce to the maximum allowed overall hull girder corrosion.

4.3.4.7 The assessment of global (hull girder and primary support member) scantlings is based on the overall global corrosion, e.g. half the full local corrosion for all structural members simultaneously. The assumption is that the full local corrosion will not occur globally and hence a lesser average value of assumed corrosion is appropriate. Individual structural elements may corrode to the maximum corrosion addition and this is taken into account in the buckling assessment.

4.3.4.8 As fatigue is an accumulative assessment the scantlings and stresses used for the assessment are to be taken as the representative mean value over the design life. The mean corrosion over the design life is given as half the corrosion assumed for scantling strength assessment. Local stresses are thus calculated based on half the full local corrosion addition and hull girder stresses are calculated based on half the overall global corrosion. Half the global overall corrosion is found by deduction of one quarter of the full local corrosion addition of all structural elements simultaneously.

4.3.4.9 The actual amount of wastage allowed in service is taken as:

(a) locally: the full corrosion addition less an amount for typical wastage between the survey periods

(b) globally: the full global overall corrosion addition less an amount for typical wastage between the survey periods. The global wastage is monitored in service by evaluating the current global characteristics of the vessel.

4.3.5 Intact structure

4.3.5.1 All strength calculations are based on the assumption that the structure is intact. The residual strength of the ship in a structurally damaged condition is not assessed.

4.3.5.2 No benefit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

4.4 Materials and Welding

4.4.1 Materials

4.4.1.1 The Rule requirements associated with the selection of materials for structural components is based on the location, design temperature (see *3.1.7.4* and *3.1.8.4)*, membrane, through thickness forces and criticality of the component. The requirements comply with *IACS UR S6.*

4.4.1.2 The Rule requirements are based on the assumption that the material is manufactured in accordance with the allowable under thickness rolling tolerances specified in *IACS UR W13*.

4.4.2 Welding

4.4.2.1 The Rule requirements for weld type, size and materials are based on the following considerations:

(a) joint type

(b) criticality of the joint

(c) magnitude, type and direction of the stresses in the joint

(d) material properties of the parent and weld material

(e) weld gap size.

4.5 Assessment/Acceptance Criteria

4.5.1 Design methods

4.5.1.1 The criteria for the assessment of the scantlings are based on one of the following design methods:

(a) Working Stress Design (WSD) method, also known as the permissible or allowable stress method

(b) Partial safety Factor (PF) method, also known as Load and Resistance Factor Design (LRFD).

4.5.1.2 For both WSD and PF, two design assessment conditions and corresponding acceptance criteria are given. These conditions are associated with the probability level of the combined loads, A and B:

(a) condition A is applicable to design load combinations based on 'expected' characteristic load values, typically covered by the static design load combinations

(b) condition B is applicable to design load combinations based on 'extreme' characteristic load values, typically covered by the static + dynamic load combinations.

4.5.1.3 The WSD method has the following composition:

$$W_{stat} \le \eta_1 R \quad \text{for condition A}$$

$$W_{stat} + W_{dyn} \le \eta_2 R \quad \text{for condition B}$$

Where:

W_{stat} simultaneously occurring static loads (or load effects in terms of stresses)

W_{dyn} simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components

R characteristic structural capacity (e.g. yield stress or buckling capacity)

η_i permissible utilisation factor (resistance factor). The utilisation factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure

4.5.1.4 The PF method has the following composition:

$$\gamma_{stat-1} W_{stat} + \gamma_{dyn-1} W_{dyn} \le \frac{R}{\gamma_R} \quad \text{for condition A}$$

$$\gamma_{stat-2} W_{stat} + \gamma_{dyn-2} W_{dyn} \le \frac{R}{\gamma_R} \quad \text{for condition B}$$

Where:

γ_{stat-i} partial safety factor that accounts for the uncertainties related to static loads

W_{stat}	simultaneously occurring static loads (or load effects in terms of stresses)
γ_{dyn-i}	partial safety factor that accounts for the uncertainties related to dynamic loads
W_{dyn}	simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components
R	characteristic structural capacity (e.g. yield stress, ultimate hull girder stress)
γ_R	partial safety factor that accounts for the uncertainties related to structural capacity

4.5.1.5 The acceptance criteria for both the WSD method and PF method are calibrated for the various requirements such that consistent and acceptable safety level for all combinations of static and dynamic load effects are achieved.

4.6 Principle of Safety Equivalence

4.6.1 General

4.6.1.1 Novel designs deviating from the design basis or structural arrangements covered by the Rules will be subject to special consideration. The principle of equivalence is to be applied to the novel design, hence it must be demonstrated that the structural safety of the novel design is at least equivalent to that intended by the Rules.

4.6.1.2 The principle of equivalence may be applied to alternative calculation methods.

4.6.1.3 A systematic review process was undertaken in developing these Rules. This identified and evaluated the likely consequences of hazards due to operational and environmental influences on tanker structural configurations and arrangements covered by these Rules. For novel designs, dependent on the nature of the deviation, it may be necessary to conduct an independent systematic review to document equivalence with the Rules.

5 APPLICATION OF PRINCIPLES

5.1 Overview of the Application of Principles

5.1.1 General

5.1.1.1 This Sub-Section shows how the design principles described in *Sub-Section 4* have been applied in the development of the rule requirements.

5.2 Structural Design Process

5.2.1 Overview of the structural design process

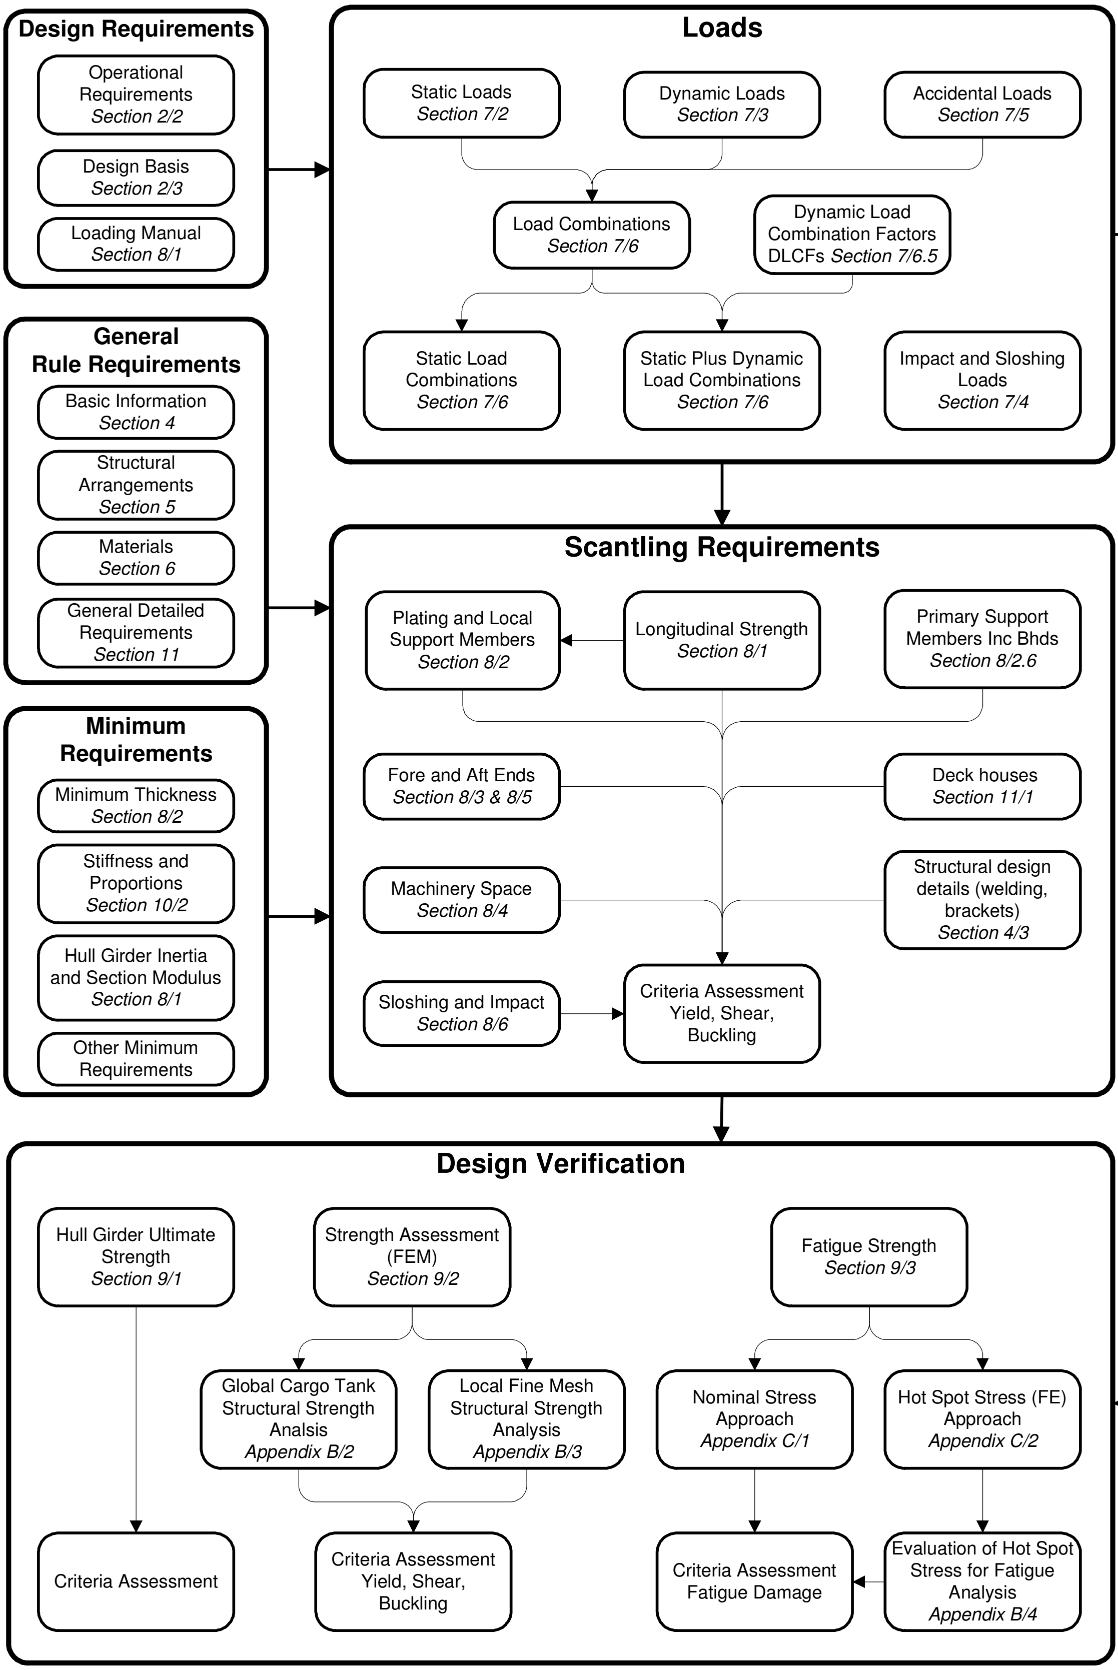
5.2.1.1 An overview of the structural design process applied in the Rules is shown in *Figure 2.5.1*.

5.2.1.2 The strength and acceptable safety of the hull and the structural elements is verified through the application of the following Rule requirements:

(a) prescriptive scantling requirements
- minimum requirements
- load-capacity based requirements

(b) design verification requirements based on load-capacity methods
- hull girder ultimate strength
- strength assessment using the Finite Element (FE) analysis
- fatigue assessment

Figure 2.5.1
Overview of Structural Design Process



5.3 Minimum Requirements

5.3.1 General

5.3.1.1 The minimum requirements are usually in one of the following forms:

(a) minimum thickness, which is independent of the yield stress, these are based on service experience and are usually expressed in the following format:

$t = A + B\,L$

Where:

A, B constants

L rule length, as defined in *Section 4/1.1.1.1*

(b) minimum stiffness and proportion, which are based on prescriptive buckling requirements

5.4 Load-capacity Based Requirements

5.4.1 General

5.4.1.1 In general, the Working Stress Design (WSD) method is applied in the requirements, except for the hull girder ultimate strength criteria where the Partial safety Factor (PF) method is applied. The partial safety factor format is applied for this highly critical failure mode to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

5.4.1.2 The identified load scenarios are addressed by the Rules in terms of design loads, design format and acceptance criteria set, as given in *Table 2.5.3*. The table is schematic and only intended to give an overview.

5.4.1.3 The load scenarios addressed by the rules cover operations such as seagoing conditions, loading and unloading, tank testing conditions, ballast water exchange situations, special operations in harbour (e.g. propeller inspection afloat condition) and accidental flooding.

5.4.1.4 The design load combinations that represent the identified load scenarios are given in *Section 7/6* and are denoted by S (static loads), S+D (static+dynamic loads), and A (accidental loads). In addition, the Rules address impact loads and sloshing loads as given in *Section 7/4* and fatigue loads as given in *Section 7/3*.

5.4.1.5 For the strength requirements, the considered loads cover the most severe operational loads that occur, hence the cargo tank finite element analysis and load-capacity based scantling requirements are based on rule loading conditions which simulate the worst possible loading conditions within the operating limits of the vessel.

5.4.1.6 For the fatigue requirements the considered loads cover an expected load history and representative loading conditions covering the ships' intended service are applied.

5.4.1.7 The acceptance criteria are categorised into three acceptance criteria sets. These are explained below and shown in *Tables 2.5.2* and *2.5.3*. The specific acceptance criteria set that is applied in the WSD rule requirements is dependent on the probability level of the characteristic combined load.

5.4.1.8 The acceptance criteria set AC1 is applied when the combined characteristic loads are frequently occurring, typically for the static design load combinations, but also applied for the sloshing design loads. This means that the loads occur on a frequent

or regular basis. The allowable stress for a frequent load is lower than for an extreme load to take into account effects of:

(a) repeated yield

(b) allowance for some dynamics

(c) margins for operational mistakes.

5.4.1.9 The acceptance criteria set AC2 is typically applied when the combined characteristic loads are extreme values, e.g. typically for the static+dynamic design load combinations. High utilisation (η_i in *Table 2.5.1*) of the structural capacity (R_i in *Table 2.5.1*) is allowed in such cases because the considered loads are extreme loads with a low probability of occurrence.

5.4.1.10 The acceptance criteria set AC3 is typically applied for capacity formulations based on the plastic collapse models such as those that are applied to address bottom slamming and bow impact loads.

Table 2.5.1
Load Scenarios and Corresponding Rule Requirements

Load Scenarios		Rule Requirements			
Operation	**Loads** (that the vessel is exposed to and is to withstand)	**Design Load Combination** (specified in *Section 7/6*) **Ref. no**	**Notation**	**Design Format** (specified in *Sections 8* and *9*) see Note 1	**Acceptance Criteria Set** (specified in *Sections 8* and *9*)
Seagoing operations					
Transit	Static and dynamic loads in heavy weather	1	S + D	1. $S_G + S_L + D_G + D_L \leq \eta_2 R_1$	AC2
				2. $\gamma_S S_G + \gamma_D D_G \leq R_2/\gamma_{R2}$	AC2
	Impact loads in heavy weather	2	Impact	$S_L + D_{imp} \leq \eta_3 R_p$	AC3
	Internal sloshing loads	3	Sloshing	$S_G + D_{slh} \leq \eta_1 R_1$	AC1
	Cyclic wave loads	4	Fatigue	$DM \leq \Sigma\eta_i / N_i$	-
BWE by flow through or sequential methods	Static and dynamic loads in heavy weather	5	S + D	$S_G + S_L + D_G + D_L \leq \eta_2 R_1$	AC2
Harbour and sheltered operations					
Loading, unloading and ballasting	Typical maximum loads during loading, unloading and ballasting operations	6	S	$S_G + S_L \leq \eta_1 R_1$	AC1
Tank testing	Typical maximum loads during tank testing operations	7	S	$S_G + S_{L1} \leq \eta_1 R_1$	AC1
Special conditions in harbour	Typical maximum loads during special operations in harbour, e.g. propeller inspection afloat or dry-docking loading conditions	8	S	$S_G + S_L \leq \eta_1 R_1$	AC1
Accidental condition					
Accidental flooding	Typically maximum loads on internal watertight subdivision structure due to accidental flooding	9	A	for water tight boundaries 1. $S_L \leq \eta_2 R_1$	AC2
				for collision bulkhead 2. $S_L \leq \eta_1 R_1$	AC1
Note 1. The symbols defined in this column are defined in the text of *5.4*					

Where:

D_G	dynamic global load
D_L	dynamic local load
DM	cumulative fatigue damage ratio
S_G	static global load
S_L	static local load
R_i	structural capacity

5.4.2 Design loads for scantling requirements and strength assessment (FEM)

5.4.2.1 The structural assessment of compartment boundaries, e.g. bulkheads, is based on the worst possible loading, hence conditions are assessed with a full tank on one side and an empty tank on the other side. The situation with the tank content reversed is also considered. Similarly the shell envelope is assessed for conditions at the deepest draught without internal filling and at the lowest draught with internal filling.

5.4.2.2 The standard loading patterns to be used in the strength assessment (FEM) are given in *Appendix B*, *Tables B.2.3* and *B.2.4* for tankers with two oil-tight longitudinal bulkheads and one centreline oil-tight longitudinal bulkhead respectively. The corresponding information for the scantling requirements is given in *Section 8*.

5.4.2.3 To ensure consistency of approach, standardised rule values for parameters such as GM, R_{roll}, T_{sc} and C_b. are applied to calculate the rule load values.

5.4.2.4 The probability level of the dynamic global and local loads (D_G, D_L and D_{imp} in *Table 2.5.1*) is 10^{-8} and are derived using the long term statistical approach specified in *4.2.6.2*.

5.4.2.5 The probability level of the sloshing loads (D_{slh} in *Table 2.5.1*) is 10^{-4} which is a load that occurs frequently.

5.4.2.6 The design load combinations corresponding to the identified load scenarios produce realistic design load sets suitable for the design and verification of the structural capability. Design load sets apply all the applicable simultaneously acting static and dynamic local load components (S_L and D_L in *Table 2.5.1*, which are usually pressure load components) and static and dynamic global load components (S_G and D_G in *Table 2.5.1*, which is usually hull girder bending moment) for the design of a particular or group of structural members. The relevant design load sets for the scantling requirements are given in *Sections 8/2* to *8/5*. The design load sets for the Finite Element analysis are referred to as load cases and are given in *Appendix B*.

5.4.2.7 The simultaneously occurring dynamic loads are specified by applying a dynamic load combination factor to the envelope dynamic load values given in *Section 7/3.* The dynamic load combination factors that define the dynamic load cases are given in *Section 7/6.4* for the structural strength assessment (FE) and in *Section* 7/*6.5* for the scantling requirements.

5.4.2.8 The dynamic load combination factors have been derived using the equivalent design wave approach to provide realistic simultaneously occurring dynamic loads components suitable for structural assessment.

5.4.2.9 For the determination of design loads for the hull girder ultimate strength requirement given in *Section 9/1*, the operational loads (i.e. ship loading conditions) and the environmental loads (i.e. hull girder wave bending moments) are maximised for sagging conditions for seagoing conditions. The characteristic value for the still water hull girder sagging bending moments M_{sw} is based on the maximum value from the seagoing conditions specified in *Section 8/1*. The characteristic value for the wave hull girder sagging bending moments M_{WV} is given in *Section 7/3.*

5.4.3 Design loads for fatigue requirements

5.4.3.1 For the fatigue requirements given in *Section 9/3* and *Appendix C*, the load assessment is based on the expected load history and an average approach is

applied. The expected load history for the design life is characterised by the 10^{-4} probability level of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding stresses.

5.4.3.2 The considered wave-induced loads include:

(a) hull girder loads (i.e., vertical and horizontal bending moments)

(b) dynamic wave pressures

(c) dynamic tank pressures.

5.4.3.3 The fatigue analysis is calculated for two representative loading conditions covering the ship's intended operation. These two conditions are:

(a) full load homogeneous conditions at design draught

(b) normal ballast condition.

The proportion of the ship's sailing life in the full load condition is 50% and in ballast 50%. It is assumed that 15% of the ships' life is in harbour/sheltered water. It is consequently assumed that the ship will be sailing in open waters in full load condition for 42.5% of the ship's life and in the ballast condition for 42.5% of the ship's life.

5.4.3.4 The load values are based on actual parameters corresponding to the applied loading conditions, e.g. *GM*, C_b, etc., and the applicable draughts at amidships is used. The actual values are taken from specified loading conditions in the loading manual.

5.4.3.5 The simultaneously occurring dynamic loads are accounted for by combination of stresses due to the various dynamic load components. The stress combination procedure is given in *Appendix C*.

5.4.3.6 Still water loads and static sea and tank pressures from the actual loading conditions are used to determine the mean stress effect.

5.4.4 Structural response analysis

5.4.4.1 In general, the following approaches are applied for determination of the structural response to the applied design load combinations

(a) Beam theory

- used for prescriptive requirements

(b) FE analysis

- coarse mesh for cargo hold model
- fine mesh for local models
- very fine mesh for fatigue assessment

5.4.5 Structural capacity assessment

5.4.5.1 The considered failure modes in the Rules are yield (plastic deformation), buckling, brittle fracture and fatigue. Structural failure due to yield and buckling is primarily controlled by the strength requirements, brittle fracture is primarily controlled by the requirements for material selection and welding, and fatigue failure is primarily controlled by the high cycle fatigue requirements.

5.4.5.2 Generally, the capacity models applied in the prescriptive rules, i.e., the scantling requirements in *Section 8*, are based on simple beam theory and include elastic yield and plastic capacity models. The buckling capacity is assessed using simplified buckling capacity models or by a more theoretical non-linear analysis procedure.

5.4.5.3 The design verification requirements are based on a linear elastic finite element analysis, a detailed prescriptive fatigue assessment procedure and a simplified ultimate strength assessment procedure. There is also a finite element based fatigue assessment procedure for some structural members, such as the hopper knuckle.

5.4.5.4 The application of the net thickness approach to assess the structural capacity is specified in *Section 6/3.3*.

5.4.6 Acceptance criteria

5.4.6.1 The acceptance criteria applied in the working stress design requirements are given as acceptance criteria sets shown in *Tables 2.5.2* and *2.5.3.* There are slight variations within each set depending on the relative contribution of local and global loads, static and dynamic loads and the structural member being considered. The specific acceptance criteria are given in the detailed rule requirements in *Section 8* and *9/2*.

Table 2.5.2
Principal Acceptance Criteria - Rule Requirements

	Plate panels and Local Support Members		Primary Support Members		Hull girder members	
Acceptance criteria set	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC1:	70-80% of yield stress	Control of stiffness and proportions. Usage factor typically 0.8	70-75% of yield stress	Control of stiffness and proportions. Pillar buckling	75% of yield stress	NA
AC2:	90-100% of yield stress	Control of stiffness and proportions. Usage factor typically 1.0	85% of yield stress	Control of stiffness and proportions. Pillar buckling	90-100% of yield stress	Usage factor typically 0.9
AC3:	Plastic criteria	Control of stiffness and proportions	Plastic criteria	Control of stiffness and proportions	NA	NA

Table 2.5.3
Principal Acceptance Criteria - Design Verification - FE Analysis

	Global cargo tank analysis		Local fine mesh analysis
Acceptance criteria set	**Yield**	**Buckling**	**Yield**
AC1:	60-80% of yield stress	Control of stiffness and proportions. Usage factor typically 0.8	local mesh as 136% of yield stress averaged stresses as global analysis
AC2:	80-100% of yield stress	Control of stiffness and proportions. Usage factor typically 1.0	local mesh as 170% of yield stress averaged stresses as global analysis

5.4.6.2 The purpose of applying different sets is to achieve a consistent and acceptable safety level for all combinations of static and dynamic loads and to account for different capacity models.

5.5 Materials

5.5.1 General

5.5.1.1 Higher material properties are selected for highly critical structural elements which are subjected to high loads in order to reduce the risk of propagation of brittle fracture.

5.6 Application of Rule Requirements

5.6.1 Minimum requirements

5.6.1.1 These specify the minimum scantling requirements which are to be applied irrespective of all other requirements, hence thickness below the minimum are not allowed.

5.6.2 Load based prescriptive requirements

5.6.2.1 These provide scantling requirements for all plating, local support members, most primary support members and the hull girder and cover all structural elements including deckhouses, foundations for deck equipment, etc.

5.6.2.2 In general, these requirements explicitly control one particular failure mode and hence several requirements may be applied to assess one particular structural member.

5.6.3 Design verification - hull girder ultimate strength

5.6.3.1 The requirements for the ultimate strength of the hull girder are based on a Partial safety Factor (PF) method, see *4.5*. A safety factor is assigned to each of the basic variables, the still water bending moment, wave bending moment and ultimate capacity. The safety factors were determined using a structural reliability assessment approach, the long term load history distribution of the wave bending moment was derived using ship motion analysis techniques suitable for determining extreme wave bending moments.

5.6.3.2 The purpose of the hull girder ultimate strength verification is to demonstrate that one of most critical failure modes of a double hull tanker is controlled.

5.6.4 Design verification - global finite element analysis

5.6.4.1 The global finite element analysis is used to verify the scantlings given by the load-capacity based prescriptive requirements. The analysis is required because the prescriptive requirements do not take into account the complex interactions between the ship's structural components, complex local structural geometry, change in thicknesses and member section properties as well as the complex load regime with sufficient accuracy. Hence the global finite element analysis is necessary to verify the proposed scantlings.

5.6.4.2 A linear elastic three dimensional finite element analysis of the cargo region (a FE model length of three tanks is required) is carried out to assess and verify the structural response of the proposed hull girder and primary support members and assist in specifying the scantling requirements for the primary support members. The purpose with the finite element analysis is to verify that the stresses and buckling capability of the primary support members are within acceptable limits for the applied design loads.

5.6.5 Design verification - fatigue assessment

5.6.5.1 The fatigue assessment is required to verify that the fatigue life of critical structural details is adequate. A prescriptive fatigue requirement is applied to details such as end connections of longitudinal stiffeners using an SN curve approach based on geometric details, i.e. Class F, F2, etc. A hot spot fatigue assessment procedure using finite element analysis is applied to details such as the hopper knuckle. In both cases, the fatigue assessment method is based on the Palmgren-Miner linear damage model.

5.6.6 Relationship between the prescriptive scantling requirements and the strength assessment (FEM)

5.6.6.1 The prescriptive minimum requirements define the minimum acceptable scantlings. These may not to be reduced by any form of alternative calculations such as load-capacity prescriptive requirements or strength analysis such as FEM.

5.6.6.2 The section modulus and/or shear area of a primary support member and/or the cross sectional area of a primary support member cross tie may be reduced to 85% of the prescriptive requirements provided that the reduced scantlings comply with the strength assessment (FEM).

5.6.6.3 The philosophy is that a coarse approach should be more conservative than a detailed approach. Hence, the prescriptive requirements are generally more conservative than the corresponding requirements based on strength assessment (FEM).

SECTION 3

RULE APPLICATION

1 NOTATIONS

1.1 Notations

1.1.1 General

1.1.1.1 Ships fully complying with the requirements of these Rules and the specific requirements of the assigning Classification Society relating to construction, survey and equipment will be eligible to be assigned with character symbols and a ship type notation appropriate to the assigning Classification Society.

1.1.1.2 In addition to *1.1.1.1*, ships fully complying with the requirements of these Rules will also be assigned the notation **CSR**.

2 DOCUMENTATION, PLANS AND DATA REQUIREMENTS

2.1 Documentation and Data Requirements

2.1.1 Loading information

2.1.1.1 Loading guidance information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations is to be provided onboard the ship. The loading guidance information is to include an approved loading manual and loading computer system complying with the requirements given in *Sections 8/1.1.2* and *8/1.1.3* respectively.

2.1.2 Submission of calculation data and results

2.1.2.1 Where calculations have been carried out in accordance with the procedures given in the Appendices of these Rules, one copy of the following supporting information is to be submitted as applicable:

(a) reference to the calculation procedure and technical program used

(b) a description of the structural modelling

(c) a summary of the analysis parameters including properties and boundary conditions

(d) details of the loading conditions and the means of applying loads

(e) a comprehensive summary of calculation results

(f) sample calculations where appropriate.

2.1.2.2 In general, submission of large volumes of input and output data associated with programs, such as finite element analysis, will not be required.

2.1.2.3 The responsibility for error free specification and input of program data and the subsequent correct transposal of output resides with the designer.

2.1.3 Use of computer software for rule calculations

2.1.3.1 In general, any rule computation program recognised by the Classification Society may be employed to determine scantlings according to these Rules provided the implementation given in *5.1* is complied with.

2.1.3.2 A computer program that has been demonstrated to produce reliable results to the satisfaction of the Classification Society is regarded as a recognised program. Where the computer programs employed are not supplied or recognised by the Classification Society, full particulars of the computer program, including example calculation output, are to be submitted. It is recommended that the designers consult the Classification Society on the suitability of the computer programs intended to be used prior to the commencement of any analysis work.

2.2 Submission of Plans and Supporting Calculations

2.2.1 General

2.2.1.1 In general, the main categories and lists of information required are given in *2.2.2*. Additional requirements for some items are also given in subsequent sections as applicable.

2.2.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations. Additional copies may be required according to the individual Classification Society requirements.

2.2.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, materials, welding and loads imposed on the structure by equipment and systems as appropriate.

2.2.1.4 Plans are to include information related to the renewal thickness as specified in *Section 12*.

2.2.2 Plans and supporting calculations

2.2.2.1 In general, plans covering the following items are to be submitted:

(a) main scantling plans:
- midship sections showing longitudinal and transverse structural members
- construction profiles/plans showing all main longitudinal structural elements along the ships length including decks, inner bottom, bulkheads, double side stringers and double bottom girders
- shell expansion
- main oil-tight and watertight transverse bulkheads including primary support members

(b) loading guidance information:
- preliminary loading manual
- final loading manual
- details of the design basis, see *Section 8/1.1.2*
- test conditions for the loading instrument

(c) detailed construction plans:
- cargo tank construction plans showing the variations in detail arrangements and scantlings of double bottom floors, double side webs and other transverse primary support members
- fore end
- aft end
- engine room construction including the engine and thrust bearing seating
- deckhouses and superstructures

(d) detail design plans except where the information is already included on plans listed in (a) and (c):
- sternframe
- hull penetration plans
- welding
- bilge keels
- booklet of standard design details
- anchoring and mooring equipment
- pillar and girder support arrangements for decks
- access arrangements through double bottom and side skin spaces in the cargo tank region
- details and arrangements of openings and attachments to the hull structure for means of access for inspection purposes

(e) plans detailing support structures except where the information is already included on plans listed in (a) to (d):

- anchoring windlass and chain stopper
- mooring winches
- masts, derrick posts or cranes
- emergency towing equipment
- other deck equipment or fittings

2.2.2.2 The following supporting documents are to be submitted:

(a) general arrangement

(b) capacity plan

(c) lines plan or equivalent

(d) dry-docking plan, where developed

(e) freeboard plan or equivalent, showing freeboards and items relative to the conditions of assignment

2.2.2.3 The following supporting calculations are to be submitted:

(a) calculation of the equipment number.

2.2.2.4 Plans of items not covered by these Rules are to be submitted according to the individual Classification Society requirements.

2.2.3 Plans to be supplied onboard the ship

2.2.3.1 One copy of the following plans indicating the new-building and renewal thickness for each structural item:

(a) main scantling plans as given in *2.2.2.1(a)*

(b) one copy of the final approved loading manual, see *2.1.1*

(c) one copy of the final loading instrument test conditions, see *Section 8/1.1.3*

(d) detailed construction plans as given in *2.2.2.1(c)*

(e) welding

(f) details of the extent and location of higher tensile steel together with details of the specification and mechanical properties, and any recommendations for welding, working and treatment of these steels

(g) details and information on use of special materials, such as aluminium alloy, used in the hull construction.

(h) towing and mooring arrangements plan, see *Section 11/3.1.6.16*

3 SCOPE OF APPROVAL

3.1 General

3.1.1 Rule application

3.1.1.1 Further to the information contained in *Section 1/1.1.2* and *Section 1/1.2.1*, the Rules cover the scantling requirements for the classification of new double hull tankers of 150m or greater in length.

3.1.1.2 The attention of owners, designers, and builders is directed to the regulations of international, national, canal, and other authorities dealing with those requirements which may affect structural aspects, in addition to or in excess of the classification requirements.

3.1.1.3 Other aspects of the structural design not covered by these Rules are to be addressed using the rules of the individual Classification Society.

3.2 Classification

3.2.1 General

3.2.1.1 The documentation, plans and data requirements specified in *Sub-Section 2* are to be submitted. Each individual Classification Society will review such documentation to verify compliance with the requirements.

3.2.1.2 An appropriate term to indicate that the plans, reports or documents have been reviewed for compliance with these Rules will be used according to the procedures of the individual Classification Society.

3.3 Requirements of National and International Regulations

3.3.1 Responsibility

3.3.1.1 It is the responsibility of the designer to ensure that the design complies with the current National and International regulations applicable to the vessel.

3.3.1.2 Classification Societies are not responsible for assessing compliance with International and National regulations as part of the general classification approval process. However, a Classification Society may enter into an agreement under which they are explicitly instructed to review and approve a vessel design for compliance with specified regulations. This approval may be accepted as proof of compliance on behalf of a Flag Administration provided the Classification Society has been designated as a suitable recognised by that Flag Administration in accordance with *SOLAS* Regulations XI/1.

3.3.2 Review procedure

3.3.2.1 When compliance is reviewed by the Flag Administration, the vessel is to be issued with certificates indicating compliance with National and International regulations by the Flag Administration. For ships with arrangements and equipment that are required to comply with the following requirements, and applicable amendments thereto, and where not issued by the Flag Administration, the applicable convention certificates are to be issued by the Classification Society or by an IACS member when authorised:

(a) *International Convention on Load Lines*, 1966

(b) *International Convention for the Safety of Life at Sea*, 1974, and its Protocol of 1978

(c) *International Convention for the Prevention of Pollution from Ships, 1973*, and as modified by the Protocol of 1978 relating thereto.

For dual class ships, convention certificates may be issued by either Classification Society with which the ship is classed, provided this is recognised in a formal dual class agreement with the Classification Societies classing the ship and that both societies are authorised by the Flag Administration.

4 EQUIVALENCE PROCEDURE

4.1 General

4.1.1 Rule applications

4.1.1.1 These Rules apply in general to double hull oil tankers of normal form, proportions, speed and structural arrangements. Relevant design parameters defining the assumptions made are given in *Section 2/3*.

4.1.1.2 The Rules are applicable to steel ships of welded construction. Other materials for use in hull construction will be specially considered.

4.1.1.3 Special consideration will be given to the application of the Rules incorporating design parameters which are outside the design basis of *Section 2/3*, for example:

(a) increased fatigue life

(b) increased corrosion additions

(c) increased cargo density.

4.1.2 Novel designs

4.1.2.1 Ships of novel design, i.e. those of unusual form, proportions, speed and structural arrangements outside those reflected in *Section 2/3.1.2* of these Rules will be specially considered according to the contents of this sub-section.

4.1.2.2 Information is be submitted to the Classification Society to demonstrate that the structural safety of the novel design is at least equivalent to that intended by the Rules.

4.1.2.3 In such cases, the Classification Society is to be contacted at an early stage in the design process to establish the applicability of the Rules and additional information required for submission.

4.1.2.4 Dependent on the nature of the deviation, a systematic review may be required to document equivalence with the Rules.

4.1.3 Alternative calculation methods

4.1.3.1 Where indicated in specific sections of the Rules, alternative calculation methods to those shown in the Rules may be accepted provided it is demonstrated that the scantlings and arrangements are of at least equivalent strength to those derived using the Rule calculation method.

5 CALCULATION AND EVALUATION OF SCANTLING REQUIREMENTS

5.1 Determination of Scantling Requirements for Plates

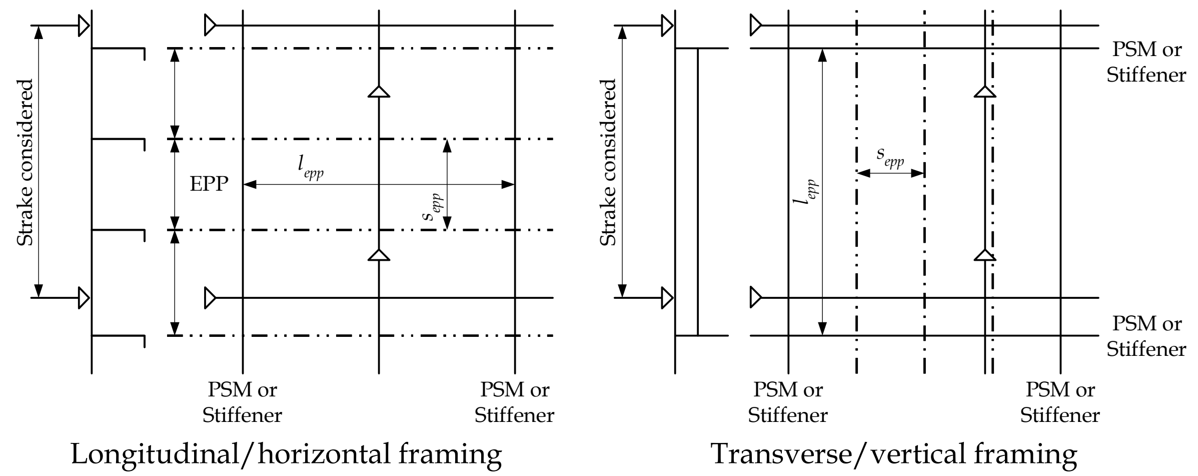
5.1.1 Determination of scantlings of plate strakes - idealisation of plate panels

5.1.1.1 Scantlings of plate strakes are to be derived based on the idealisation of the as-built structure as a series of Elementary Plate Panels (EPP).

5.1.1.2 An EPP is the unstiffened part of the plating between stiffeners. The plate panel length, l_{epp}, and breadth, s_{epp}, of the EPP are defined in relation to the longest and shortest plate edges respectively, as shown in *Figure 3.5.1*.

5.1.1.3 For strength assessment, the idealisation of EPP may be different and take into account the mesh arrangement in the FEM model.

Figure 3.5.1
Elementary Plate Panel Definition



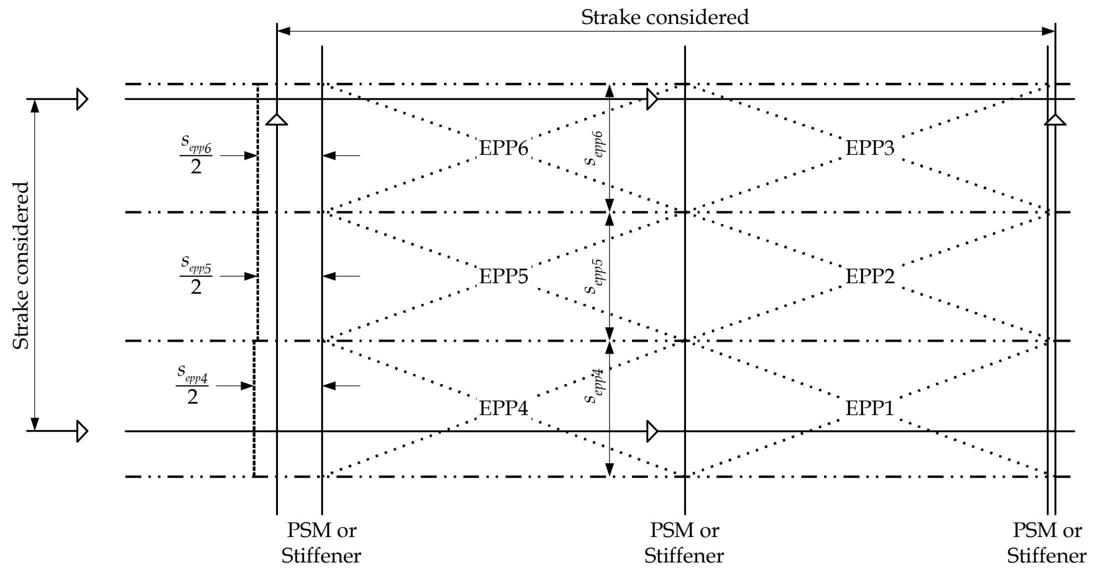
5.1.1.4 The required scantling of a plate strake is to be taken as the greatest value required for each EPP within that strake as given by:

(a) an EPP positioned entirely within the strake boundaries, e.g. EPP2 in *Figure 3.5.2*

(b) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the long edge of the EPP, e.g. EPP1, 3, 4 and 6 in *Figure 3.5.2*

(c) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the short edge of the EPP within more than half the EPP breadth, s_{epp}, from the edge, e.g. EPP1 and EPP2 in *Figure 3.5.3(a)*.

Figure 3.5.2
Determining Elementary Plate Panels for a Strake



5.1.2 Determination of scantlings of elementary plate panels for scantling requirements

5.1.2.1 The required scantling of each elementary plate panel is to be calculated based on a Load Calculation Point (LCP) defined as:

(a) for longitudinal framing, at the mid length of the EPP measured along the global x-axis at its lower edge. For horizontal plating the load calculation point is to be taken at the outboard y-value of the EPP. See *Figure 3.5.3(a)*

(b) for transverse framing, at the mid length of the EPP measured along the global x-axis at the lower edge of strake. For horizontal plating the load calculation point is to be taken at the outboard y-value of the EPP. See *Figure 3.5.3(b)*

(c) for horizontal framing on vertical transverse structure, at the lower edge of the elementary plate panel at the point of outboard y-value of the EPP. See *Figure 3.5.3(c)*

(d) for vertical framing on vertical transverse structure, at the greatest y-value of the lower edge of the EPP or at the lower edge of strake. See *Figure 3.5.3(d)*

5.1.2.2 Both the local pressure and hull girder stress used for the calculation of the local scantling requirements are to be taken at the LCP.

5.1.3 Determination of scantlings of elementary plate panels for hull girder strength

5.1.3.1 The required scantlings of the elementary plate panels are to satisfy the hull girder bending and hull girder shear requirements of *Section 8/1*.

5.1.3.2 The required thickness of each elementary plate panel, with respect to buckling, is to be calculated based on stresses taken at the mid length of the EPP measured along the global x-axis.

5.1.3.3 The buckling evaluation is to be calculated using the stress distribution across the width of the panel defined with a reference stress taken at the edge with maximum stress and reduced stress at the other edge given as a fraction, Ψ, defined in *Table 10.3.1*, of the reference stress.

5.1.3.4 The required scantling of a plate strake is to be taken as the greatest value required for each EPP within that strake as given by:

(a) an EPP positioned entirely within the strake boundaries, e.g. EPP2 in *Figure 3.5.2*

(b) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the long edge of the EPP, e.g. EPP 1, 3, 4 and 6 in *Figure 3.5.2*

(c) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the short edge of the EPP within more than half the EPP breadth, S_{epp}, from the edge, e.g. EPP 1 and 2 in *Figure 3.5.3(a)*.

5.1.4 Determination of scantlings of elementary plate panels for FEM strength assessment

5.1.4.1 The required scantlings of elementary plate panels are to be derived from the plate mesh element with maximum utilisation, see *Section 9/2*.

Figure 3.5.3
Example of Load Calculation Point for Typical Structural Configurations

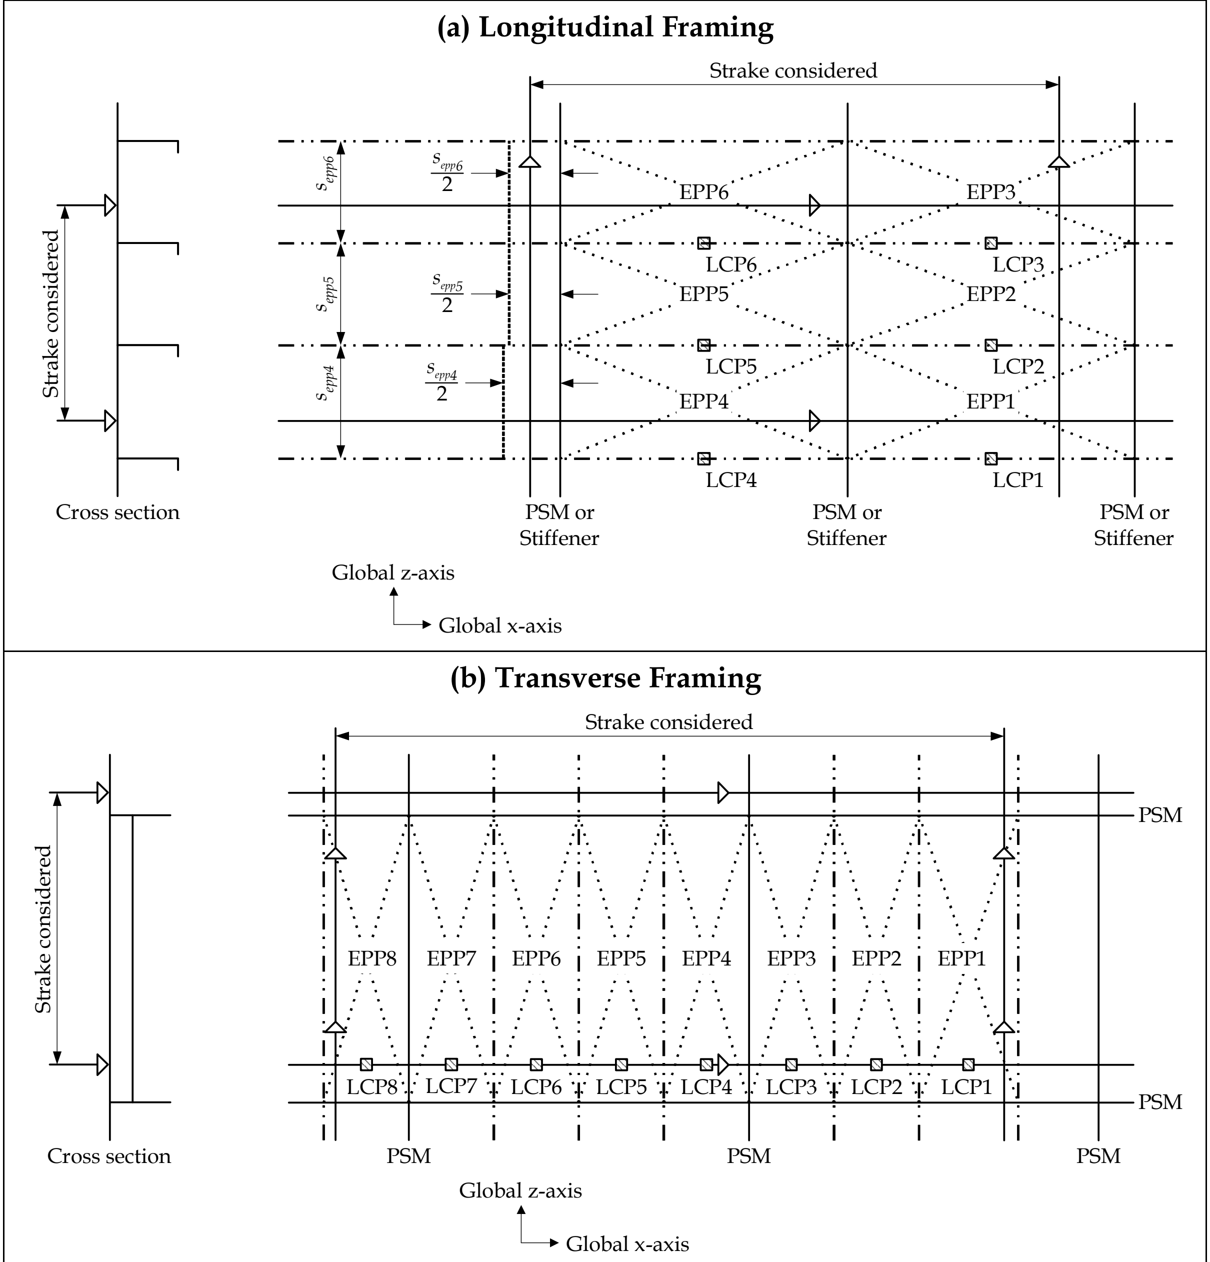


Figure 3.5.3 (Continued)
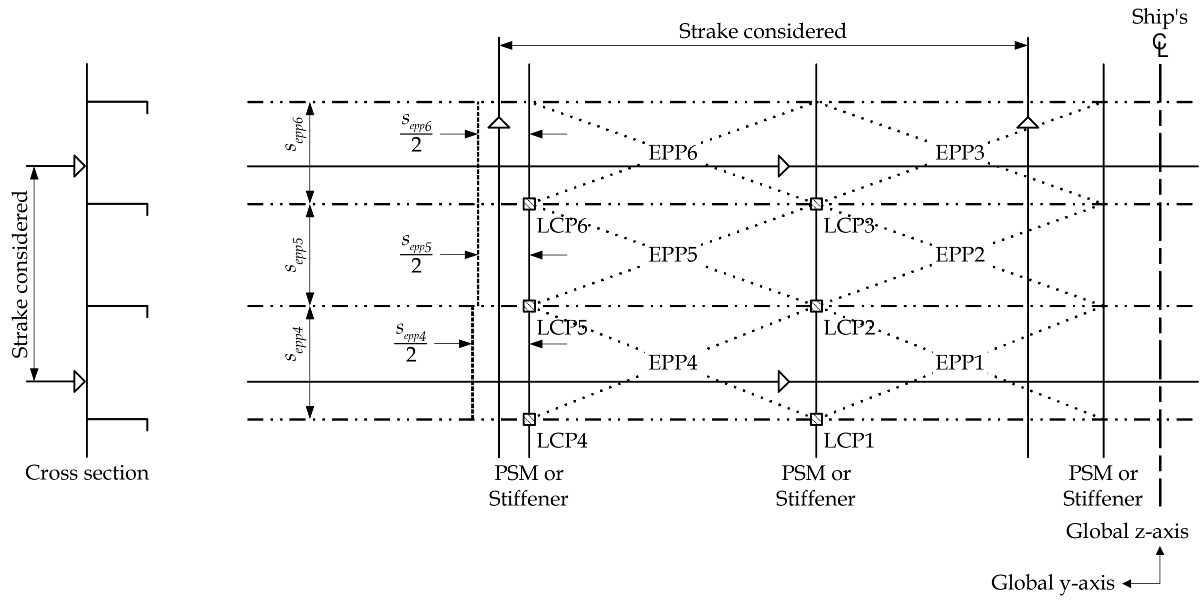
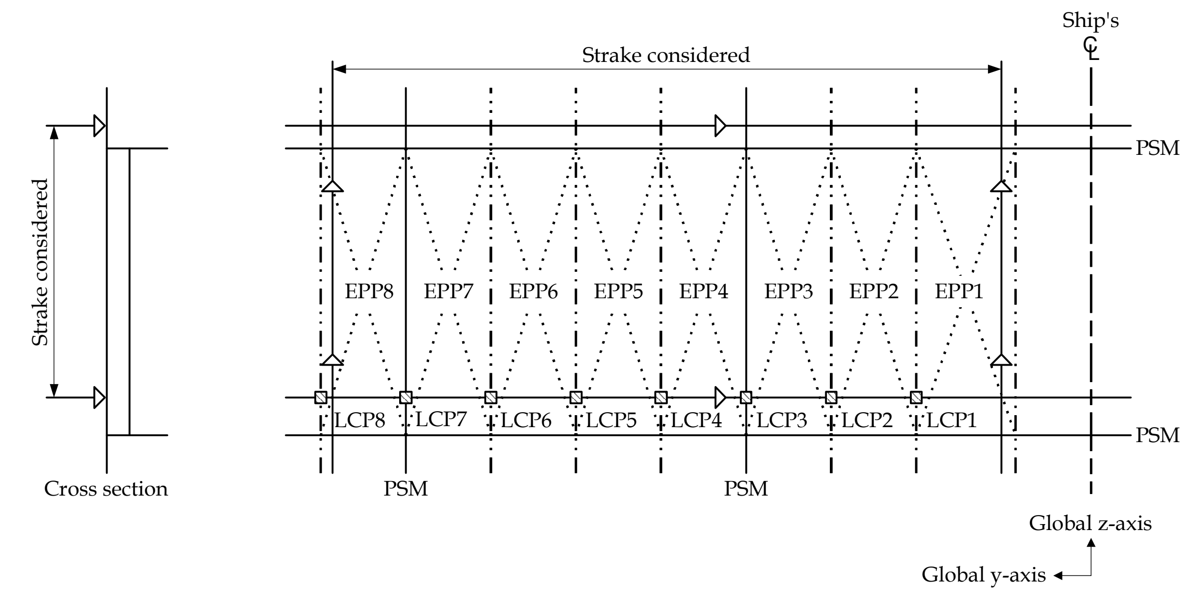
Example of Load Calculation Point for Typical Structural Configurations

(c) Horizontal Framing on Transverse Structure



(d) Vertical Framing on Transverse Structure



5.2 Determination of Scantlings of Stiffeners

5.2.1 Determination of scantlings of stiffeners - idealisation of stiffeners

5.2.1.1 Scantlings of individual stiffeners are to be derived based on the idealisation of the as-built structure as a series of stiffened panels.

5.2.1.2 A stiffened panel consists of a single idealised stiffener profile and effective plate flange supporting a boundary of one or more elementary plate panels. The arrangement of stiffened panels is based on the idealisation of the structure according to the elementary plate panel definition in *5.1.1*.

5.2.1.3 Scantlings of stiffeners based on requirements in *Section 8* may be decided based on the concept of grouping designated sequentially placed stiffeners of equal scantlings. The scantling of the group is to be taken as the greater of the following:

(a) the average of the required scantling of all stiffeners within a group

(b) 90% of the maximum scantling required for any one stiffener within the group.

The concept of grouping is not applicable to fatigue requirements as given in *Section 9/3* and *Appendix C.*

5.2.2 Determination of scantlings of stiffened panels for scantling requirements and fatigue

5.2.2.1 The required scantling of a stiffened panel is to be based on a pressure load calculation point defined as:

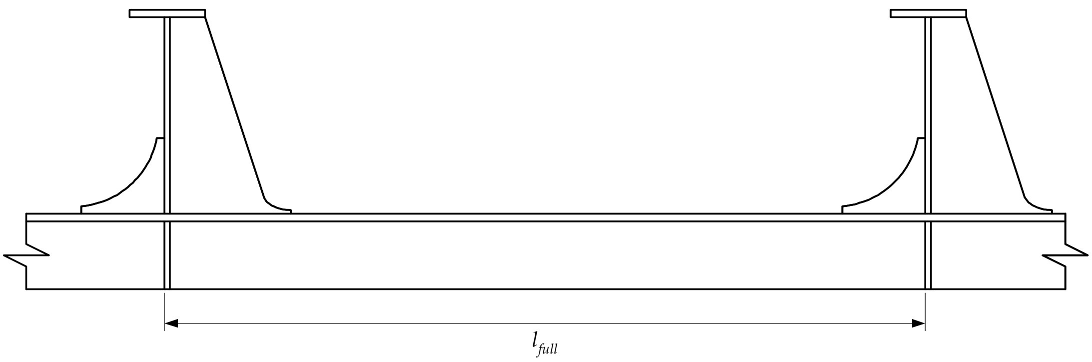
(a) mid point of the overall span, l_{full}, of the stiffener between primary support members, see *Figure 3.5.4*

(b) at the connection of the stiffener to the plating.

Figure 3.5.4
Definition of Overall Span of Stiffeners, l_{full}

Double Skin Construction

Single Skin Construction



5.2.2.2 For longitudinal and horizontal framing the design pressure is to be taken as the pressure at the mid point of the overall span.

5.2.2.3 For transverse and vertical framing the design pressure is to be taken as the greater of the following:

P_{ms} kN/m²

$\frac{(P_{end-1}+P_{end-2})}{2}$ kN/m²

Where:

P_{ms} calculated pressure at mid point of overall span, l_{full}, in kN/m²

P_{end-1} calculated pressure at 1st end of overall span, in kN/m²

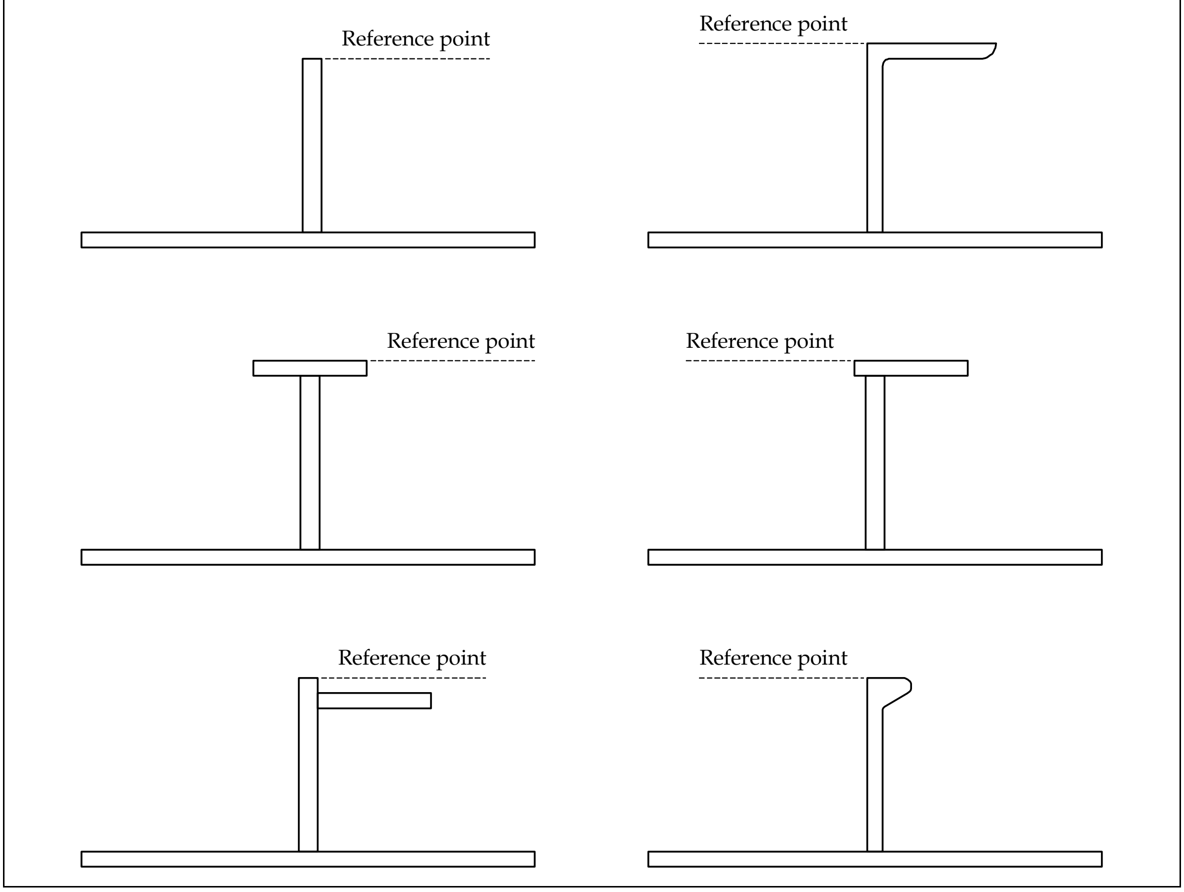
P_{end-2} calculated pressure at 2nd end of overall span, in kN/m²

l_{full} overall span, in m, see *Figure 3.5.4*

5.2.2.4 The section modulus requirements given in these Rules relate to the reference point giving the minimum section modulus. In general, this will be on the outer surface of the faceplate. The reference point for calculation of section modulus for typical profiles is shown in *Figure 3.5.5*.

5.2.2.5 The hull girder stress used for calculation of local scantling requirements for stiffeners is to be taken at the reference point as shown in *Figure 3.5.5*

Figure 3.5.5
Reference Point for Calculation of Section Modulus and Hull Girder Stress for Local Scantling Assessment



5.2.3 Determination of scantlings of stiffened panels for hull girder buckling strength

5.2.3.1 The required scantling of a stiffened panel, with respect to buckling, is to be based on the axial stress calculated at the attachment point of the stiffener to the plate and at the mid length of the stiffener measured along the global x-axis.

5.2.3.2 The required scantling as given in *5.2.3.1* applies to stiffeners outside of a distance s from the support, where *s* is the stiffener spacing.

5.2.4 Determination of scantlings of stiffened panels for FEM strength assessment

5.2.4.1 The required scantlings of the stiffened panel are to be based on the derivation of applied stresses in accordance with *Section 9/2*.

5.2.5 Shear area requirements of stiffeners

5.2.5.1 Requirements for the shear area and/or web thickness of stiffeners are given in *Section 8*.

5.2.5.2 The requirements in *Section 8* are to be calculated based on the load point defined in *5.2.2* and the effective span as given in *Section 4/2.1.2*.

5.2.5.3 The requirements in *Section 8* are to be evaluated against the actual shear area of the stiffener, based on the effective shear height of the stiffener as given in *Section 4/2.4.2* and based on the specified minimum yield of the stiffener.

5.2.5.4 The effect of brackets may be included in the calculation of the effective span, but no part of the bracket is to be included in the calculation of the actual shear area.

5.2.6 Bending requirements of stiffeners

5.2.6.1 Requirements for the section modulus and moment of inertia of stiffeners are given in *Section 8*.

5.2.6.2 The requirements in *Section 8* are to be calculated based on the load point defined in *5.2.1* and the effective span as given in *Section 4/2.1.1*.

5.2.6.3 The requirements in *Section 8* are to be evaluated against the actual section modulus/moment of inertia of the stiffener. The stiffener web and flanges are to be included in the calculation of actual sectional properties.

5.2.6.4 The effect of brackets may be included in the calculation of the effective span, but no part of the bracket is to be included in the calculation of section modulus/moment of inertia.

5.2.6.5 When the stiffener is of a higher strength material than the attached plate, the yield stress used for the calculation of the section modulus requirements in *Section 8* is in general not to be greater than 1.35 times the minimum specified yield stress of the attached plate. If the yield stress of the stiffener exceeds this limitation the following criterion is to be satisfied:

$$\sigma_{yd-stf} \leq \left(\sigma_{yd-plt} - |\sigma_{hg}|\right)\frac{Z_{net-plt}}{Z_{net}} + |\sigma_{hg}| \quad \text{N/mm}^2$$

Where:

$\sigma_{yd\text{-}stf}$ specified minimum yield stress of the material of the stiffener, in N/mm^2

$\sigma_{yd\text{-}plt}$ specified minimum yield stress of the material of the attached plate, in

N/mm²

σ_{hg} maximum hull girder stress of sagging and hogging (S+D), in N/mm², as defined in *Table 8.2.5* and *Table 8.4.3* for stiffeners in cargo tank region and machinery spaces respectively and not to be taken as less than 0.4 $\sigma_{yd\text{-}plt}$

Z_{net} net section modulus, in way of face plate/free edge of the stiffener, in cm³

$Z_{net\text{-}plt}$ net section modulus, in way of the attached plate of stiffener, in cm³

5.2.7 Evaluation of slanted stiffeners

5.2.7.1 The shear area and section modulus requirements for local support members are valid about an axis parallel to the plate flange. If the angle φ_w between the stiffener web and the attached plating is less than 75 degrees, see *Figure 4.2.14*, then the actual shear area and section modulus is to be adjusted in accordance with *Sections 4/2.4.2* and *2.4.3*. The angle between the stiffener web, φ_w, and the attached plating is not to be less than 50 degrees.

5.3 Calculation and Evaluation of Scantling Requirements for Primary Support Members

5.3.1 Load application point for primary support members

5.3.1.1 The design pressure for primary support members is generally taken at the mid point of the load area. The design pressures for the primary support members are defined for individual members as given in *Section 8*.

5.3.2 Shear requirements of primary support members

5.3.2.1 Requirements for shear area and/or web thickness of primary support members are given in *Section 8*.

5.3.2.2 These requirements are to be calculated based on the load point defined in *5.3.1* and the effective span as given in *Section 4/2.1.5*.

5.3.2.3 These requirements are to be evaluated against the actual shear area and the specified minimum yield of the web plate of the primary support member. The actual shear area of the primary support member is defined in *Section 4/2.5.1*. The effect of brackets may be included in the calculation of effective span, but are not to be included in the calculation of actual shear area.

5.3.3 Bending requirements of primary support members

5.3.3.1 Requirements for section modulus and moment of inertia of primary support members are given in *Section 8* and *Section 10*, respectively.

5.3.3.2 These requirements are to be calculated based on the load point defined in *5.3.1* and the effective span as given in *Section 4/2.1.4*.

5.3.3.3 These requirements are to be evaluated against the actual section modulus/moment of inertia of the primary support member. Web and flanges are included in the calculation of actual sectional properties. The effect of brackets may be included in calculation of effective span, but are not to be included in the calculation of section modulus/moment of inertia.

5.3.3.4 Where it is impracticable to fit a primary support member with the required web depth, then it is permissible to fit a member with reduced depth provided that the fitted member has equivalent moment of inertia or deflection to the required

member. The required equivalent moment of inertia is to be based on an equivalent section given by the effective width of plating at mid span with required plate thickness, web of required depth and thickness and face plate of sufficient width and thickness to satisfy the required mild steel section modulus. All other rule requirements, such as minimum thicknesses, slenderness ratio, section modulus and shear area, are to be satisfied for the member of reduced depth. The equivalent moment of inertia may be also demonstrated by an equivalent member having the same deflection as the required member.

5.4 Rounding of Calculated Thickness

5.4.1 Required gross thickness

5.4.1.1 The minimum required gross thickness of any member to be fitted at the new-building stage, exclusive of any owners' extras, is to be taken as the rounded net thickness required plus the appropriate corrosion addition.

5.4.1.2 The required net thickness is given by rounding the calculated net thickness to the nearest half millimetre. For example:

(a) for $10.75 \le t_{calc\text{-}net} < 11.25$ mm the Rule required thickness is 11mm

(b) for $11.25 \le t_{calc\text{-}net} < 11.75$ mm the Rule required thickness is 11.5mm.

SECTION 4

BASIC INFORMATION

1 DEFINITIONS

1.1 Principal Particulars

1.1.1 *L*, rule length

1.1.1.1 *L*, the rule length, is the distance on the waterline at the scantling draught, from the forward side of the stem to the centreline of the rudder stock, in metres. *L* is not to be less than 96%, and need not be greater than 97%, of the extreme length on the summer load waterline. In ships with an unusual stern and bow arrangement the length, *L*, will be specially considered.

1.1.2 L_L, load line length

1.1.2.1 L_L, the load line length is defined in the *International Convention on Load Lines*.

1.1.3 Moulded breadth

1.1.3.1 *B*, the moulded breadth, is the maximum breadth of the ship, measured amidships to the moulded line of the frame, in metres.

1.1.4 Moulded depth

1.1.4.1 *D*, the moulded depth, is the vertical distance, in metres, amidships, from the moulded baseline to the moulded deck line of the uppermost continuous deck measured at deck at side. On vessels with a rounded gunwale, *D* is to be measured to the continuation of the moulded deck line.

1.1.5 Draughts

1.1.5.1 *T*, the draught in metres, is the summer load line draught for the ship in operation, measured from the moulded base line at amidships. Note this may be less than the maximum permissible summer load waterline draught.

1.1.5.2 T_{bal}, is the minimum design ballast draught, in metres, at which the strength requirements for the scantlings of the ship are met. The minimum design ballast draught is not to be greater than the minimum draught of ballast conditions including ballast water exchange operation, measured from the moulded base line at amidships, for any ballast loading condition in the loading manual including both departure and arrival conditions.

1.1.5.3 T_{bal-n}, the normal ballast draught in metres, is the draught at departure given for the normal ballast condition in the loading manual, measured from the moulded base line at amidships, see *Section 8/1.1.2.3*. The normal ballast condition is the ballast condition in compliance with condition specified in *Section 8/1.1.2.2 a)*.

1.1.5.4 T_{full}, the full load design draught in metres, is the draught at departure given for the homogeneous full load condition in the loading manual, measured from the moulded base line at amidships, see *Section 8/1.1.2.3*.

1.1.5.5 T_{sc}, is the maximum design draught, in metres, at which the strength requirements for the scantlings of the ship are met.

1.1.6 Amidships

1.1.6.1 Amidships is to be taken as the middle of the rule length, *L*.

1.1.7 Moulded displacement

1.1.7.1 Δ, the moulded displacement, in tonnes, corresponding to the underwater volume of the ship, at draught T_{sc}, in sea water with a density of 1.025t/m^3.

1.1.8 Maximum service speed

1.1.8.1 V, the maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest sea-going draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

1.1.9 Block coefficient

1.1.9.1 C_b, the block coefficient at the scantling draught, is defined as:

$$C_b = \frac{\nabla}{L B_{WL} T_{sc}}$$

Where:

∇	moulded displacement volume at the scantling draught, in m^3
L	rule length, as defined in *1.1.1.1*
B_{WL}	moulded breadth measured amidships, in m, at the scantling draught waterline
T_{sc}	scantling draught, as defined in *1.1.5.5*

1.1.9.2 C_{b-LC}, the block coefficient at considered loading condition, is defined as:

$$C_{b-LC} = \frac{\nabla_{LC}}{L B_{WL} T_{LC}}$$

Where:

∇_{LC}	moulded displacement volume at the T_{LC}, in m^3
L	rule length, as defined in 1.1.1.1
B_{WL}	moulded breadth measured amidships, in m, at the T_{LC}
T_{LC}	draught at amidships, in m, in the loading condition being considered.

1.1.10 Length between perpendiculars

1.1.10.1 L_{pp}, the length between perpendiculars, is the distance, in metres, on the scantling draught waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post.

1.1.11 The forward perpendicular

1.1.11.1 F.P., the forward perpendicular, is the perpendicular at the intersection of the scantling draught waterline with the fore side of the stem. The F.P. is the forward end of the rule length, L.

1.1.12 The aft perpendicular

1.1.12.1 A.P., the aft perpendicular, is the perpendicular at the aft end of the rule length, L, measured from the F.P.

1.1.13 Load line block coefficient

1.1.13.1 C_{bL}, the load line block coefficient, is defined in the *International Convention on Load Lines* as follows:

$$C_{bL} = \frac{\nabla_L}{L_L B T_L}$$

Where:

∇_L	moulded displacement volume at the moulded draught, T_L, in m^3
L_L	load line length, as defined in *1.1.2.1*
B	moulded breadth, in m, as defined in *1.1.3.1*
T_L	the moulded draught measured to the waterline at 85 per cent of the least moulded depth, in m

1.1.14 Deadweight

1.1.14.1 DWT, is the deadweight of the ship, in tonnes, floating in water with a specific gravity of 1.025, at the summer load line draught.

1.2 Position 1 and Position 2

1.2.1 Position 1

1.2.1.1 Position 1 is defined as any location upon exposed freeboard and raised quarterdecks, and exposed superstructure decks within the forward $0.25L_L$.

1.2.2 Position 2

1.2.2.1 Position 2 is defined as any location upon exposed superstructure decks abaft the forward $0.25L_L$.

1.3 Type 'A' and Type 'B' Freeboard Ships

1.3.1 ICLL definition

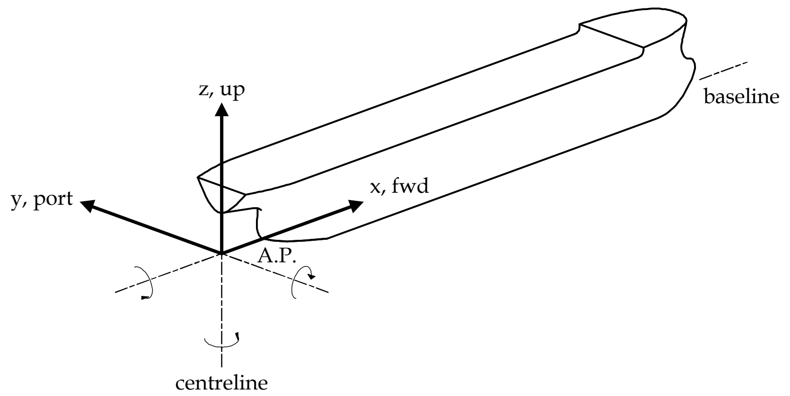
1.3.1.1 A Type 'A' or Type 'B' freeboard ship is as defined in the *International Convention on Load Lines*.

1.4 Coordinate System

1.4.1 Origin and orientation

1.4.1.1 The coordinate system used within these Rules is shown in *Figure 4.1.1*. Motions and displacements are considered positive in the forward, up and to port direction. Angular motions are considered positive in the clockwise direction about the x, y or z axis.

Figure 4.1.1
Coordinate System



1.5 Naming Convention

1.5.1 Bulkhead nomenclature

1.5.1.1 *Figures 4.1.2*, *4.1.3* and *4.1.4* show the common structural nomenclature used within these Rules.

Figure 4.1.2
Corrugated Transverse Bulkhead Nomenclature

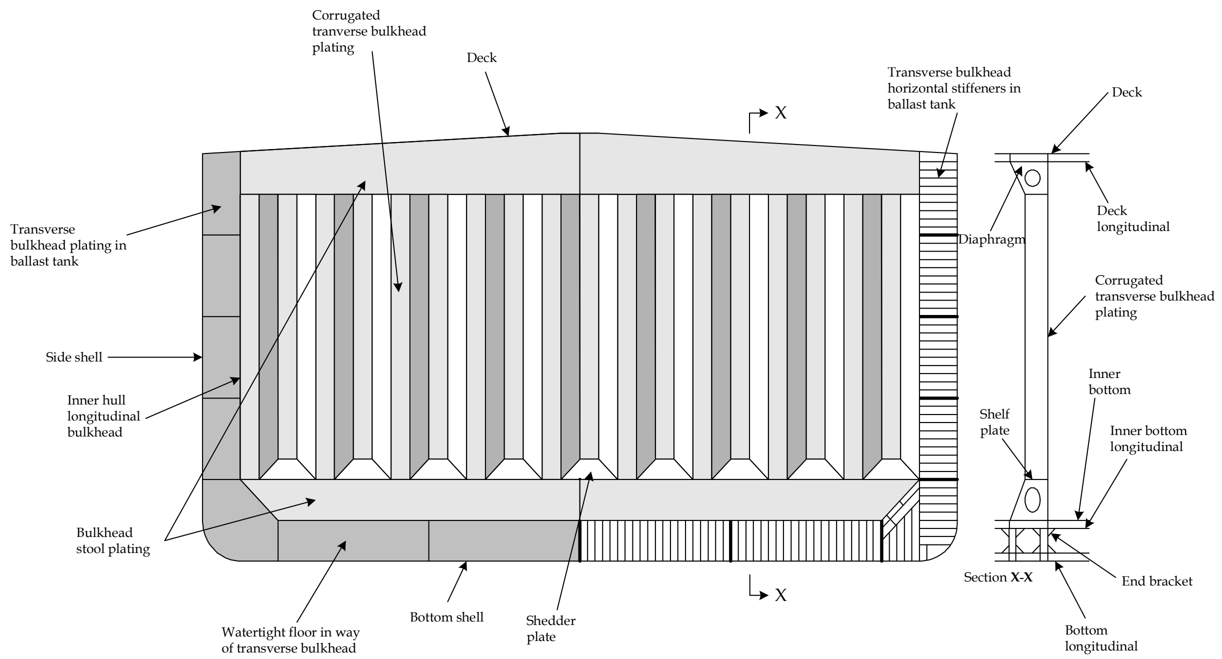


Figure 4.1.3
Flat Transverse Bulkhead Nomenclature

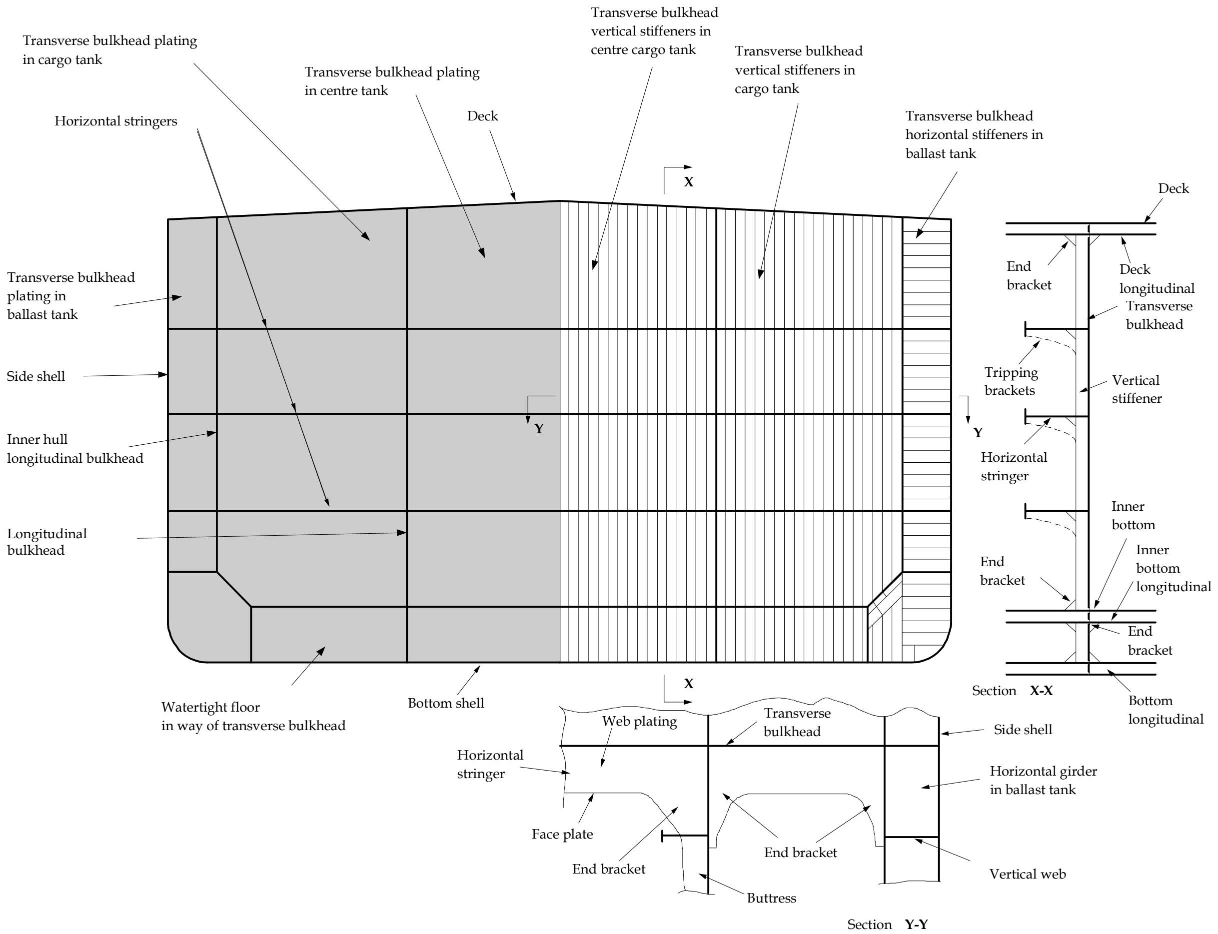

Figure 4.1.4
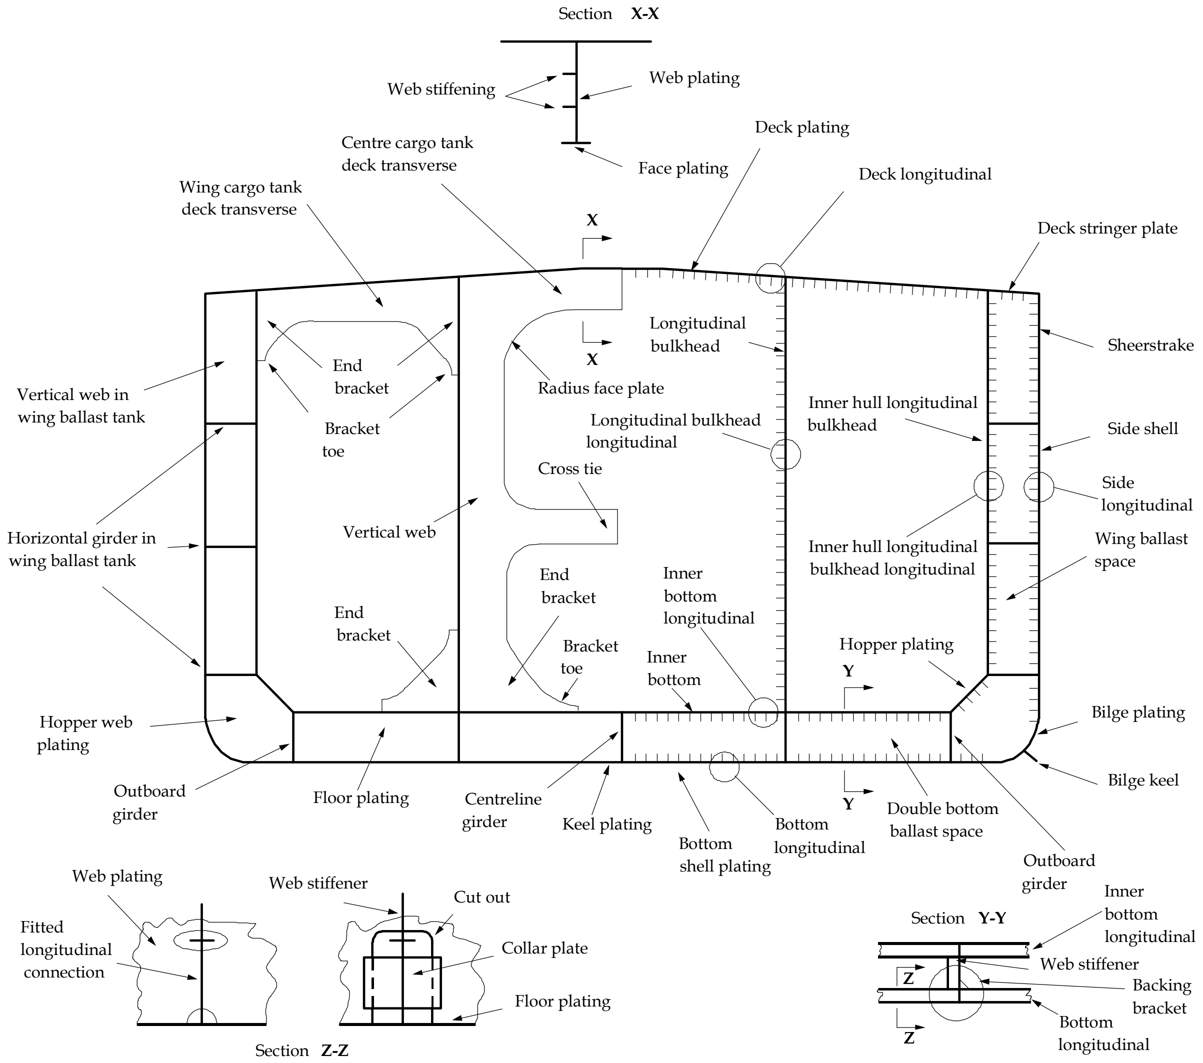
Mid Cargo Hold Transverse Section



1.6 Symbols

1.6.1 General

1.6.1.1 The symbols and subscripts used within these Rules are defined locally. The principal particulars, as defined in *1.1*, may be referred to within text without reference.

1.7 Units

1.7.1 General

1.7.1.1 The following units are used within these Rules. The units to be used within equations are given locally.

(a) General:

- dimensions/distances	m
- primary spacings	m
- secondary spacings	mm
- area	m^2

- volume m^3
- mass t
- velocity m/s
- acceleration m/s^2

(b) Hull girder properties:

- dimensions m
- area m^2
- section modulus m^3
- moment of inertia m^4
- moment of area m^3

(c) Stiffener properties:

- dimensions mm
- area cm^2
- section modulus cm^3
- inertia cm^4
- length/effective length m
- span m

(d) Plating dimensions:

- breadth mm
- length m
- thickness mm

(e) Loads:

- pressures kN/m^2
- loads kN
- bending moment kNm
- shear force kN

(f) Miscellaneous:

- yield strength N/mm^2
- stress N/mm^2
- deflections mm
- modulus of elasticity N/mm^2
- density t/m^3
- displacement t
- angle deg
- calculated angle rad
- period s
- frequency Hz
- ship speed knots

1.8 Glossary

1.8.1 Definitions of terms

1.8.1.1 The terms in *Table 4.1.1* are used within these Rules to describe the items which their respective definitions describe.

Table 4.1.1
Definitions of Terms

Terms	Definition
Accommodation deck	A deck used primarily for the accommodation of the crew
Accommodation ladder	A portable set of steps on a ship's side for people boarding from small boats or from a pier
Aft peak	The area aft of the aft peak bulkhead
Aft peak bulkhead	The first main transverse watertight bulkhead forward of the stern
Aft peak tank	The compartment in the narrow part of the stern aft of the aft peak bulkhead
Anchor	a device which is attached to anchor chain at one end and lowered into the sea bed to hold a ship in position; it is designed to grip the bottom when it is dragged by the ship trying to float away under the influence of wind and current; usually made of heavy casting or casting
Ballast tank	A compartment used for the storage of water ballast
Bay	The area between adjacent transverse frames or transverse bulkheads
Bilge keel	A piece of plate set perpendicular to a ship's shell along the bilges to reduce the rolling motion
Bilge plating	The area of curved plating between the bottom shell and side shell. To be taken as follows: From the start of the curvature at the lower turn of bilge on the bottom to the lesser of, the end of curvature at the upper turn of the bilge on the side shell or 0.2D above the baseline/local centreline elevation
Bilge strake	The lower strake of bilge plating
Boss	The boss of propeller is the central part to which propeller blades are attached and through which the shaft end passes
Bottom shell	The shell envelope plating forming the predominantly flat bottom portion of the shell envelope including the keel plate
Bow	The structural arrangement and form of the forward end of the ship
Bower Anchor	An anchor carried at the bow of the ship
Bracket	An extra structural component used to increase the strength of a joint between two structural members
Bracket toe	The narrow end of a tapered bracket
Breakwater	Inclined and stiffened plate structure on a weather deck to break and deflect the flow of water coming over the bow
Breast hook	A triangular plate bracket joining port and starboard side structural members at the stem
Bridge	An elevated superstructure having a clear view forward and at each side, and from which a ship is steered
Bulb profile	A stiffener utilising an increase in steel mass on the outer end of the web instead of a separate flange
Bulkhead	A structural partition wall sub-dividing the interior of the ship into compartments
Bulkhead deck	The uppermost continuous deck to which transverse watertight bulkheads and shell are carried
Bulkhead stool	The lower or upper base of a corrugated bulkhead

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Bulkhead structure	The transverse or longitudinal bulkhead plating with stiffeners and girders
Bulwark	The vertical plating immediately above the upper edge of the ship's side surrounding the exposed deck(s)
Bunker	A compartment for the storage of fuel oil used by the ship's machinery
Cable	A rope or chain attached to the anchor
Camber	The upward rise of the weather deck from both sides towards the centreline of the ship
Cargo tank bulkhead	A boundary bulkhead separating cargo tanks
Cargo area	The part of the ship that contains cargo tanks and cargo/slop tanks and adjacent areas including ballast tanks, fuel tanks, cofferdams, void spaces and also including deck areas throughout the entire length and breadth of the part of the ship over the mentioned spaces. It includes the collision bulkhead and the transverse bulkhead at the aft end of the cargo block.
Carlings	A stiffening member used to supplement the regular stiffening arrangement
Casing	The covering or bulkhead around or about any space for protection
Cellular construction	A structural arrangement where there are two closely spaced boundaries and internal diaphragm plates arranged in such a manner to create small compartments
Centreline girder	A longitudinal member located on the centreline of the ship
Chain	Connected metal rings or links used for holding anchor, fastening timber cargoes, etc.
Chain locker	A compartment usually at the forward end of a ship which is used to store the anchor chain
Chain pipe	A section of pipe through which the anchor chain enters or leaves the chain locker
Chain stopper	A device for securing the chain cable when riding at anchor as well as securing the anchor in the housed position in the hawse pipe, thereby relieving the strain on the windlass
Coaming	The vertical boundary structure of a hatch or skylight
Cofferdams	The spaces between two bulkheads or decks primarily designed as a safeguard against leakage of oil from one compartment to another
Collar plate	A patch used to, partly or completely, close a hole cut for a longitudinal stiffener passing through a transverse web
Collision bulkhead	The foremost main transverse watertight bulkhead
Companionway	A weathertight entrance leading from a ship's deck to spaces below
Compartment	An internal space bounded by bulkheads or plating
Confined space	A space identified by one of the following characteristics: limited openings for entry and exit, unfavourable natural ventilation or not designed for continuous worker occupancy
Corrugated bulkhead	A bulkhead comprised of plating arranged in a corrugated fashion
Cross ties	Large transverse structural members joining longitudinal bulkheads and used to support them against hydrostatic and hydrodynamic loads
Deck	A horizontal structure element that defines the upper or lower boundary of a compartment
Deck house	A decked structure other than a superstructure, located on the freeboard deck or above.
Deck structure	The deck plating with stiffeners, girders and supporting pillars

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Deep tank	any tank which extends between two decks or the shell/inner bottom and the deck above or higher
Discharges	Any piping leading through the ship's sides for conveying bilge water, circulating water, drains etc.
Docking bracket	A bracket located in the double bottom to locally strengthen the bottom structure for the purposes of docking
Double bottom structure	The shell plating with stiffeners below the top of the inner bottom and other elements below and including the inner bottom plating
Doubler	Small piece of plate which is attached to a larger area of plate that requires strengthening in that location. Usually at the attachment point of a stiffener
Double skin member	Double skin member is defined as a structural member where the idealized beam comprises webs, with top and bottom flanges formed by attached plating
Duct keel	A keel built of plates in box form extending the length of the cargo tank. It is used to house ballast and other piping leading forward which otherwise would have to run through the cargo tanks
Enclosed superstructure	The superstructure with bulkheads forward and/or aft fitted with weather tight doors and closing appliances
Engine room bulkhead	A transverse bulkhead either directly forward or aft of the engine room
Face plate	The section of a stiffening member attached to the plate via a web and is usually parallel to the plated surface
Flange	The section of a stiffening member, typically attached to the web, but is sometimes formed by bending the web over. It is usually parallel to the plated surface
Flat bar	A stiffener comprising only of a web
Floor	A bottom transverse member
Forecastle	A short superstructure situated at the bow
Fore peak	The area of the ship forward of the collision bulkhead
Fore peak deck	A short raised deck extending aft from the bow of the ship
Freeboard deck	Generally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all exposed openings
Freeing port	An opening in the bulwarks to allow water shipped on deck to run freely overboard
Gangway	The raised walkway between superstructure, such as between the forecastle and bridge, or between the bridge and poop
Girder	A collective term for primary supporting structural members
Gudgeon	A block with a hole in the centre to receive the pintle of a rudder; located on the stern post, it supports and allows the rudder to swing
Gunwale	The upper edge of the ship's sides
Gusset	A plate, usually fitted to distribute forces at a strength connection between two structural members
Hatch ways	Openings, generally rectangular, in a ship's deck affording access into the compartment below
Hawse pipe	Steel pipe through which the hawser or cable of anchor passes, located in the ship's bow on either side of the stem, also known as spurling pipe
Hawser	Large steel wire or fibre rope used for towing or mooring
Hopper plating	Plating running the length of a compartment sloping between the inner bottom and vertical portion of inner hull longitudinal bulkhead
HP	Holland Profile

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Independent tank	A self supporting tank
Inner hull	The innermost plating forming a second layer to the hull of the ship
Intercostal	Longitudinal member between the floors or frames of a ship; it is non-continuous
JIS	Japanese industrial standard profile
Keel	The main structural member or backbone of a ship running longitudinal along centreline of bottom. Usually a flat plate stiffened by a vertical plate on its centreline inside the shell
Knuckle	A discontinuity in a structural member
Lightening hole	A hole cut in a structural member to reduce its weight
Limber hole	A small drain hole cut in a frame or plate to prevent water or oil from collecting
Local support members	Local support members are defined as local stiffening members which only influence the structural integrity of a single panel, e.g. deck beams
Longitudinal centreline bulkhead	A longitudinal bulkhead located on the centreline of the ship
Longitudinal hull girder structural members	Structural members that contribute to the longitudinal strength of the hull girder, including: deck, side, bottom, inner bottom, inner hull longitudinal bulkheads including upper sloped plating where fitted, hopper, bilge plate, longitudinal bulkheads, double bottom girders and horizontal girders in wing ballast tanks
Longitudinal hull girder shear structural members	Structural members that contribute to strength against hull girder vertical shear loads, including: side, inner hull longitudinal bulkheads, hopper, longitudinal bulkheads and double bottom girders
Manhole	A round or oval hole cut in decks, tanks, etc., for the purpose of providing access
Margin plate	The outboard strake of the inner bottom and when turned down at the bilge the margin plate (or girder) forms the outer boundary of the double bottom
Notch	A discontinuity in a structural member caused by welding
Oil fuel tank	A tank used for the storage of fuel oil
Pillar	A vertical support placed between decks where the deck is unsupported by the shell or bulkhead
Pintle	Vertical pin on a rudder's forward edge that enables the rudder to hang onto the stern post and swing when it fits into the gudgeon
Pipe tunnel	The void space running in the midships fore and aft lines between the inner bottom and shell plating forming a protective space for bilge, ballast and other lines extending from the engine room to the tanks
Poop	The space below an enclosed superstructure at the extreme aft end of a ship
Poop deck	The first deck above the shelter deck at the aft end of a ship
Primary support members	Members of the beam, girder or stringer type which ensure the overall structural integrity of the hull envelope and tank boundaries, e.g. double bottom floors and girders, transverse side structure, deck transverses, bulkhead stringers and vertical webs on longitudinal bulkheads
Rudder	A device, usually of an aerofoil or flat section, that is used to steer a ship. A common type has a vertical fin at the stern and is able to move from 35 degrees port to 35 degrees starboard; rudders are characterised by their area, aspect ratio, and shape

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Scallop	A hole cut into a stiffening member to allow continuous welding of a plate seam
Scarfing bracket	A bracket used between two offset structural items
Scantlings	The physical dimensions of a structural item
Scupper	Any opening for carrying off water from a deck, either directly or through piping
Scuttle	A small opening in a deck or elsewhere, usually fitted with a cover or lid or a door for access to a compartment
Shedder plates	Slanted plates that are fitted to minimise pocketing of residual cargo in way of corrugated bulkheads
Sheer strake	The top strake of a ship’s side shell plating
Shelf plate	A horizontal plate located on the top of a bulkhead stool
Shell envelope plating	The shell plating forming the effective hull girder
Side shell	The shell envelope plating forming the side portion of the shell envelope above the bilge plating
Single skin member	Single skin member is defined as a structural member where the idealized beam comprises a web, with a top flange formed by attached plating and a bottom flange formed by a face plate
Skylight	A deck opening fitted with or without a glass port light and serving as a ventilator for engine room, quarters, etc.
Slop tank	A tank in an oil tanker which is used to collect the oil and water mixtures from cargo tanks after tank washing
Spaces	Separate compartments including tanks
Stay	Bulwark and hatch coaming brackets
Stem	The piece of bar or plating at which a ship's outside plating terminates at forward end
Stern frame	The heavy strength member in single or triple screw ships, combining the rudder post
Stern tube	A tube through which the shaft passes to the propeller; and acts as an after bearings for the shafting and may be water or oil lubricated
Stiffener	A collective term for secondary supporting structural members
Stool	A structure supporting tank bulkheads
Strake	A course, or row, of shell, deck, bulkhead, or other plating
Strength deck	The uppermost continuous deck
Stringer	Horizontal girders linking vertical web frames
Stringer plate	The outside strake of deck plating
Superstructure	A decked structure on the freeboard deck, extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 0.04B.
Tank top	The horizontal plating forming the bottom of a cargo tank
Towing pennant	A long rope which is used to effect the tow of a ship
Transom	The structural arrangement and form of the aft end of the ship
Transverse ring	All transverse material appearing in a cross-section of the ship's hull, in way of a double bottom floor, vertical web and deck transverse girder
Transverse web frame	The primary transverse girders which join the ships longitudinal structure
Tripping bracket	A bracket used to strengthen a structural member under compression, against torsional forces
‘Tween deck	An abbreviation of between decks, placed between the upper deck and the tank top in the cargo tanks

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Ullage	The quantity represented by the unoccupied space in a tank
Void	An enclosed empty space in a ship
Wash bulkhead	A perforated or partial bulkhead in a tank
Watertight	Watertight means capable of preventing the passage of water through the structure under a head of water for which the surrounding structure is designed
Weather deck	A deck or section of deck exposed to the elements which has means of closing weathertight, all hatches and openings
Weathertight	Weathertight means that in any sea conditions water will not penetrate into the ship
Web	The section of a stiffening member attached perpendicular to the plated surface
Wind and water strakes	The strakes of a ship's side shell plating between the ballast and the deepest load waterline
Windlass	A machine for lifting and lowering the anchor chain
Wing tank	The space bounded by the inner hull longitudinal bulkhead and side shell

RCN 2 to July 2008 version (effective from 1 July 2010)

2 STRUCTURAL IDEALISATION

2.1 Definition of Span

2.1.1 Effective bending span of local support members

2.1.1.1 The effective bending span, l_{bdg}, of a stiffener is defined for typical arrangements in *2.1.1.3* to *2.1.1.7*. Where arrangements differ from those shown in *Figure 4.2.1* through *Figure 4.2.8*, span definition may be specially considered.

2.1.1.2 The effective bending span may be reduced due to the presence of brackets, provided the brackets are effectively supported by the adjacent structure, otherwise the effective bending span is to be taken as the full length of the stiffener between primary member supports.

2.1.1.3 If the web stiffener is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full length between primary member supports unless a backing bracket is fitted, see *Figure 4.2.2*.

2.1.1.4 The effective bending span may only be reduced where brackets are fitted to the flange or free edge of the stiffener. Brackets fitted to the attached plating on the side opposite to that of the stiffener are not to be considered as effective in reducing the effective bending span.

2.1.1.5 The effective bending span, l_{bdg}, for stiffeners forming part of a double skin arrangement is to be taken as shown in *Figure 4.2.1*.

2.1.1.6 The effective bending span, l_{bdg}, for stiffeners forming part of a single skin arrangement is to be taken as shown in *Figure 4.2.2*.

2.1.1.7 For stiffeners supported by a bracket on one side of primary support members, the effective bending span is to be taken as the full distance between primary support members as shown in *Figure 4.2.2(a)*. If brackets are fitted on both sides of the primary support member, the effective bending span is to be taken as in *Figures 4.2.2(b), (c)* and (*d*).

Figure 4.2.1
Effective Bending Span of Stiffeners Supported by Web Stiffeners
(Double Skin Construction)

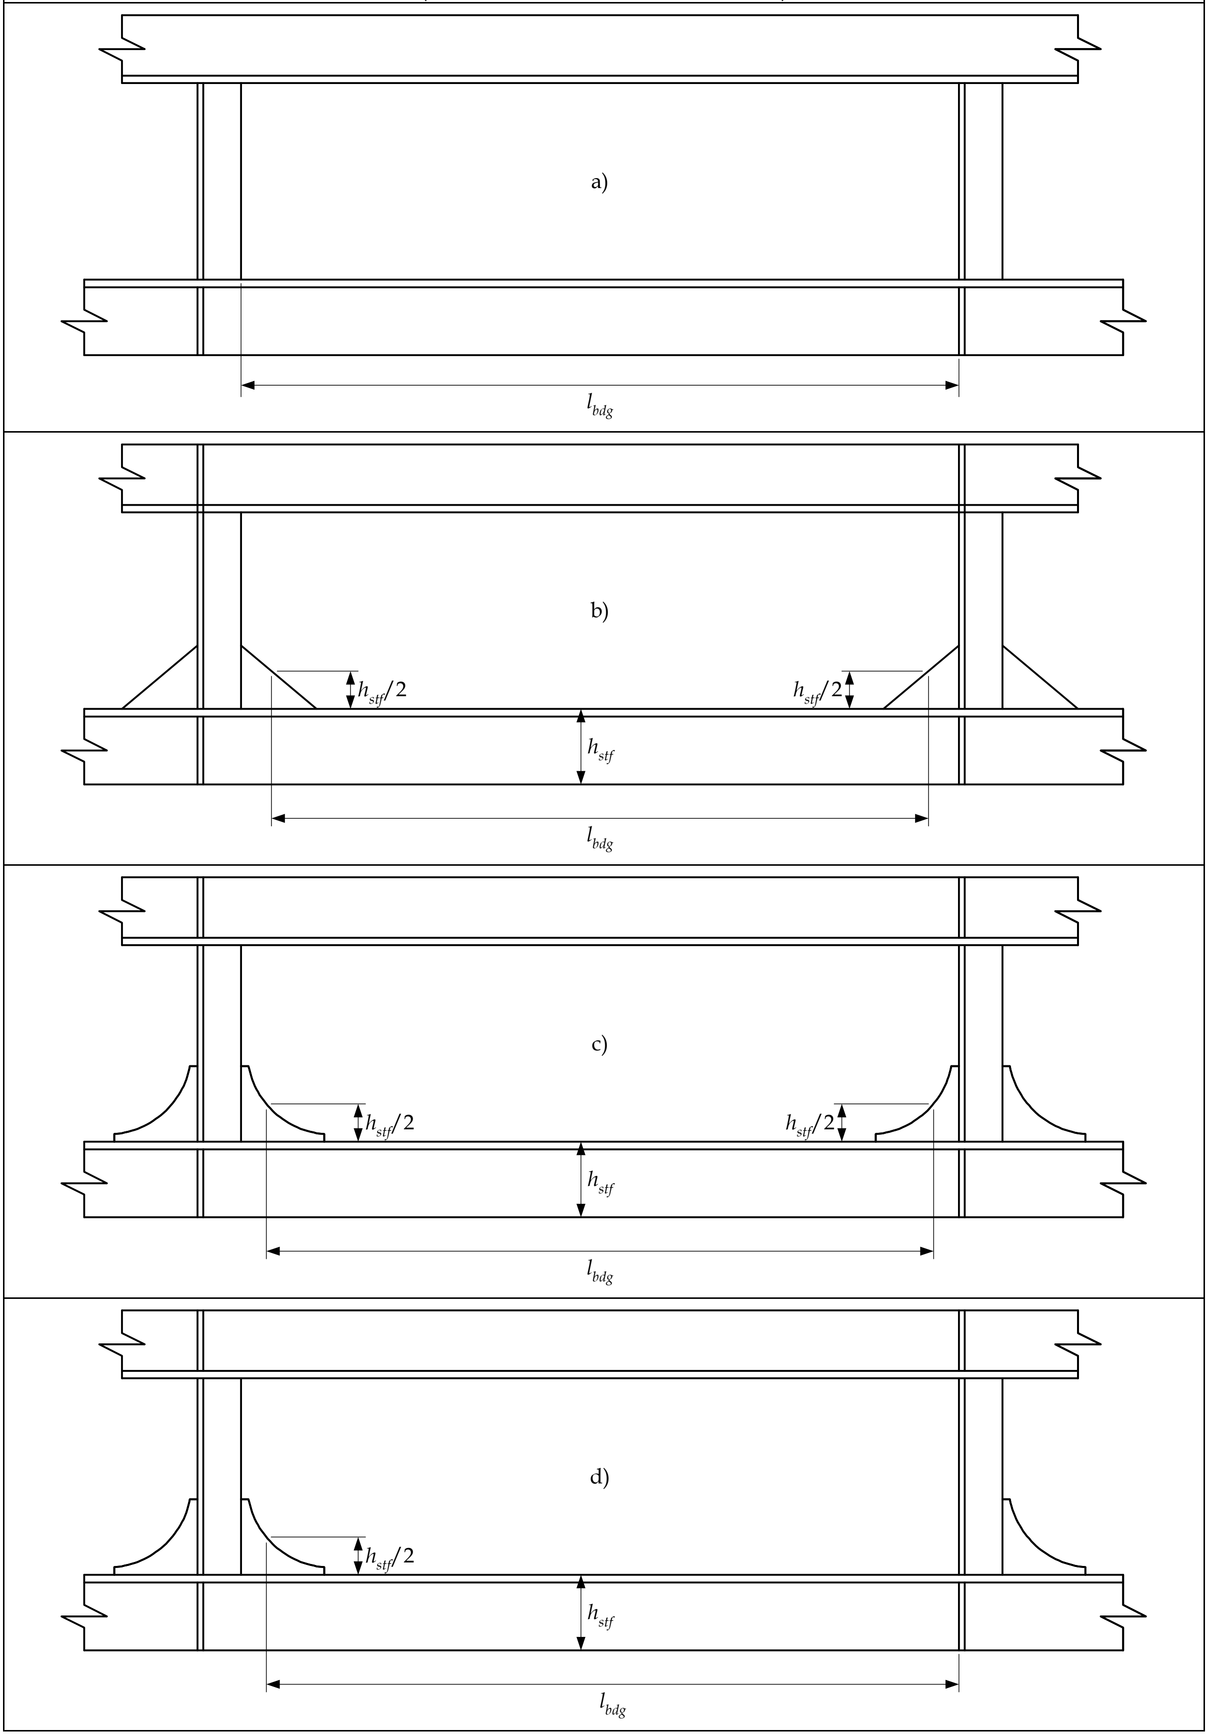


Figure 4.2.2
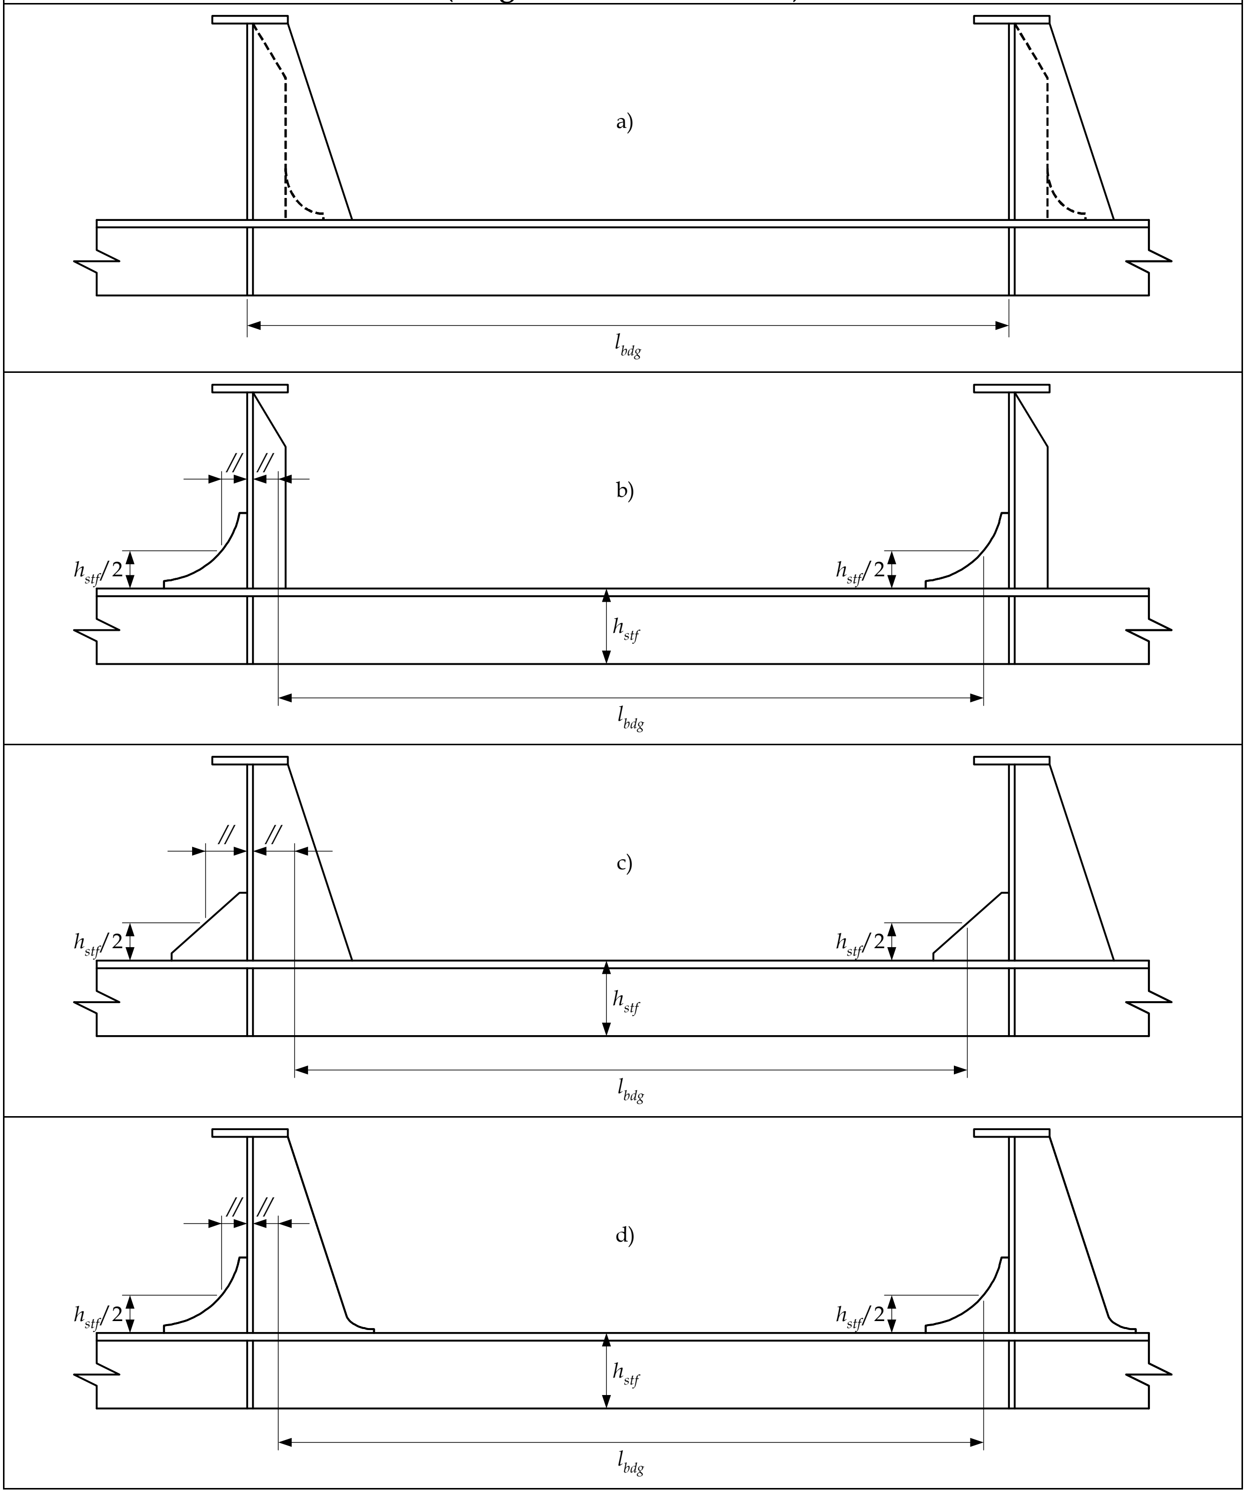
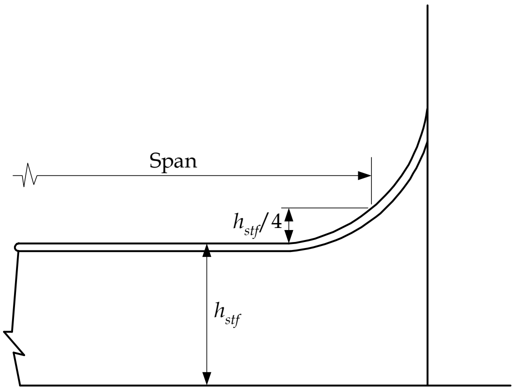
Effective Bending Span of Stiffeners Supported by Web Stiffeners
(Single Skin Construction)



2.1.1.8 Where the face plate of the stiffener is continuous along the edge of the bracket, the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener, see *Figure 4.2.3*.

Figure 4.2.3
Effective Bending Span for Local Support Members with Continuous Face Plate along Bracket Edge



2.1.1.9 For the calculation of the span point, the bracket length is not to be taken greater than 1.5 times the length of the arm on the bulkhead or base.

2.1.2 Effective shear span of local support members

2.1.2.1 The effective shear span, l_{shr}, of a stiffener is defined for typical arrangements in *2.1.2.5* to *2.1.2.7*. Effective bending span for other arrangements will be specially considered.

2.1.2.2 The effective shear span may be reduced due to the presence of brackets provided the brackets are effectively supported by the adjacent structure, otherwise the effective shear span is to be as the full length as given in *2.1.2.4*.

2.1.2.3 The effective shear span may be reduced for brackets fitted on either the flange or the free edge of the stiffener, or for brackets fitted to the attached plating on the side opposite to that of the stiffener. If brackets are fitted at both the flange or free edge of the stiffener, and to the attached plating on the side opposite to that of the stiffener the effective shear span may be calculated using the longer effective bracket arm.

2.1.2.4 The effective shear span may be reduced by a minimum of $s/4000$ m at each end of the member, regardless of support detail, hence the effective shear span, l_{shr}, is not to be taken greater than:

$$l_{shr} \le l - \frac{s}{2000} \quad \text{m}$$

Where:

l full length of the stiffener between primary support members, in m

s stiffener spacing, in mm, as defined in *2.2.1*

2.1.2.5 The effective shear span, l_{shr}, for stiffeners forming part of a double skin arrangement is to be taken as shown in *Figure 4.2.4*.

2.1.2.6 The effective shear span, l_{shr}, for stiffeners forming part of a single skin arrangement is to be taken as shown in *Figure 4.2.5*.

Figure 4.2.4
Effective Shear Span of Stiffeners Supported by Web Stiffeners (Double Skin Construction)

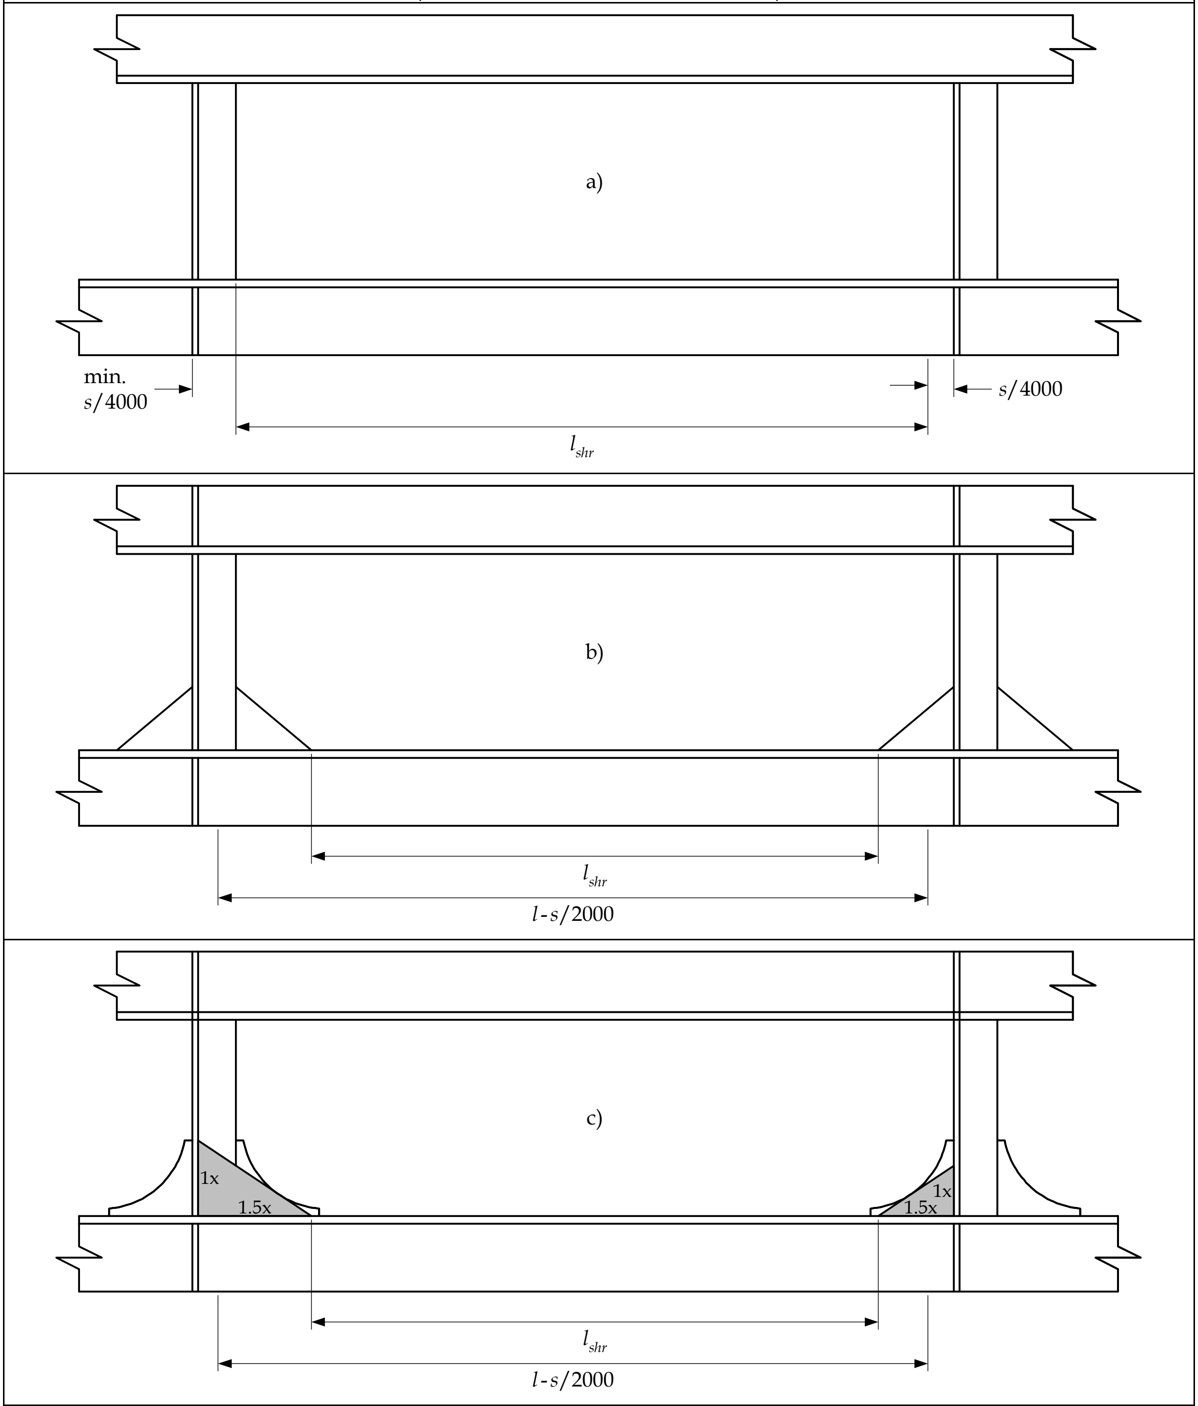


Figure 4.2.5
Effective Shear Span of Stiffeners Supported by Web Stiffeners (Single Skin Construction)

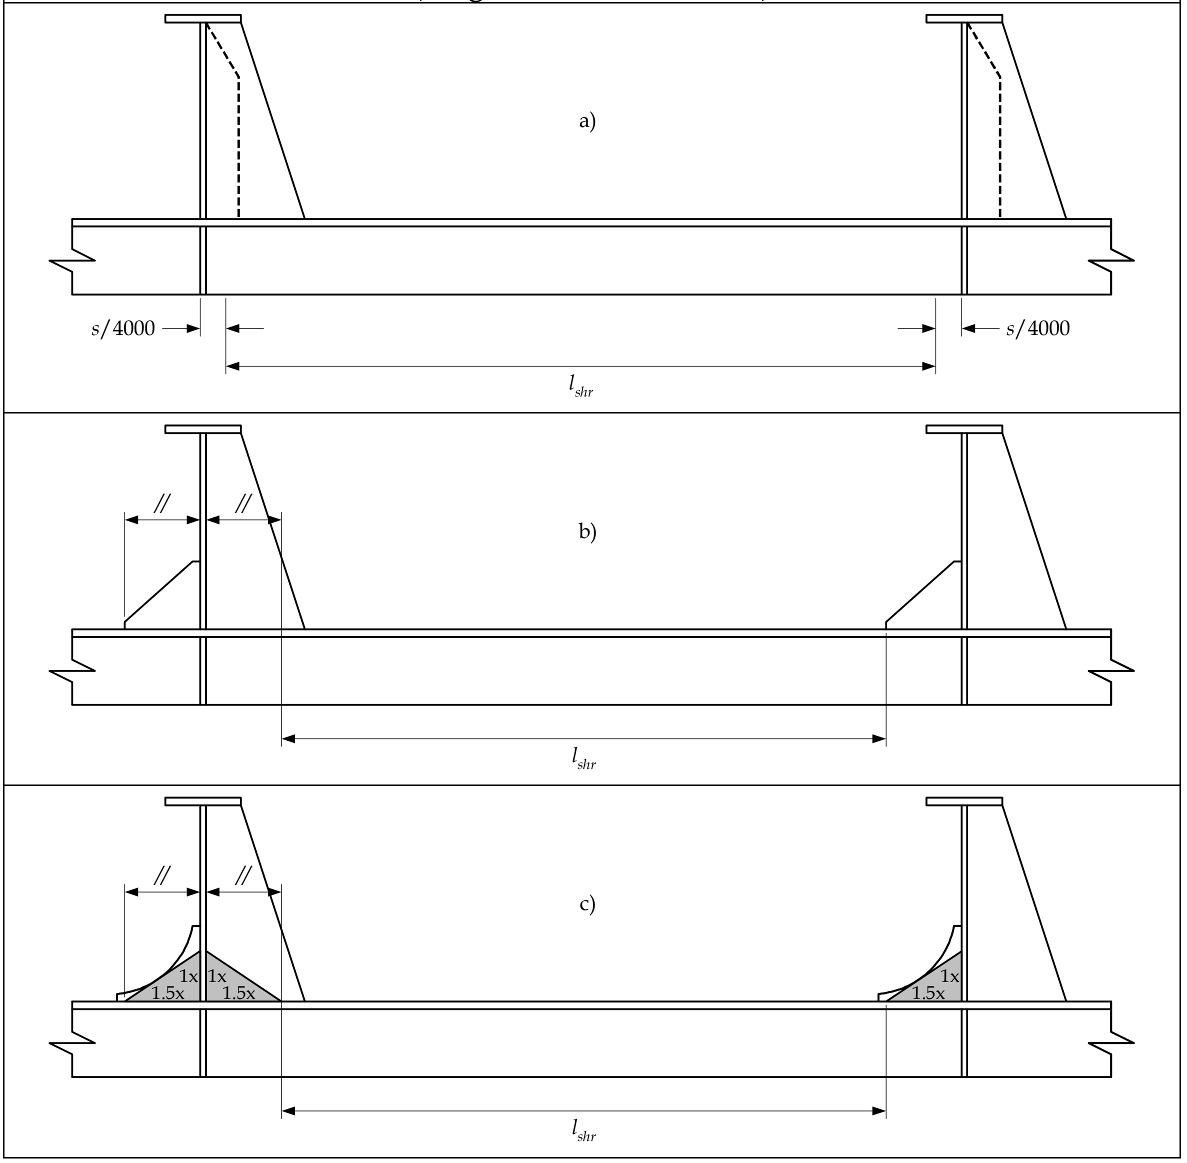

Figure 4.2.6
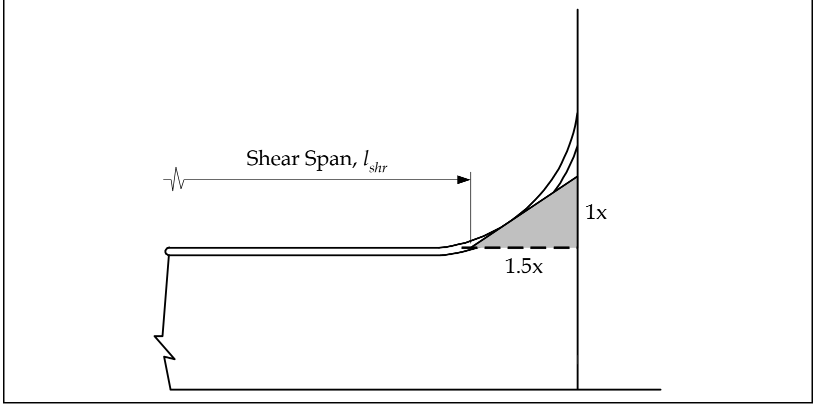
Effective Shear Span for Local Support Members with Continuous Face Plate along Bracket Edge



2.1.2.7 Where the face plate of the stiffener is continuous along the curved edge of the bracket, the effective shear span is to be taken as shown in *Figure 4.2.6*.

2.1.2.8 For curved and/or long brackets (high length/height ratio) the effective bracket length is to be taken as the maximum inscribed 1:1.5 bracket as shown in *Figure 4.2.4(c)* and *Figure 4.2.5(c)*.

2.1.3 Effect of hull form shape on span of local support members

2.1.3.1 The full length of the stiffener between primary support members, l, is to be measured along the flange for stiffeners with a flange, and along the free edge for flat bar stiffeners. For curved stiffeners the span is defined as the chord length between span points. The calculation of the effective span is to be in accordance with requirements given in *2.1.1*.

2.1.4 Effective bending span of primary support members

2.1.4.1 The effective bending span, l_{bdg}, of a primary support member may be taken as less than the full length of the member between supports provided that suitable end brackets are fitted.

2.1.4.2 For arrangements where the primary support member face plate is not carried continuously around the edge of the bracket, i.e. the bracket is welded to the primary support member, the span point at each end of the member, between which the effective bending span is measured, is to be taken at the point where the depth of end bracket measured from the face of the member is equal to one half the depth of the member, as shown in *Figure 4.2.7(b)*. The effective bracket used to define the span point is to be taken as given in *2.1.4.4*.

2.1.4.3 For brackets where the face plate of the primary support member is continuous along the face of the bracket, i.e. the bracket is integral part of the primary support member, the span point is to be taken at the position where the depth of the bracket is equal to one quarter the depth of the member, see *Figures 4.2.7(a)*, *(c)* and *(d)*. The effective bracket used to define the span point is to be taken as given in *2.1.4.4*.

2.1.4.4 The effective bracket is defined as the maximum size of triangular bracket with a length to height ratio of 1.5 that just fits inside the as fitted bracket, for curved brackets the tangent point is to be used to define the fit, see *Figure 4.2.7* for examples.

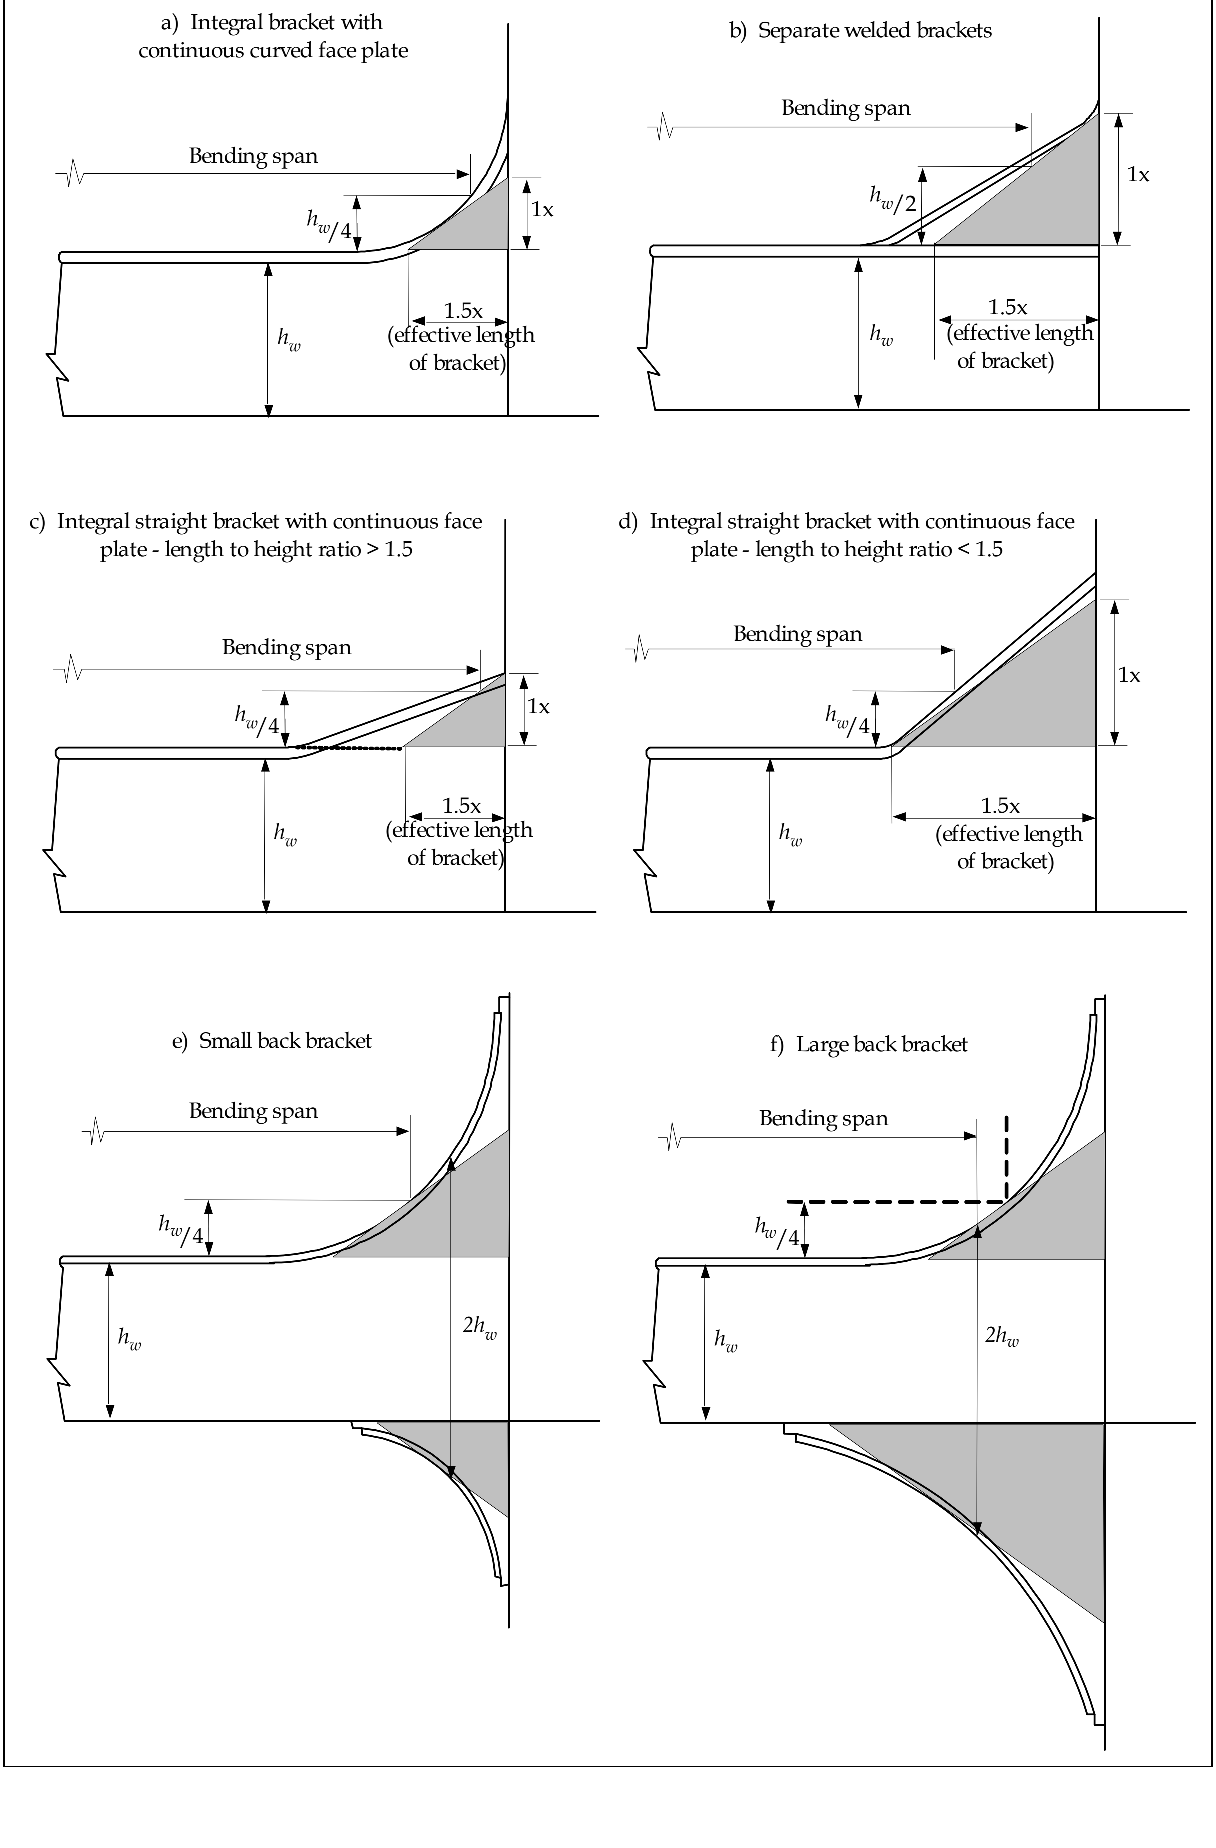
2.1.4.5 For straight brackets with a length to height ratio greater than 1.5, the span point is to be taken to the effective bracket; for steeper brackets the span point is to be taken to the as fitted bracket.

2.1.4.6 For curved brackets the span point is to be measured taken to the fitted bracket at span positions above the tangent point between fitted bracket and effective bracket. For span positions below the tangent point the span point is to be measured to the effective bracket.

2.1.4.7 For arrangements where the primary support member face plate is carried on to the bracket and backing brackets are fitted the span point need not be taken greater than to the position where the total depth reaches twice the depth of the primary support member. Arrangements with small and large backing brackets are shown in *Figure 4.2.7(e)* and *(f)*.

2.1.4.8 For arrangements where the height of the primary support member is maintained and the face plate width is increased towards the support the effective bending span may be taken to a position where the face plate breadth reaches twice the nominal breadth.

Figure 4.2.7
Effective Span of Primary Support Member for Bending Assessment

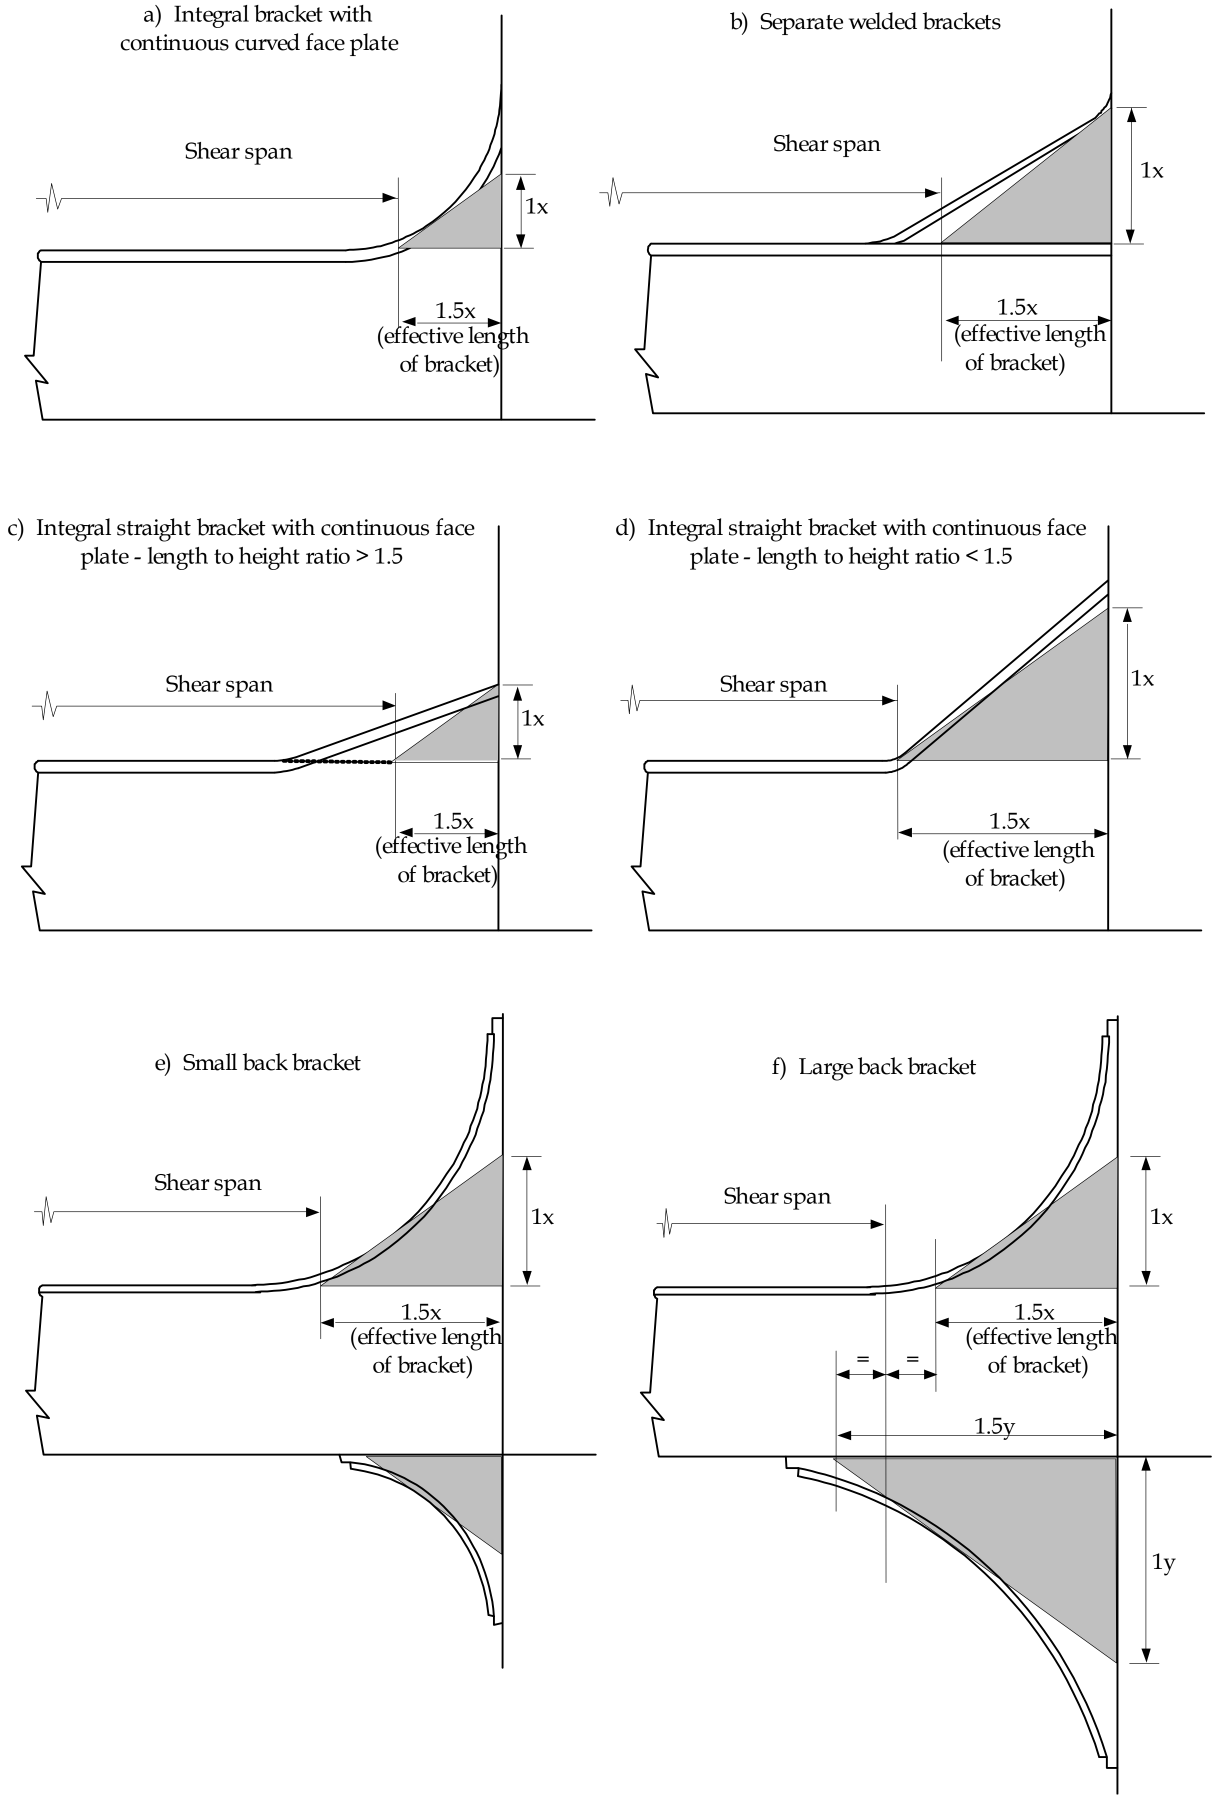


2.1.5 Effective shear span of primary support members

2.1.5.1 The span point at each end of the primary support member, between which the shear span is measured, is to be taken at the toe of the effective brackets supporting the member, where the toes of effective brackets are as shown in *Figure 4.2.8*. The effective bracket used to define the toe point is given in *2.1.4.4*.

2.1.5.2 For arrangements where the effective backing bracket is larger than the effective bracket in way of face plate, the shear span is to be taken as the mean distance between toes of the effective brackets as shown in *Figure 4.2.8 (f)*.

Figure 4.2.8
Effective Span of Primary Support Member for Shear Assessment



2.2 Definition of Spacing and Supported Breadth

2.2.1 Supported load breadth of local support members

2.2.1.1 The mean of the stiffener spacings on each side is to be used for the calculation of the effective plate flange of stiffeners and the load breadth supported by a stiffener, *s*, see *Figure 4.2.9*.

2.2.2 Spacing and supporting load breadth of primary support members

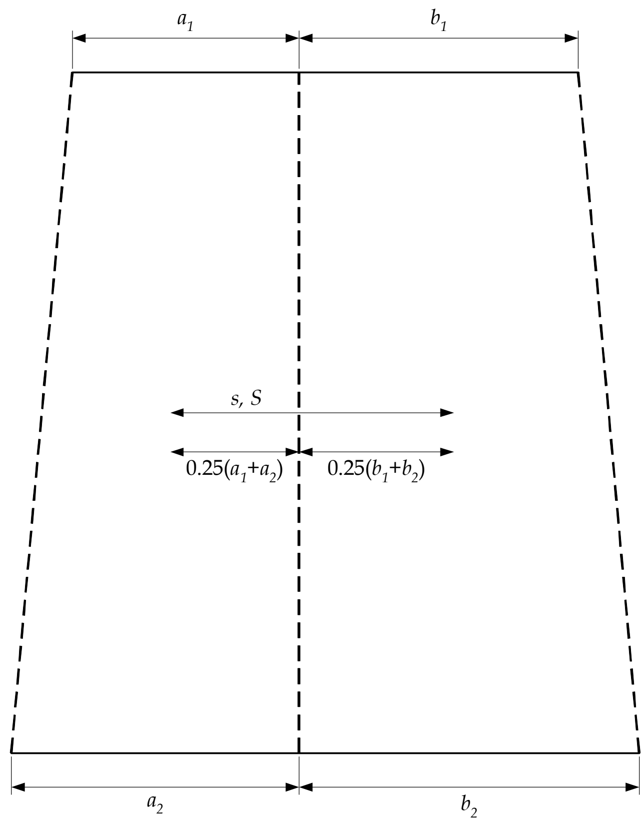
2.2.2.1 Primary support member spacing, *S*, for the calculation of the effective plate flange of primary support members is to be taken as the mean spacing between adjacent primary support members, as shown in *Figure 4.2.9*.

2.2.2.2 Unless specifically defined elsewhere in the Rules, the loading breadth supported by a girder is defined as half the sum of the primary support member spacing on each side, see *Figure 4.2.9*.

2.2.3 Effective spacing of curved plating

2.2.3.1 For curved plating the stiffener spacing or the primary support member spacing, *s* or S, is to be measured on the mean chord between members.

Figure 4.2.9
Supported Load Breadth and Breadth of Attached Plating for Local and Primary Support Members



Note

1. The mean breadth is to be taken as 0.25 $(a_1 + a_2 + b_1 + b_2)$, where a_1, a_2, b_1, b_2 are the spacings between local and primary support members at ends as appropriate.

2.3 Effective Breadth of Plating

2.3.1 Effective breadth of attached plate of local support members for strength evaluation

2.3.1.1 The effective breadth as defined in *2.3.1.2* is applicable to the scantling requirements of stiffeners as given in *Section 8*.

2.3.1.2 The effective breadth of the attached plate, b_{eff}, to be used for calculating the combined section modulus of the stiffener and attached plate is to be taken as the mean stiffener spacing, s, as given in *2.2.1*. However, where the attached plate net thickness, $t_{p\text{-}net}$, is less than 8mm, the effective breadth is not to be taken greater than 600mm.

2.3.2 Effective breadth of attached plate and flanges of primary support members for strength evaluation

2.3.2.1 The effective breadths as defined in *2.3.2.2* to *2.3.2.4* are applicable to the scantling requirements of primary support members as given in *Section 8*.

2.3.2.2 At the end of the span where no effective end bracket is fitted, the effective breadth of attached plate, b_{eff}, for calculating the section modulus and/or moment of inertia of a primary support member is to be taken as:

$$b_{eff} = 0.67\,S \sin\left[\frac{\pi}{6}\left(\frac{l_{bdg}\,(1-\frac{1}{\sqrt{3}})}{2\,S}\right)\right] \quad \text{m} \qquad \text{for } \left(\frac{l_{bdg}\,(1-\frac{1}{\sqrt{3}})}{2S}\right) \le 3$$

$$b_{eff} = 0.67S \quad \text{m} \qquad \text{for } \left(\frac{l_{bdg}\,(1-\frac{1}{\sqrt{3}})}{2S}\right) > 3$$

Where:

S mean spacing of primary support member as defined in *2.2.2* at position considered, in m

l_{bdg} effective bending span, as defined in *2.1.4*, in m

<u>Note</u> sin() is to be calculated in radians

2.3.2.3 At mid span, the effective breadth of attached plate, b_{eff}, for calculating the section modulus and/or moment of inertia of a primary support member is to be taken as:

$$b_{eff} = S \sin\left[\frac{\pi}{18}\left(\frac{l_{bdg}}{S\sqrt{3}}\right)\right] \quad \text{m} \qquad \text{for } \left(\frac{l_{bdg}}{S\sqrt{3}}\right) \le 9$$

$$b_{eff} = 1.0S \quad \text{m} \qquad \text{for } \left(\frac{l_{bdg}}{S\sqrt{3}}\right) > 9$$

Where:

S mean spacing of primary support member as defined in *2.2.2* at position considered, in m

l_{bdg} effective bending span, as defined in *2.1.4*, in m

<u>Note</u> sin() is to be calculated in radians

2.3.2.4 At the end of the span where an effective end bracket is fitted, the effective breadth of attached plate, b_{eff}, for calculating the section modulus of a primary support member is to be taken as the mean values of those given by *2.3.2.2* and *2.3.2.3*. A bracket is considered effective when the length as defined in *Figure 4.2.7* is equal or greater than $0.1l_{bdg}$.

2.3.2.5 The free flange of primary support members of single skin construction may generally be considered fully effective provided tripping bracket arrangements are fitted as required in *Section 10/2.3.3*. For curved face plates see *2.3.4*.

2.3.3 Effective breadth of attached plate of local support members for fatigue strength evaluation

2.3.3.1 The effective breadths as defined in *2.3.3.2* and *2.3.3.3* are applicable to the fatigue strength evaluation of local support members as given in *Section 9/3* and *Appendix C*.

2.3.3.2 At the ends of the span and in way of end brackets and supports, the effective breadth of attached plating, b_{eff}, to be used for calculating the combined section modulus of the stiffener and attached plate is to be taken as:

$$b_{eff} = 0.67\, s\, \sin\left[\frac{\pi}{6}\left(\frac{1000 l_{bdg}(1-\frac{1}{\sqrt{3}})}{2s}\right)\right] \quad \text{mm} \qquad \text{for } \left(\frac{1000 l_{bdg}\,(1-\frac{1}{\sqrt{3}})}{2s}\right) \le 3$$

$$b_{eff} = 0.67 s \quad \text{mm} \qquad \text{for } \left(\frac{1000 l_{bdg}\,(1-\frac{1}{\sqrt{3}})}{2s}\right) > 3$$

Where:

s stiffener spacing, in mm, as defined in *2.2.1*

l_{bdg} effective bending span, as defined in *2.1.1*, in m

<u>Note</u> sin() is to be calculated in radians

2.3.3.3 At mid span, the effective breadth of attached plate, b_{eff}, to be used for calculating the combined section modulus of the stiffener and attached plate is to be taken as:

$$b_{eff} = s\, \sin\left[\frac{\pi}{18}\left(\frac{1000 l_{bdg}}{s\sqrt{3}}\right)\right] \quad \text{mm} \qquad \text{for } \left(\frac{1000 l_{bdg}}{s\sqrt{3}}\right) \le 9$$

$$b_{eff} = 1.0\, s \quad \text{mm} \qquad \text{for } \left(\frac{1000 l_{bdg}}{s\sqrt{3}}\right) > 9$$

Where:

s stiffener spacing, in mm, as defined in *2.2.1*

l_{bdg} effective bending span, as defined in *2.1.1*, in m

<u>Note</u> sin() is to be calculated in radians

2.3.4 Effective area of curved face plates or attached plating of primary support members

2.3.4.1 The effective area as defined in *2.3.4.2* and *2.3.4.3* is applicable to primary support members as follows:

(a) deriving the effective net area of curved face plates and curved attached plating for calculating the section modulus of primary support members for the scantling requirements in *Section 8*

(b) deriving the effective net area of curved face plates, modelled by beam elements, for the strength assessment (FEM) in *Section 9/2* and *Appendix B*

2.3.4.2 The effective net area of curved face plates or attached plating of primary support members, $A_{eff\text{-}net50}$, is to be taken as:

$A_{eff\text{-}net50} = C_f\, t_{f\text{-}net50}\, b_f$ mm^2

Where:

C_f flange efficiency coefficient as shown in *Figure 4.2.10*

$= C_{f1} \dfrac{\sqrt{r_f\, t_{f-net50}}}{b_1}$ but not to be taken greater than 1.0

C_{f1} $= \dfrac{0.643\,(\sinh\beta\cosh\beta + \sin\beta\cos\beta)}{\sinh^2\beta + \sin^2\beta}$ for symmetrical and unsymmetrical face plates, see *Curve 1* in *Figure 4.2.10*

$= \dfrac{0.78\,(\sinh\beta + \sin\beta)(\cosh\beta - \cos\beta)}{\sinh^2\beta + \sin^2\beta}$ for attached plating of box girders with two webs, see *Curve 2* in *Figure 4.2.10*

$= \dfrac{1.56\,(\cosh\beta - \cos\beta)}{\sinh\beta + \sin\beta}$ for attached plating of box girders with multiple webs, see *Curve 3* in *Figure 4.2.10*

β $\dfrac{1.285\, b_1}{\sqrt{r_f\, t_{f-net50}}}$ rad

b_1 $= 0.5\,(b_f - t_{w\text{-}net50})$ for symmetrical face plates

$= b_f$ for unsymmetrical face plates

$= s_w - t_{w\text{-}net50}$ for attached plating of box girders

s_w spacing of supporting webs for box girders, in mm

$t_{f\text{-}net50}$ net flange thickness

$= t_{f\text{-}grs} - 0.5t_{corr}$ mm

for calculation of C_f and β for unsymmetrical face plates $t_{f\text{-}net50}$ is not to be taken greater than $t_{w\text{-}net50}$

$t_{f\text{-}grs}$ gross flange thickness, in mm

$t_{w\text{-}net50}$ net web plate thickness

$= t_{w\text{-}grs} - 0.5t_{corr}$ mm

$t_{w\text{-}grs}$ gross web thickness, in mm

t_{corr} corrosion addition, as given in *Section 6/3.2*

r_f radius of curved face plate or attached plating, in mm

b_f breadth of face plate or attached plating, in mm

2.3.4.3 The effective net area of curved face plates supported by radial brackets, or attached plating supported by cylindrical stiffeners, $A_{eff\text{-}net50}$, is given by:

$$A_{eff-net50} = \left(\frac{3r_f\ t_{f-net50} + C_f\ s_r^2}{3r_f\ t_{f-net50} + s_r^2} \right) t_{f-net50}\ b_f \quad \text{mm}^2$$

Where:

C_f as defined in *2.3.4.2*

$t_{f\text{-}net50}$ net flange thickness, as defined in *2.3.4.2*

s_r spacing of tripping brackets or web stiffeners or stiffeners normal to the web plating, in mm, see *Figure 4.2.11*

b_f breadth of face plate or attached plating, in mm, see *Figure 4.2.11*

r_f radius of curved face plate or attached plating, in mm, see *Figure 4.2.11*

Figure 4.2.10
Effective Width of Curved Face Plates for Alternative Structural Configurations

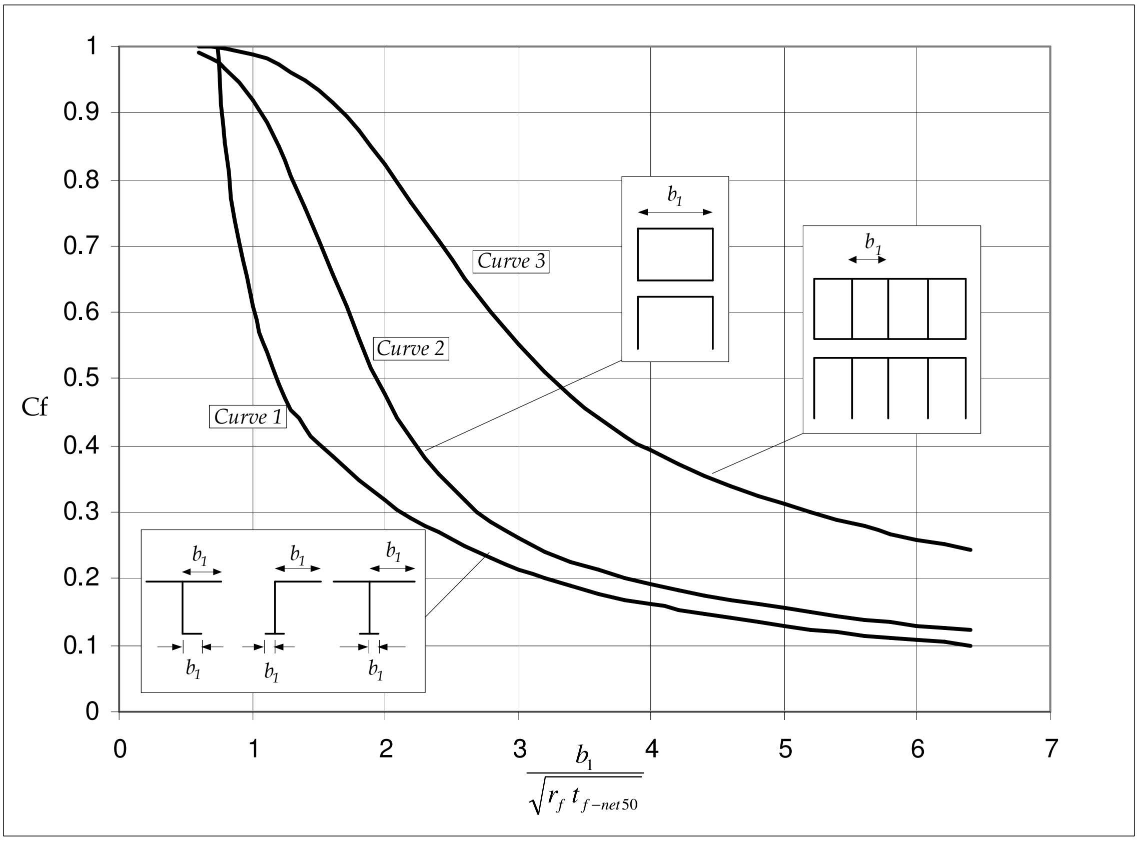


Figure 4.2.11
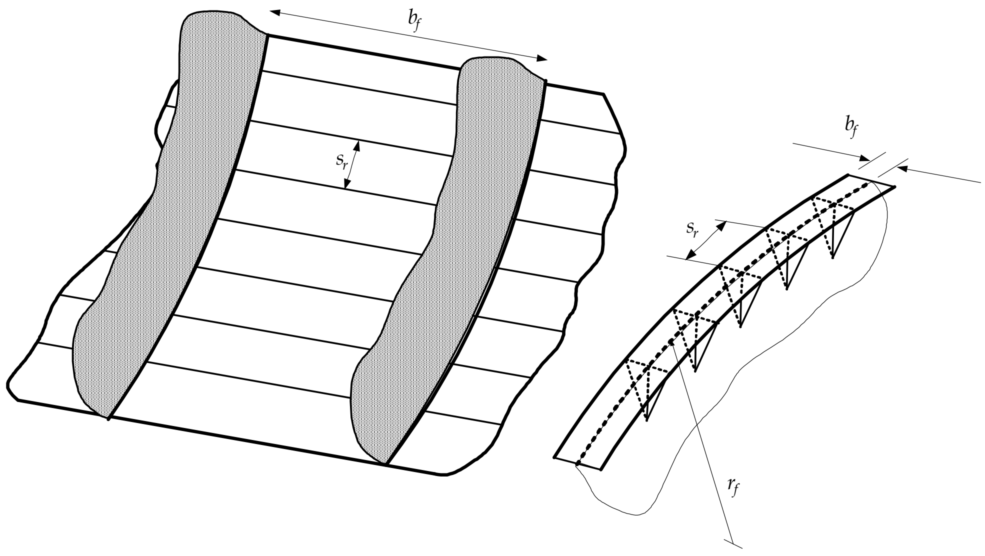
Curved Shell Panel and Face Plate



2.3.4.4 The effective area given in *2.3.4.2* and *2.3.4.3* is only applicable to faceplates and attached plating of primary support members. This is not to be applied for the area of web stiffeners parallel to the face plate.

2.4 Geometrical Properties of Local Support Members

2.4.1 Calculation of net section properties for local support members

2.4.1.1 The net section modulus, moment of inertia and shear area properties of local support members are to be calculated using the net thicknesses of the attached plate, web and flange.

2.4.1.2 The description of the net dimensions for typical profiles is given in *Figure 4.2.12*.

2.4.2 Effective elastic sectional properties of local support members

2.4.2.1 The net elastic shear area, $A_{shr\text{-}el\text{-}net}$, of local support members is to be taken as:

$$A_{shr-el-net} = \frac{(h_{stf} + t_{p-net})t_{w-net} \sin \varphi_w}{100} \quad \text{cm}^2$$

Where:

h_{stf} stiffener height, including face plate, in mm. See also *2.4.1.2*

$t_{p\text{-}net}$ net thickness of attached plate, in mm

$t_{w\text{-}net}$ net web thickness, in mm

φ_w angle between the stiffener web and attached plating, see *Figure 4.2.14*, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.2.2 The effective shear depth of stiffeners, d_{shr}, is to be taken as:

$$d_{shr} = (h_{stf} + t_{p-net})\sin \varphi_w \quad \text{mm}$$

Where:

h_{stf} stiffener height, including face plate, in mm. See also *2.4.1.2*

$t_{p\text{-}net}$ net thickness of attached plate, in mm

φ_w angle between the stiffener web and attached plating, see *Figure 4.2.14*, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.2.3 The elastic net section modulus, $Z_{el-\varphi r\text{-net}}$ of local support members is to be taken as:

$$Z_{el-\varphi-net} = Z_{stf\text{-}net} \sin \varphi_w \quad \text{cm}^3$$

Where:

$Z_{stf\text{-}net}$ net section modulus of corresponding upright stiffener, i.e. when φ_w is equal to 90 degrees, in cm³. See also *2.4.1.2*

φ_w angle between the stiffener web and attached plating, see *Figure 4.2.14*, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.3 Effective plastic section modulus and shear area of stiffeners

2.4.3.1 The net plastic shear area, $A_{shr\text{-}pl\text{-}net}$, of local support members is to be taken as:

$$A_{shr-pl-net} = \frac{(h_{stf} + t_{p-net})t_{w-net} \sin \varphi_w}{100} \quad \text{cm}^2$$

Where:

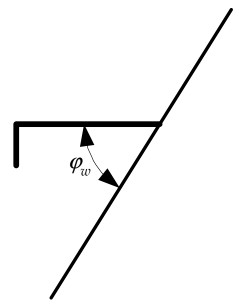
h_{stf} stiffener height, including face plate, in mm. See also *2.4.1.2*

$t_{p\text{-}net}$ net thickness of attached plate, in mm

$t_{w\text{-}net}$ net web thickness, in mm

φ_w angle between the stiffener web and the plate flange, see *Figure 4.2.14*, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

Figure 4.2.14
Angle between Stiffener Web and Plate Flange



2.4.3.2 The effective net plastic section modulus, $Z_{pl\text{-}net}$, of local support members is to be taken as:

$$Z_{pl-net} = \frac{f_w\, d_w{}^2\, t_{w-net} \sin\varphi_w}{2000} + \frac{(2\,\gamma - 1) A_{f-net} \left(h_{f-ctr} \sin\varphi_w - b_{f-ctr} \cos\varphi_w\right)}{1000} \quad \text{cm}^3$$

Where:

f_w web shear stress factor

= 0.75 for flanged profile cross-sections with n = 1 or 2

= 1.0 for flanged profile cross-sections with n = 0 and for flat bar stiffeners

n number of moment effective end supports of each member

= 0, 1 or 2

A moment effective end support may be considered where:

(a) the stiffener is continuous at the support

(b) the stiffener passes through the support plate while it is connected at it's termination point by a carling (or equivalent) to adjacent stiffeners

(c) the stiffener is attached to a abutting stiffener effective in bending (not a buckling stiffener) or bracket. The bracket is assumed to be bending effective when it is attached to another stiffener (not a buckling stiffener).

d_w depth of stiffener web, in mm:

= h_{stf} - $t_{f\text{-}net}$ for T, L (rolled and built up) and L2 profiles

= h_{stf} for flat bar and L3 profiles

to be taken as given in *Table 4.2.3* and *Table 4.2.4* for bulb profiles

h_{stf} stiffener height, in mm, see *Figure 4.2.12*

γ $= 0.25\left(1+\sqrt{3+12\,\beta}\right)$

β = 0.5 for all cases, except L profiles without a mid span tripping bracket

$$= \frac{10^6 t^2_{w-net} f_b l_f^2}{80 b_f^2 t_{f-net} h_{f-ctr}} + \frac{t_{w-net}}{2 b_f}$$

but not to be taken greater than 0.5 for L (rolled and built-up) profiles without a mid span tripping bracket

A_{f-net} net cross-sectional area of flange, in mm²:

= $b_f t_{f-net}$ in general

= 0 for flat bar stiffeners

b_f breadth of flange, in mm, see *Figure 4.2.12*. For bulb profiles, see *Table 4.2.3* and *Table 4.2.4*

b_{f-ctr} distance from mid thickness of stiffener web to the centre of the flange area:

$= 0.5(b_f - t_{w-grs})$ for rolled angle profiles

= 0 for T profiles

as given in *Table 4.2.3* and *Table 4.2.4* for bulb profiles

h_{f-ctr} height of stiffener measured to the mid thickness of the flange:

= h_{stf} – 0.5 t_{f-net} for profiles with flange of rectangular shape except for L3 profiles

= h_{stf} – d_{edge} – 0.5 t_{f-net} for L3 profiles

as given in *Table 4.2.3* and *4.2.4* for bulb profiles

d_{edge} distance from upper edge of web to the top of the flange, in mm. For L3 profiles, see *Figure 4.2.12*

f_b = 1.0 in general

= 0.8 for continuous flanges with end bracket(s). A continuous flange is defined as a flange that is not sniped and continuous through the primary support member

= 0.7 for non-continuous flanges with end bracket(s). A non-continuous flange is defined as a flange that is sniped at the primary support member or terminated at the support without aligned structure on the other side of the support

l_f length of stiffener flange between supporting webs, in m, but reduced by the arm length of end bracket(s) for stiffeners with end bracket(s) fitted

t_{f-net} net flange thickness, in mm

= 0 for flat bar stiffeners

as given in *Table 4.2.3* and *Table 4.2.4* for bulb profiles

t_{w-net} net web thickness, in mm

φ_w angle between the stiffener web and the plate flange, see *Figure 4.2.14*, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

Table 4.2.3
Characteristic Flange Data for HP Bulb Profiles (see *Figure 4.2.15*)

h_{stf} (mm)	d_w (mm)	$b_{f\text{-}grs}{}^*$ (mm)	$t_{f\text{-}grs}{}^*$ (mm)	$b_{f\text{-}ctr}$ (mm)	$h_{f\text{-}ctr}$ (mm)

Note

1. Characteristic flange data converted to net scantlings are given as:

$b_f \cong b_{f\text{-}grs}{}^* + 2\, t_{w\text{-}net}$

$t_{f\text{-}net} = t_{f\text{-}grs}{}^* - t_{corr}$

$t_{w\text{-}net} = t_{w\text{-}grs} - t_{corr}$

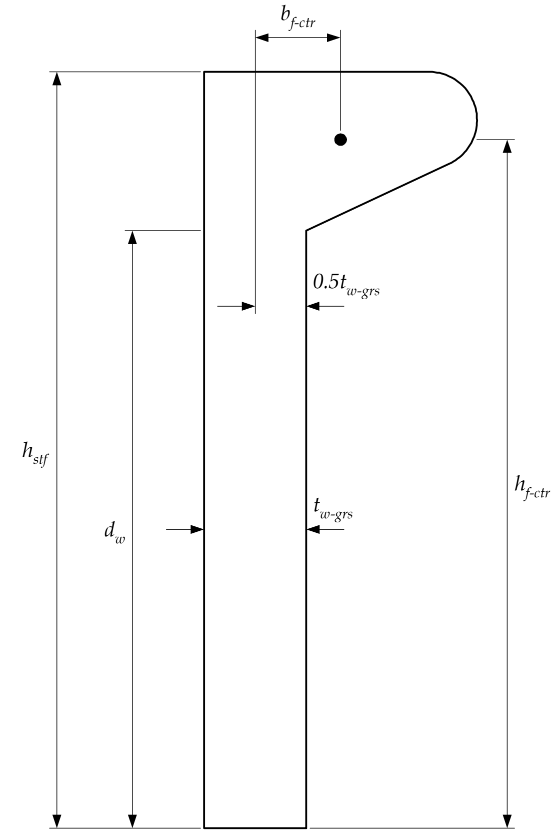
Figure 4.2.15
Characteristic Data for Bulb Profiles



2.5 Geometrical Properties of Primary Support Members

2.5.1 Effective shear area of primary support members

2.5.1.1 For calculation of the shear area of primary support members the web height, h_w, is to be taken as the moulded height of the primary support member.

2.5.1.2 For single and double skin primary support members, the effective net shear area, $A_{shr-net50}$, is to be taken as:

$$A_{shr-net50} = 0.01\, h_n\, t_{w-net50}\, \sin\varphi_w \quad \text{cm}^2$$

Where:

h_n — for a single skin primary support member, *see Figure* 4.2.16, the effective web height, in mm, is to be taken as the lesser of:

(a) h_w

(b) $h_{n3} + h_{n4}$

(c) $h_{n1} + h_{n2} + h_{n4}$

for a double skin primary support member, the same principle is to be adopted in determining the effective web height.

h_w — web height of primary support member, in mm

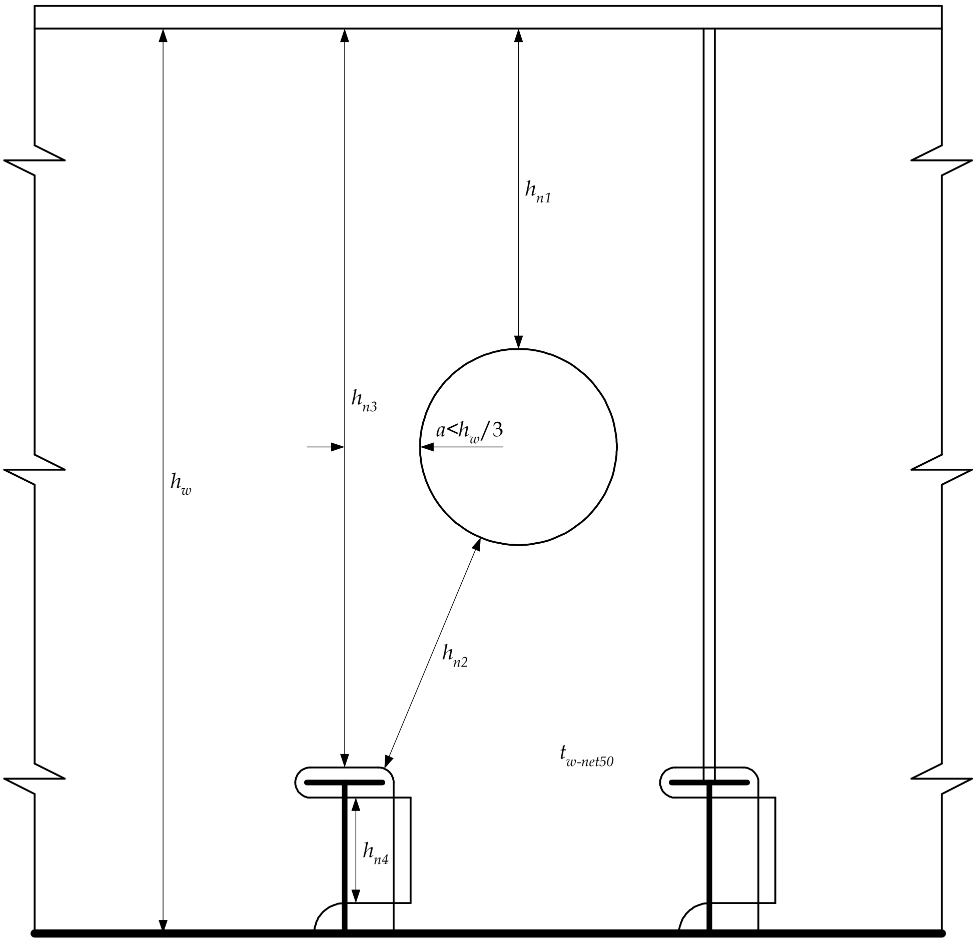
h_{n1}, h_{n2}, h_{n3}, h_{n4} — as shown in *Figure 4.2.16*

$t_{w-net50}$ — net web thickness
$= t_{w-grs} - 0.5\, t_{corr}$ mm

$t_{w\text{-}grs}$	gross web thickness, in mm
t_{corr}	corrosion addition, as given in *Section 6/3.2*, in mm
φ_w	angle between the web and attached plating, see *Figure 4.2.14*, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

(RCN 2, effective from 1 July 2008)

Figure 4.2.16
Effective Shear Area in way of Openings



Note
The figure shows effective web height for a single skin primary support member. The effective web height of a double skin primary support member follows the same principles.

2.5.1.3 Where an opening is located at a distance less than $h_w/3$ from the cross-section considered, h_n is to be taken as the smaller of the net height and the net distance through the opening. See *Figure 4.2.16.*

2.5.1.4 Where a girder flange of a single skin primary support member is not parallel to the axis of the attached plating, the effective net shear area, $A_{shr\text{-}net50}$, is to be taken as:

$$A_{shr\text{-}net50} = 0.01\, h_n\, t_{w\text{-}net50} + 1.3\, A_{f\text{-}net50} \sin 2\theta \sin\theta \quad \text{cm}^2$$

Where:

$A_{f\text{-}net50}$ net flange/face plate area

$= 0.01\, b_f\, t_{f\text{-}net50}$ cm^2

b_f breadth of flange or face plate, in mm

$t_{f\text{-}net50}$ net flange thickness

$= t_{f\text{-}grs} - 0.5t_{corr}$ mm

$t_{f\text{-}grs}$ gross flange thickness, in mm

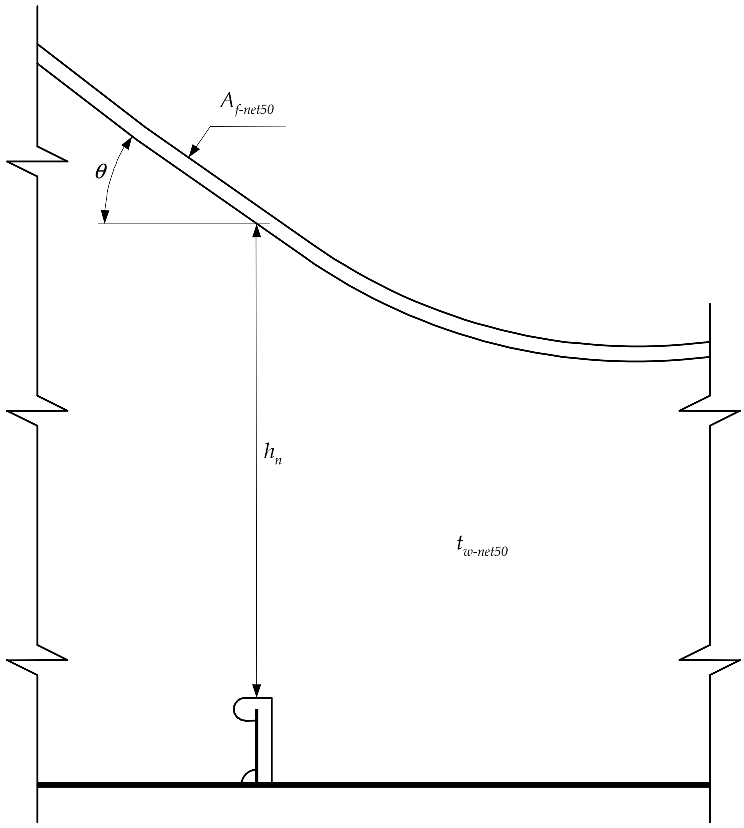
t_{corr} corrosion addition, as given in *Section 6/3.2*, in mm

θ angle of slope of continuous flange, see *Figure 4.2.17*

$t_{w\text{-}net50}$ net web thickness, as defined in *2.5.1.2*, in mm

h_n effective web height, as defined in *Figure 4.2.16,* in mm

Figure 4.2.17
Effective Shear Area in way of Brackets



2.5.2 Effective section modulus of primary support members

2.5.2.1 The net section modulus of primary support members is to be calculated using the net thicknesses of the attached plate, web and face plate (or top attached plate for double skin girders), where the net thicknesses are to be taken as:

$t_{w\text{-}net50} = t_{w\text{-}grs} - 0.5t_{corr}$ mm, for the net web thickness

$t_{p\text{-}net50} = t_{p\text{-}grs} - 0.5t_{corr}$ mm, for the net lower attached plate thickness

$t_{f\text{-}net50} = t_{f\text{-}grs} - 0.5t_{corr}$ mm, for the net upper attached plate or face plate

Where:

$t_{w\text{-}grs}$ gross web thickness, in mm

$t_{p\text{-}grs}$ gross thickness of lower attached plate, in mm

$t_{f\text{-}grs}$ gross thickness of upper attached plate or face plate, in mm

t_{corr} corrosion addition, as given in *Section 6/3.2*, in mm

Note

See *2.3.4* for curved face plates of primary support members

Where angle between the primary support member web and the plate flange is less than 75 degrees, the section modulus is to be directly calculated

(RCN 2, effective from 1 July 2008)

2.6 Geometrical Properties of the Hull Girder Cross-Section

2.6.1 Vertical hull girder section modulus

2.6.1.1 The effective vertical hull girder section modulus, Z_v, at any vertical distance, z, above the baseline is defined by:

$$Z_v = \frac{I_v}{|z - z_{NA}|} \quad \text{m}^3$$

where:

I_v vertical hull girder moment of inertia, of all longitudinally continuous members in cross section under consideration, after deduction of openings as given in *2.6.3*, in m^4

z distance from the structural member under consideration to the baseline, in m

z_{NA} distance from the baseline to the horizontal neutral axis of the hull girder cross-section, in m

2.6.1.2 For calculation of the vertical net hull girder section modulus for the strength assessment, $Z_{v\text{-}net50}$, required by *Section 8,* the vertical net hull girder moment of inertia and position of horizontal neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2*.

2.6.1.3 For calculation of vertical net hull girder section modulus for the fatigue assessment, $Z_{v\text{-}net75}$, required by *Section 9/3,* the vertical net hull girder moment of inertia and position of horizontal neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.25t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2.*

2.6.2 Horizontal hull girder section modulus

2.6.2.1 The effective horizontal hull girder section modulus, Z_h, at any transverse coordinate, y, is to be taken as:

$$Z_h = \frac{I_h}{|y - y_{NA}|} \quad \text{m}^3$$

where:

I_h horizontal hull girder moment of inertia, of all longitudinally continuous members in cross section under consideration, after deduction of openings as given in *2.6.3*, in m^4

y transverse coordinate, in m

y_{NA} distance from the centreline to the vertical neutral axis of the hull girder cross section, in m

2.6.2.2 For calculation of the horizontal net hull girder section modulus for the strength assessment, $Z_{h\text{-}net50}$, required by *Section 8,* the horizontal net hull girder moment of inertia and position of vertical neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2.*

2.6.2.3 For calculation of the horizontal net hull girder section modulus for fatigue assessment, $Z_{h\text{-}net75}$, as required in *Section 9/3,* the net horizontal hull girder moment of inertia and position of vertical neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.25t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2.*

2.6.3 Effective area for calculation of hull girder moment of inertia and section modulus

2.6.3.1 The effective hull girder sectional area includes all the longitudinally continuous structural members after deduction of openings. The structural members given in *2.6.3.2* are not to be included in the effective hull girder sectional area. The definition of openings to be deducted and deduction free openings are given in *2.6.3.4 – 2.6.3.9*. The definition of effective area in way of non-continuous bulkheads and decks is given in *2.6.3.10.*

2.6.3.2 The following structural members are not to be considered as effectively contributing to the hull girder sectional area as they do not provide sufficient structural continuity and are therefore to be excluded in the calculation:

(a) superstructures which do not form a strength deck
(b) deck houses
(c) vertically corrugated bulkheads
(d) bulwarks and gutter plates
(e) bilge keels
(f) sniped or non-continuous longitudinal stiffeners if the cross-section under consideration is closer than twice the height of the stiffener from the end of the stiffener.

2.6.3.3 The following definitions of opening are to be applied:

(a) large openings are openings exceeding 2.5m in length and/or 1.2m in breadth, where the length is measured along the global x-axis of the ship as defined in *Figure 4.1.1*
(b) small openings are openings that are not large openings i.e. manholes, lightening holes, etc.
(c) isolated openings are openings spaced not less than 1m apart in the ship's transverse/vertical direction

2.6.3.4 Large openings and small openings that are not isolated are to be deducted from the sectional area used in the section modulus calculation.

2.6.3.5 Isolated small openings in longitudinal stiffeners or girders are to be deducted if their depth exceeds 25% of the web depth.

2.6.3.6 When several openings are located in or adjacent to the same cross-section, the total equivalent breadth of the combined openings, Σb_{ded}, is to be deducted, see *2.6.3.7* to *2.6.3.8* and *Figure 4.2.18*.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.6.3.7 Isolated small openings need not be deducted provided that the sum of their breadths, or shadow area breadths, in one transverse section does not reduce the hull girder section modulus at deck or baseline by more than 3%. Alternatively isolated small openings need not to be deducted provided the total equivalent breadth of small openings, Σb_{sm}, is less than:

$$\Sigma b_{sm} = 0.06\left(B_{sect} - \Sigma b_{ded}\right) \quad \text{m}$$

Where:

Σb_{sm} total equivalent breadth of small openings, see *Figure 4.2.18*

$= b_{sm1} + b_{sm2} + b_{sm3}$ m

B_{sect} the breadth of the ship at the section being considered, in m

Σb_{ded} total equivalent breadth of combined openings specified in *2.6.3.7*, in m

The effect of the shadow area of deductible openings is to be taken into account.

2.6.3.8 When calculating the total equivalent breadth of small openings, Σb_{sm}, each opening is assumed to have a longitudinal shadow area, see *Figure 4.2.18*. This shadow area is obtained by drawing two tangent lines with an angle of 15 degrees to the longitudinal axis of the ship.

2.6.3.9 Full or partial compensation of openings may be provided by increasing the sectional area of the plating, longitudinal stiffeners or girders, or other suitable structure. The compensation area is to extend well beyond the forward and aft end of the opening. Any local edge reinforcement of the opening is not to be included in the effective area of the hull girder section modulus calculations. Compensation is not necessary for openings which are not required to be deducted in accordance with *2.6.3.7*.

2.6.3.10 When calculating the ineffective area in way of large openings and in way of non-continuous decks and longitudinal bulkheads, the effective area is to be taken as shown in *Figure 4.2.19.* The shadow area, which indicates the area that is not effective, is obtained by drawing two tangent lines with an angle of 15 degrees to the longitudinal axis of the ship.

Figure 4.2.18
Calculation of equivalent Breadth

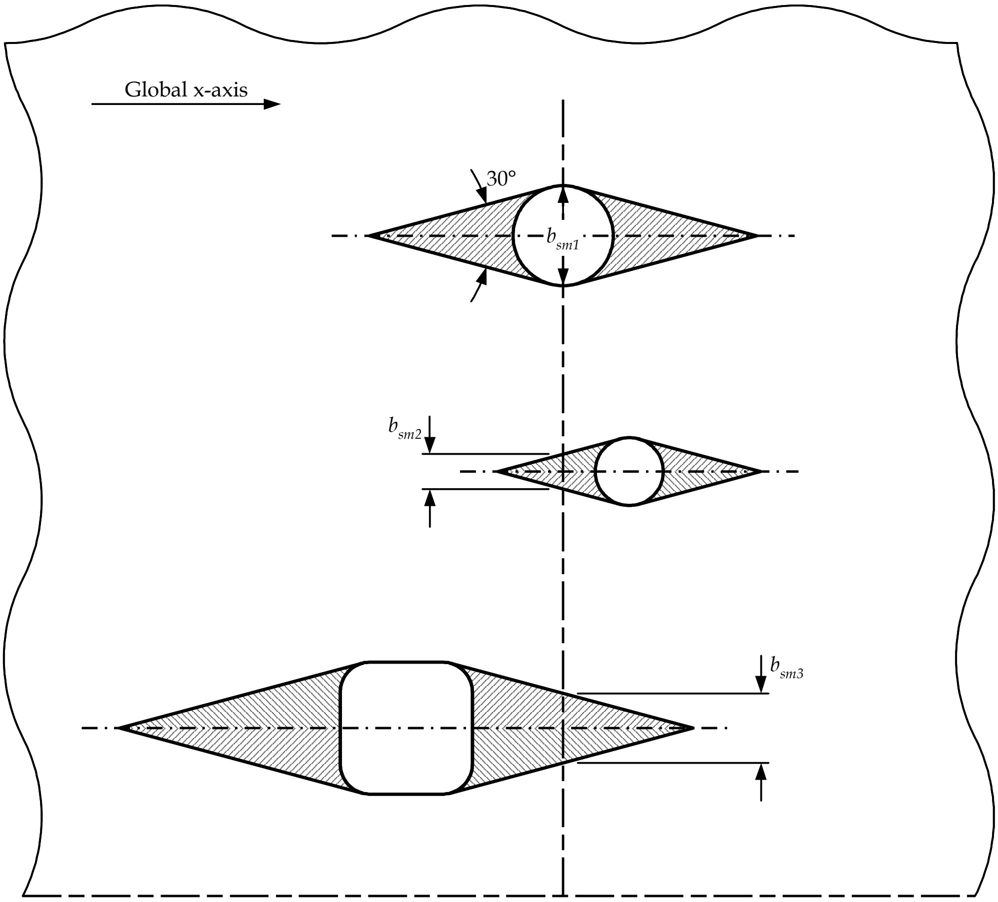


Figure 4.2.19
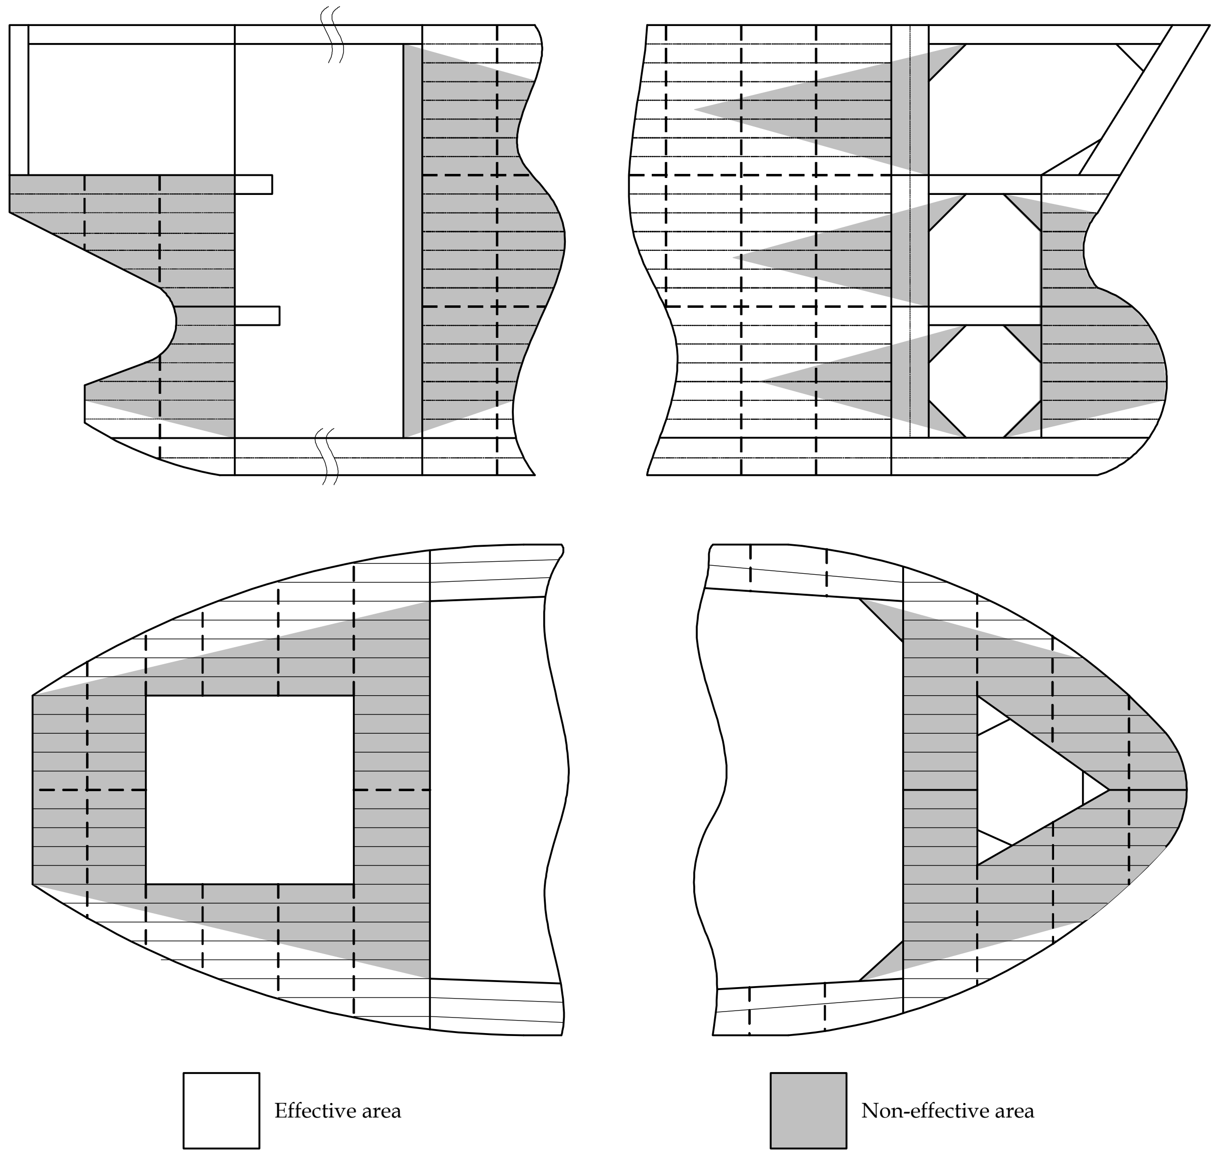
Effective Area in way of Non-Continuous Decks and Bulkheads



2.6.4 Effective vertical hull girder shear area

2.6.4.1 The effective net hull girder vertical shear area includes the net plating area of the side shell including the bilge, the inner hull including the hopper side and the outboard girder under and the longitudinal bulkheads including the double bottom girders in line.

2.6.4.2 For calculation of the net hull girder vertical shear area, the net plating area is to be calculated based on the net thickness, t_{net50}, given by the gross thickness minus the corrosion addition $0.5t_{corr}$ of all effective structural members given in *2.6.4.1*. Where t_{corr} is as defined in *Section 6/3.2*.

2.6.4.3 For longitudinal strength members forming the web of the hull girder which are inclined to the vertical, the area of the member to be included in the shear force calculation is to be based on the projected area onto the vertical plane. See *Figure 4.2.20*.

2.6.4.4 The calculation of the net effective shear area for vertical and horizontal corrugated bulkheads is to be based on the net effective equivalent thickness, $t_{cg\text{-}net50}$, given by:

$$t_{cg-net50} = \left[0.5\left(t_{w-grs} + t_{f-grs}\right) \frac{b_{cg}}{b_{w-cg} + b_{f-cg}} \right] - 0.5t_{corr} \quad \text{mm}$$

Where:

t_{w-grs} gross corrugation web thickness, in mm

t_{f-grs} gross corrugation flange thickness, in mm

b_{cg} projected length of one corrugation, in mm, as defined in *Figure 4.2.20*

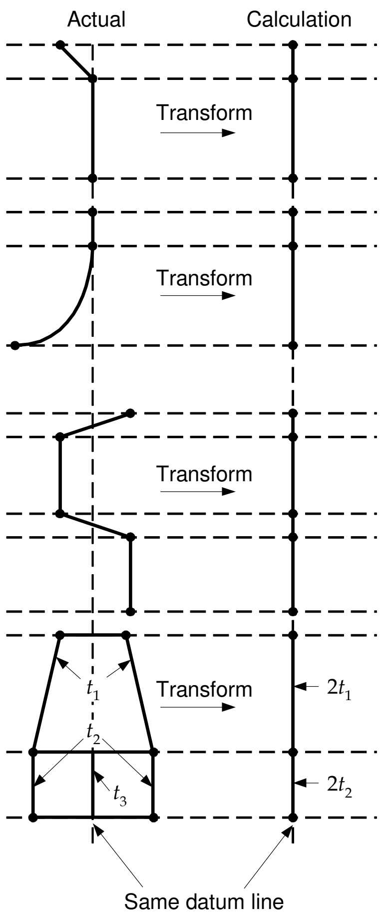
b_{w-cg} breadth of corrugation web, in mm, as defined in *Figure 4.2.20*

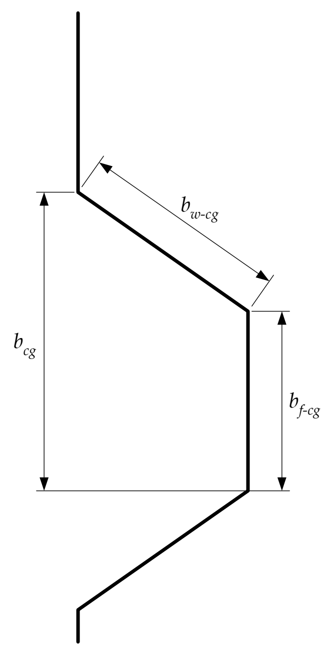
b_{f-cg} breadth of corrugation flange, in mm, as defined in *Figure 4.2.20*

t_{corr} corrosion addition, as defined in *Section 6/3.2*

2.6.4.5 The equivalent net corrugation thickness, $t_{cg-net50}$, is only applicable for the calculation of the effective area, $A_{eff-net50}$, and shear force distribution factor, f_i, as defined in *Section 8/1.3.2.2*.

Figure 4.2.20
Effective Shear Area





3 STRUCTURE DESIGN DETAILS

3.1 Standard Construction Details

3.1.1 Details to be submitted

3.1.1.1 A booklet of standard construction details is to be submitted for review. It is to include the following:

(a) the proportions of built-up members to demonstrate compliance with established standards for structural stability, see Section 10

(b) the design of structural details which reduce the harmful effects of stress concentrations, notches and material fatigue; such as:

- details of the ends, at the intersections of members and associated brackets
- shape and location of air, drainage, and/or lightening holes
- shape and reinforcement of slots or cut-outs for internals
- elimination or closing of weld scallops in way of butts, 'softening' of bracket toes, reduction of abrupt changes of section or structural discontinuities
- proportion and thickness of structural members to reduce fatigue response due to engine, propeller or wave induced cyclic stresses, particularly for higher strength steels.

3.2 Termination of Local Support Members

3.2.1 General

3.2.1.1 In general, structural members are to be effectively connected to adjacent structures to avoid hard spots, notches and stress concentrations.

3.2.1.2 Where a structural member is terminated, structural continuity is to be maintained by suitable back-up structure fitted in way of the end connection of frames, or the end connection is to be effectively extended with additional structure and integrated with an adjacent beam, stiffener, etc.

3.2.1.3 All types of stiffeners (longitudinals, beams, frames, bulkhead stiffeners) are to be connected at their ends. However, in special cases sniped ends may be permitted. Requirements for the various types of connections (bracketed, bracketless or sniped ends) are given in *3.2.3* to *3.2.5*.

3.2.2 Longitudinal members

3.2.2.1 All longitudinals are to be kept continuous within the $0.4L$ amidships cargo tank region. In special cases, in way of large openings, foundations and partial girders, the longitudinals may be terminated, but end connection and welding is to be specially considered.

3.2.2.2 Where continuity of strength of longitudinal members is provided by brackets, the correct alignment of the brackets on each side of the primary support member is to be ensured, and the scantlings of the brackets are to be such that the combined stiffener/bracket section modulus and effective cross-sectional area are not less than those of the member.

3.2.3 Bracketed connections

3.2.3.1 At bracketed end connections, continuity of strength is to be maintained at the stiffener connection to the bracket and at the connection of the bracket to the supporting member. The brackets are to have scantlings sufficient to compensate for the non-continuous stiffener flange or non-continuous stiffener.

3.2.3.2 The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection, the section modulus is less than that required for the stiffener.

3.2.3.3 Minimum net bracket thickness, $t_{bkt-net}$, is to be taken as:

$$t_{bkt-net} = \left(2 + f_{bkt}\sqrt{Z_{rl-net}}\right)\left(\sqrt{\frac{\sigma_{yd-stf}}{\sigma_{yd-bkt}}}\right)$$ mm, but is not to be less than 6mm and need not be greater than 13.5mm

Where:

f_{bkt} 0.2 for brackets with flange or edge stiffener
0.3 for brackets without flange or edge stiffener

Z_{rl-net} net rule section modulus, for the stiffener, in cm^3. In the case of two stiffeners connected, it need not be taken as greater than that of the smallest connected stiffener

σ_{yd-stf} specified minimum yield stress of the material of the stiffener, in N/mm^2

σ_{yd-bkt} specified minimum yield stress of the material of the bracket, in N/mm^2

3.2.3.4 Brackets to provide fixity of end rotation are to be fitted at the ends of discontinuous local support members, except as otherwise permitted by *3.2.4*. The end brackets are to have arm lengths, l_{bkt}, not less than:

$$l_{bkt} = c_{bkt}\sqrt{\frac{Z_{rl-net}}{t_{bkt-net}}}$$ mm, but is not to be less than:

- 1.8 times the depth of the stiffener web for connections where the end of the stiffener web is supported and the bracket is welded in line with the stiffener web or with offset necessary to enable welding, see *Figure 4.3.1(c)*
- 2.0 times for other cases, see *Figure 4.3.1(a), (b) and (d)*

Where:

c_{bkt} 65 for brackets with flange or edge stiffener
70 for brackets without flange or edge stiffener

Z_{rl-net} net rule section modulus, for the stiffener, in cm^3. In the case of two stiffeners connected, it need not be taken as greater than that of the smallest connected stiffener

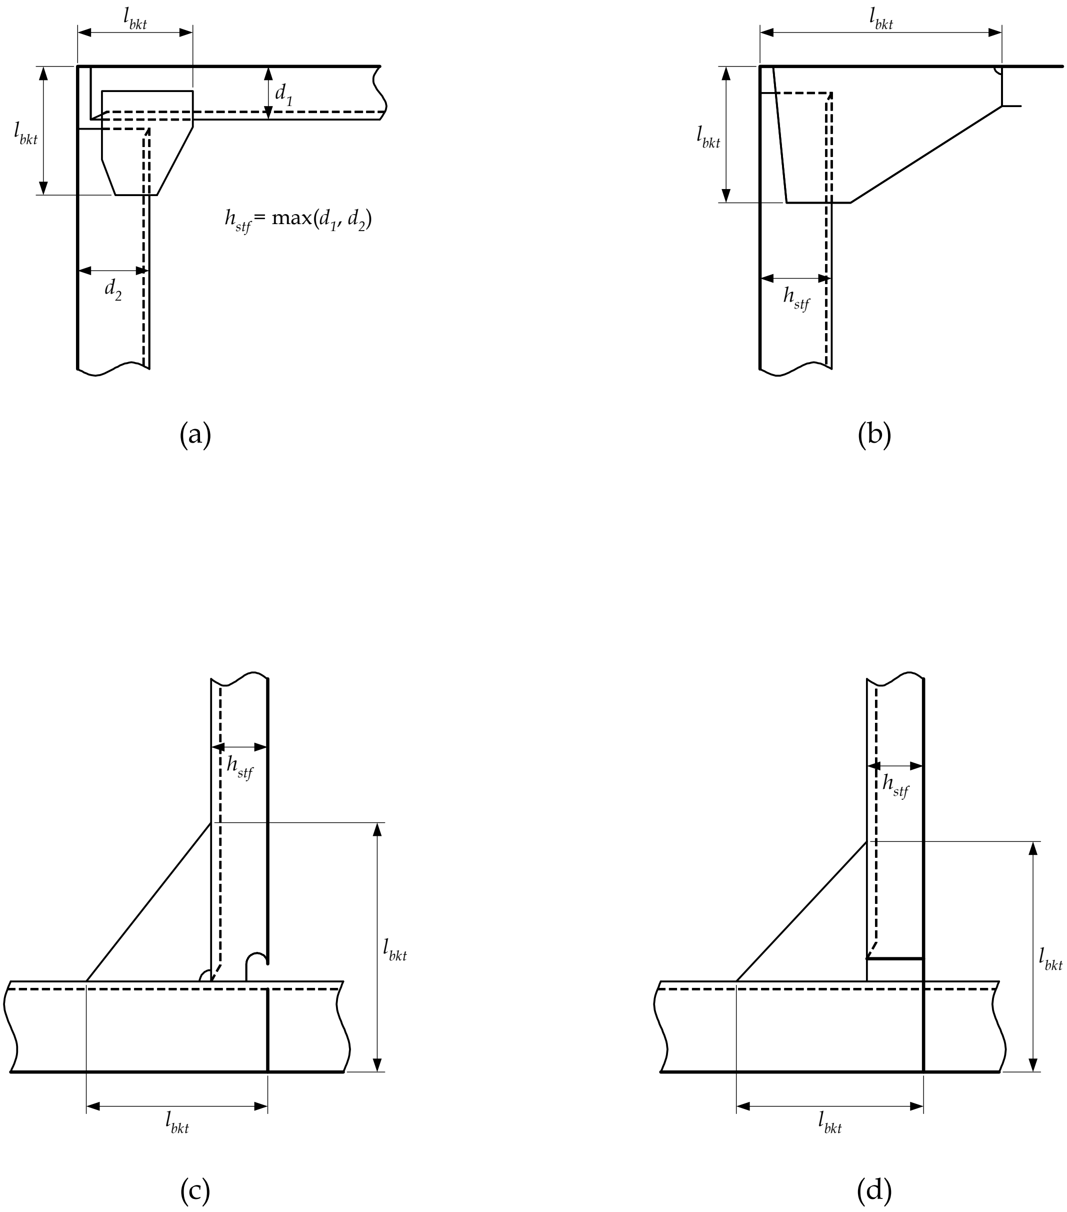
$t_{bkt-net}$ minimum net bracket thickness, as defined in 3.*2.3.3*

(RCN 2, effective from 1 July 2008)

3.2.3.4bis In case of different arm lengths the lengths of the arms, measured from the plating to the toe of the bracket, are to be such that the sum of them is greater than $2l_{bkt}$ and each arm not to be less than $0.8l_{bkt}$, where l_{bkt} is as defined in 3.2.3.4.

RCN 2 to July 2008 version (effective from 1 July 2010)

Figure 4.3.1
Bracket Arm Length



Note:

- For stiffeners of configuration (b) that are not lapped, the bracket arm length l_{bkt} is not to be less than the stiffener height h_{stf}.
- For stiffener arrangements similar to (c) and (d) where the smaller attached stiffener, labelled as h_{stf}, is connected to a primary support member or bulkhead, the height of the bracket is not to be less than the height of the attached stiffener, h_{stf}.

(RCN 2, effective from 1 July 2008)

3.2.3.5 The proportions and edge stiffening of brackets are to be in accordance with the requirements of *Section 10/2.4*. Where an edge stiffener is required, the depth of stiffener web, d_w, is not to be less than:

$$d_w = 45\left(1 + \frac{Z_{rl-net}}{2000}\right) \quad \text{mm, but is not to be less than 50mm}$$

Where:

$Z_{rl\text{-}net}$ net rule section modulus, for the stiffener, in cm^3. In the case of two stiffeners connected, it need not be taken as greater than that of the smallest connected stiffener

3.2.4 Bracketless connections

3.2.4.1 Local support members, for example longitudinals, beams, frames and bulkhead stiffeners forming part of the hull structure, are generally to be connected at their ends, in accordance with the requirements of *3.2.2* and *3.2.3*.

3.2.4.2 Where alternative connections are adopted, the proposed arrangements will be specially considered.

3.2.4.3 The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint.

3.2.5 Sniped ends

3.2.5.1 Stiffeners with sniped ends may be used where dynamic loads are small and where the incidence of vibration is considered to be small, i.e. structure not in the stern area and structure not in the vicinity of engines or generators, provided the net thickness of plating supported by the stiffener, $t_{p\text{-}net}$, is not less than:

$$t_{p-net} = c_1\sqrt{\left(1000l - \frac{s}{2}\right)\frac{sPk}{10^6}}$$

RCN 1 to July 2008 version (effective from 1 February 2010)

Where:

l stiffener span, in m

s stiffener spacing, in mm, as defined in *2.2*

P design pressure for the stiffener for the design load set being considered, in kN/m^2. The design load sets and method to derive the design pressure are to be taken in accordance with the following criteria, which define the acceptance criteria set to be used:

a) Table 8.2.5 in the cargo tank region

b) Section 8/3.9.2.2 in the area forward of the forward cargo tank, and in the aft end

c) Section 8/4.8.1.2 in the machinery space

d) Section 8/6.2.4.1 and 6.2.5.3 as applicable for the particular structure under consideration

RCN 1 to July 2008 version (effective from 1 February 2010)

RCN 1 to July 2010 version (effective from 1 July 2012)

k higher strength steel factor, as defined in *Section 6/1.1.4*

c_1 coefficient for the design load set being considered, to be taken as:

=1.2 for acceptance criteria set AC1 and sloshing design load

=1.1 for acceptance criteria set AC2

RCN 1 to July 2008 version (effective from 1 February 2010)
RCN 1 to July 2010 version (effective from 1 July 2012)

3.2.5.2 Bracket toes and sniped end members are, in general, to be kept within 25mm of the adjacent member. The maximum distance is not to exceed 40mm unless the bracket or member is supported by another member on the opposite side of the plating. Special attention is to be given to the end taper by using a sniped end of not more than 30 degrees. The depth of toe or sniped end is, generally, not to exceed the thickness of the bracket toe or sniped end member, but need not be less than 15mm.

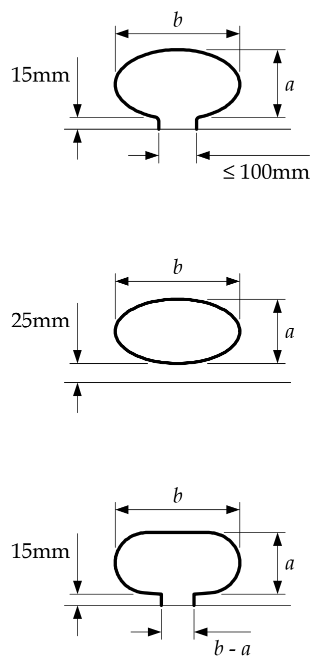
3.2.5.3 The end attachments of non-load bearing members may be snipe ended. The sniped end is to be not more than 30 degrees and is generally to be kept within 50mm of the adjacent member unless it is supported by a member on the opposite side of the plating. The depth of the toe is generally not to exceed 15mm.

3.2.6 Air and drain holes and scallops

3.2.6.1 Air and drain holes and scallops are to be kept at least 200mm clear of the toes of end brackets, end connections and other areas of high stress concentration measured along the length of the stiffener toward the mid-span and 50mm measured along the length in the opposite direction. See Figure 4.3.2(b). Openings that have been fitted with closing plates, such as scallops, may be permitted in way of block fabrication butts. In areas where the shear stress is less than 60 percent of the allowable limit, alternative arrangements may be accepted. Openings are to be well-rounded. Figure 4.3.2(a) shows some examples of air and drain holes and scallops. In general, the ratio of a/b, as defined in Figure 4.3.2(a), is to be between 0.5 and 1.0. In fatigue sensitive areas further consideration may be required with respect to the details and arrangements of openings and scallops.

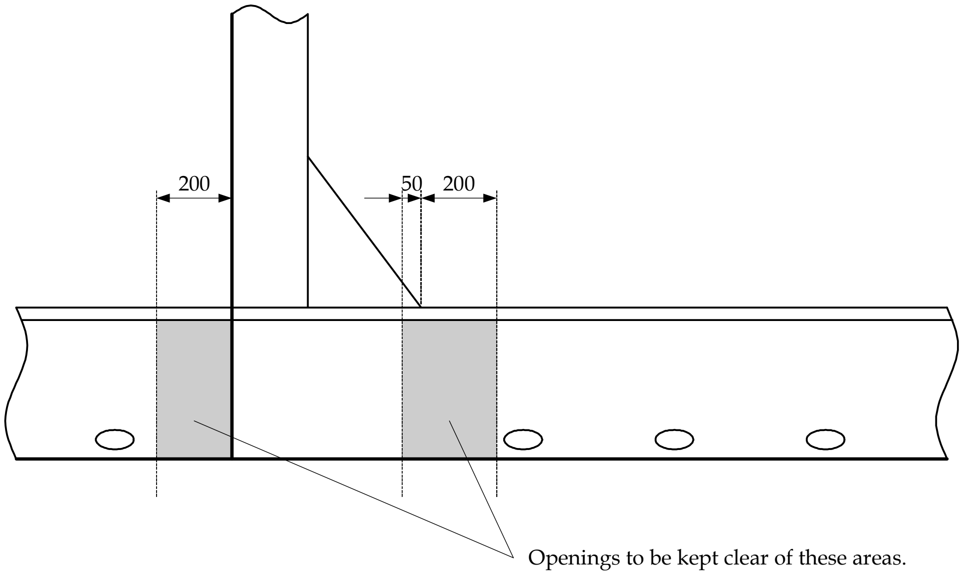
RCN 1 to July 2010 version (effective from 1 July 2012)

Figure 4.3.2(a)
Examples of Air and Drain Holes and Scallops



Note
The details shown in this figure are for guidance and illustration only.

Figure 4.3.2(b)
Location of Air and Drain Holes



3.2.7 Special requirements

3.2.7.1 Closely spaced scallops or drain holes, i.e. where the distance between scallops/drain holes is less than twice the width b as shown in *Figure 4.3.2(a)*, are not permitted in longitudinal strength members or within 20% of the stiffener span measured from the end of the stiffener. Widely spaced air or drain holes may be permitted provided that they are of elliptical shape or equivalent to minimise stress concentration and are, in general, cut clear of the weld connection.

3.3 Termination of Primary Support Members

3.3.1 General

3.3.1.1 Primary support members are to be arranged to ensure effective continuity of strength. Abrupt changes of depth or section are to be avoided. Primary support members in tanks are to form a continuous line of support and, wherever possible, a complete ring system.

3.3.1.2 The members are to have adequate lateral stability and web stiffening, and the structure is to be arranged to minimise hard spots and other sources of stress concentration. Openings are to have well-rounded corners and are to be located considering the stress distribution and buckling strength of the panel.

3.3.2 End connection

3.3.2.1 Primary support members are to be provided with adequate end fixity by brackets or equivalent structure. The design of end connections and their supporting structure is to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member.

3.3.2.2 The ends of brackets are generally to be soft-toed. The free edges of the brackets are to be stiffened. Scantlings and details are given in *3.3.3*.

3.3.2.3 Where primary support members are subject to concentrated loads additional strengthening may be required, particularly if these are out of line with the member web.

3.3.2.4 In general, ends of primary support members or connections between primary support members forming ring systems are to be provided with brackets. Bracketless connections may be applied provided that there is adequate support of the adjoining face plates.

3.3.3 Brackets

3.3.3.1 In general, the arm lengths of brackets connecting primary support members are not to be less than the web depth of the member, and need not be taken as greater than 1.5 times the web depth. The thickness of the bracket is, in general, not to be less than that of the girder web plate.

3.3.3.2 For a ring system where the end bracket is integral with the webs of the members and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained close to the mid point of the bracket and gradually tapered to the smaller face plates. Butts in face plates are to be kept well clear of the bracket toes.

3.3.3.3 Where a wide face plate abuts a narrower one, the taper is generally not to be greater than 1 in 4. Where a thick face plate abuts against a thinner one and the difference in thickness is greater than 4mm, the taper of the thickness is not to be greater than 1 in 3.

3.3.3.4 Face plates of brackets (typical brackets similar to those indicated in *Figure 4.2.7b*) are to have a net cross-sectional area, A_{f-net}, which is not to be less than:

$$A_{f-net} = l_{bkt-edge} t_{bkt-net} \quad \text{cm}^2$$

Where:

$l_{bkt-edge}$ length of free edge of bracket, in m. For brackets that are curved the length of the free edge may be taken as the length of the tangent at the midpoint of the free edge. If $l_{bkt-edge}$ is greater than 1.5m, 40 percent of the face plate area is to be in a stiffener fitted parallel to the free edge and a maximum 0.15m from the edge

$t_{bkt-net}$ minimum net bracket thickness, in mm, as defined in *3.2.3.3*

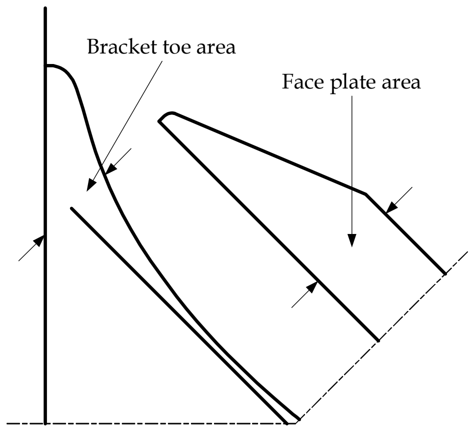
3.3.4 Bracket toes

3.3.4.1 The toes of brackets are not to land on unstiffened plating. Notch effects at the toes of brackets may be reduced by making the toe concave or otherwise tapering it off. In general, the toe height is not to be greater than the thickness of the bracket toe, but need not be less than 15mm. The end brackets of large primary support members are to be soft-toed. Where any end bracket has a face plate, it is to be sniped and tapered at an angle not greater than 30°.

3.3.4.2 Where primary support members are constructed of higher strength steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates, which are welded onto the edge of primary support member brackets, are to be carried well around the radiused bracket toe and are to incorporate a taper not greater than 1 in 3. Where sniped face plates are welded adjacent to the edge of primary support member brackets, adequate cross-sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area, measured perpendicular to the face plate

is to be not less than 60 percent of the full cross-sectional area of the face plate, see *Figure 4.3.3*.

Figure 4.3.3
Bracket Toe Construction



Note
The details shown in this figure are only used to illustrate items described in the text and are not intended to represent design guidance or recommendations.

3.4 Intersections of Continuous Local Support Members and Primary Support Members

3.4.1 General

3.4.1.1 Cut-outs for the passage of stiffeners through the web of primary support members, and the related collaring arrangements, are to be designed to minimize stress concentrations around the perimeter of the opening and on the attached web stiffeners.

3.4.1.2 Cut-outs in way of cross-tie ends and floors under bulkhead stools or in high stress areas are to be fitted with "full" collar plates, see *Figure 4.3.4*.

3.4.1.3 Lug type collar plates are to be fitted in cut-outs where required for compliance with the requirements of *3.4.3*, and in areas of significant stress concentrations, e.g., in way of primary support member toes. See *Figure 4.3.5* for typical lug arrangements.

3.4.1.4 When, in the following locations, the calculated direct stress, σ_w, in the primary support member web stiffener according to *3.4.3.5* exceeds 80% of the permissible values a soft heel is to be provided in way of the heel of primary support member web stiffeners:

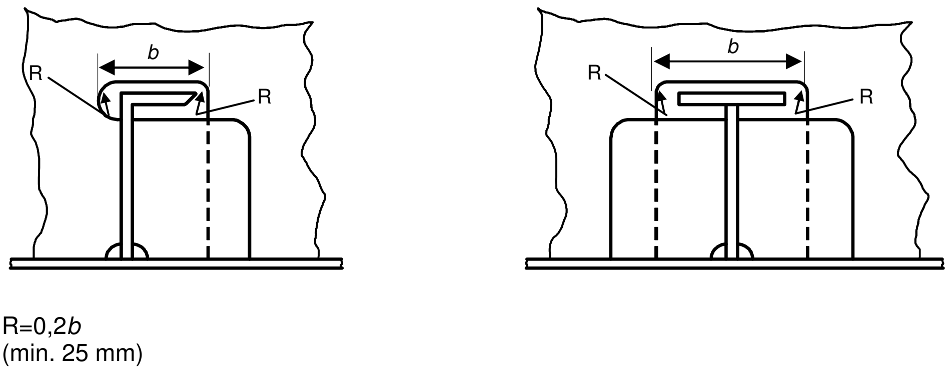
(a) connection to shell envelope longitudinals below the scantling draught, T_{sc}

(b) connection to inner bottom longitudinals.

A soft heel is not required at the intersection with watertight bulkheads and primary support members, where a back bracket is fitted or where the primary support member web is welded to the stiffener face plate. The soft heel is to have a keyhole, similar to that shown in *Figure 4.3.6(c)*.

RCN 1 to July 2010 version (effective from 1 July 2012)

Figure 4.3.4
Collars for Cut-outs in Areas of High Stress



RCN 2 to July 2008 version (effective from 1 July 2010)

3.4.2 Details of cut-outs

3.4.2.1 In general, cut-outs are to have rounded corners and the corner radii, *R*, are to be as large as practicable, with a minimum of 20 percent of the breadth, *b*, of the cut-out or 25mm, whichever is greater, but need not be greater than 50mm, see Figure 4.3.4. Consideration will be given to other shapes on the basis of maintaining equivalent strength and minimizing stress concentration.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.4.3 Connection between primary support members and intersecting stiffeners (local support members)

3.4.3.1 The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.

3.4.3.2 The total load, *W*, transmitted through the connection to the primary support member is given by:

$$W = P s \left(S - \frac{s}{2000} \right) 10^{-3} \quad \text{kN}$$

Where:

P design pressure for the stiffener for the design load set being considered, in kN/m². The design load sets, method to derive the design pressure and applicable acceptance criteria set are to be taken in accordance with the following criteria, which define the Acceptance Criteria Set to be used:

Table 8.2.5 in the cargo tank region

Section 8/3.9.2.2 in the area forward of the forward cargo tank

Section 8/3.9.2.2 in the aft end

Section 8/4.8.1.2 in the machinery space

Section 8/6.2.4.1 if subjected to sloshing loads

Section 8/6.3.5.1 if subjected to bottom slamming loads

Section 8/6.4.5.1 if subjected to bow impact loads

S primary support member spacing, in m, as defined in *Section*

4/2.2

s stiffener spacing, in mm, as defined in *Section 4/2.2*

For stiffeners having different primary support member spacing, S, and/or different pressure, P, at each side of the primary support member, the average load for the two sides is to be applied, e.g. vertical stiffeners at transverse bulkhead.

3.4.3.3 The load, W_1, transmitted through the shear connection is to be taken as follows.

If the web stiffener is connected to the intersecting stiffener:

$$W_1 = W\left(\alpha_a + \frac{A_{1-net}}{4 f_c A_{w-net} + A_{1-net}}\right) \quad \text{kN}$$

If the web stiffener is not connected to the intersecting stiffener:

$$W_1 = W$$

Where:

W the total load, in kN, as defined in *3.4.3.2*

α_a panel aspect ratio, not to be taken greater than 0.25

$$= \frac{s}{1000S}$$

S primary support member spacing, in m

s stiffener spacing, in mm

A_{1-net} effective net shear area of the connection, to be taken as the sum of the components of the connection:

$$A_{1d-net} + A_{1c-net} \quad \text{cm}^2$$

in case of a slit type slot connections area, A_{1-net}, is given by:

$$A_{1-net} = 2 l_d t_{w-net} 10^{-2} \quad \text{cm}^2$$

in case of a typical double lug or collar plate connection area, A_{1-net}, is given by:

$$A_{1-net} = 2 f_1 l_c t_{c-net} 10^{-2} \quad \text{cm}^2$$

A_{1d-net} net shear connection area excluding lug or collar plate, as given by the following and *Figure 4.3.5*:

$$A_{1d-net} = l_d t_{w-net} 10^{-2} \quad \text{cm}^2$$

l_d length of direct connection between stiffener and primary support member web, in mm

t_{w-net} net web thickness of the primary support member, in mm

A_{1c-net} net shear connection area with lug or collar plate, given by the following and *Figure 4.3.5*:

$$A_{1c-net} = f_1 l_c t_{c-net} 10^{-2} \quad \text{cm}^2$$

l_c length of connection between lug or collar plate and primary support member, in mm

t_{c-net} net thickness of lug or collar plate, not to be taken greater than the net thickness of the adjacent primary support member web, in mm

f_1 shear stiffness coefficient:

= 1.0 for stiffeners of symmetrical cross section

= $140/w$ for stiffeners of asymmetrical cross section

but is not to be taken as greater than 1.0

w the width of the cut-out for an asymmetrical stiffener, measured from the cut-out side of the stiffener web, in mm, as indicated in *Figure 4.3.5*

A_{w-net} effective net cross-sectional area of the primary support member web stiffener in way of the connection including backing bracket where fitted, as shown in *Figure 4.3.6,* in cm^2. If the primary support member web stiffener incorporates a soft heel ending or soft heel and soft toe ending, A_{w-net}, is to be measured at the throat of the connection, as shown in *Figure 4.3.6*.

f_c the collar load factor defined as follows:

for intersecting stiffeners of symmetrical cross section:

= 1.85 for $A_{w-net} \leq 14$

= $1.85 - 0.0441(A_{w-net} - 14)$ for $14 < A_{w-net} \leq 31$

= $1.1 - 0.013(A_{w-net} - 31)$ for $31 < A_{w-net} \leq 58$

= 0.75 for $A_{w-net} > 58$

for intersecting stiffeners of asymmetrical cross section:

$$= 0.68 + 0.0172 \frac{l_s}{A_{w-net}}$$

where:

$l_s = l_c$ for a single lug or collar plate connection to the primary support member

= l_d for a single sided direct connection to the primary support member

= mean of the connection length on both sides, i.e., in the case of a lug or collar plus a direct connection, $l_s = 0.5(l_c + l_d)$

3.4.3.4 The load, W_2, transmitted through the primary support member web stiffener is to be taken as follows.

If the web stiffener is connected to the intersecting stiffener:

$$W_2 = W\left(1 - \alpha_a - \frac{A_{1-net}}{4 f_c A_{w-net} + A_{1-net}}\right) \quad \text{kN}$$

If the web stiffener is not connected to the intersecting stiffener:

$W_2 = 0$

Where:

W the total load, in kN, as defined in *3.4.3 2*

α_a panel aspect ratio

$$= \frac{s}{1000S}$$

S primary support member spacing, in m

s stiffener spacing, in mm

A_{1-net} effective net shear area of the connection, in cm², as defined in *3.4.3.3*

f_c collar load factor, as defined in *3.4.3.3*

A_{w-net} effective net cross-sectional area of the primary support member web stiffener , in cm², as defined in *3.4.3.3*

3.4.3.5 The values of A_{w-net}, A_{wc-net} and A_{1-net} are to be such that the calculated stresses satisfy the following criteria:

for the connection to the primary support member web stiffener away from the weld:

$$\sigma_w \le \sigma_{perm}$$

for the connection to the primary support member web stiffener in way of the weld:

$$\sigma_{wc} \le \sigma_{perm}$$

for the shear connection to the primary support member web:

$$\tau_w \le \tau_{perm}$$

Where:

σ_w direct stress in the primary support member web stiffener at the minimum bracket area away from the weld connection:

$$= \frac{10 W_2}{A_{w-net}} \quad \text{N/mm}^2$$

σ_{wc} direct stress in the primary support member web stiffener in way of the weld connection:

$$= \frac{10 W_2}{A_{wc-net}} \quad \text{N/mm}^2$$

τ_w shear stress in the shear connection to the primary support member

$$= \frac{10 W_1}{A_{1-net}} \quad \text{N/mm}^2$$

A_{w-net} effective net cross-sectional area of the primary support member web stiffener, in cm², as defined in *3.4.3.3*

A_{wc-net} effective net area of the web stiffener in way of the weld as shown in *Figure 4.3.6*, in cm²

A_{1-net} effective net shear area of the connection, in cm², as defined in *3.4.3.3*

W_1 load transmitted through the shear connection, in kN, as defined in *3.4.3.3*

W_2 load transmitted through the web stiffener, in kN, as defined in *3.4.3.4*

σ_{perm} permissible direct stress given in *Table 4.3.1* for the applicable acceptance criteria, see *3.4.3.2*, in N/mm²

τ_{perm} permissible shear stress given in *Table 4.3.1* for the applicable acceptance criteria, see *3.4.3.2*, in N/mm²

3.4.3.5 bis 1 When total load, W, is bottom slamming or bow impact loads the following criteria apply in lieu of 3.4.3.3-3.4.3.5.

$$0.9W \le \frac{\left(A_{1-net}\tau_{perm} + A_{w-net}\sigma_{perm}\right)}{10}\ \text{kN}$$

A_{1-net} effective net shear area in cm² of the connection, as defined in 3.4.3.3.

A_{w-net} effective net cross sectional area in cm² of the primary support member web stiffener in way of the connection including backing bracket where fitted, as defined in 3.4.3.3.

σ_{perm} permissible direct stress given in *Table 4.3.1* for AC-3, in N/mm²

τ_{perm} permissible shear stress given in *Table 4.3.1* for AC-3, in N/mm²

RCN 1 to July 2008 version (effective from 1 February 2010)

3.4.3.6 Where a backing bracket is fitted in addition to the primary support member web stiffener, it is to be arranged on the opposite side to, and in alignment with the web stiffener. The arm length of the bracket is to be not less than the depth of the web stiffener and its net cross-sectional area through the throat of the bracket is to be included in the calculation of A_{w-net} as shown in *Figure 4.3.6*.

3.4.3.7 Lapped connections of primary support member web stiffeners or tripping brackets to local support members are not permitted in the cargo tank region, e.g., lapped connections between transverse and longitudinal local support members.

3.4.3.8 Fabricated stiffeners having their face plate welded to the side of the web, leaving the edge of the web exposed, are not recommended for side shell and longitudinal bulkhead longitudinals. Where such sections are connected to the primary support member web stiffener, a symmetrical arrangement of connection to the transverse members is to be incorporated. This may be implemented by fitting backing brackets on the opposite side of the transverse web or bulkhead. In way of the cargo tank region, the primary support member web stiffener and backing brackets are to be butt welded to the intersecting stiffener web.

3.4.3.9 Where the web stiffener of the primary support member is parallel to the web of the intersecting stiffener, but not connected to it, the offset primary support member web stiffener may be located as shown in *Figure 4.3.7*. The offset primary support member web stiffener is to be located in close proximity to the slot edge. See also *Figure 4.3.7*. The ends of the offset web stiffeners are to be suitably tapered and softened.

3.4.3.10 Alternative arrangements will be specially considered on the basis of their ability to transmit load with equivalent effectiveness. Details of calculations made and/or testing procedures and results are to be submitted.

3.4.3.11 The size of the fillet welds is to be calculated according to *Section 6/5* based on the weld factors given in *Table 4.3.2*. For the welding in way of the shear connection the size is not to be less than that required for the primary support member web plate for the location under consideration.

Table 4.3.1
Permissible Stresses for Connection between Stiffeners and Primary Support Members

Item	Direct Stress, σ_{perm}, in N/mm²			Shear Stress, τ_{perm}, in N/mm²		
	Acceptance Criteria Set See *3.4.3.2*			Acceptance Criteria Set See *3.4.3.2*		
	AC1	AC2	AC3	AC1	AC2	AC3
Primary support member web stiffener	$0.83\sigma_{yd}$ (3)	σ_{yd}	σ_{yd}	-	-	-
Primary support member web stiffener to intersecting stiffener in way of weld connection:						
double continuous fillet	$0.58\ \sigma_{yd}$ (3)	$0.70\ \sigma_{yd}$ (3)	σ_{yd}	-	-	-
partial penetration weld	$0.83\ \sigma_{yd}$ (2)(3)	σ_{yd} (2)	σ_{yd}	-	-	-
Primary support member stiffener to intersecting stiffener in way of lapped welding	$0.50\ \sigma_{yd}$	$0.60\ \sigma_{yd}$	σ_{yd}	-	-	-
Shear connection including lugs or collar plates:						
single sided connection	-	-	-	$0.71\ \tau_{yd}$	$0.85\ \tau_{yd}$	τ_{yd}
double sided connection	-	-	-	$0.83\ \tau_{yd}$	τ_{yd}	τ_{yd}

Where:

τ_{perm} permissible shear stress, in N/mm²

σ_{perm} permissible direct stress, in N/mm²

σ_{yd} minimum specified material yield stress, in N/mm²

τ_{yd} $\frac{\sigma_{yd}}{\sqrt{3}}$, in N/mm²

Note

1. The stress computation on plate type members is to be performed on the basis of net thicknesses, whereas gross values are to be used in weld strength assessments, see *3.4.3.11*.
2. The root face is not to be greater than one third of the gross thickness of the primary support member stiffener.
3. Allowable stresses may be increased by 5 percent where a soft heel is provided in way of the heel of the primary support member web stiffener.

Table 4.3.2
Weld Factors for Connection between Stiffeners and Primary Support Members

Item	Weld factor
Primary support member stiffener to intersecting stiffener	$0.6\ \sigma_{wc} / \sigma_{perm}$ not to be less than 0.38
Shear connection inclusive lug or collar plate	0.38
Shear connection inclusive lug or collar plate, where the web stiffener of the primary support member is not connected to the intersection stiffener	$0.6\ \tau_w / \tau_{perm}$ not to be less than 0.44

Where:

τ_w shear stress, as defined in *3.4.3.5*

σ_w as defined in *3.4.3.5*

τ_{perm} permissible shear stress, in N/mm², see *Table 4.3.1*

σ_{perm} permissible direct stress, in N/mm² see *Table 4.3.1*

Figure 4.3.5

(c) keyhole in way of soft heel

(d) symmetrical soft toe brackets

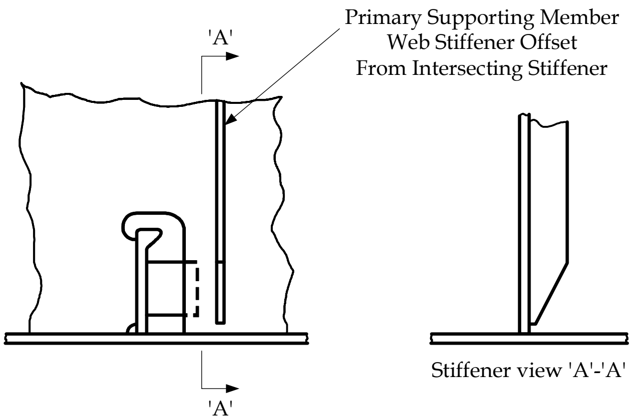
Where:

$t_{ws\text{-}net}$, $t_{ws1\text{-}net}$ and $t_{ws2\text{-}net}$	net thickness of the primary support member web stiffener/backing bracket, in mm
d_w, d_{w1} and d_{w2}	minimum depth of the primary support member web stiffener/backing bracket, in mm
d_{wc}, d_{wc1} and d_{wc2}	length of connection between the primary support member web stiffener/backing bracket and the local support stiffener, in mm

Note

Except where specific dimensions are noted for the details of the keyhole in way of the soft heel, see *3.4.1.4*, the details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance or recommendations.

Figure 4.3.7
Offset Primary Support Member Web Stiffeners



3.5 Openings

3.5.1 General

3.5.1.1 Openings are to have well rounded corners.

3.5.1.2 Manholes, lightening holes and other similar openings are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are to be avoided in high stress areas unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory. Examples of high stress areas include:

(a) in vertical or horizontal diaphragm plates in narrow cofferdams/double plate bulkheads within one-sixth of their length from either end

(b) in floors or double bottom girders close to their span ends

(c) above the heads and below the heels of pillars.

Where larger openings than given by *3.5.2* or *3.5.3* are proposed, the arrangements and compensation required will be specially considered.

3.5.2 Manholes and lightening holes in single skin sections not requiring reinforcement

3.5.2.1 Openings cut in the web with depth of opening not exceeding 25 percent of the web depth and located so that the edges are not less than 40 percent of the web depth from the faceplate do not generally require reinforcement. The length of opening is not to be greater than the web depth or 60 percent of the local support member spacing, whichever is greater. The ends of the openings are to be equidistant from the corners of cut outs for local support members.

3.5.3 Manholes and lightening holes in double skin sections not requiring reinforcement

3.5.3.1 Where openings are cut in the web and are clear of high stress areas, reinforcement of these openings is not required provided that the depth of the opening does not exceed 50 percent of the web depth and is located so that the edges are well clear of cut outs for the passage of local support members.

3.5.4 Manholes and lightening holes requiring reinforcement

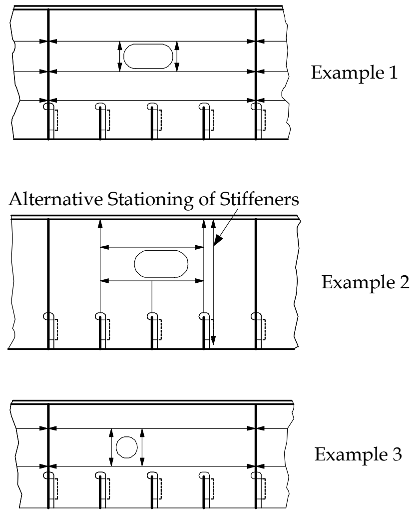
3.5.4.1 Manholes and lightening holes are to be stiffened as required by *3.5.4.2* and *3.5.4.3*. The stiffening requirements of *3.5.4.2* and *3.5.4.3* may be modified where

alternative arrangements are demonstrated as satisfactory with regards to stress and stability, in accordance with analysis methods described in *Section 9/2*.

3.5.4.2 The web plate is to be stiffened at openings when the mean shear stress, as determined by application of the requirements of *Section 8* or *Section 9/2*, is greater than 50N/mm² for acceptance criteria set AC1 or greater than 60N/mm² for acceptance criteria set AC2. The stiffening arrangement is to ensure buckling strength as required by *Section 10* under application of the loading as required in *Section 8* or *Section 9/2*.

3.5.4.3 On members contributing to longitudinal strength, stiffeners are to be fitted along the free edges of the openings parallel to the vertical and horizontal axis of the opening. Stiffeners may be omitted in one direction if the shortest axis is less than 400mm, and in both directions if length of both axes is less than 300mm. Edge reinforcement may be used as an alternative to stiffeners. See *Figure 4.3.8*.

Figure 4.3.8
Web Plate with Large Openings



3.6 Local Reinforcement

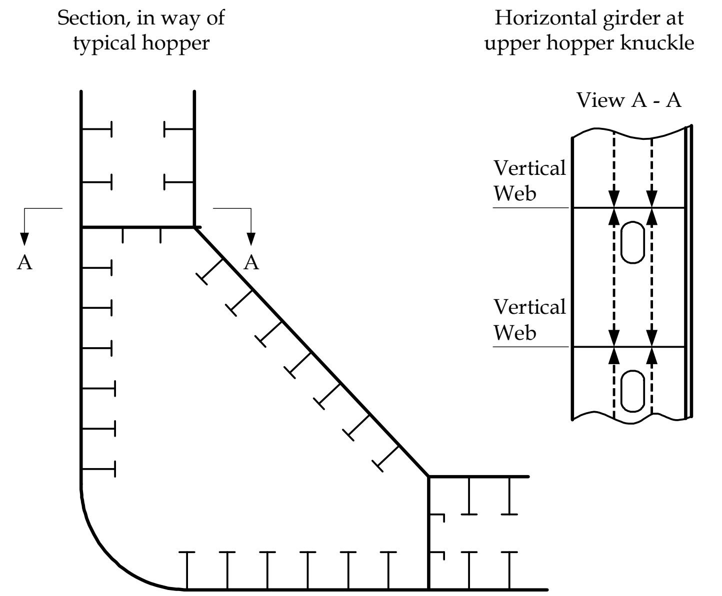
3.6.1 Reinforcement at knuckles

3.6.1.1 Whenever a knuckle in a main member (shell, longitudinal bulkhead etc.) is arranged, adequate stiffening is to be fitted at the knuckle to transmit the transverse load. This stiffening, in the form of webs, brackets or profiles, is to be connected to the transverse members to which they are to transfer the load (in shear). See *Figure 4.3.9*.

3.6.1.2 In general, for longitudinal shallow knuckles, closely spaced carlings are to be fitted across the knuckle, between longitudinal members above and below the knuckle. Carlings or other types of reinforcement need not be fitted in way of shallow knuckles that are not subject to high lateral loads and/or high in-plane loads across the knuckle, such as deck camber knuckles.

3.6.1.3 Generally, the distance between the knuckle and the support stiffening described in *3.6.1.1* is not to be greater than 50mm.

Figure 4.3.9
Example of Reinforcement at Knuckles



3.6.2 Reinforcement for openings and attachments associated with means of access for inspection purposes

3.6.2.1 Local reinforcement is to be provided taking into account proper location and strength of all attachments to the hull structure for access for inspection purposes.

3.7 Fatigue Strength

3.7.1 General

3.7.1.1 Structural details are to be designed for compliance with the requirements of fatigue strength as specified in *Section 9/3*.

SECTION 5

STRUCTURAL ARRANGEMENT

1 GENERAL

1.1 Introduction

1.1.1 Scope

1.1.1.1 This section covers the general structural arrangement requirements for the ship, which are based on or derived from National and International regulations, see *Sections 2/2.1.1* and *3/3.3*.

2 WATERTIGHT SUBDIVISION

2.1 Watertight Bulkhead Arrangement

2.1.1 General

2.1.1.1 All ships are to be provided with watertight bulkheads arranged to subdivide the hull into watertight compartments in accordance with the following requirements.

2.1.2 Minimum number and disposition of watertight bulkheads

2.1.2.1 The following watertight bulkheads are to be fitted on all ships:

(a) a collision bulkhead, see *2.2.1.1*

(b) an aft peak bulkhead

(c) a bulkhead at each end of the machinery space.

2.1.2.2 The bulkheads in the cargo tank region are to be spaced at uniform intervals so far as practicable.

2.1.2.3 The applicable number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the requirements of National regulations.

2.1.2.4 The number of openings in watertight bulkheads is to be kept to a minimum. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. Additional requirements apply to collision bulkheads in *Section 8/3.6.2*.

2.2 Position of Collision Bulkhead

2.2.1 General

2.2.1.1 A collision bulkhead is to be fitted on all ships and is to extend to the freeboard deck. It is to be located between $0.05L_L$ or 10m, whichever is less, and $0.08L_L$ aft of the reference point, where the load line length, L_L, is as defined in *Section 4/1.1.2.1* and the reference point is as defined in *2.2.1.2*. Proposals for location of the collision bulkhead aft of $0.08L_L$ will be specially considered.

2.2.1.2 For ships without bulbous bows the reference point is to be taken where the forward end of L_L coincides with the forward side of the stem, on the waterline which L_L is measured. For ships with bulbous bows, it is to be measured from the forward end of L_L a distance x forward; where x is to be taken as the lesser of the following:

(a) half the distance, from the forward end of L_L and the extreme forward end of the bulb extension

(b) $0.015L_L$

(c) 3.0m.

2.2.1.3 In general, the collision bulkhead is to be in one plane, however, the bulkhead may have steps or recesses provided they are in compliance with the limits prescribed in *2.2.1.1* and *2.2.1.2*.

2.3 Position of Aft Peak Bulkhead

2.3.1 General

2.3.1.1 An aft peak bulkhead, enclosing the stern tube and rudder trunk in a watertight compartment, is to be provided. Where the shafting arrangements make enclosure of the stern tube in a watertight compartment impractical, alternative arrangements will be specially considered. The aft peak bulkhead location on ships powered and/or controlled by equipment that do not require the fitting of a stern tube and/or rudder trunk will also be subject to special consideration.

2.3.1.2 The aft peak bulkhead may terminate at the first deck above the summer load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor.

3 DOUBLE HULL ARRANGEMENT

3.1 General

3.1.1 Protection of cargo tanks

3.1.1.1 Every tanker is to be provided with double bottom tanks and spaces, and double side tanks and spaces, in accordance with *3.2* and *3.3*. The double bottom and double side tanks and spaces, protect the cargo tanks or spaces, and are not to be used for the carriage of oil cargoes.

3.1.2 Capacity of ballast tanks

3.1.2.1 The capacity of the segregated ballast tanks shall be so determined that the ship may operate safely on ballast voyages without recourses to the use of cargo tanks for water ballast. The capacity of ballast shall be at least such that, in any ballast condition at any part of the voyage, including the conditions consisting of lightweight plus segregated ballast only, the ships draught and trim can meet the requirements in *3.1.2.2* to *3.1.2.4*.

3.1.2.2 The moulded draught amidships, T_{mid}, excluding any hogging or sagging correction, is not to be less than:

$$T_{mid} = 2.0 + 0.02L \quad \text{m}$$

Where:

L rule length, as defined in *Section 4/1.1.1.1*, in m

3.1.2.3 The draughts at the F.P. and A.P. are to correspond to those determined by the draught amidships, as given in *3.1.2.2*, and in association with a trim by the stern not greater than $0.015L$ (m).

3.1.2.4 The draught at the A.P. is not to be less than that required to obtain full immersion of the propeller(s).

3.1.3 Limitation of size and arrangement of cargo tanks

3.1.3.1 Cargo tanks are to be of a size and arrangement that hypothetical oil outflow from side and bottom damage, anywhere in the length of the ship, is limited.

3.2 Double Bottom

3.2.1 Double bottom depth

3.2.1.1 The minimum double bottom depth, d_{db}, is to be taken as the lesser of:

$$d_{db} = \frac{B}{15} \quad \text{m, but not less than 1.0m}$$

$$d_{db} = 2.0 \quad \text{m}$$

Where:

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

3.3 Double Side

3.3.1 Double side width

3.3.1.1 The minimum double side width, w_{ds}, is to be taken as the lesser of:

$$w_{ds} = 0.5 + \frac{DWT}{20000} \quad \text{m, but not less than 1.0m}$$

$$w_{ds} = 2.0 \quad \text{m}$$

Where:

DWT deadweight of the ship, in tonnes, as defined in *Section 4/1.1.14.1*

4 SEPARATION OF SPACES

4.1 Separation of Cargo Tanks

4.1.1 General

4.1.1.1 The cargo pump room, cargo tanks, slop tanks and cofferdams are to be positioned forward of machinery spaces. Main cargo control stations, control stations, accommodation and service spaces are to be positioned aft of cargo tanks, slop tanks, and spaces which isolate cargo or slop tanks from machinery spaces, but not necessarily aft of the oil fuel bunker tanks and ballast tanks.

4.2 Cofferdam Spaces

4.2.1 General

4.2.1.1 Cofferdam spaces are to be kept gas-tight. Where applicable, access requirements to permit internal inspections, are to be in accordance with *5.3*.

5 ACCESS ARRANGEMENTS

5.1 Access Into and Within Spaces in, and Forward of, the Cargo Tank Region

5.1.1 General

5.1.1.1 Access into and within spaces in, and forward of, the cargo tank region is to satisfy the *International Convention for the Safety of Life at Sea, 1974,* as amended, Chapter II-1, Part A-1, Regulation 3-6, as required by the Flag Administration, for details and arrangements of openings and attachments to the hull structure. This will be reviewed in conjunction with the structural requirements. In addition, the requirements of *5.1.1.2* to *5.1.1.5* are to be complied with.

5.1.1.2 Where a duct keel or pipe tunnel is fitted provision is to be made for at least two exits to the open deck arranged at a maximum distance from each other. The duct keel or pipe tunnel is not to pass into machinery spaces. The aft access may lead from the pump room to the duct keel. Where an aft access is provided from the pump room to the duct keel, the access opening from the pump room to the duct keel is to be provided with an oil-tight cover plate or a watertight door. Mechanical ventilation is to be provided and such spaces are to be sufficiently ventilated prior to entry. A notice board is to be fitted at each entrance to the pipe tunnel stating that before any attempt is made to enter, the ventilating fan must have been in operation for a sufficient period. In addition, the atmosphere in the tunnel is to be sampled by a gas monitor, and where an inert gas system is fitted in cargo tanks, an oxygen monitor is to be provided.

5.1.1.3 Where a watertight door is fitted in the pump room for access to the duct keel, the scantlings of the watertight door are to comply with the requirements of the individual Classification Society and the following additional requirements:

(a) the watertight door is to be capable of being manually closed from outside the main pump room entrance, in addition to bridge operation. A means of indicating whether the door is open or closed is to be provided locally and on the bridge.

(b) a notice is to be affixed at each operating position to the effect that the watertight door is to be kept closed during normal operations of the ship, except when access to the pipe tunnel is required.

5.1.1.4 At least one horizontal access opening of 600mm by 800mm clear opening is to be fitted in each horizontal girder in the vertical wing ballast space and weather deck to assist in rescue operations. Where an opening of 600mm by 800mm is not permitted due to structural arrangements, a 600mm by 600mm clear opening will be accepted.

5.1.1.5 Special consideration will be given to any proposals to fit permanent repair/maintenance access openings with oil-tight covers in cargo tank bulkheads. Attention is drawn to the relevant National regulations concerning load line and oil outflow aspects of such arrangements.

SECTION 6

MATERIALS AND WELDING

1 STEEL GRADES

1.1 Hull Structural Steel

1.1.1 Scope

1.1.1.1 Materials used during construction are to comply with the Rules for Materials of the individual Classification Society. Use of other materials and the corresponding scantlings will be specially considered.

1.1.2 Strength

1.1.2.1 Steel having a specified minimum yield stress of 235N/mm^2 is regarded as normal strength hull structural steel. Steel having a higher specified minimum yield stress is regarded as higher strength hull structural steel.

1.1.3 Material grades

1.1.3.1 Material grades of hull structural steels are referred to as follows:

(a) A, B, D and E denote normal strength steel grades

(b) AH, DH and EH denote higher strength steel grades.

1.1.4 Higher strength steel factor

1.1.4.1 For the determination of hull girder section modulus, where higher strength hull structural steel is used, a higher strength steel factor, k is given in *Table 6.1.1*.

Table 6.1.1
Values of k

Specified minimum yield stress, N/mm^2	k
235	1.00
265	0.93
315	0.78
340	0.74
355	0.72
390	0.68

Note
1. Intermediate values are to be calculated by linear interpolation.

1.1.5 Through thickness property

1.1.5.1 Where tee or cruciform connections employ partial or full penetration welds, and the plate material is subject to significant tensile strain in a direction perpendicular to the rolled surfaces, consideration is to be given to the use of special material with specified through thickness properties, in accordance with the Rules for Materials of the individual Classification Society. These steels are to be designated on the approved plan by the required steel strength grade followed by the letter Z (e.g. EH36 Z).

1.1.6 Steel castings and forgings

1.1.6.1 Steel castings or forgings that are used for stern frames, rudder frames, rudder stocks, propeller shaft brackets and other major structural items are to be in accordance with the Rules for Materials of the individual Classification Society.

1.2 Application of Steel Materials

1.2.1 Selection of material grades

1.2.1.1 Steel materials for particular locations are not to be of lower grades than those given in *Table 6.1.2* for the material class given in *Table 6.1.3*.

1.2.2 Applicable thickness

1.2.2.1 For application of *Table 6.1.2* and *Table 6.1.3*, the steel grade is to correspond to the as-built thickness.

1.2.3 Operation in areas with low air temperature

1.2.3.1 For ships intended to operate for long periods in areas with a lowest mean daily average temperature below –10 degrees C (i.e. regular service during winter to Arctic or Antarctic waters) the materials in exposed structures will be specially considered.

RCN 2 to July 2008 version (effective from 1 July 2010)

RCN 1 to July 2010 version (effective from 1 July 2012)

Table 6.1.2
Material Grades

Thickness, t in mm	Material Class		
	I	II	III
$t \le 15$	A, AH	A, AH	A, AH
$15 < t \le 20$	A, AH	A, AH	B, AH
$20 < t \le 25$	A, AH	B, AH	D, DH
$25 < t \le 30$	A, AH	D, DH	D, DH
$30 < t \le 35$	B, AH	D, DH	E, EH
$35 < t \le 40$	B, AH	D, DH	E, EH
$40 < t \le 51$	D, DH	E, EH	E, EH

Table 6.1.3
Material Class or Grade of Structural Members

Structural member category	Material Class or Grade	
	Within 0.4L Amidships	Outside 0.4L
Secondary Longitudinal bulkhead strakes, other than those belonging to primary category Deck plating exposed to weather other than that belonging to primary or special category Side plating	Class I	Grade A(8)/AH
Primary Bottom plating including keel plate Strength deck plating, excluding that belonging to the special category (10) (11) Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings (11) Uppermost strake in longitudinal bulkheads (10) Vertical strake (hatch side girder) and upper sloped strake in top wing tank	Class II	Grade A(8) / AH
Special Sheer strake at strength deck (1)(2)(3)(10) (11) Stringer plate in strength deck (1)(2)(3)(10) (11) Deck strake at longitudinal bulkhead, excluding deck plating in way of inner hull longitudinal bulkhead (2)(4)(10) (11) Strength deck plating at outboard corners of cargo hatch openings (11) Bilge strake (2)(6) Continuous longitudinal hatch coamings (11)	Class III	Class II (Class I outside 0.6L amidships)
Other Categories Plating for stern frames, rudder horns and shaft brackets Longitudinal strength members of strength deck plating for ships with single strength deck (11) Strength members not referred to in above categories (9)	– Grade B / AH Grade A(8) / AH	Class II - Grade A(8) / AH

Note

1. Not to be less than E/EH within 0.4L amidships in vessels with length, L, exceeding 250m.
2. Single strakes required to be of material class III or E/EH are, within 0.4L amidships, to have breadths not less than 800 + 5L mm, but need not be greater than 1800mm.
3. A radius gunwale plate may be considered to meet the requirements for both the stringer plate and the sheer strake, provided it extends generally 600mm inboard and vertically.
4. For tankers having a breadth, B, exceeding 70m, the centreline strake and the strakes in way of the longitudinal bulkheads port and starboard, are to be class III.
5. (void)
6. To be not lower than D/DH within 0.6L amidships of vessels with length, L, exceeding 250m.
7. (void)
8. Grade B/AH to be used for plate thickness more than 40mm. For engine foundation heavy plates, Grade B/AH to be used for plate thickness more than 30mm. However, engine foundation heavy plates outside 0.6L amidships may be of Grade A/AH.
9. The material class used for reinforcement and the quality of material (i.e. whether normal or higher strength steel) used for welded attachments, such as spill protection bars and bilge keel, is to be similar to that of the hull envelope plating in way. Where attachments are made to round gunwale plates, special consideration will be given to the required grade of steel, taking account of the intended structural arrangements and attachment details.
10. The material class for deck plating, sheer strake and upper strake of longitudinal bulkhead within 0.4L amidships is also to be applied at structural breaks of the superstructure, irrespective of position.
11. To be not lower than B/AH within 0.4L amidships for ships with single strength deck.

RCN 2 to July 2008 version (effective from 1 July 2010)

RCN 1 to July 2010 version (effective from 1 July 2012)

1.2.4 Guidance for repairs

1.2.4.1 Where materials are used in the construction, which are not in accordance with the Rules for Materials of the individual Classification Society, a set of plans showing the following information, for each material, is to be placed aboard the vessel in addition to those normally retained on the vessel:

(a) material specification and applicable thickness

(b) welding procedure

(c) location and extent of application.

1.3 Aluminium Alloys

1.3.1 General

1.3.1.1 The use of aluminium alloys in superstructures, deckhouses, hatch covers, helicopter platforms, or other local components will be specially considered. A specification of the proposed alloys and their proposed method of fabrication is to be submitted for approval.

1.3.1.2 Details of the proposed method of joining any aluminium and steel structures are to be submitted for approval.

1.3.1.3 Material requirements and scantlings are to comply with the Rules for Materials of the individual Classification Society.

1.3.2 Incendiary sparking on impact with steel

1.3.2.1 Aluminium may, under certain circumstances give rise to incendiary sparking on impact with oxidized steel. A particular risk is where an aluminium component is dragged or rubbed against the uncoated steel structure creating a thin smear of aluminium on the surface. Subsequent high energy impact by a rusted component on that smear could generate an incendiary spark capable of igniting any surrounding inflammable gas. The following requirements are therefore to be complied with:

(a) aluminium fittings in tanks used for the carriage of oil, and in cofferdams and pump rooms are to be avoided

(b) where fitted, aluminium fittings, units and supports, in tanks used for the carriage of oil, cofferdams and pump rooms are to satisfy the requirements of *2.1.2* for aluminium anodes

(c) the underside of heavy portable aluminium structures such as gangways, etc., is to be protected by means of a hard plastic or wood cover, or other approved means, in order to avoid the creation of smears. Such protection is to be permanently and securely attached to the structures.

2 CORROSION PROTECTION INCLUDING COATINGS

2.1 Hull Protection

2.1.1 General

2.1.1.1 All dedicated seawater ballast tanks are to have an efficient corrosion prevention system, as required by *SOLAS Reg. II-1/3-2*, see *Section 2/2.1.1*.

2.1.1.2 For ships contracted for construction on or after 8 December 2006, the date of IMO adoption of the amended SOLAS Regulation II-1/3-2, by which an IMO "Performance standard for protective coatings for ballast tanks and void spaces" will be made mandatory, the coatings of internal spaces subject to the amended SOLAS Regulation are to satisfy the requirements of the IMO performance standard. For ships contracted for construction on or after 1 July 2012, the IMO performance standard is to be applied as interpreted by IACS UI SC 223 and UI SC 227. In applying IACS UI SC 223, "Administration" is to be read to be the "Classification Society".

RCN 1 to July 2010 version (effective from 1 July 2012)

2.1.1.3 Consistent with *IMO Resolution A.798(19)* and *IACS UI SC 122*, the selection of the coating system, including coating selection, specification, and inspection plan, are to be agreed between the shipbuilder, coating system supplier and the owner, in consultation with the Classification Society, prior to commencement of construction . The specification for the coating system for these spaces is to be documented and this documentation is to be verified by the Classification Society and is to be in full compliance with the coating performance standard.

2.1.1.4 The shipbuilder is to demonstrate that the selected coating system with associated surface preparation and application methods is compatible with the manufacturing processes and methods.

2.1.1.5 The shipbuilder is to demonstrate that the coating inspectors have proper qualification as required by the IMO standard.

2.1.1.6 The attending surveyor of the Classification Society will not verify the application of the coatings but will review the reports of the coating inspectors to verify that the specified shipyard coating procedures have been followed.

2.1.1.7 Where anodes are fitted in ballast tanks, ballast tank anode distribution drawings are to be submitted for approval. Such drawings are to include details of the connections to the hull, e.g. welding details.

2.1.2 Internal cathodic protection systems

2.1.2.1 When a cathodic protection system is to be fitted to steel structures in tanks used for liquid cargo with flash point below 60°C, a plan of the fitting arrangement is to be submitted for approval. The arrangements will be considered for safety against fire and explosion. This approval also applies to adjacent tanks.

2.1.2.2 Permanent anodes in tanks made of, or alloyed with magnesium are not acceptable, except in tanks solely intended for water ballast that are not adjacent to cargo tanks. Impressed current systems are not to be used in cargo tanks due to the development of chlorine and hydrogen that can result in an explosion. Aluminium anodes are accepted, however, in tanks with liquid cargo with flash point below 60°C and in

adjacent ballast tanks, aluminium anodes are to be located so a kinetic energy of not more than 275J is developed in the event of their loosening and becoming detached.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.1.2.3 Aluminium anodes are to be located in such a way that they are protected from falling objects. They are not to be located under tank hatches or Butterworth openings unless protected by adjacent structure.

2.1.2.4 All anodes are to be attached to the structure in such a way that they will remain securely fastened both initially and during service. The following methods are acceptable:

(a) steel core connected to the structure by continuous fillet welds of sufficient cross section

(b) attachment by properly secured through-bolts or other positive locking devices. Attachment by clamps fixed with setscrews is to be by approved means.

2.1.2.5 Anode steel cores bent and directly welded to the steel structure are to be of a material complying with the requirements for grade A of the Rules for Materials of the individual Classification Society.

2.1.2.6 Anodes are to be attached to stiffeners or aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

2.1.2.7 Where cores or supports are welded to local support members or primary support members, they are to be kept clear of end supports, toes of brackets and similar stress raisers. Where they are welded to asymmetrical members, the welding is to be at least 25mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate, but well clear of the free edges. Generally, anodes are not to be fitted to a face plate of higher strength steel.

2.1.2.8 Tanks in which anodes are installed, are to have sufficient holes for the circulation of air to prevent gas from collecting in pockets.

2.1.3 Paint containing aluminium

2.1.3.1 Paint containing aluminium is not to be used in positions where cargo vapours may accumulate unless it has been shown by appropriate tests that the paint to be used does not increase the incendiary sparking hazard. Tests need not be performed for coatings with less than 10 percent aluminium by weight.

3 CORROSION ADDITIONS

3.1 General

3.1.1 Introduction

3.1.1.1 The required net thickness of steel structures is to be increased by the corrosion addition as specified in this Sub-Section.

3.1.1.2 The corrosion additions given in this Sub-Section are applicable to carbon-manganese steels, see *1.1*. Application of corrosion additions for other materials, such as stainless steel, is to be in accordance with the requirements of the individual Classification Society.

3.1.1.3 The application of the corrosion additions in rule calculations is given in *3.3*.

3.2 Local Corrosion Additions

3.2.1 General

3.2.1.1 The local corrosion additions, t_{corr}, for structural members are to be taken as:

$$t_{corr} = t_{was} + 0.5 \quad \text{mm}$$

Where:

t_{was} total wastage allowance of the considered structural member, in mm, as given in *Section 12/1.4.2.2*

3.2.1.2 The local corrosion additions, t_{corr}, for typical structural elements in the cargo tank region are given in *Table 6.3.1* and *Figure 6.3.1*.

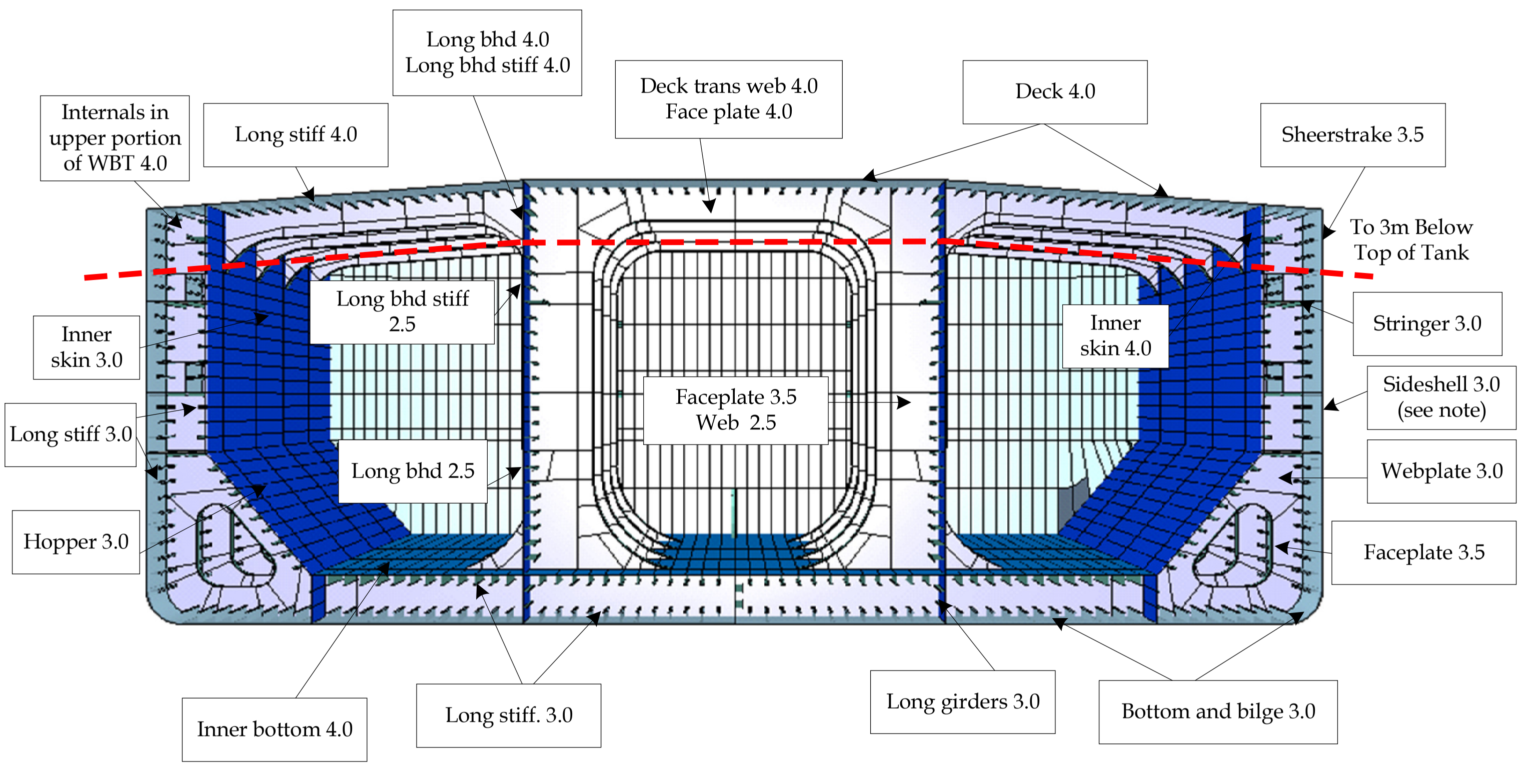
Table 6.3.1
Corrosion Addition, t_{corr}, for Typical Structural Elements Within the Cargo Tank Region

Category of contents			**Corrosion Addition t_{corr}, in mm**
Internal members and plate boundary between spaces with the same category of contents			
In and between ballast water tanks	Face plate of PSM	Within 3m below top of tank (1)	4.5
		Elsewhere	3.5
	Other members	Within 3m below top of tank (1)	4.0
		Elsewhere	3.0
	Stiffeners on boundaries to heated cargo tanks	Within 3m below top of tank (1)	4.5
		Elsewhere	3.5
In and between cargo oil tanks	Face plate of PSM	Within 3m below top of tank (1)	4.0
		Elsewhere	3.5
	Other members	Within 3m below top of tank (1)	4.0
		Elsewhere	2.5
Exposed to atmosphere on both sides	Support members on deck		2.5
In and between void spaces	Spaces not normally accessed, e.g. access only via bolted manhole openings, pipe tunnels, etc.		2.0
In and between dry spaces	Internals of deckhouses, machinery spaces, pump room, store rooms, steering gear space, etc.		1.5
Plate boundary between spaces having a different category			
Boundary between ballast tank and cargo oil tank	Unheated cargo tank	Within 3m below top of tank (1)	4.0
		Inner bottom plating	4.0
		Elsewhere	3.0
	Heated cargo tank	Within 3m below top of tank (1)	4.5
		Inner bottom plating	4.5
		Elsewhere	3.5
Boundary between ballast tank and atmosphere or sea	Weather deck plating		4.0
	Other members(2)	Within 3m below top of tank (1)	3.5
		Elsewhere	3.0
Boundary between ballast tank and void or dry space	Within 3m below top of tank(1)		3.0
	Elsewhere		2.5
Boundary between cargo tank and atmosphere	Weather deck plating		4.0
Boundary between cargo tank and void spaces	Within 3m below top of tank (1)		3.0
	Elsewhere		2.5
Boundary between cargo tank and dry spaces	Within 3m below top of tank (1)		3.0
	Elsewhere		2.0

Note
1. Only applicable to cargo and ballast tanks with weather deck as the tank top
2. 0.5mm to be added for side plating in the quay contact region defined in *Section 8/Figure 8.2.2*
3. Heated cargo oil tanks are defined as cargo tanks arranged with any form of heating capability

(RCN 1, effective from 1 April 2007)

Figure 6.3.1
Corrosion Addition, t_{corr}, for Typical Structural Elements Within the Cargo Tank



Note
1. Corrosion additions are given for a standard configuration and without heated cargo
2. 0.5mm to be added for side plating in the quay contact region defined in *Section 8/Figure 8.2.2*
3. The distance 3m below top of tank is to be measure parallel to the deck

RCN 1 to July 2010 version (effective from 1 July 2012)

3.3 Application of Corrosion Additions

3.3.1 General

3.3.1.1 The application of corrosion additions described in *3.3.2* to *3.3.7* is to be applied unless otherwise specified in the specific rule requirements.

3.3.1.2 Compliance with the Rules may be performed either by:

(a) comparison of the proposed gross scantling with the gross required, in which case the applicable corrosion addition is added to the net requirement of the Rules

(b) comparison of the proposed net scantling with the net required, in which case the applicable corrosion addition is deducted from the gross proposed.

Methods (a) and (b) are suitable for assessment of thickness. Method (b) is the most suitable for assessment of section properties, e.g. section modulus, area and moment of inertia.

3.3.1.3 The gross scantlings specified in *3.3.2* to *3.3.7* used to derive the net scantlings are to exclude any owner's extra thicknesses, see also *Section 2/4.3.4.3*.

3.3.2 Application for hull girder longitudinal strength calculations

3.3.2.1 The calculation of hull girder stresses for the assessment of longitudinal strength as given in *Section 8/1* is to be based on the net hull girder sectional properties calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross-section.

3.3.2.2 The local buckling capacity of plates and stiffeners subject to hull girder stresses are to be calculated based on the net scantlings, as given in *Section 8/1.4.2.* The net scantling is calculated by deducting the full corrosion addition, i.e. $-1.0t_{corr}$, from the gross thickness.

3.3.3 Application for scantling assessment of plates and local support members

3.3.3.1 The required gross thickness for plates and local support members are calculated by adding the full corrosion addition, i.e. $+1.0t_{corr}$, to the net thickness required in accordance with the scantling requirements in *Sections 4/3.4* and *8/2* to *8/7*.

3.3.3.2 The net sectional properties of local support members are calculated by deducting the full corrosion addition, i.e. $-1.0t_{corr}$, from the web, flange and attached plate gross thicknesses as described in *Section 4/2.4.1* and are to comply with required section modulus, moment of inertia and shear area as given in *Sections 4/3.4* and *8/2* to *8/7*.

3.3.3.3 The calculation of hull girder stresses for the strength assessment of members under combined local and global loading is to be based on the net hull girder sectional properties calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross-section.

3.3.3.4 The required minimum gross thickness of plates and local support members is calculated by adding the full corrosion addition, i.e. $+1.0t_{corr}$, to the minimum net thickness requirements given in *Section 8/2.1.5.*

3.3.4 Application of corrosion additions for scantling strength assessment of primary support members

3.3.4.1 The required gross thickness of primary support members is calculated by adding half the corrosion addition, i.e. $+0.5t_{corr}$, to the net thickness required in accordance with the strength requirements in *Section 8/2.6* and *8/3* to *8/7*.

3.3.4.2 The net sectional properties of primary support members are to be calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the web and flange gross thicknesses, and are to comply with the required section modulus, moment of inertia and area as given in *Section 8/2.6* and *8/3* to *8/7*.

3.3.4.3 The required minimum gross thickness of primary support members is calculated by adding the full corrosion addition, i.e. $+1.0t_{corr}$, to the minimum net thickness requirement given in *Section 8/2.1.6.1, 8/3.1.4.1, 8/4.1.5.1, 8/5.1.4.1, 8/6.3.7.5, 8/6.4.5.4* and *10/2.3*.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.3.5 Application of corrosion additions for hull girder ultimate strength analysis

3.3.5.1 The calculation of the hull girder ultimate capacity, M_u, as given in *Section 9/1*, is to be based on the net hull girder sectional properties calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross-section.

3.3.5.2 The buckling capacity of the structural elements used to derive the hull girder ultimate capacity is to be calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thicknesses of the plates and stiffener webs and flanges.

3.3.6 Application of corrosion additions for strength assessment by finite element analysis

3.3.6.1 For the cargo tank structural strength analysis, as given in *Section 9/2.2* and *Appendix B/2*, the finite element model is to be modelled with thicknesses calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements.

3.3.6.2 The local buckling capacity of plates and stiffeners are to be calculated by deducting the full corrosion addition, i.e. $-1.0t_{corr}$, from the gross thickness.

3.3.6.3 The local fine mesh structural strength analysis models, as given in *Section 9/2.3* and *Appendix B/3,* are to be modelled with thicknesses calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness. The specified fine mesh areas are to be modelled by deduction of the full corrosion addition, i.e. $-1.0t_{corr}$, from the gross thickness.

3.3.7 Application of corrosion additions for fatigue strength assessment

3.3.7.1 The calculation of hull girder stresses for the fatigue strength assessment, as given in *Section 9/3* and *Appendix C/1,* is to based on the net fatigue hull girder sectional properties, calculated by deducting a quarter of the corrosion addition, i.e. $-0.25t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross section.

3.3.7.2 The calculation of stresses in local support members from lateral load for the fatigue strength assessment, as given in *Section 9/3* and *Appendix C/1,* are to be based on deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the stiffener web, flange and attached plate.

3.3.7.3 For hot spot stress (FE based) approach, as given in *Section 9/3* and *Appendix C/2,* the FE model of the hopper knuckle is to be modelled with thickness calculated by deducting a quarter of the corrosion addition, i.e. $-0.25t_{corr}$, from the gross thicknesses. The very fine mesh areas are to be modelled by deduction of half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness.

3.3.7.4 As an alternative to *3.3.7.3,* the hopper fatigue FE model may be made in accordance with requirements for FE strength model, i.e. all areas at $-0.5t_{corr}$, as described in *3.3.6.1*. However the calculated stress range is then to be corrected by the factor f_{model} as described in *Appendix C/2.4.2.7*.

4 FABRICATION

4.1 General

4.1.1 Workmanship

4.1.1.1 All workmanship is to be of commercial marine quality and acceptable to the Surveyor. Welding is to be in accordance with the requirements of *Sub-Section 5.* Any defect is to be rectified to the satisfaction of the Surveyor before the material is covered with paint, cement or any other composition.

4.1.2 Fabrication standard

4.1.2.1 Structural fabrication is to be carried out, in accordance with '*IACS Recommendation 47, Shipbuilding and Repair Quality Standard for New Construction*' or a recognised fabrication standard which has been accepted by the Classification Society prior to the commencement of fabrication/construction.

4.1.2.2 The fabrication standard to be used during fabrication/construction is to be made available to the attending representative of the Classification Society, prior to the commencement of the fabrication/construction.

4.1.2.3 The fabrication standard is to include information, to establish the range and the tolerance limits, for the items specified as follows:

(a) Cutting edge
- the slope of the cut edge and the roughness of the cut edges

(b) Flanged longitudinals and brackets and built-up sections
- the breadth of flange and depth of web, angle between flange and web, and straightness in plane of flange or at the top of face plate

(c) Pillars
- the straightness between decks, and cylindrical structure diameter

(d) Brackets and small stiffeners
- the distortion at the free edge line of tripping brackets and small stiffeners

(e) Sub-assembly stiffeners
- details of snipe end of secondary face plates and stiffeners

(f) Plate assembly
- for flat and curved blocks the dimensions (length and breadth), distortion and squareness, and the deviation of interior members from the plate

(g) Cubic assembly
- in addition to the criteria for plate assembly, twisting deviation between upper and lower plates, for flat and curved cubic blocks

(h) Special assembly
- the distance between upper and lower gudgeons, distance between aft edge of propeller boss and aft peak bulkhead, twist of stern frame assembly, deviation of rudder from shaft centreline, twist of rudder plate, and flatness, breadth and length of top plate of main engine bed. Where boring out of the propeller boss and stern frame, skeg or solepiece is carried out at a late stage of construction, it is to be carried out after completing the major part of the welding of the aft part of the ship. Where block boring is used, the shaft

alignment is to be carried out using a method and sequence submitted to and recognized by the Classification Society. The fit-up and alignment of the rudder, pintles and axles, are to be carried out after completing the major part of the welding of the aft part of the ship. The contacts between the conical surfaces of pintles, rudder stocks and rudder axles are to be checked before the final mounting.

RCN 1 to July 2010 version (effective from 1 July 2012)

(i) Butt joints in plating

- alignment of butt joint in plating

(j) Cruciform joints

- alignment measured on the median line and measured on the heel line of cruciform joints

(k) Alignment of interior members

- alignments of flange of T longitudinals, alignment of panel stiffeners, gaps in T joints and lap joints, and distance between scallop and cut outs for continuous stiffeners in assembly and in erection joints

(l) Keel and bottom sighting

- deflections for whole length of the ship, and for the distance between two adjacent bulkheads, cocking-up of fore body and of aft body, and rise of floor amidships

(m) Dimensions

- dimensions of length between perpendiculars, moulded breadth and depth at midship, and length between aft edge of propeller boss and main engine

(n) Fairness of plating between frames

- deflections between frames of shell, tank top, bulkhead, upper deck, superstructure deck, deck house deck and wall plating

(o) Fairness of plating in way of frames

- deflections of shell, tank top, bulkhead, strength deck plating and other structures measured in way of frames

4.2 Cold Forming

4.2.1 Special structural members

4.2.1.1 For highly stressed components of the hull girder where notch toughness is of particular concern (e.g. items required to be Class III in *Table 6.1.3*, such as radius gunwales and bilge strakes) the inside bending radius, in cold formed plating, is not to be less than 10 times the gross plate thickness for carbon-manganese steels (hull structural steels, see *1.1*). The allowable inside bending radius may be reduced below 10 times the gross plate thickness, providing the additional requirements stated in *4.2.3* are complied with.

4.2.2 Other members

4.2.2.1 For main structural members, e.g. corrugated bulkheads and hopper knuckles, the inside bending radius, in cold formed plating, is not to be less than 4.5 times the gross plate thickness for carbon-manganese steels (hull structural steels, see *1.1*). The allowable inside bending radius may be reduced below 4.5 times the gross plate thickness, providing the additional requirements stated in *4.2.3* are complied with.

4.2.3 Additional requirements

4.2.3.1 When steel is formed below 650°C with a radius of less than 10 or 4.5 times the gross plate thickness for special and other members, respectively, supporting data is to be provided. As a minimum, the following additional requirements are to be complied with:

(a) the steel is to be of grade D/DH or higher

(b) the material is impact tested in the strain-aged condition and satisfies the requirements stated herein. The deformation is to be equal to the maximum deformation to be applied during production, calculated by the formula $t_{grs}/(2r_{bdg}+t_{grs})$, where t_{grs} is the gross thickness of the plate material and r_{bdg} is the bending radius. One sample is to be plastically strained at the calculated deformation or 5%, whichever is greater and then artificially aged at 250°C for one hour then subject to Charpy V-notch testing. The average impact energy after strain ageing is to meet the impact requirements specified for the grade of steel used.

(c) 100% visual inspection of the deformed area is to be carried out. In addition, random checks by magnetic particle testing are to be carried out.

The bending radius is in no case to be less than twice the gross plate thickness.

4.3 Hot Forming

4.3.1 Temperature requirements

4.3.1.1 Steel is not to be formed between the upper and lower critical temperatures. If the forming temperature exceeds 650°C for as-rolled, controlled rolled, thermo-mechanical controlled rolled or normalised steels, or is not at least 28°C lower than the tempering temperature for quenched and tempered steels, mechanical tests are to be made to assure that these temperatures have not adversely affected both the tensile and impact properties of the steel. Where curve forming or fairing, by line or spot heating, is carried out in accordance with *4.3.2.1* these mechanical tests are not required.

4.3.1.2 Confirmation is required to demonstrate the mechanical properties after further heating meet the requirements specified by a procedure test using representative material, when considering further heating other than in *4.3.1.1* of thermo-mechanically controlled steels (TMCP plates) for forming and stress relieving.

4.3.2 Line or spot heating

4.3.2.1 Curve forming or fairing, by linear or spot heating, is to be carried out using approved procedures in order to ensure that the properties of the material are not adversely affected. Heating temperature, on the surface, is to be controlled so as not to exceed the maximum allowable limit applicable to the plate grade.

4.4 Welding

4.4.1 General

4.4.1.1 All welding is to be carried out by approved welders, in accordance with approved welding procedures, using approved welding consumables and is to comply with the Rules for Materials of the individual Classification Society.

4.4.2 Welding sequence

4.4.2.1 Consideration is to be given to the assembly sequence and the effect on the overall shrinkage of plate panels, assemblies, etc., resulting from the welding processes employed. Welding is to proceed systematically, with each welded joint being completed in the correct sequence, without undue interruption.

4.4.2.2 Where practicable, welding is to commence at the centre of a joint and proceed outwards, or at the centre of an assembly and progress outwards towards the perimeter so that each part has freedom to move in one or more directions.

4.4.2.3 Generally, the welding of stiffener members, including transverses, frames, girders, etc., to welded plate panels by automatic processes is to be carried out in such a way as to minimize angular distortion of the stiffener.

4.4.3 Arrangements at junctions of welds

4.4.3.1 Welds are to be made flush in way of the faying surface where stiffening members, attached by continuous fillet welds, cross the completely finished butt or seam welds. Similarly, butt welds in webs of stiffening members are to be completed and made flush with the stiffening member before the fillet weld is made. The ends of the flush portion are to run out smoothly without notches or sudden changes of section. Where these conditions cannot be complied with, a scallop is to be arranged in the web of the stiffening member. Scallops are to be of a size, and in a position, that a satisfactory return weld can be made.

4.4.4 Leak stoppers

4.4.4.1 Where structural members pass through the boundary of a tank, leakage into the adjacent space could be hazardous or undesirable, and full penetration welding is to be adopted for the members for at least 150mm on each side of the boundary. Alternatively, a small scallop of suitable shape may be cut in the member close to the boundary outside of the compartment, and carefully welded all around.

5 WELD DESIGN AND DIMENSIONS

5.1 General

5.1.1 Scope

5.1.1.1 In general, weld sizes are based on the Rule gross thickness values.

5.1.1.2 Requirements for welding sequence, qualification of welders, welding procedures and welding consumables are given in *4.4*.

5.1.2 Plans and specifications

5.1.2.1 Plans and/or specifications showing weld sizes and weld details are to be submitted for approval for each new construction project.

5.1.2.2 Where reductions in weld sizes are proposed the requirements given in *5.9* are to be applied and the following details are to be included in the welding specification:

(a) proposed weld gap size

(b) proposed welding consumable.

5.1.3 Tolerance requirements

5.1.3.1 The gaps between the faying surfaces of members being joined are to be kept to a minimum or in accordance with approved specification.

5.1.3.2 Where the gap between the members joined by fillet welds exceeds 2mm, the weld size is to be increased in accordance with *5.7.1.6*.

5.1.4 Special precautions

5.1.4.1 Welding is to be based on approved welding procedure specifications where small fillets are used to attach heavy plates or sections. Special precautions, such as the use of preheating, low-hydrogen electrodes or low-hydrogen welding processes, are accepted.

5.1.4.2 When heavy structural members are attached to relatively light plating, the weld size and sequence may require modification.

5.2 Butt Joints

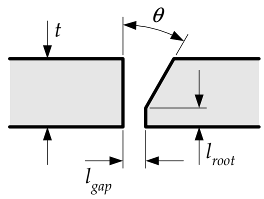
5.2.1 General

5.2.1.1 Joints in the plate components of stiffened panel structures are generally to be joined by butt welds. Typical types of butt welds with corresponding edge preparation are shown in *Figure 6.5.1*.

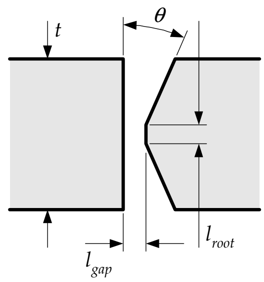
5.2.1.2 All types of butt joints are to be welded from both sides. Before welding is carried out on the second side, unsound weld metal is to be removed at the root by a suitable method. Butt welding from one side will only be permitted for specific applications with an approved welding procedure specification.

Figure 6.5.1
Typical Butt Welds

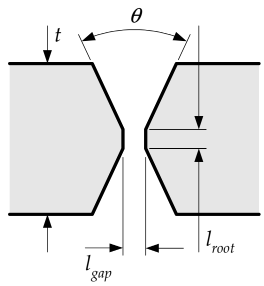
Single bevel butt



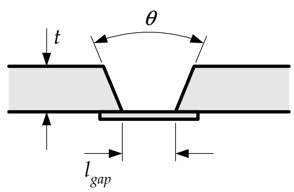
Double bevel butt



Double vee butt, uniform bevels



Single vee butt, one side welding with backing strip (temporary or permanent)



<u>Note</u>

1. The above figures are shown for guidance only. Actual details and dimensions are to be in accordance with a recognised fabrication standard. See *4.1.2.1*

5.2.2 Thickness difference in butt welds

5.2.2.1 Abrupt change of section is to be avoided where plates of different thicknesses are butt welded.

5.2.2.2 Where plates to be joined differ in thickness by more than 4mm, a suitable transition taper is to be provided. The transition may be formed by tapering the thicker member, or by specifying a weld joint design which provides the required transition.

5.2.2.3 For the transverse butts in longitudinal strength members, the transition taper length is to be not less than three times the offset.

5.2.2.4 Differences in thickness greater than 4mm and without transition taper may be accepted for specific applications.

5.3 Tee or Cross Joints

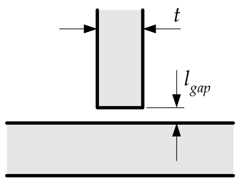
5.3.1 General

5.3.1.1 The connection of primary support members and stiffener web/end connections and joints formed by plating abutting on another plate panel is generally to be made by fillet welds sized in accordance with *5.7* and *Figure 6.5.2*. Examples of other typical tee or cross joint weld arrangements are shown in *Figure 6.5.3*.

5.3.1.2 Where the connection is highly stressed or otherwise considered critical, a partial or full penetration weld is to be achieved by bevelling the edge of the abutting plate. See *5.3.4* and *Figure 6.5.3*.

Figure 6.5.2
Typical Tee or Cross Joint Fillet Welds

Tee fillet

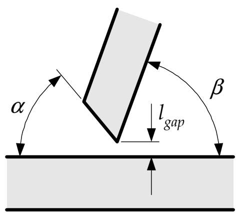


Note

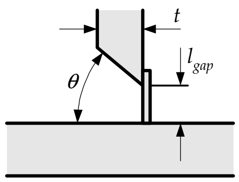
1. The above figure is shown for guidance only. Actual details and dimensions are to be in accordance with a recognised fabrication standard. See *4.1.2.1*.

Figure 6.5.3
Other Typical Tee and Cross Joint Welds

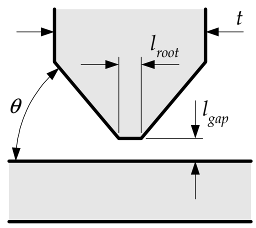
Small angle fillet



Single bevel tee with permanent backing



Double bevel tee symmetrical



Notes

1. The above figures are shown for guidance only. Actual details and dimensions are to be in accordance with a recognised fabrication standard. See *4.1.2.1*.

5.3.2 Continuous welding

5.3.2.1 Continuous welding is to be adopted in the following locations:

(a) all fillet welds where higher strength steel is used

(b) boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings

(c) boundaries of tanks and watertight compartments

(d) all structures in ballast and fresh water tanks and the ballast and fresh water tank bulkhead stiffeners

(e) all structures in the aft peak and the aft peak bulkhead stiffeners

(f) all structures in the fore peak tank/void

(g) all welding inside tanks intended for crude oil, petroleum products, chemicals, edible liquids or fresh water cargoes

(h) welding in way of all end connections, including end brackets, lugs, scallops, and at the orthogonal connections with other members

(i) all lap welds in the main hull

(j) primary support members and stiffener members to bottom shell in the $0.3L$ forward region

(k) flat bar longitudinals to plating

(l) the attachment of minor fittings to higher strength steel plating and other connections or attachments.

5.3.3 Intermittent welding

5.3.3.1 Where continuous welding is not required, intermittent welding may be applied.

5.3.3.2 Where beams, stiffeners, frames, etc, are intermittently welded and pass through slotted girders, shelves or stringers, there is to be a pair of matched intermittent welds on each side of every intersection. In addition, the beams, stiffeners and frames are to be efficiently attached to the girders, shelves and stringers.

5.3.4 Full or partial penetration corner or tee joints

5.3.4.1 Where high tensile stresses act through an intermediate plate (see *Figure 6.5.4*), increased fillet welds or penetration welds are to be used as required by *5.8*. Examples of such structures are:

(a) connection of hopper to inner hull

(b) longitudinal/transverse bulkhead primary support member end connections to the double bottom

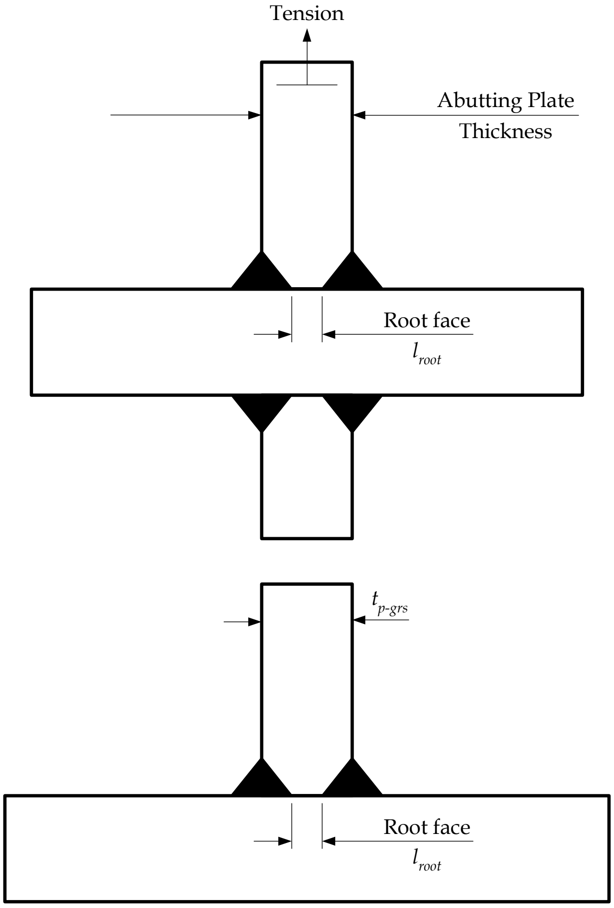
(c) connection of corrugated bulkhead lower stool side plates to shelf plate and inner bottom/hopper tank

(d) connections of gusset plates to corrugated bulkheads

(e) connection of double bottom floors, lower hopper tank webs and double bottom girders below corrugated bulkhead flanges and gusset plates for corrugated bulkheads configured without lower stools

(f) structural elements in double bottoms below bulkhead primary support members and stool plates.

Figure 6.5.4
Abutting Plate Panel



5.3.4.2 Full or partial penetration welds, with maximum root face, $l_{root} = t_{p\text{-}grs}/3$, where l_{root} is the weld root face length and $t_{p\text{-}grs}$ is the gross plate thickness, as shown in *Figure 6.5.4,* are to be used in the connection of hopper sloped plating to inner bottom.

5.3.4.3 Full penetration welds are to be used in the following connections:

(a) lower end of vertical corrugated bulkhead connections

(b) lower end of gusset plates fitted to corrugated bulkheads

(c) rudder horns and shaft brackets to shell structure

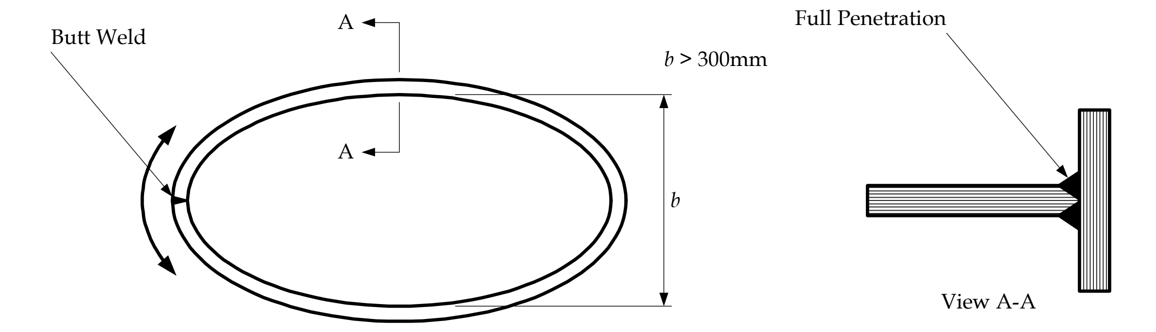
(d) rudder side plating to rudder stock connection areas

(e) edge reinforcements within 0.6*L* amidships to the strength deck, sheer strake, bottom and bilge plating, when the transverse dimensions of the opening exceeds 300mm, see *Figure 6.5.5*. Where collar plates are fitted in way of pipe penetrations, the collar plate is to be welded by a continuous fillet weld.

(f) abutting plate panels with gross plate thickness, $t_{p\text{-}grs}$, as shown in *Figure 6.5.4*, less than or equal to 12mm, forming outer shell boundaries below the scantling draught, T_{sc}, including, but not limited to; sea chests, rudder trunks, and portions of transoms. For gross plate thickness, $t_{p\text{-}grs}$, greater than 12mm, partial penetration welding with a maximum root face length $l_{root} = t_{p\text{-}grs}/3$ is acceptable.

(g) crane pedestals and associated bracketing and support structure, as required by *Section 11/3.1.4.14*.

Figure 6.5.5
Examples of Suitable Edge Reinforcements



5.4 Lapped Joints

5.4.1 General

5.4.1.1 Overlaps may be adopted for end connections where the connection is not subject to high tensile or compressive loading.

5.4.1.2 Where overlaps are adopted, the width of the overlap, w_{lap}, is not to be less than three times, but not greater than four times, the gross thickness of the thinner of the plates being joined. See *Figure 6.5.6*. Where the gross thickness of the thinner plate being joined has a thickness of 25mm or more the overlap will be subject to special consideration.

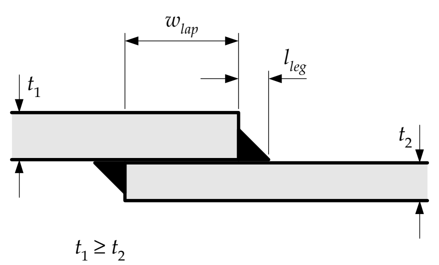
5.4.1.3 The overlaps for lugs and collars in way of cut-outs for the passage of stiffeners through webs and bulkhead plating are not to be less than three times the gross thickness of the lug but need not be greater than 50mm. The joints are to be positioned to allow adequate access for completion of sound welds.

RCN 2 to July 2008 version (effective from 1 July 2010)

5.4.1.4 The faying surfaces of lap joints are to be in close contact and both edges of the overlap are to have continuous fillet welds.

Figure 6.5.6
Lapped Joints

Fillet weld in lap joint



5.4.2 Overlapped end connections

5.4.2.1 Lapped end connections, where accepted by the Rules, are to have continuous welds on each edge with leg length, l_{leg}, as shown in *Figure 6.5.6*, such that the sum of the two leg lengths is not less than 1.5 times the gross thickness of the thinner plate.

5.4.3 Overlapped seams

5.4.3.1 Overlapped seams are to have continuous welds on both edges, of the sizes required by *Table 6.5.1* for the boundaries of tank or watertight bulkheads. Seams for plates with a gross thickness of 12.5mm or less, which are clear of tanks, may have one edge with intermittent welds in accordance with *Table 6.5.1* for watertight bulkhead boundaries.

5.5 Slot Welds

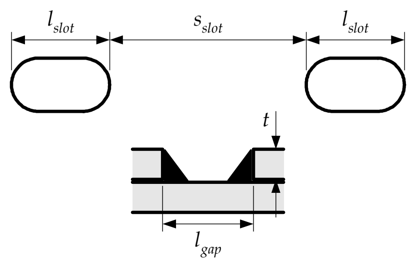
5.5.1 General

5.5.1.1 Slot welds may be specially approved for particular applications. Typical applications are indicated in *5.5.2* and *5.5.3,* and typical arrangements are shown in *Figure 6.5.7*.

5.5.1.2 Slots are to be well-rounded and have a minimum slot length, l_{slot}, of 75mm and width, w_{slot}, of twice the gross plate thickness. Where used in the body of doublers and similar locations, such welds are in general to be spaced a distance, s_{slot}, of $2l_{slot}$ to $3l_{slot}$ but not greater than 250mm.

Figure 6.5.7
Slot Welds

Slot welding



5.5.2 Closing plates

5.5.2.1 For the connection of plating to internal webs, where access for welding is not practicable, the closing plating may be attached by slot fillet welds to face plates fitted to the webs.

5.5.2.2 Slots are to be well rounded and have a minimum slot length, l_{slot}, of 90mm and a minimum width, w_{slot}, of twice the gross plate thickness. Slots cut in plating are to have smooth, clean and square edges and are in general to be spaced a distance, s_{slot}, not greater than 140mm. Slots are not to be filled with welding.

5.5.3 (void)

5.5.3.1 (void)

5.6 Stud Welds

5.6.1 General

5.6.1.1 Where permanent or temporary studs are to be attached by welding to main structural parts in areas subject to high stress, the proposed location of the studs is to be submitted for approval.

5.7 Determination of the Size of Welds

5.7.1 General

5.7.1.1 The following weld sizes are to be rounded to the nearest half millimetre.

5.7.1.2 The leg length, l_{leg}, as shown in *Figure 6.5.8*, of continuous, lapped or intermittent fillet welds, in association with the requirements of *5.7.2* to *5.7.5,* is not to be taken as less than:

(a) $l_{leg} = f_1 t_{p-grs}$

(b) $l_{leg} = f_{yd} f_{weld} f_2 t_{p-grs} + t_{gap}$

(c) l_{leg} as given in *Table 6.5.2*

Where:

f_1 = 0.30 for double continuous welding
= 0.38 for intermittent welding

t_{p-grs} the gross plate thickness, in mm. Is generally to be taken as that of the abutting member (member being attached). See *5.7.1.5*

f_{yd} correction factor taking into account the yield strength of the weld deposit:

$$= \left(\frac{1}{k}\right)^{0.5} \left(\frac{235}{\sigma_{weld}}\right)^{0.75}$$ but is not to be taken as less than 0.707

σ_{weld} minimum yield stress of the weld deposit, and is not to be less than:

305N/mm^2 for welding of normal strength steel

375N/mm^2 for welding of higher strength steels with yield strength of 265 to 355N/mm^2

400 N/mm^2 for welding of higher strength steel with yield strength of 390N/mm^2

See *5.9.4* for additional requirements that are to be applied where the weld size is determined based on a weld deposit yield strength that exceeds the specified minimum value

k higher strength steel factor, as defined in *1.1.4*. k is to be based on the material of the abutting member

f_{weld} weld factor depending on the type of structural member, see *5.7.2*, *5.7.3* and *5.7.5*

f_2 correction factor for the type of weld:

1.0 for double continuous fillet

$\frac{s_{ctr}}{l_{weld}}$ for intermittent or chain welding

l_{weld} the actual length of weld fillet, clear of crater, in mm

s_{ctr} the distance between successive weld fillets, from centre to centre, in mm

t_{gap} allowance for weld gap (lesser gaps may be permitted, see *5.9.2*):

$=2.0\text{mm}$ for $t_{p-grs} > 6.5\text{mm}$

$= 2\left(1.25 - \frac{1}{f_2}\right)\text{mm}$ for $t_{p-grs} \le 6.5\text{mm}$

5.7.1.3 The throat size is not to be less than $l_{leg}/\sqrt{2}$, where the leg length, l_{leg}, is as shown in *Figure 6.5.8*.

5.7.1.4 The leg size for matched fillet welds either side of an intersection with intermittent welding is not to be greater than $0.62t_{p-grs}$ or 6.5mm, whichever is the lesser.

5.7.1.5 Where the gross web thickness of the abutting longitudinal stiffener is greater than 15mm and exceeds the thickness of the table member (e.g. plating), the welding is to be double continuous and the leg length of the weld is to be not less than the greatest of the following:

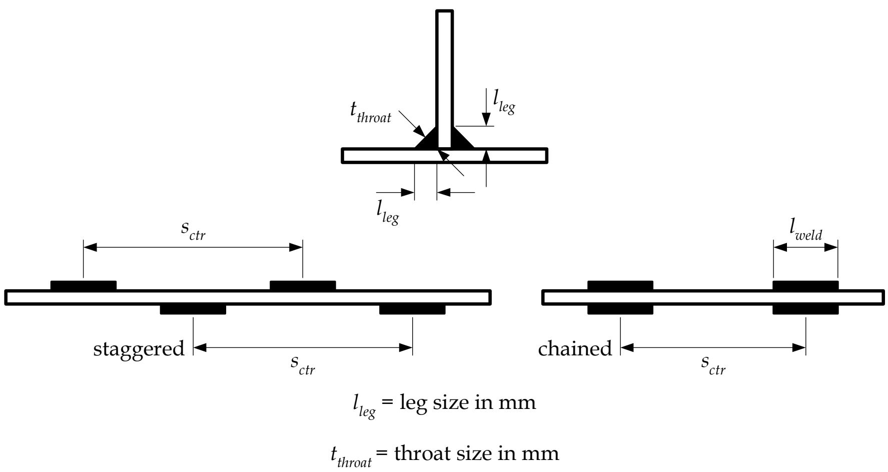
(a) 0.3 times the gross thickness of the table member. The table member thickness used need not be greater than 30mm

(b) 0.27 times the gross thickness of the abutting member plus 1.0mm. The leg size need not be greater than 8.0mm

(c) as given by *Table 6.5.2* for stiffeners to plating.

5.7.1.6 Where the gap between members being joined exceeds 2mm and is not greater than 5mm, the weld leg size is to be increased by the amount of the opening in excess of 2mm. Where the opening between members is greater than 5mm, corrective measures are to be taken, in accordance with an approved welding procedure specification.

Figure 6.5.8
Weld Definitions



5.7.2 Welding of fillet joints of main structural components

5.7.2.1 General weld factors for the connections of the structural components of the hull are given in *Table 6.5.1*.

5.7.2.2 Where components of the hull form a part of a double skin primary support member the requirements of *5.7.4* are also to be applied.

5.7.2.3 Where high tensile stresses act through an intermediate plate (see *Figure 6.5.4*), increased fillet welds or penetration welds are to be used as required by *5.8*.

5.7.3 Welding of primary support members

5.7.3.1 Weld factors for the connections of the web plating of primary support members are given in *Table 6.5.4*.

5.7.3.2 Where the minimum weld size is determined by the requirements of *5.7.1.2(b)* the weld connections to shell, decks or bulkheads are to take account of the material lost in the cut out where stiffeners pass through the member. In cases where the web plating and the width of the notch exceeds 15 percent of the stiffener spacing, the size of the weld leg length is to be multiplied by:

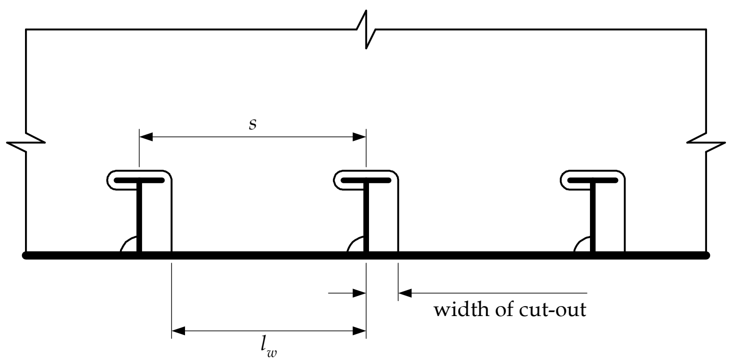
$$\frac{0.85s}{l_w}$$

Where:

s stiffener spacing, in mm

l_w length of web plating between notches, in mm, see *Figure 6.5.9*

Figure 6.5.9
Lost Material in Web Cut-outs for Stiffeners



5.7.4 Welding of end connections of primary support members

5.7.4.1 Welding of end connections of primary support members (i.e. transverse frames and girders) is to be such that the weld area, A_{weld}, is to be equivalent to the Rule gross cross-sectional area of the member. In terms of weld leg length, l_{leg}, this is to be taken as by:

$$l_{leg} = 1.41 f_{yd} \frac{h_w t_{p-grs}}{l_{dep}} \quad \text{mm}$$

Where:

h_w web height of primary support member, in mm, see *Figure 6.5.10*

t_{p-grs} rule gross thickness of the primary support member, in mm

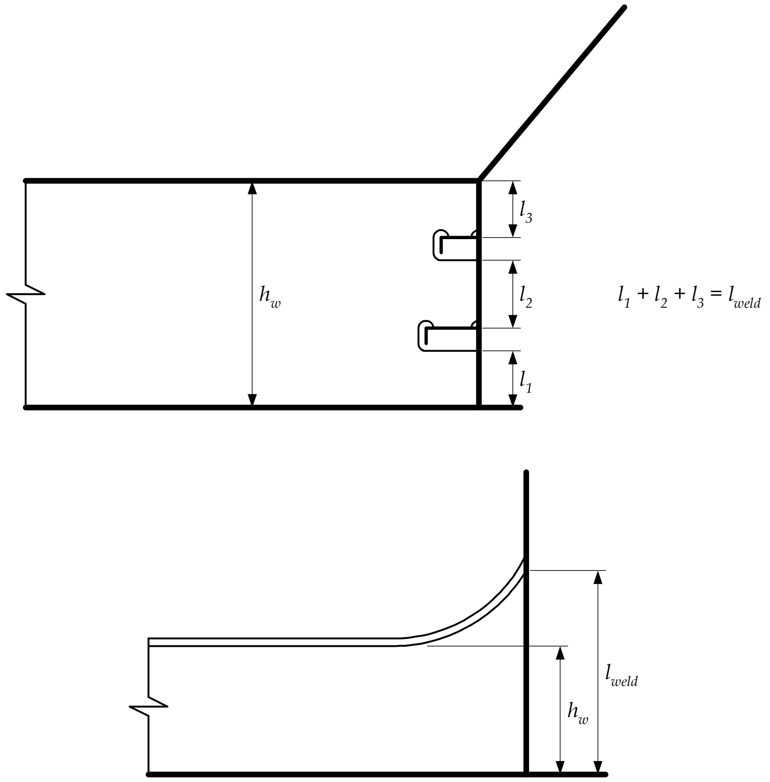
l_{dep} total length of deposit of weld metal, in mm. Generally this can be taken as twice l_{weld} shown in *Figure 6.5.10* for a double continuous fillet weld

f_{yd} correction factor taking into account the yield strength of the weld deposit, as defined in *5.7.1.2*

In no case is the size of weld to be less than that calculated in accordance with *5.7.1.2*, using a minimum weld factor, f_{weld}, of 0.48 in tanks or 0.38 elsewhere.

RCN 2 to July 2008 version (effective from 1 July 2010)

Figure 6.5.10
End Connection of Primary Support Members



Note

1. The length l_{weld} is the length of the welded connection. The total length of the weld deposit l_{dep} is, for double continuous fillet welds, twice the length of the welded connection l_{weld}

5.7.5 Welding at the ends of stiffeners

5.7.5.1 Welding of longitudinals to plating is to be double continuous at the ends of the longitudinals. In way of transverses the length of the double continuous weld is to be equal the depth of the longitudinal, or the depth of the end bracket, whichever is greater.

5.7.5.2 For deck longitudinals, a matched pair of welds is required at the intersection of longitudinals with transverses.

5.7.5.3 The welding of stiffener (i.e. longitudinals, beams and bulkhead stiffeners) end connections is to be not less than as required by *Table 6.5.5*. Where two requirements are given, the greater is to be complied with. The area of weld, A_{weld}, indicated in *Table 6.5.5*, is to be applied to each arm of the bracket or lapped connection.

5.7.5.4 Where a longitudinal strength member is cut at a primary support structure and the continuity of strength is provided by brackets, the weld area, A_{weld}, based on the effective throat times the length of the weld, is to be not less than the gross cross-sectional area of the member. If the longitudinal strength member is of high strength steel, the weld area, A_{weld}, is to be multiplied by f_{yd}, the correction factor taking into account the yield strength of the weld deposit as defined in *5.7.1.2*.

5.7.5.5 Where the stiffener member passes through, and is supported by the web of a primary support member, the weld connection is to be in accordance with the requirements of *Section 4/3.4.3.11*.

5.7.5.6 Where intermittent welding is permitted, unbracketed stiffeners of shell, watertight and oil-tight bulkheads, and house fronts are to have double continuous welds for one-tenth of their length at each end. Unbracketed stiffeners of non-tight structural bulkheads, deck house sides and aft ends are to have a pair of matched intermittent welds at each end.

5.8 Weld for Structures Subject to High Tensile Stresses

5.8.1 Minimum leg size

5.8.1.1 Where high tensile stresses act through an intermediate plate, see *Figure 6.5.11*, the minimum leg length, l_{leg}, of double continuous welds is to be taken as:

$$l_{leg} = 1.92\left(\frac{235}{\sigma_{weld}}\right)^{0.75}\left[0.2 + \left(\frac{\sigma}{270} - 0.25\right)\frac{l_{root}}{t_{p-grs}}\right]t_{p-grs} + 2.0 \quad \text{mm}$$

Where:

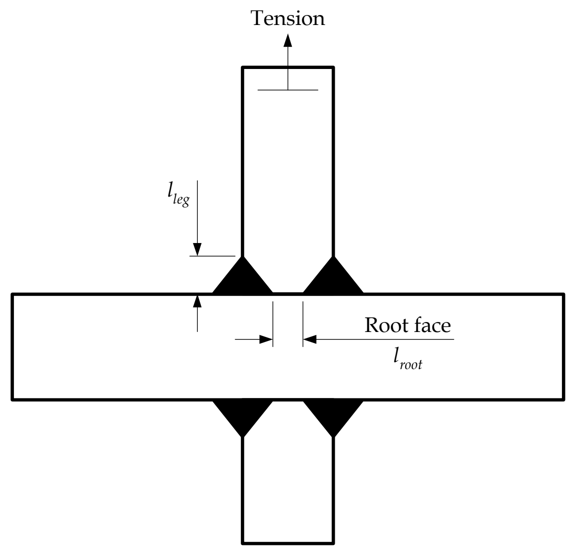
σ maximum tensile stress in plate being attached, in N/mm²

l_{root} root face length, in mm

t_{p-grs} gross thickness of plate being attached, in mm

σ_{weld} as defined in *5.7.1.2*, where σ_{weld} is limited to the maximum value permitted by the limits imposed on correction factor taking into account the yield strength of the weld deposit, f_{yd}, as defined in *5.7.1.2*

Figure 6.5.11
Welds Subject To High Tensile Stresses



5.9 Reduced Weld Size

5.9.1 General

5.9.1.1 Reduction in fillet weld sizes that are required by *5.7* may be specially approved in accordance with either *5.9.2*, *5.9.3* or *5.9.4*.

5.9.1.2 Where any of the methods for reduction of the weld size are adopted, the specific requirements giving justification for the reduction are to be indicated on the drawings. The drawings are to document the weld design and dimensioning requirements for the reduced weld leg length and the required weld leg length given by *5.7* without the permitted leg length reduction. Also, notes are to be added to the drawings to describe the difference in the two leg lengths and the requirements for their application.

5.9.2 Controlled gaps

5.9.2.1 Where quality control facilitates working to a gap between members of 1mm or less, a reduction in fillet weld leg size of 0.5mm is permitted.

5.9.3 Deep penetration welding

5.9.3.1 Where an approved automatic deep penetration procedure is used and quality control facilitates are working to a gap between members of 1mm or less, the weld factors given in *Tables 6.5.1, 6.5.2(c)* and *(d), 6.5.4* and *6.5.5* may be reduced by 15 percent. Reductions of up to 20 percent, but not more than the fillet weld leg size of 1.5mm, will be accepted provided that the Shipyard is able to consistently meet the following requirements:

(a) the welding is performed to a suitable process selection confirmed by welding procedure tests covering both minimum and maximum root gaps

(b) the penetration at the root is at least the same amount as the reduction into the members being attached

(c) demonstrate that an established quality control system is in place.

5.9.4 Controlled welding consumables

5.9.4.1 Where quality control systems are in place which ensure that the grade of welding consumable used is higher than the minimum required for the particular strength steel being welded, the welding consumables that are used may have a weld deposit material yield strength that is greater than the minimums specified in *5.7.1.2* and the size of the weld may be determined based on the yield strength of the higher grade welding consumable.

5.10 End Connections of Pillars and Cross Ties

5.10.1 Effective weld area

5.10.1.1 The end connections of pillars and cross ties are to have an effective fillet weld area (weld throat multiplied by weld length) not less than:

$$A_{weld} = f_3 \left(\frac{235}{\sigma_{weld}}\right)^{0.75} A_{grs} P \quad \text{cm}^2$$

Where:

A_{grs} gross cross-sectional area, for the pillar or cross tie, in m^2

P design pressure load, for the structure under consideration, in kN/m²

σ_{weld} minimum yield stress of the deposit, as given in *5.7.1.2*, where σ_{weld} is limited to the maximum value permitted by the limits imposed on f_{yd} in *5.7.1.2*

f_3 = 0.05 when pillar or cross tie is in compression only

= 0.14 when pillar or cross tie is in tension

5.11 Alternatives

5.11.1 General

5.11.1.1 The foregoing are considered minimum requirements for electric-arc welding in hull construction, but alternative methods, arrangements and details will be specially considered for approval.

5.11.1.2 The leg length limits given in *Table 6.5.2* are to be complied with in all cases.

Table 6.5.1
Weld Factors

Items	Weld Factor f_{weld}	Remarks
(1) General application		except as required by items 2-11
Watertight boundaries	0.43	
Non-tight plate boundaries	0.18	
Strength deck plating to shell	see *Table 6.5.3*	
Other decks to shell and bulkheads (except where forming tank boundaries)	0.30	generally continuous
Stiffeners to plating (clear of end connections)	0.13	in dry spaces
	0.18	in tanks
Stiffeners to plating for 0.1 span at ends	0.21	or extent of end bracket if greater
Panel stiffeners	0.13	
Overlapped welds generally	0.36	
Longitudinals, with gross web thickness greater than 15mm, to plating	see *5.7.1.5*	t_{p-grs} as defined in *5.7.1.5*
(2) Bottom construction in cargo tank region		(1)
Non-tight centre girder: to keel	0.30	
to inner bottom	0.28	no scallops
Non-tight boundaries of floors and girders	0.15	mid half span
	0.24	end quarters span
Floors and girder to inner bottom in way of:		
vertical primary supporting members	0.43	(1)
Connection between floors and girders	0.36	(1)
End connection of floors and girders	0.43	(1)
Docking brackets	0.30	

Table 6.5.1 (Continued)
Weld Factors

Items	Weld Factor f_{weld}	Remarks
(3) Side construction in cargo tank region		including bilge hopper tanks, (1)
Vertical webs to inner hull bulkhead		
in way of deck transverse/bracket	0.43	
in way of cross tie, as applicable	0.36	
Elsewhere	0.24	
Vertical webs to shell	0.24	
Vertical webs end connection	0.43	(1)
(4) Cargo tank bulkhead construction		including pump room and cofferdam, (1)
Longitudinal and transverse oil-tight bulkhead boundaries:		
to deck, inner bottom and bottom shell	0.51	
at sides	0.43	
Vertical corrugation		
at upper end	0.51	
at lower end	see *5.3.4*	
Non-tight bulkhead boundaries	0.24	
Primary support members	see *Table 6.5.4*	
Connection between primary support members	0.49	
(5) Structures in machinery space		
Centre girder to keel and inner bottom	0.36	
Floors to centre girder in way of:		
Engines	0.36	
thrust and boiler bearers	0.36	
Floors to main engine foundation girders	0.36	
Floors/girders to shell and inner bottom	0.24	
Main engine foundation girders to top plate and primary hull structure	Partial penetration	edge to be prepared with maximum root $0.33t_{p-grs}$ deep penetration
Foundation:		
auxiliary diesels (>350kw)	0.40	
boiler and other auxiliaries	0.35	
Brackets supporting engine foundation	0.21	
(6) Construction in 0.25*L* forward		
In way of flat of bottom:		
floors to shell and inner bottom	0.18	
girders to shell and inner bottom	0.28	
Bottom longitudinals to shell:		
flat of bottom forward	0.30	
Elsewhere	0.18	
side shell stringers to shell	0.24	
Fore peak construction:		
internal structures	0.18	
(7) Aft peak construction		
Internal structure:		
below water line	0.30	
above waterline	0.18	

Table 6.5.1 (Continued)
Weld Factors

Items	Weld Factor f_{weld}	Remarks
(8) Superstructures and deck houses		
Connection of external bulkhead to deck		
first and second tier erections	0.28	
Elsewhere	0.15	
Internal bulkheads	0.12	
(9) Closing Arrangements		
Hatch coaming to deck	0.43	
Cleats and fittings	0.60	minimum weld factor. Where t_{p-grs} > 11.5mm, l_{leg} need not exceed 0.62 t_{p-grs}. Penetration welding may be required depending on design
Hatch covers:		
oil-tight joints	0.46	
watertight joints:		
Outside	0.46	
Inside	0.18	
Hatch covers:		
at end of stiffener (unbracketed)	0.38	(2)
at end of stiffener (bracketed)	0.38	
Elsewhere	0.12	
(10) Deck Equipment		(3)
Masts, derrick posts, crane pedestals, etc., to deck	0.43	
Deck machinery seats to deck	0.20	
Mooring equipment seats	0.43	
(11) Miscellaneous fittings and equipment		
Rings for access hole type covers to ship	0.43	
Frames of shell and weathertight doors	0.43	
Stiffening of shell and weathertight doors	0.24	
Ventilators, air pipes, etc., coaming to deck	0.43	
Ventilators, etc., fittings	0.24	
Scuppers and discharge to deck	0.55	
Bulwark stays to deck	0.24	
Bulwark attachment to deck	0.43	
Guard rails, stanchions, etc., to deck	0.43	
Bilge keel ground bars to shell	see *Table 11.3.1*	
Bilge keels to ground bars	see *Table 11.3.1*	
Fabricated anchors	full penetration	

Note

1. The weld size is to be increased for areas with high tensile stress, see *5.8*.
2. Unbracketed stiffeners and webs of hatch covers are to be welded continuously to the plating and to the face plate for a length, at the ends, equal to the end depth of the member.
3. Weld factors are minimum values.

Table 6.5.2
Leg Size

Item	Minimum Leg Size(1), mm
(a) Gross plate thickness $t_{p\text{-}grs} \leq 6.5$mm (5)	
Hand or automatic welding	4.0
Automatic deep penetration welding	4.0
(b) Gross plate thickness $t_{p\text{-}grs} > 6.5$mm (5)	
Hand or automatic welding	4.5
Automatic deep penetration welding	4.0
(c) Welds within 3m below top of ballast and cargo tanks(2) (4)	6.5
(d) All welds in cargo tank region, except in (c) (4)	6.0

Note

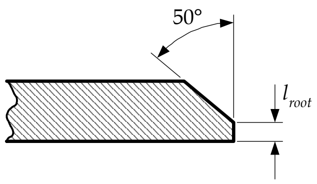
1. In all cases, the limiting value is to be taken as the greatest of the applicable values given above.
2. Only applicable to cargo and ballast tanks with weather deck as the tank top.
3. See *5.9* for provisions to reduce minimum leg size.
4. A reduction to 5.5mm leg size for the secondary structural elements such as carling, buckling stiffeners and tripping brackets may be applied without additional gap control.
5. For superstructure and deck houses, the minimum leg length may be taken as 3.5mm.

(RCN 2, effective from 1 July 2008)

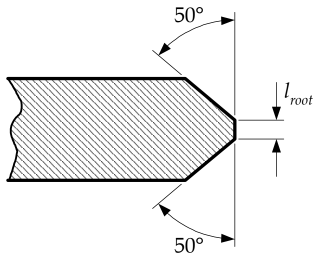
Table 6.5.3
Weld Connection of Strength Deck Plating to Sheer Strake

Stringer gross plate thickness, in mm	Weld type
$t_{p\text{-}grs} \le 15$	Double continuous fillet weld with a leg size of 0.60 $t_{p\text{-}grs}$ + 2.0mm
$15 < t_{p\text{-}grs} \le 20$	Single vee preparation to provide included angle of 50° with root face length $l_{root} < t_{p\text{-}grs}/3$ in conjunction with a continuous fillet weld with a weld factor of 0.35 or Double vee preparation to provide included angle of 50° with root face length $l_{root} < t_{p\text{-}grs}/3$
$t_{p\text{-}grs} > 20$	Double vee preparation to provide included angle of 50° with root face length $l_{root} < t_{p\text{-}grs}/3$, but not to be greater than 10mm

Where $t_{p\text{-}grs}$ = gross thickness of stringer plate, in mm



or



single vee preparation double vee preparation

Note

1. Welding procedure, including joint preparation, is to be specified and approved for individual builders.
2. Where structural members pass through the boundary of a tank a leak stopper is to be arranged in accordance with *4.4.4*.
3. Alternative connections will be specially considered.

Table 6.5.4
Connection of Primary Support Members

Primary Support Member gross face area, in cm²		Position [(1)]	Weld factor, f_{weld}			
			In tanks		In dry spaces	
Greater than	Not greater than		To face plate	To plating	To face plate	To plating
	30.0	At ends Remainder	0.20 0.12	0.26 0.20	0.20 0.12	0.20 0.15
30.0	65.0	At ends Remainder	0.20 0.12	0.38 0.26	0.20 0.12	0.20 0.15
65.0	95.0	At ends Remainder	0.42 0.30 [(2)]	0.59 [(3)] 0.42	0.20 0.15	0.30 0.20
95.0	130.0	At ends Remainder	0.42 0.30 [(2)]	0.59 [(3)] 0.42	0.30 0.20	0.42 0.30
130.0		At ends Remainder	0.59 [(3)] 0.42	0.59 [(3)] 0.42	0.42 0.30	0.59 [(3)] 0.42

Note

1. The weld factors 'at ends' are to be applied for 0.2 times the overall length of the member from each end, but at least beyond the toe of the member end brackets. On vertical webs, the increased welding may be omitted at the top, but is to extend at least 0.3 times overall length from the bottom.
2. Weld factor 0.38 to be used for cargo tanks.
3. Where the web plate thickness is increased locally to meet shear stress requirements, the weld size may be based on the gross web thickness clear of the increased area, but is to be not less than weld factor of 0.42 based on the increased gross thickness.
4. In regions of high stress, see *5.3.4*, *5.7.4* and *5.8*.

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 6.5.5
Stiffener End Connection Welds

Connection	Weld area, A_{weld}, in cm²	Weld Factor, f_{weld} [(1)]
(1) Stiffener welded direct to plating	$0.25A_{stf\text{-}grs}$ or 6.5 cm² whichever is the greater	0.38
(2) Bracketless connection of stiffeners, stiffener lapped to bracket or bracket lapped to stiffener:		
(a) in dry space	$1.2\sqrt{Z_{grs}}$	0.26
(b) in tank	$1.4\sqrt{Z_{grs}}$	0.38
(c) main frame to tank side bracket in 0.15*L* forward	as (a) or (b)	0.38
(3) Bracket welded to face of stiffener and bracket connection to plating	–	0.38

Where:

$A_{stf\text{-}grs}$ gross cross sectional area of the stiffener, in cm²

A_{weld} weld area, in cm², and is calculated as total length of weld, in cm, times throat thickness, in cm (Where the gap exceeds 2mm the weld size is to be increased. See *5.7.1.6*)

Z_{grs} the gross section modulus required, in cm³, of the stiffener on which the scantlings of the bracket are based

Note

1. For minimum weld fillet sizes, see *Table 6.5.2*.

SECTION 7

LOADS

1 INTRODUCTION

1.1 General

1.1.1 Application

1.1.1.1 This section provides in detail the loads and load combinations for the scantling calculations. The loads cover load scenarios in harbour and at sea, see *Section 2/5.4*, dividing the loads into static load components, dynamic load components, sloshing loads and impact loads.

1.2 Definitions

1.2.1 Coordinate system

1.2.1.1 The applied coordinate system x, y, z is as defined in *Section 4/1.4.1.1*.

1.2.1.2 The direction of the incident waves are specified by the angle β between the x-axis and the propagating wave direction as shown in *Figure 7.1.1*. Examples given:

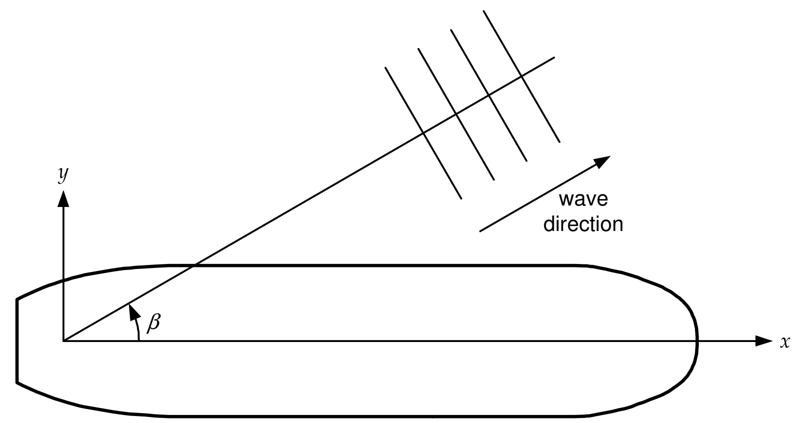
(a) head sea is waves propagating in the negative x-direction,

(b) beam sea is waves propagating in the positive or negative y-direction,

(c) oblique sea is waves propagating in a direction between head and beam sea (or following and beam sea), and

(d) following sea is waves propagating in positive x-direction.

Figure 7.1.1
Definition of Wave Heading



1.2.2 Sign conventions

1.2.2.1 Positive motions, as shown in *Figure 7.1.2,* are defined as:

(a) positive surge is translation along positive x-axis (forward)

(b) positive sway is translation along positive y-axis (towards port side of vessel)

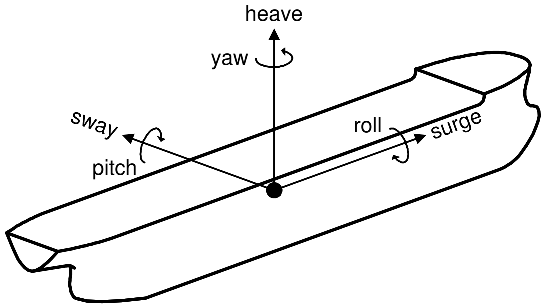
(c) positive heave is translation along positive z-axis (upwards)

(d) positive roll is starboard down and port side up

(e) positive pitch is bow down and stern up

(f) positive yaw is bow rotating towards portside of vessel and stern towards starboard side.

Figure 7.1.2
Definition of Positive Motions



Note
1. This figure shows the rotation axis and not the coordinate system.

1.2.2.2 Positive accelerations are defined as:

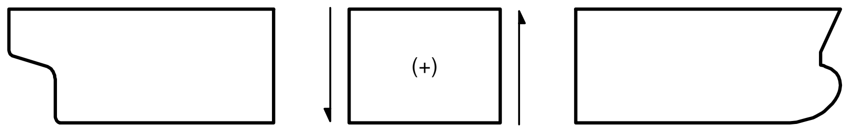
(a) positive longitudinal acceleration is acceleration along positive *x*-axis (forward)

(b) positive transverse acceleration is acceleration along positive *y*-axis (towards portside of vessel)

(c) positive vertical acceleration is acceleration along positive *z*-axis (upwards).

1.2.2.3 The sign convention of positive vertical hull girder shear force is shown in *Figure 7.1.3*.

Figure 7.1.3
Positive Vertical Shear Force



1.2.2.4 The sign conventions of positive hull girder bending moments are shown in *Figures 7.1.4* and *7.1.5,* and are defined as:

(a) positive vertical bending moment is a hogging moment and negative vertical bending moment is a sagging moment

(b) positive horizontal bending moment is tension on the starboard side and compression on the port side.

Figure 7.1.4
Positive Vertical Bending Moment

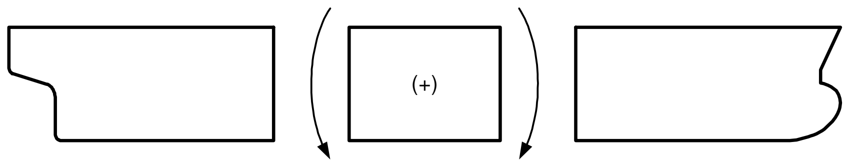


Figure 7.1.5
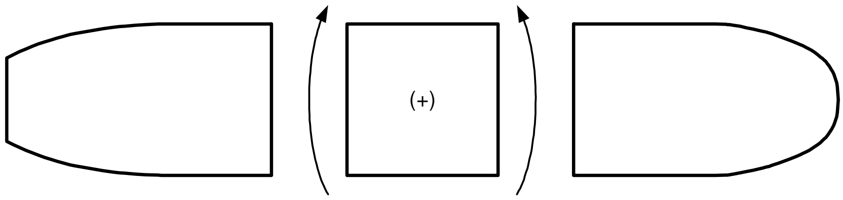
Positive Horizontal Bending Moment



2 STATIC LOAD COMPONENTS

2.1 Static Hull Girder Loads

2.1.1 Permissible hull girder still water bending moment

2.1.1.1 The designer is to provide the permissible hull girder hogging and sagging still water bending moment limits for seagoing, $M_{sw\text{-}perm\text{-}sea}$, and harbour/sheltered water operations, $M_{sw\text{-}perm\text{-}harb}$.

2.1.1.2 The permissible hull girder hogging and sagging still water bending moment limits are to be given at each transverse bulkhead in the cargo area, at the middle of cargo tanks, at the collision bulkhead, at the engine room forward bulkhead and at the midpoint between the fwd and aft engine room bulkhead.

2.1.1.3 The permissible hull girder hogging and sagging still water bending moment envelope is given by linear interpolation between values at the longitudinal positions given in *2.1.1.2.*

2.1.1.4 The permissible hull girder hogging and sagging still water bending moment envelopes are to be included in the loading manual as required in *Section 8/1.1.2*.

2.1.1.5 The permissible hull girder hogging and sagging still water bending moment envelopes for seagoing operations, $M_{sw\text{-}perm\text{-}sea}$, are to envelop the minimum hull girder hogging and sagging still water bending moments given in *2.1.2.1* and *2.1.2.2* and the most severe hogging and sagging hull girder still water bending moments calculated for any seagoing loading condition given in the loading manual. The requirements for the loading conditions are given in *Section 8/1.1.2*.

2.1.1.6 The permissible hull girder hogging and sagging still water bending moment envelopes for harbour/sheltered water operation, $M_{sw\text{-}perm\text{-}harb}$, are to envelop the minimum hull girder hogging and sagging still water bending moments given in *2.1.2.3* and the most severe hogging and sagging hull girder still water bending moments calculated for any harbour/sheltered water loading condition given in the loading manual and are not to be less than the permissible envelopes for seagoing operation, $M_{sw\text{-}perm\text{-}sea}$.

Guidance note:

It is recommended that, for initial design, the permissible hull girder hogging and sagging still water bending moment envelopes are at least 5% above the hull girder still water bending moment envelope from the loading conditions in the loading manual, to account for growth and design margins during the design and construction phase of the ship.

2.1.2 Minimum hull girder still water bending moment

2.1.2.1 The minimum hull girder hogging and sagging still water bending moment for seagoing operations, $M_{sw\text{-}min\text{-}sea\text{-}mid}$, at amidships is to be taken as:

for hogging:

$$M_{sw-min-sea-mid} = f_{sea}\left(Z_{v-\min}\,\sigma_{perm-sea}\,10^3 - M_{wv-hog}\right) \quad \text{kNm}$$

which is identical to

$$M_{sw-min-sea-mid} = 0.01\,C_{wv}\,L^2\,B\left(11.97 - 1.9C_b\right) \quad \text{kNm}$$

for sagging:

$$M_{sw-min-sea-mid} = f_{sea}\left(Z_{v-\min}\,\sigma_{perm-sea}\,10^3 + M_{wv-sag}\right) \quad \text{kNm}$$

which is identical to

$$M_{sw-min-sea-mid} = -0.05185\, C_{wv}\, L^2\, B(C_b + 0.7) \quad \text{kNm}$$

Where:

f_{sea} -0.85 for sagging
1.0 for hogging

Z_{v-min} rule minimum hull girder section modulus as given in *Section 8/1.2.2.2*, in m^3

$\sigma_{perm-sea}$ allowable seagoing hull girder bending stress at midships, as defined in *Section 8/1.2.3.2*, in N/mm^2

M_{wv-hog} envelope values of hogging vertical wave bending moment at midships as defined in *3.4.1.1*, in kNm

M_{wv-sag} envelope values of sagging vertical wave bending moment at midships as defined in *3.4.1.1*, in kNm

C_{wv} wave coefficient, as defined in *3.4.1.1*

L rule length, , in m, as defined in *Section 4/1.1.1.1*

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*, in m

C_b block coefficient, as defined in *Section 4/1.1.9.1*

2.1.2.2 The minimum hull girder hogging and sagging still water bending moment for seagoing operations, $M_{sw-min-sea}$, at any longitudinal position is to be taken as:

$$M_{sw-min-sea} = f_{sw}\, M_{sw-min-sea-mid} \quad \text{kNm}$$

Where:

f_{sw} 1.0 within 0.4*L* amidships
0.15 at 0.1*L* from A.P. or F.P.
0 at A.P. and F.P.

intermediate f_{sw} values are to be obtained by linear interpolation, see *Figure 7.2.1*

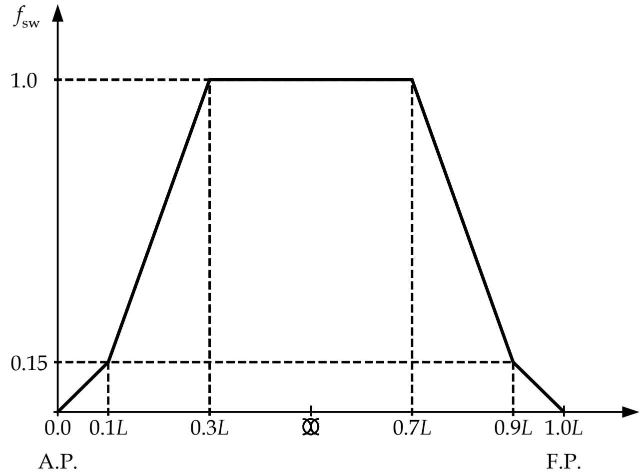
2.1.2.3 The minimum hull girder hogging and sagging still water bending moment for harbour/sheltered water operations, $M_{sw-min-harb}$, at any longitudinal position is to be taken as:

$$M_{sw-min-harb} = 1.25\, M_{sw-min-sea} \quad \text{kNm}$$

Where:

$M_{sw-min-sea}$ corresponding minimum hull girder hogging and sagging still water bending moment for seagoing operation at the section under consideration, see *2.1.2.1* and *2.1.2.2*

Figure 7.2.1
Still Water Bending Moment Distribution



2.1.3 Still water shear force

2.1.3.1 The designer is to provide the permissible hull girder positive and negative still water shear force limits for seagoing, $Q_{sw\text{-}perm\text{-}sea}$, and harbour/sheltered water operations, $Q_{sw\text{-}perm\text{-}harb}$.

2.1.3.2 The permissible hull girder positive and negative still water shear force limits are to be given at each transverse bulkhead in the cargo area, at the middle of cargo tanks, at the collision bulkhead and at the engine room forward bulkhead.

2.1.3.3 The permissible hull girder positive and negative still water shear force envelope is given by linear interpolation between values at the longitudinal positions given in *2.1.3.2.*

2.1.3.4 The permissible hull girder positive and negative still water shear force envelopes are to be included in the loading manual as required in *Section 8/1.1.2*.

2.1.3.5 The permissible hull girder positive and negative still water shear force envelopes for seagoing operation, $Q_{sw\text{-}perm\text{-}sea}$, are to envelope the minimum hull girder positive and negative still water shear forces given in *2.1.4.1, 2.1.4.2* and the most severe positive and negative hull girder still water shear forces for any seagoing loading condition given in the loading manual. The requirements for the loading conditions are given in *Section 8/1.1.2.*

2.1.3.6 The permissible hull girder positive and negative still water shear force envelopes for harbour operation, $Q_{sw\text{-}perm\text{-}harb}$, are to envelop the minimum hull girder positive and negative still water shear forces given in *2.1.4.3, 2.1.4.4* and the most severe positive and negative hull girder still water shear forces for any harbour/sheltered water loading condition given in the loading manual and are not to be less than the permissible envelopes for seagoing operation, $Q_{sw\text{-}perm\text{-}sea}$.

Guidance note:

It is recommended that, for initial design, the permissible hull girder still water shear force envelopes are at least 10% above the hull girder shear force envelope from the loading conditions in the loading manual, to account for growth and design margins during the design and construction phase of the ship.

2.1.4 Minimum hull girder still water shear force

2.1.4.1 For ships with two longitudinal bulkheads, the minimum hull girder positive and negative still water shear force for seagoing operation, $Q_{sw-min-sea}$, in way of transverse bulkheads between centre cargo tanks, is to be taken as:

$$Q_{sw-min-sea} = \pm \max \begin{cases} 0.225 \rho g B_{local} l_{tk} T_{sc} \\ 0.5 \rho g \left[0.98 (V_{CT} + 2V_{ST}) - 0.7 B_{local} l_{tk} T_{sc} \right] \end{cases} \quad \text{kN}$$

and taken as the maximum value of $Q_{sw-min-sea}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m^3
g	acceleration due to gravity, 9.81 m/s^2
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in *Section 4/1.1.5.5*
V_{CT}	volume of centre cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m^3
V_{ST}	volume of side cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m^3

2.1.4.2 For ships with centreline longitudinal bulkhead, the minimum hull girder positive and negative still water shear force for seagoing operation, $Q_{sw-min-sea}$, in way of transverse bulkheads between cargo tanks is to be taken as:

$$Q_{sw-min-sea} = \pm 0.4 \rho g B_{local} l_{tk} T_{sc} \quad \text{kN}$$

and taken as the maximum value of $Q_{sw-min-sea}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m^3
g	acceleration due to gravity, 9.81 m/s^2
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in *Section 4/1.1.5.5*

2.1.4.3 For ships with two longitudinal bulkheads, the minimum hull girder positive and negative still water shear force for harbour/sheltered water operation, $Q_{sw\text{-}min\text{-}harb}$, in way of transverse bulkheads between centre cargo tanks, is to be taken as:

$$Q_{sw-min-harb} = \pm \max\begin{cases} 0.275\rho g B_{local} l_{tk} T_{sc} \\ 0.5\rho g \left[0.98\left(V_{CT} + 2V_{ST}\right) - 0.6 B_{local} l_{tk} T_{sc}\right] \end{cases} \quad \text{kN}$$

and taken as the maximum value of $Q_{sw\text{-}min\text{-}harb}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m^3
g	acceleration due to gravity, 9.81 m/s^2
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in *Section 4/1.1.5.5*
V_{CT}	volume of centre cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m^3
V_{ST}	volume of side cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m^3

2.1.4.4 For ships with centreline longitudinal bulkhead, the minimum hull girder positive and negative still water shear force for harbour/sheltered water operation, $Q_{sw\text{-}min\text{-}harb}$, in way of transverse bulkheads between cargo tanks, is to be taken as:

$$Q_{sw-min-harb} = \pm\, 0.45\rho g B_{local} l_{tk} T_{sc} \quad \text{kN}$$

and taken as the maximum value of $Q_{sw\text{-}min\text{-}harb}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m^3
g	acceleration due to gravity, 9.81 m/s^2
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in *Section 4/1.1.5.5*

2.2 Local Static Loads

2.2.1 General

2.2.1.1 The following static loads are considered:

(a) static sea pressure

(b) static tank pressure

(c) tank overpressure

(d) static deck load

2.2.2 Static sea pressure

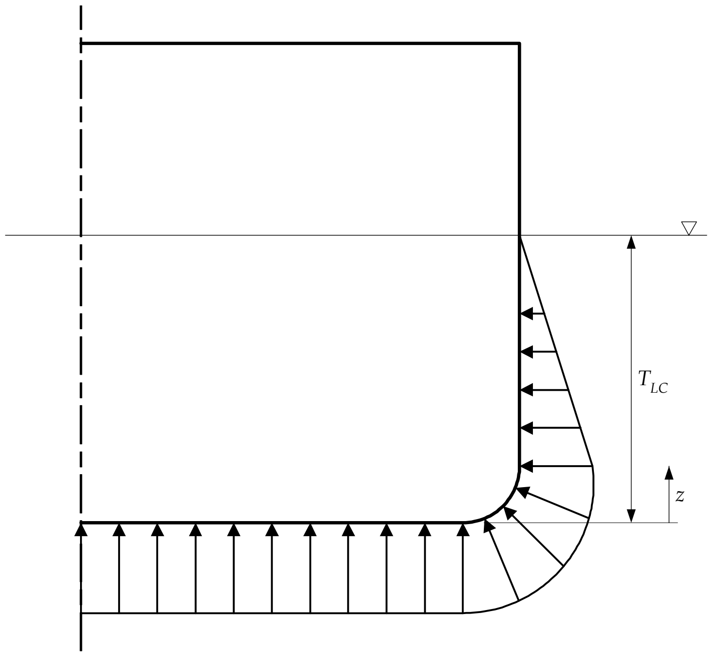
2.2.2.1 The static sea pressure, P_{hys}, is to be taken as:

$$P_{hys} = \rho_{sw} g (T_{LC} - z) \quad \text{kN/m}^2$$

Where:

z	vertical coordinate of load point, in m, and is not to be greater than T_{LC}, see *Figure 7.2.2*
ρ_{sw}	density of sea water, 1.025tonnes/m^3
T_{LC}	draught in the loading condition being considered, in m
g	acceleration due to gravity, 9.81m/s^2

Figure 7.2.2
Static Sea Pressure



2.2.3 Static tank pressure

2.2.3.1 The static tank pressure, P_{in-tk}, is to be taken as:

$$P_{in-tk} = \rho g z_{tk} \quad \text{kN/m}^2$$

Where:

z_{tk} vertical distance from highest point of tank, excluding small

	hatchways, to the load point, see *Figure 7.2.3,* in m
ρ	density of liquid in the tank, is not to be taken as less than 0.9 for liquid cargo for fatigue strength 1.025 otherwise see *Section 2/3.1.8*, in tonnes/m^3
g	acceleration due to gravity, 9.81m/s^2

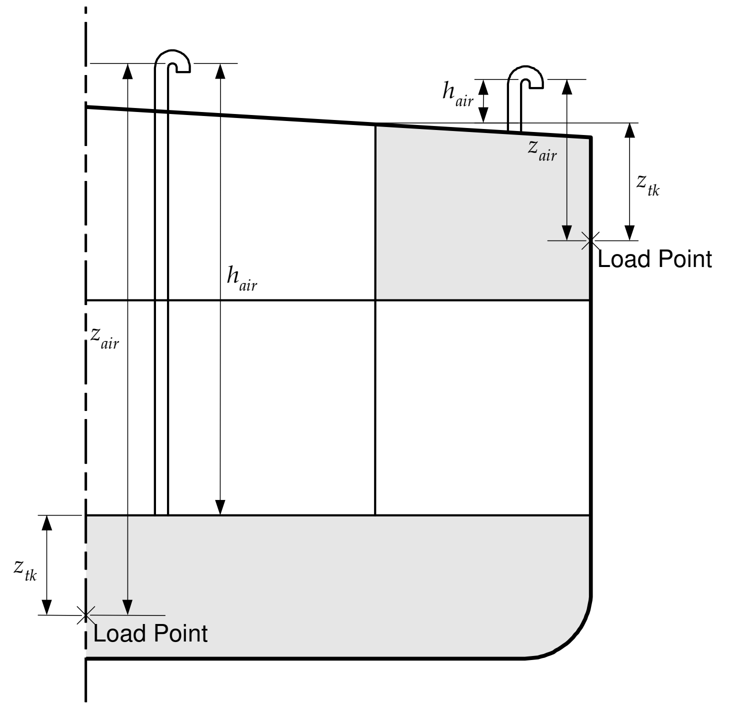
2.2.3.2 The static tank pressure, P_{in-air}, in the case of overfilling or filling during flow through ballast water exchange, is to be taken as:

$$P_{in-air} = \rho_{sw} g z_{air} \quad \text{kN/m}^2$$

Where:

z_{air}	vertical distance from top of air pipe or overflow pipe to the load point, whichever is the lesser, see *Figure 7.2.3*, in m $= z_{tk} + h_{air}$
ρ_{sw}	density of sea water, 1.025tonnes/m^3
g	acceleration due to gravity, 9.81m/s^2
h_{air}	height of air pipe or overflow pipe, in m, is not to be taken less than 0.76m above highest point of tank, excluding small hatchways. For tanks with tank top below the weather deck the height of air-pipe or overflow pipe is not to be taken less than 0.76m above deck at side unless a lesser height is approved by the flag Administration. See also *Figure 7.2.3*.

Figure 7.2.3
Pressure-Heads and Distances used for Calculation of Static Tank Pressure



2.2.3.3 The added overpressure due to sustained liquid flow through air pipe or overflow pipe in the case of overfilling or filling during flow through ballast water exchange, P_{drop}, is to be taken as 25 kN/m². Additional calculations may be required where piping arrangements may lead to a higher pressure drop, for example long pipes or arrangements such as bends and valves.

2.2.3.4 The pressure, $P_{in\text{-}flood}$, in compartments and tanks in a flooded or damaged condition is to be taken as:

$$P_{in-flood} = \rho_{sw} g z_{flood} \quad \text{kN/m}^2$$

Where:

z_{flood} vertical distance from the load point to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations or to freeboard deck if the damage waterline is not given, in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

2.2.3.5 The tank testing pressure, $P_{in\text{-}test}$, is to be taken as the greater of the following, see also the testing requirements in *Table 11.5.1*:

$$P_{in-test} = \rho_{sw} g z_{test} \quad \text{kN/m}^2$$

$$P_{in-test} = \rho_{sw} g z_{tk} + P_{valve} \quad \text{kN/m}^2$$

Where:

z_{test} vertical distance to the load point, is to be taken as the greater of the following, in m:

(a) top of overflow

(b) 2.4 m above top of tank

z_{tk} vertical distance from highest point of tank, excluding small hatchways, to the load point, see *Figure 7.2.3,* in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

P_{valve} setting of pressure relief valve, if fitted, is not to be taken less than 25kN/m²

2.2.4 Static deck pressure from distributed loading

2.2.4.1 The pressure on decks and inner bottom, P_{stat}, is to be taken as:

$$P_{stat} = P_{deck} \quad \text{kN/m}^2$$

Where:

P_{deck} uniformly distributed pressure on lower decks and decks within superstructures, including platform decks in the main engine room and for other spaces with heavy machinery components, in kN/m². P_{deck} is not to be taken less than 16kN/m². Design pressures for decks of deck houses are provided in *Section 11/1.4*.

2.2.5 Static deck loads from heavy units

2.2.5.1 The scantlings of structure in way of heavy units of cargo and equipment are to consider gravity forces acting where the mass is 20 tonnes or greater. The load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, F_{stat}, is to be taken as:

$$F_{stat} = m_{un} g \quad \text{kN}$$

Where:

m_{un} mass of unit, in tonnes

g acceleration due to gravity, 9.81m/s²

3 DYNAMIC LOAD COMPONENTS

3.1 General

3.1.1 Basic components

3.1.1.1 Formulas for ship motions and accelerations are given in this sub-section.

3.1.1.2 Formulas for the envelope value of the basic dynamic load components are also given. The basic load components are:

(a) vertical wave bending moment and shear force

(b) horizontal wave bending moment

(c) dynamic wave pressure

(d) dynamic tank pressures.

3.1.2 Envelope load values

3.1.2.1 The envelope loads for scantling requirements and strength assessment are given at a 10^{-8} probability level, while the envelope loads for fatigue strength are given at a 10^{-4} probability level.

3.1.2.2 For scantling requirements and strength assessments, correction factors to account for non-linear effects and operational considerations in heavy weather are given.

3.1.2.3 For fatigue strength a factor adjusts the envelope load from a 10^{-8} probability level to a 10^{-4} probability level. A speed correction factor is applicable where appropriate.

3.1.2.4 The envelope value is the long term value, at a given probability level, taking into consideration the effect of all wave headings.

3.1.3 Metacentric height and roll radius of gyration

3.1.3.1 The metacentric height, GM, and roll radius of gyration, $r_{roll-gyr}$, associated with the rule loading conditions or specified draughts are specified in *Table 7.3.1*.

Table 7.3.1
GM and $r_{roll-gyr}$

	T_{LC}	GM	$r_{roll-gyr}$
Loaded at deep draught	between $0.9T_{sc}$ and T_{sc}	$0.12B$	$0.35B$
Loaded on reduced draught	$0.6T_{sc}$	$0.24B$	$0.40B$
In ballast	T_{bal}, T_{bal-n}	$0.33B$	$0.45B$

Where:

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

T_{LC} draught in the loading condition being considered, in m

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{bal} minimum design ballast draught, in m, as defined in *Section 4/1.1.5.2*

T_{bal-n} normal ballast draught, in m, as defined in *Section 4/1.1.5.3*

3.1.3.2 For the optional loading conditions, GM is to be taken as the corrected metacentric height given in the loading manual. Where GM for optional loaded or gale/emergency ballast conditions is not specified, GM is to be taken as $0.12B$ for mean draught greater or equal to $0.9T_{sc}$, and $0.24B$ for mean draught equal or less than $0.6T_{sc}$. For optional loading conditions with a mean draught other than the

values defined, GM is to be obtained by linear interpolation based on values for $0.6T_{sc}$ and $0.9T_{sc}$.

3.1.3.3 $r_{roll\text{-}gyr}$ for optional loaded or gale/emergency ballast conditions is, unless provided based on the loading manual, to be taken as $0.35B$ for mean draught greater or equal to $0.9T_{sc}$, and $0.4B$ for mean draught equal or less than $0.6T_{sc}$. For optional loading conditions with a mean draught other than the values defined above, $r_{roll\text{-}gyr}$ may be obtained by linear interpolation based on values for $0.6T_{sc}$ and $0.9T_{sc}$.

3.1.3.4 For the loading conditions used for fatigue strength, GM is to be taken as the corrected metacentric height given in the loading manual. If not available, GM is to be taken as specified in *Table 7.3.1* for ballast condition and according to the procedure described in *3.1.3.2* for full load condition. $r_{roll\text{-}gyr}$ is, unless based on the loading condition, to be taken as specified in *Table 7.3.1* for ballast condition and according to the procedure described in 3.1.3.3 for full load condition.

3.2 Motions

3.2.1 General

3.2.1.1 The envelope values for ship motions are given at a 10^{-8} probability level.

3.2.2 Roll motion

3.2.2.1 The natural roll period, U_{roll}, is to be taken as:

$$U_{roll} = \frac{2.30 r_{roll-gyr}}{\sqrt{GM}} \quad \text{secs}$$

Where:

GM metacentric height, in m, as defined in *3.1.3*

$r_{roll\text{-}gyr}$ roll radius of gyration, in m, as defined in *3.1.3*

3.2.2.2 The roll angle, θ, is to be taken as:

$$\theta = \frac{50}{B+75}(1.25 - 0.025U_{roll})f_{bk} \quad \text{rads}$$

Where:

f_{bk} 1.2 for ships without bilge keels
1.0 for ships with bilge keels

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

U_{roll} roll period, in secs, as defined in *3.2.2.1*

3.2.3 Pitch motion

3.2.3.1 The characteristic pitch period, U_{pitch}, is to be taken as:

$$U_{pitch} = f_V \sqrt{0.6\frac{2\pi}{g}(1+f_T)L} \quad \text{s}$$

Where:

f_V $= 1.0 + \frac{V_0}{V}\left(\frac{L}{525} - 0.67\right)$

f_T = $\dfrac{T_{LC}}{T_{sc}}$

V_0 vessel speed, in knots, is to be taken as:

0 for scantling requirements and strength assessment

$0.75V$ for fatigue strength

V maximum service speed, in knots, as defined in *Section 4/1.1.8.1*

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{LC} draught in the loading condition being considered, in m

L rule length, in m, as defined in *Section 4/1.1.1.1*

3.2.3.2 The pitch angle, φ, is to be taken as:

$$\varphi = 960\left(\frac{V_1}{C_b}\right)^{0.25}\frac{1}{L}\frac{\pi}{180} \quad \text{radians}$$

Where:

V_1 vessel speed, in knots. Is to be taken as V, but not to be taken as less than 10

V maximum service speed, in knots, as defined in *Section 4/1.1.8.1*

C_b block coefficient, as defined in *Section 4/1.1.9.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

3.3 Ship Accelerations

3.3.1 General

3.3.1.1 The envelope values for combined translatory accelerations due to motion in six degrees of freedom are given. The transverse and longitudinal components of acceleration include the component of gravity due to roll and pitch.

3.3.2 Common acceleration parameter

3.3.2.1 The common acceleration parameter, a_0, is to be taken as:

$$a_0 = (1.58 - 0.47C_b)\left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right)$$

Where:

C_b block coefficient, as defined in *Section 4/1.1.9.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

3.3.3 Vertical acceleration

3.3.3.1 The envelope vertical acceleration, a_v, at any position, is to be taken as:

$$a_v = f_{prob}\sqrt{a_{heave}^2 + a_{pitch-z}^2 + a_{roll-z}^2} \quad \text{m/s}^2$$

Where:

a_{heave} vertical acceleration due to heave, is to be taken as:

$= f_V \, a_0 \, g$ m/s²

$a_{pitch\text{-}z}$ vertical acceleration due to pitch, is to be taken as:

$$= \left(0.3 + \frac{L}{325}\right)\varphi\left(\frac{2\pi}{U_{pitch}}\right)^2 |x - 0.45L| \quad \text{m/s}^2$$

$a_{roll\text{-}z}$ vertical acceleration due to roll, is to be taken as:

$$= 1.2\theta\left(\frac{2\pi}{U_{roll}}\right)^2 |y| \quad \text{m/s}^2$$

a_0 common acceleration parameter, as defined in *3.3.2.1*

g acceleration due to gravity, 9.81m/s²

φ pitch angle, in rads, as defined in *3.2.3.2*

U_{pitch} pitch period, in secs, as defined in *3.2.3.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

θ roll angle, in rads, as defined in *3.2.2.2*

U_{roll} roll period, in secs, as defined in *3.2.2.1*

x longitudinal coordinate, in m

y transverse coordinate, in m

f_{prob} as defined in *3.3.3.2* and *3.3.3.3* as appropriate

f_V as defined in *3.3.3.2* and *3.3.3.3* as appropriate

3.3.3.2 For scantling requirements and strength assessment:

f_{prob} is to be taken as 1.0

f_V is to be taken as 1.0

3.3.3.3 For fatigue strength:

f_{prob} is to be taken as 0.45

f_V $$= \left(\frac{C_{b-LC}}{C_b}\right)^2 \left(1.2 - \frac{L}{1000}\right)$$

Where:

$C_{b\text{-}LC}$ block coefficient for considered loading condition, as defined in *Section 4/1.1.9.2*

C_b block coefficient, as defined in *Section 4/1.1.9.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

3.3.4 Transverse acceleration

3.3.4.1 The envelope transverse acceleration, a_t, at any position, is to be taken as:

$$a_t = f_{prob}\sqrt{a_{sway}^2 + (g\, sin\theta + a_{roll-y})^2} \quad \text{m/s}^2$$

Where:

a_{sway} transverse acceleration due to sway and yaw, is to be taken as:

$= 0.3 g a_0$ m/s²

a_{roll-y} transverse acceleration due to roll, is to be taken as:

$$= \theta \left(\frac{2\pi}{U_{roll}} \right)^2 R_{roll} \quad \text{m/s}^2$$

θ roll angle, in rads, as defined in *3.2.2.2*

U_{roll} roll period, in secs, as defined in *3.2.2.1*

R_{roll} $= z - \left(\frac{D}{4} + \frac{T_{LC}}{2} \right)$ or $z - \left(\frac{D}{2} \right)$, whichever is the greater, in m

g acceleration due to gravity, 9.81m/s²

a_0 common acceleration parameter, as defined in *3.3.2.1*

T_{LC} draught in the loading condition being considered, in m

D moulded depth, as defined in *Section 4/1.1.4.1*

z vertical coordinate, in m

f_{prob} as defined in *3.3.4.2* or *3.3.4.3* as appropriate

3.3.4.2 For scantling requirements and strength assessment:

f_{prob} is to be taken as 1.0

3.3.4.3 For fatigue strength:

f_{prob} is to be taken as 0.5

3.3.5 Longitudinal acceleration

3.3.5.1 The envelope longitudinal acceleration, a_{lng}, at any position, is to be taken as:

$$a_{lng} = 0.7 f_{prob} \sqrt{a_{surge}^2 + \left(\frac{L}{325} \left(g \sin\varphi + a_{pitch-x} \right) \right)^2}$$

Where:

a_{surge} longitudinal acceleration due to surge, is to be taken as:
$= 0.2 g a_0$ m/s²

$a_{pitch-x}$ longitudinal acceleration due to pitch, is to be taken as:
$= f_V \varphi (2\pi / U_{pitch})^2 R_{pitch}$ m/s²

φ pitch angle, in rads, as defined in *3.2.3.2*

U_{pitch} pitch period, in secs, as defined in *3.2.3.1*

R_{pitch} pitch radius and is to be taken as the greater of
$z - \left(\frac{D}{4} + \frac{T_{LC}}{2} \right)$ or $z - \left(\frac{D}{2} \right)$, in m

g acceleration due to gravity, 9.81m/s²

a_0 common acceleration parameter, as defined in *3.3.2.1*

T_{LC} draught in the loading condition being considered, in m

D moulded depth, in m, as defined in *Section 4/1.1.4.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

z vertical coordinate, in m

f_{prob} as defined in *3.3.5.2* and *3.3.5.3* as appropriate

f_V as defined in *3.3.5.2* and *3.3.5.3* as appropriate

3.3.5.2 For scantling requirements and strength assessment:

f_{prob} is to be taken as 1.0

f_V is to be taken as 1.0

3.3.5.3 For fatigue strength:

f_{prob} is to be taken as 0.5

f_V is to be taken as 1.7

3.4 Dynamic Hull Girder Loads

3.4.1 Vertical wave bending moment

3.4.1.1 The envelope hogging and sagging vertical wave bending moments, $M_{wv\text{-}hog}$ and $M_{wv\text{-}sag}$, are to be taken as:

$$\begin{aligned} M_{wv-hog} &= f_{prob}\,0.19 f_{wv-v} C_{wv} L^2 B C_b \\ M_{wv-sag} &= -f_{prob}\,0.11 f_{wv-v} C_{wv} L^2 B (C_b + 0.7) \end{aligned} \quad \text{kNm}$$

Where:

$f_{wv\text{-}v}$ distribution factor for vertical wave bending moment along the vessel length, see *3.4.1.2* or *3.4.1.3* as appropriate

C_{wv} wave coefficient to be taken as:

$= 10.75 - \left(\dfrac{300 - L}{100}\right)^{\frac{3}{2}}$ for $150 \le L \le 300$

$= 10.75$ for $300 < L \le 350$

$= 10.75 - \left(\dfrac{L - 350}{150}\right)^{\frac{3}{2}}$ for $350 < L \le 500$

L rule length, in m, as defined in *Section 4/1.1.1.1*

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

C_b block coefficient, as defined in *Section 4/1.1.9.1*

3.4.1.2 For scantling requirements and strength assessment:

$f_{wv\text{-}v}$ distribution factor for vertical wave bending moment along the vessel length, is to be taken as:

0.0 at A.P.

1.0 for $0.4L$ to $0.65L$ from A.P.

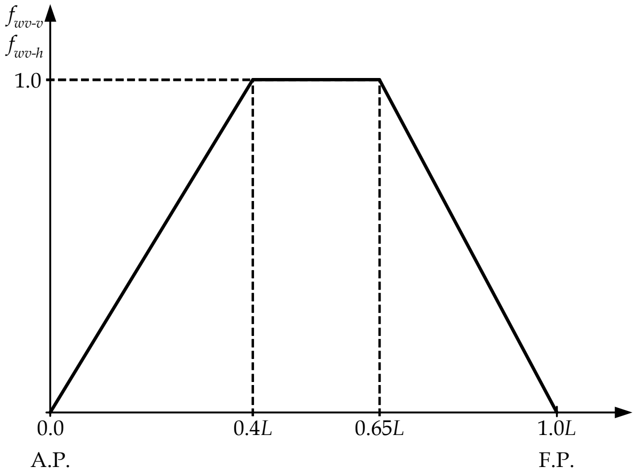
0.0 at F.P.

intermediate values to be obtained by linear interpolation, see *Figure 7.3.1*

f_{prob} is to be taken as 1.0

L rule length, in m, as defined in *Section 4/1.1.1.1*

Figure 7.3.1
Vertical and Horizontal Wave Bending Moment Distribution for Scantling Requirements and Strength Assessment



3.4.1.3 For fatigue strength:

f_{wv-v} distribution factor for vertical wave bending moment along the vessel length, is to be taken as:

0.0 at A.P.

0.1 at 0.1*L* from A.P.

1.0 for 0.4*L* to 0.65*L* from A.P.

0.1 at 0.9*L* from A.P.

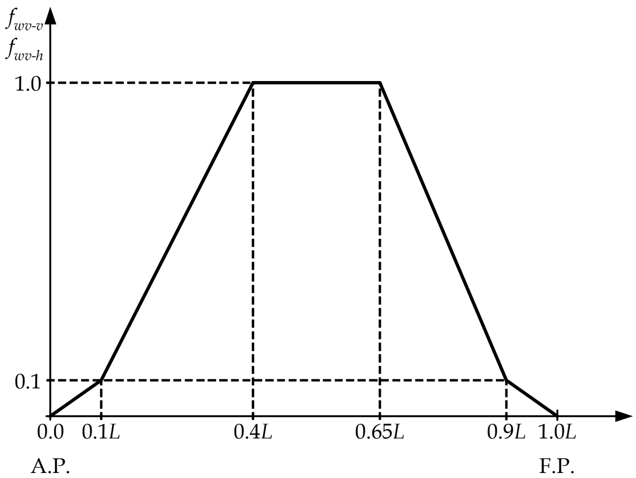
0.0 at F.P.

intermediate values to be obtained by linear interpolation, see *Figure 7.3.2*

f_{prob} is to be taken as 0.5

L rule length, in m, as defined in *Section 4/1.1.1.1*

Figure 7.3.2
Vertical and Horizontal Wave Bending Moment Distribution for Fatigue Strength



3.4.2 Horizontal wave bending moment

3.4.2.1 The envelope horizontal wave bending moment, M_{wv-h}, is to be taken as:

$$M_{wv-h} = f_{prob}(0.3 + \frac{L}{2000})f_{wv-h} C_{wv} L^2 T_{LC} C_b \quad \text{kNm}$$

Where:

f_{wv-h} distribution factor for wave horizontal bending moment along the vessel length, see *3.4.2.2* or *3.4.2.3* as appropriate

C_{wv} wave coefficient, as defined in *3.4.1.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

T_{LC} draught in the loading condition being considered, in m

C_b block coefficient, as defined in *Section 4/1.1.9.1*

3.4.2.2 For scantling requirements and strength assessment:

f_{wv-h} distribution factor for wave horizontal bending moment along the vessel length, is to be taken as:

0.0 at A.P.

1.0 for 0.4L to 0.65L from A.P.

0.0 at F.P.

intermediate values to be obtained by linear interpolation, see *Figure 7.3.1*

f_{prob} is to be taken as 1.0

L rule length, in m, as defined in *Section 4/1.1.1.1*

3.4.2.3 For fatigue strength:

f_{wv-h} distribution factor for wave horizontal bending moment along the vessel length, is to be taken as:

0.0 at A.P.

0.1 at 0.1L from A.P.

1.0 for 0.4L to 0.65L from A.P.

0.1 at 0.9L from A.P.

0.0 at F.P.

intermediate values to be obtained by linear interpolation, see *Figure 7.3.2*

f_{prob} is to be taken as 0.5

L rule length, in m, as defined in *Section 4/1.1.1.1*

3.4.3 Vertical wave shear force

3.4.3.1 The envelope positive and negative vertical wave shear forces, Q_{wv-pos} and Q_{wv-neg}, are to be taken as:

$$\begin{aligned} Q_{wv-pos} &= 0.3 f_{qwv-pos} C_{wv} LB(C_b + 0.7) \\ Q_{wv-neg} &= -0.3 f_{qwv-neg} C_{wv} LB(C_b + 0.7) \end{aligned} \quad \text{kN}$$

Where:

$f_{qwv\text{-}pos}$	distribution factor for positive vertical wave shear force along the vessel length and is to be taken as:	
	0.0	at A.P.
	$1.59\dfrac{C_b}{(C_b+0.7)}$	for 0.2L to 0.3L from A.P.
	0.7	for 0.4L to 0.6L from A.P.
	1.0	for 0.7L to 0.85L from A.P.
	0.0	at F.P.
$f_{qwv\text{-}neg}$	distribution factor for negative vertical wave shear force along the vessel length and is to be taken as:	
	0.0	at A.P.
	0.92	for 0.2L to 0.3L from A.P.
	0.7	for 0.4L to 0.6L from A.P.
	$1.73\dfrac{C_b}{(C_b+0.7)}$	for 0.7L to 0.85L from A.P.
	0.0	at F.P.
	intermediate values of $f_{qwv\text{-}pos}$ and $f_{qwv\text{-}neg}$ are to be obtained by linear interpolation, see *Figure 7.3.3* and *Figure 7.3.4* respectively.	
C_{wv}	wave coefficient, as defined in *3.4.1.1*	
L	rule length, in m, as defined in *Section 4/1.1.1.1*	
B	moulded breadth, in m, as defined in *Section 4/1.1.3.1*	
C_b	block coefficient, as defined in *Section 4/1.1.9.1*

Positive Vertical Wave Shear Force Distribution

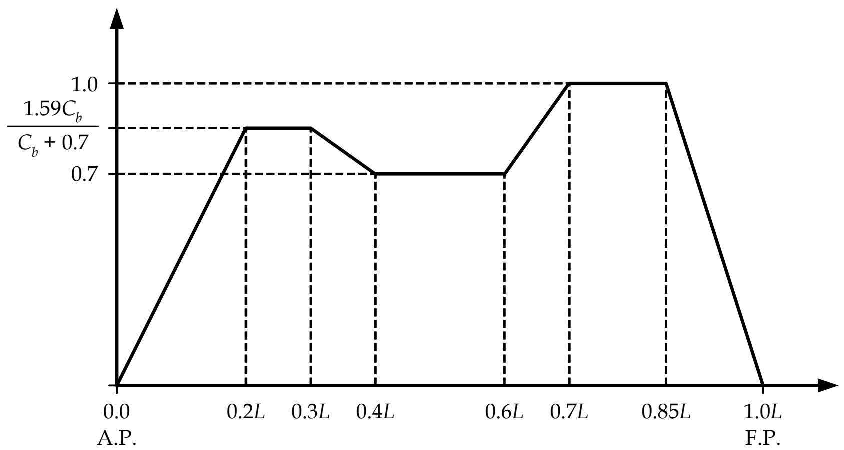

Figure 7.3.4
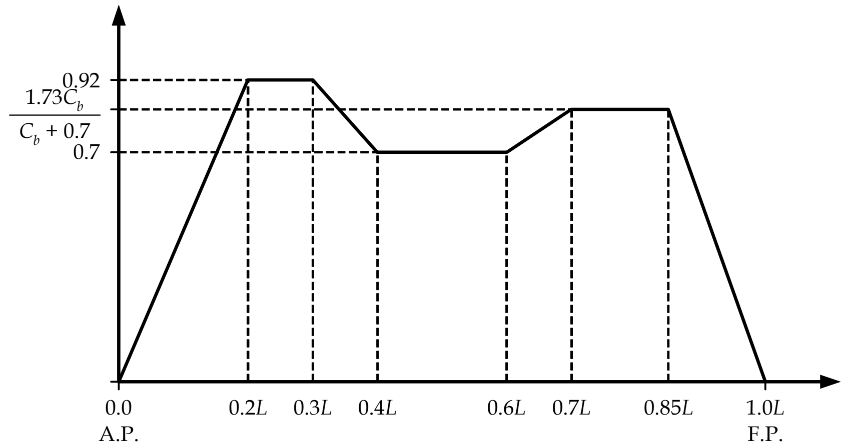
Negative Vertical Wave Shear Force Distribution



3.5 Dynamic Local Loads

3.5.1 General

3.5.1.1 This section provides the envelope values for dynamic wave pressure, dynamic tank pressure, green sea load and dynamic deck loads.

3.5.1.2 The envelope dynamic wave pressures are given in *3.5.2*

3.5.1.3 The envelope green sea load given in *3.5.3* only applies to scantling requirements and strength assessment. The green sea load for fatigue strength is to be taken as 0.

3.5.1.4 The envelope dynamic tank pressure is a combination of the inertial components due to vertical, transverse and longitudinal acceleration. The envelope dynamic tank pressure components are given in *3.5.4*.

3.5.1.5 The envelope dynamic deck loads are given in *3.5.5* and *3.5.6*.

3.5.2 Dynamic wave pressure

3.5.2.1 The envelope dynamic wave pressure, $P_{ex\text{-}dyn}$, is to be taken as the greater of the following:

$$P_1 = 2 f_{prob} f_{nl-P1}\left[\left(P_{11} + \frac{135B_{local}}{4(B+75)} - 1.2(T_{LC} - z)\right)f_1 + \frac{135B_{local}}{4(B+75)} f_2\right] \quad \text{kN/m}^2$$

$$P_2 = 26 f_{prob} f_{nl-P2}\left[\begin{aligned}&\left(\frac{B_{local}}{8}\theta + f_T C_b \frac{0.25B_{local} + 0.8C_{wv}}{14}\left(0.7 + \frac{2z}{T_{LC}}\right)\right)f_1 \\ &+\left(\frac{B_{local}}{8}\theta + f_T C_b \frac{0.25B_{local}}{14}\left(0.7 + \frac{2z}{T_{LC}}\right)\right)f_2\end{aligned}\right] \quad \text{kN/m}^2$$

Where:

B_{local} local breadth at the waterline, for considered draught, not to be taken less than 0.5B, in m

θ roll angle, in rads, as defined in *3.2.2.2*

P_{11} = $(3f_s + 0.8)C_{wv}$

C_{wv} wave coefficient, as defined in *3.4.1.1*

L rule length, in m, as defined in *Section 4/1.1.1.1*

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

T_{LC} draught in the loading condition being considered, in m

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

C_b block coefficient, as defined in *Section 4/1.1.9.1*

f_1 $= f_{lng} - \frac{f_{lng}}{f_V} f_2 + f_2$

f_2 $= 0.25 f_V \left(\frac{4|y|}{B_{local}} - 1 \right)$ for $|y| < 0.25 B_{local}$

$= f_V \left(\frac{4|y|}{B_{local}} - 1 \right)$ for $|y| \geq 0.25 B_{local}$

f_T $= \frac{T_{LC}}{T_{sc}}$

f_s $= C_b + \frac{1.33}{\sqrt{C_b}}$ at, and aft of A.P.

$= C_b$ between 0.2L and 0.7L from A.P.

$= C_b + \frac{1.33}{C_b}$ at, and forward of F.P.

intermediate values to be obtained by linear interpolation

f_{lng} = 1.0 at, and aft of A.P.

= 0.7 for 0.2L to 0.7L from A.P.

= 1.0 at, and forward of F.P.

intermediate values to be obtained by linear interpolation

y transverse coordinate, in m

z vertical coordinate, in m

$f_{nl\text{-}P1}$, $f_{nl\text{-}P2}$, f_{prob}, and f_V are given in *3.5.2.2* for scantling requirements and strength assessment application and in *3.5.2.3* for fatigue strength.

3.5.2.2 For scantling requirements and strength assessment, the envelope maximum dynamic wave pressure, $P_{ex\text{-}max}$, see *Figure 7.3.5,* and minimum dynamic wave pressure, $P_{ex\text{-}min}$, see *Figure 7.3.6*, are to be taken as:

$P_{ex\text{-}max}$ $= P_{ex\text{-}dyn}$ kN/m² below still waterline

$= P_{WL} - 10(z - T_{LC})$ kN/m² for $T_{LC} < z \leq T_{LC} + \frac{P_{WL}}{10}$

$= 0$ kN/m² for $z > T_{LC} + \frac{P_{WL}}{10}$

$P_{ex\text{-}min}$ $= - P_{ex\text{-}dyn}$ kN/m² below still waterline

$= 0$ kN/m² above still waterline

$P_{ex\text{-}min}$ is not to be taken as less than $-\rho_{sw} g (T_{LC} - z)$

Where:

$P_{ex\text{-}dyn}$ envelope dynamic wave pressure, in kN/m², as defined in *3.5.2.1* with:

f_{prob} = 1.0

$f_{nl\text{-}P1}$ = 0.9

$f_{nl\text{-}P2}$ = 0.65

f_V = 1.0

P_{WL} pressure at waterline, to be taken as $P_{ex\text{-}dyn}$ at still waterline, in kN/m²

T_{LC} draught in the loading condition being considered, in m

ρ_{sw} density of sea water, 1.025 tonnes/m³

z vertical coordinate, in m

Figure 7.3.5
Transverse Distribution of Maximum Dynamic Wave Pressure for Scantling Requirements and Strength Assessment

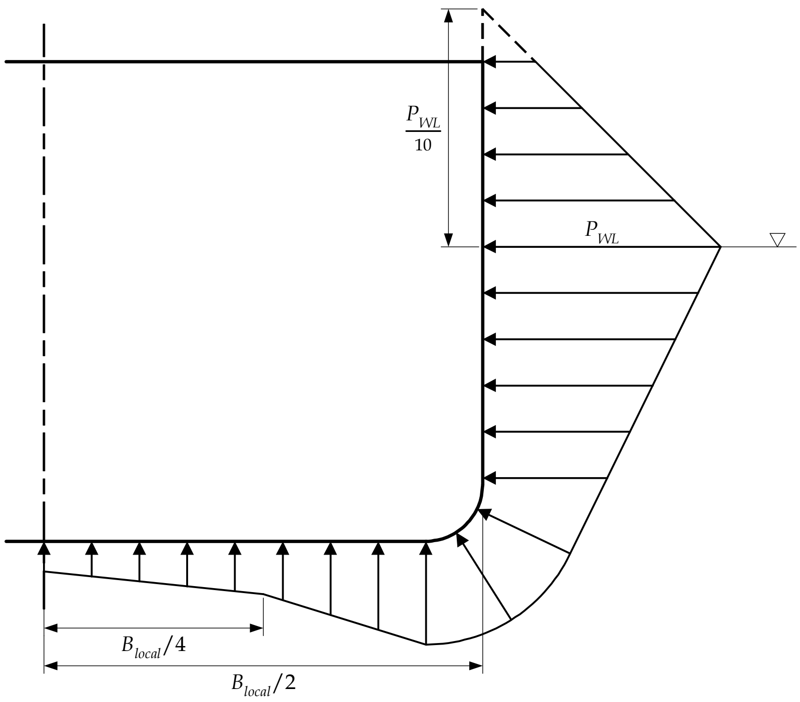


Figure 7.3.6
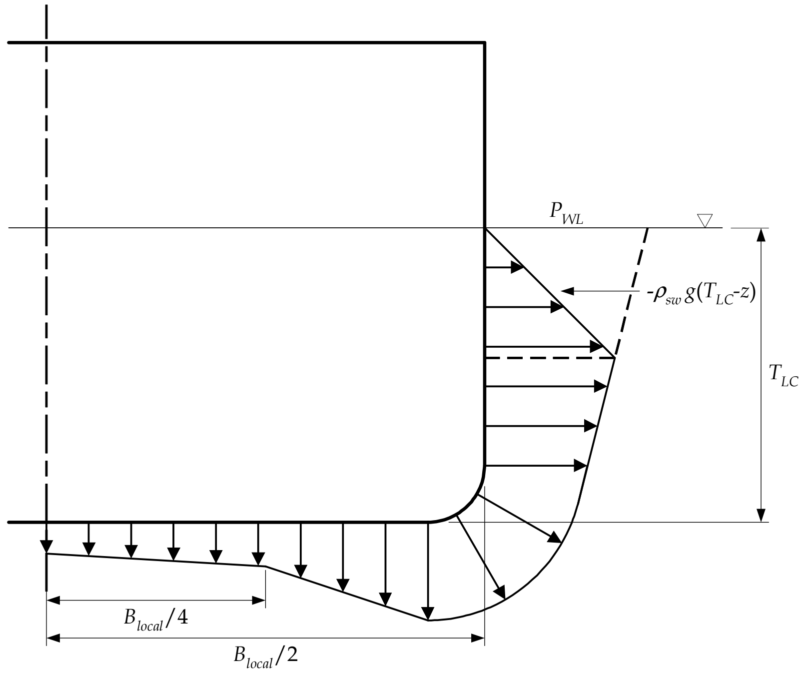
Transverse Distribution of Minimum Dynamic Wave Pressure for Scantling Requirements and Strength Assessment



3.5.2.3 The dynamic wave pressure pseudo-amplitude (half range), $P_{ex\text{-}amp}$, for fatigue strength, see *Figure 7.3.7,* is to be taken as:

$P_{ex\text{-}amp}$ = 0 kN/m^2		for $z \geq T_{LC} + h_{WL}$ or D, whichever is the lesser
	= 0.5 P_{WL} kN/m^2	at still waterline
	= $P_{ex\text{-}dyn}$ kN/m^2	for $z \leq T_{LC} - h_{WL}$ or 0, whichever is the greater

Intermediate values between the still waterline and $z = T_{LC} - h_{WL}$ to be obtained by linear interpolation

Where:

h_{WL} dynamic wave pressure head at the still waterline, is to be taken as:

$= P_{WL}/10$ m

P_{WL} pressure at waterline, and is to be taken as $P_{ex\text{-}max}$ at still waterline, in kN/m^2

$P_{ex\text{-}max}$ envelope maximum dynamic wave pressure is to be taken as the greater of P_1 and P_2, in kN/m^2

T_{LC} draught in the loading condition being considered, in m

D moulded depth, in m, as defined in *Section 4/1.1.4.1*

P_1 as defined in *3.5.2.* , in kN/m^2, with:

f_{prob} = 0.5

$f_{nl\text{-}P1}$ = 1.0

$$f_V = \begin{cases} 1.0 & \text{at, and aft of } 0.7L \\ 1.5 & \text{at, and forward of F.P.} \end{cases}$$

intermediate values of f_V to be obtained by linear interpolation

P_2 as defined in *3.5.2.1*, in kN/m², with:

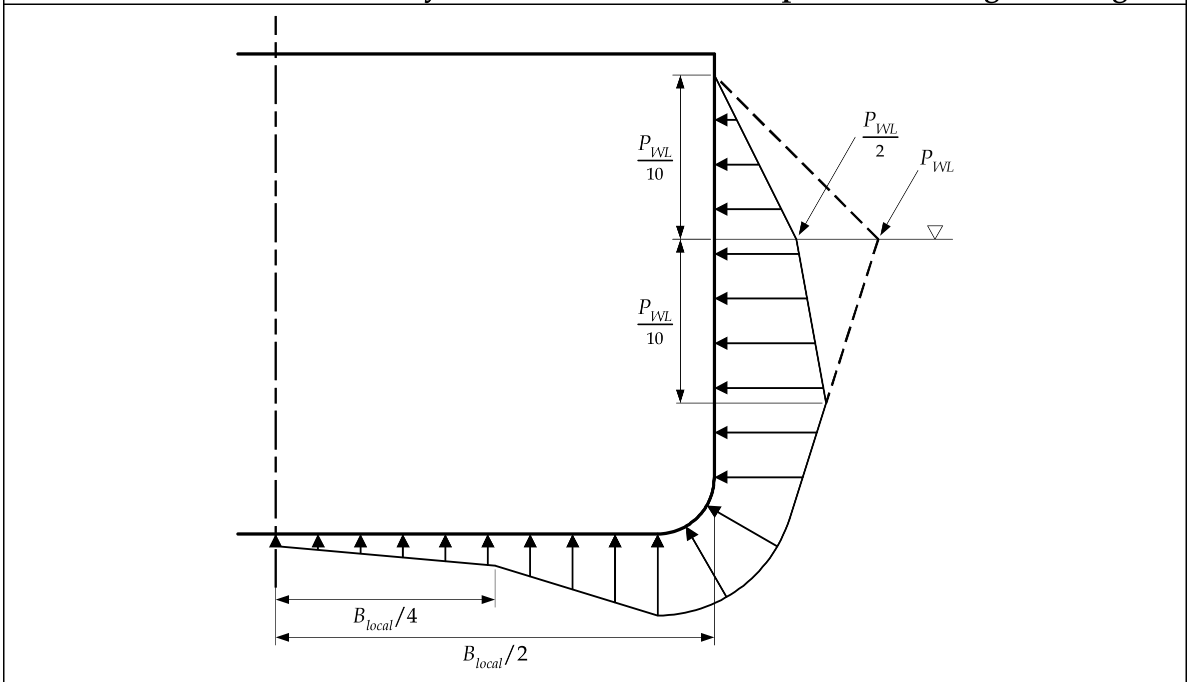
$f_{prob} = 0.5$

$f_{nl\text{-}P2} = 1.0$

$f_V = 1.0$

z vertical coordinate, in m

Figure 7.3.7
Transverse Distribution of Dynamic Wave Pressure Amplitude for Fatigue Strength



3.5.3 Green sea load

3.5.3.1 The envelope green sea load on the weather deck, P_{wdk}, is to be taken as the greater of the following:

$P_{wdk} = f_{1-dk}\left(f_{op} P_{1-WL} - 10 z_{dk-T}\right)$ kN/m²

$P_{wdk} = 0.8 f_{2-dk}\left(P_{2-WL} - 10 z_{dk-T}\right)$ kN/m²

$P_{wdk} = 34.3$ kN/m²

Where:

$f_{1-dk} = 0.8 + \dfrac{L}{750}$

$f_{2-dk} = 0.5 + \dfrac{|y|}{B_{wdk}}$

f_{op} = 1.0 at and forward of 0.2L from A.P.

= 0.8 at and aft of A.P.

intermediate values to be obtained by linear interpolation

$P_{1\text{-}WL}$	P_1 pressure at still waterline for considered draught, in kN/m², see *3.5.2.1*
$P_{2\text{-}WL}$	P_2 pressure at still waterline for considered draught, in kN/m², see *3.5.2.1*
$z_{dk\text{-}T}$	distance from the deck to the still waterline at the applicable draught for the loading condition being considered, in m
B_{wdk}	local breadth at the weather deck, in m
L	rule length, in m, as defined in *Section 4/1.1.1.1*
y	transverse coordinate of load point, in m

3.5.4 Dynamic tank pressure

3.5.4.1 The envelope dynamic tank pressure, $P_{in\text{-}v}$, due to vertical tank acceleration is to be taken as:

$P_{in-v} = \rho a_v (z_0 - z)$ kN/m² for strength assessment and scantling requirements

$P_{in-v} = \rho a_v |z_0 - z|$ kN/m² for fatigue strength

Where:

ρ	density of liquid in the tank, in tonnes/m³, and is not to be taken as less than: 0.9 for cargo tanks for fatigue strength 1.025 otherwise, see *Section 2/3.1.8*
a_v	envelope vertical acceleration, in m/s², as defined in *3.3.3.1,* and is to be taken at tank centre of gravity
z	vertical coordinate of load point, in m
z_0	vertical coordinate of reference point, see *6.3.7* for scantling requirements and strength assessment, and *3.5.4.5* for fatigue strength, in m

3.5.4.2 The envelope dynamic tank pressure, $P_{in\text{-}t}$, due to transverse acceleration is to be taken as:

$P_{in-t} = f_{ull-t} \rho a_t (y_0 - y)$ kN/m² for strength assessment and scantling requirements

$P_{in-t} = \rho a_t |y_0 - y|$ kN/m² for fatigue strength

Where:

ρ	density of liquid in the tank, in tonnes/m³, and is not to be taken as less than: 0.9 for cargo tanks for fatigue strength 1.025 otherwise, see *Section 2/3.1.8*

f_{ull-t} factor to account for ullage in cargo tanks, and is to be taken as:

0.67 for cargo tanks, including cargo tanks designed for filling with water ballast

1.0 for ballast and other tanks

a_t envelope transverse acceleration, in m/s^2, as defined in *3.3.4.1*, and is to be taken at tank centre of gravity

y transverse coordinate of load point, in m

y_0 transverse coordinate of reference point, see *6.3.7* for scantling requirements and strength assessment, and *3.5.4.5* for fatigue strength, in m

3.5.4.3 The envelope dynamic tank pressure, P_{in-lng}, due to longitudinal acceleration is to be taken as:

$P_{in-lng} = f_{ull-lng} \rho a_{lng} (x_0 - x)$ kN/m^2 for strength assessment and scantling requirements

$P_{in-lng} = \rho a_{lng} |x_0 - x|$ kN/m^2 for fatigue strength

Where:

ρ density of tank liquid, in tonnes/m^3, and is not to be taken as less than:

0.9 for cargo tanks for fatigue strength

1.025 otherwise, see *Section 2/3.1.8*

$f_{ull-lng}$ factor to account for ullage in cargo tanks, and is to be taken as:

0.62 for cargo tanks, including cargo tanks designed for filling with water ballast

1.0 for ballast and other tanks

a_{lng} envelope longitudinal acceleration, in m/s^2, as defined in *3.3.5.1,* and is to be taken at tank centre of gravity

x longitudinal coordinate of load point, in m

x_0 longitudinal coordinate of reference point, see *6.3.7* for scantling requirements and strength assessment, and *3.5.4.5* for fatigue strength, in m

3.5.4.4 For scantling requirements and strength assessment the simultaneous acting dynamic tank pressure, P_{in-dyn}, is to be taken as the summation of the components for the considered dynamic load case, see *6.3.7.*

3.5.4.5 For fatigue strength the dynamic tank pressure amplitude, P_{in-amp}, on a tank boundary with adjacent tank empty, is to be taken as:

$$P_{in-amp} = f_v P_{in-v} + f_{ull-t} f_t P_{in-t} + f_{ull-lng} f_{lng} P_{in-lng} \quad \text{kN/m}^2$$

Where:

P_{in-v} envelope dynamic tank pressure due to vertical acceleration, in kN/m^2, as defined in *3.5.4.1*

P_{in-t} envelope dynamic tank pressure due to transverse acceleration, in kN/m^2, as defined in *3.5.4.2*

$P_{in\text{-}lng}$ envelope dynamic tank pressure due to longitudinal acceleration, in kN/m², as defined in *3.5.4.3*

$f_{ull\text{-}t}$ factor to account for ullage in cargo tanks, not to be taken less than 0.0 nor greater than 1.0

$= \dfrac{|z_0 - z| + h_{roll}}{2h_{roll}}$ for cargo tanks

= 1.0 for ballast tanks

$f_{ull\text{-}lng}$ factor to account for ullage in cargo tanks, not to be taken less than 0.0 nor greater than 1.0

$= \dfrac{|z_0 - z| + h_{pitch}}{2h_{pitch}}$ for cargo tanks

= 1.0 for ballast tanks

h_{roll} roll height $= \dfrac{b_{fs} f_{prob} \theta}{2}$

h_{pitch} pitch height $= \dfrac{l_{fs} f_{prob} \varphi}{2}$

f_{prob} is to be taken as 0.5

θ roll angle, in rads, as defined in 3.2.2.2

φ pitch angle, in secs, as defined in *3.2.3.2*

b_{fs} tank breadth at the top of the tank, see *Figure 7.3.8*, in m

l_{fs} tank length at the top of the tank, in m

x_0 longitudinal coordinate of reference point, and is to be taken as the middle of tank length at the top of the tank, in m

y_0 transverse coordinate of reference point, and is to be taken as the middle of tank breadth at the top of the tank, see *Figure 7.3.8*, in m

z_0 vertical coordinate of reference point, and is to be taken as the highest point of the tank, excluding small hatchways, see *Figure 7.3.8*, in m

f_v pressure combination factor, as given in *Table 7.3.2*

f_t pressure combination factor, as given in *Table 7.3.2*

f_{lng} pressure combination factor, as given in *Table 7.3.2*

3.5.4.6 For fatigue strength the dynamic tank pressure amplitude, $P_{in\text{-}amp}$, on a longitudinal tank boundary with adjacent tank full, is to be taken as:

$$P_{in-amp} = f_v |P_{in-v-tk1} - P_{in-v-tk2}| + f_t |f_{ull-t-tk1} P_{in-t-tk1} + f_{ull-t-tk2} P_{in-t-tk2}| + f_{lng} |f_{ull-lng-tk1} P_{in-lng-tk1} - f_{ull-lng-tk2} P_{in-lng-tk2}| \quad \text{kN/m}^2$$

Where:

$P_{in\text{-}v\text{-}tk1}$ dynamic tank pressure due to vertical acceleration in tank 1, in kN/m²

$P_{in\text{-}v\text{-}tk2}$ dynamic tank pressure due to vertical acceleration in tank 2, in kN/m²

$P_{in-t-tk1}$ dynamic tank pressure due to transverse acceleration in tank 1, in kN/m²

$P_{in-t-tk2}$ dynamic tank pressure due to transverse acceleration in tank 2, in kN/m²

$P_{in-lng-tk1}$ dynamic tank pressure due to longitudinal acceleration in tank 1, in kN/m²

$P_{in-lng-tk2}$ dynamic tank pressure due to longitudinal acceleration in tank 2, in kN/m²

$f_{ull-t-tk1}$ factor to account for ullage for tank 1, as defined in *3.5.4.5*

$f_{ull-t-tk2}$ factor to account for ullage for tank 2, as defined in *3.5.4.5*

$f_{ull-lng-tk1}$ factor to account for ullage for tank 1, as defined in *3.5.4.5*

$f_{ull-lng-tk2}$ factor to account for ullage for tank 2, as defined in *3.5.4.5*

f_v pressure combination factor, as given in *Table 7.3.2*

f_t pressure combination factor, as given in *Table 7.3.2*

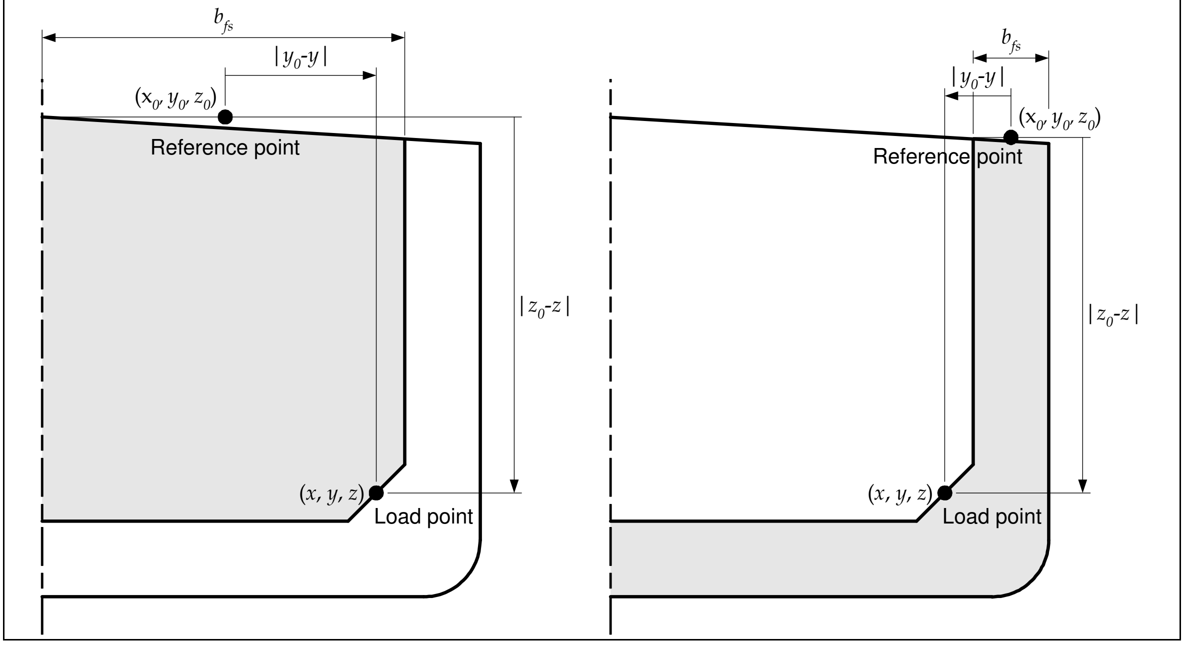
f_{lng} pressure combination factor, as given in *Table 7.3.2*

Tank 1 and 2 are adjacent tanks with common longitudinal boundary

Table 7.3.2
Pressure Combination Factors for Fatigue Assessment

	Cargo tanks	Ballast tanks
f_v	0.9	0.9
f_t	0.9	0.6
f_{lng}	0.4	0.4

Figure 7.3.8
Dynamic Tank Pressure Load and Reference Points for Fatigue Strength



3.5.4.7 For fatigue strength by hot spot stress (FE) approach, the dynamic tank pressure amplitudes due to vertical, transverse and longitudinal accelerations, illustrated in *Figure 7.3.9* are to be taken as:

$$P_{in-v} = \rho a_v (z_0 - z) \quad \text{in kN/m}^2$$

$$P_{in-t} = f_{ull-t} \rho a_t (y_0 - y) \quad \text{in kN/m}^2$$

$$P_{in-lng} = f_{ull-lng} \rho a_{lng} (x_0 - x) \quad \text{in kN/m}^2$$

Where:

ρ density of liquid in the tank, in tonnes/m^3, and is not to be taken as less than:

0.9 for cargo tanks

1.025 otherwise,

see *Section 2/3.1.8*

f_{ull-t} factor to account for ullage in cargo tanks, as defined in *3.5.4.5*

$f_{ull-lng}$ factor to account for ullage in cargo tanks, as defined in *3.5.4.5*

x longitudinal coordinate of load point, in m

y transverse coordinate of load point, in m

z vertical coordinate of load point, in m

x_0 longitudinal coordinate of reference point, and is to be taken as the middle of the tank length at the top of the tank, in m

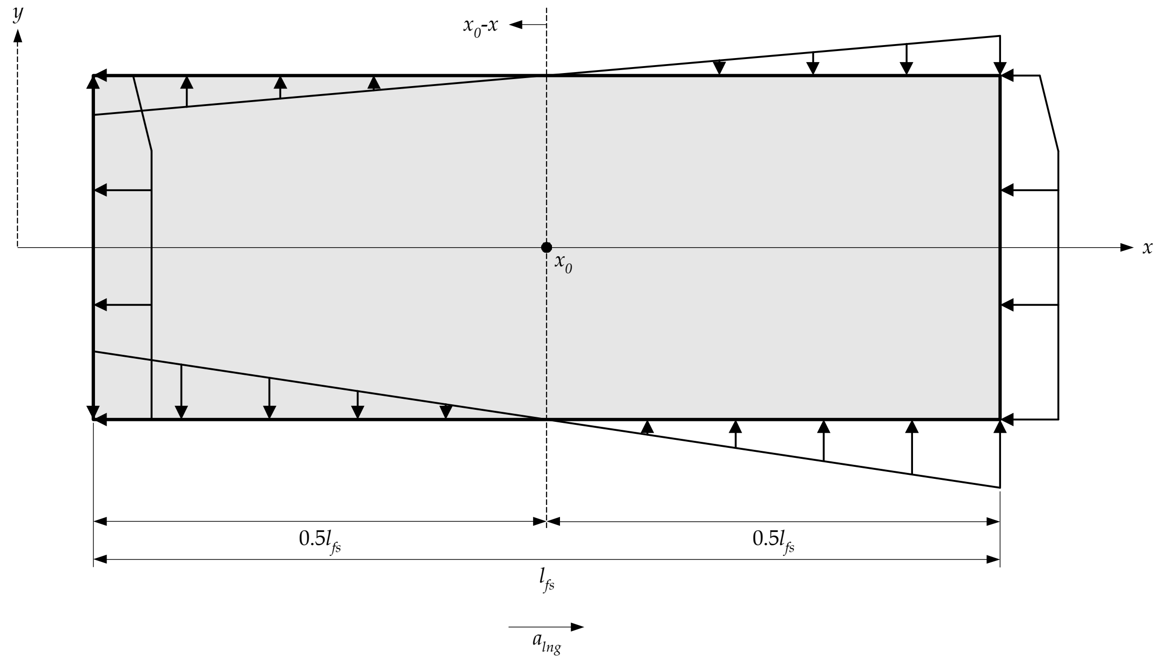
Dynamic Tank Pressure due to Longitudinal Acceleration for Fatigue Strength Illustrated for a Cargo Tank



3.5.5 Dynamic deck pressure from distributed loading

3.5.5.1 The envelope dynamic deck pressure, $P_{deck-dyn}$, on decks, inner bottom and hatch covers is to be taken as:

$$P_{deck-dyn} = P_{deck}\frac{a_v}{g} \quad \text{kN/m}^2$$

Where:

a_v envelope vertical acceleration, in m/s², as defined in *3.3.3.1*

P_{deck} uniformly distributed pressure on lower decks and decks within superstructure, in kN/m², as defined in *2.2.4.1*

g acceleration due to gravity, 9.81 m/s²

3.5.6 Dynamic loads from heavy units

3.5.6.1 The envelope dynamic deck loads, F_v, F_t, F_{lng} acting vertically, transversely and longitudinally on supporting structures and securing systems for heavy units of cargo, equipment or structural components are to be taken as:

$$F_v = m_{un} a_v \quad \text{kN}$$

$$F_t = m_{un} a_t \quad \text{kN}$$

$$F_{lng} = m_{un} a_{lng} \quad \text{kN}$$

Where:

m_{un} mass of unit, in tonnes

a_v envelope vertical acceleration, in m/s², as defined in *3.3.3.1*, at centre of gravity of considered unit

a_t envelope transverse acceleration, in m/s², as defined in *3.3.4.1*,

at centre of gravity of considered unit

a_{lng} envelope longitudinal acceleration, in m/s^2, as defined in *3.3.5.1,* at centre of gravity of considered unit

4 SLOSHING AND IMPACT LOADS

4.1 General

4.1.1 Load Components

4.1.1.1 Sloshing pressures in tanks, and bow impact and bottom slamming pressures are given in this sub-section.

4.2 Sloshing Pressure in Tanks

4.2.1 Application and limitations

4.2.1.1 The sloshing pressures given in *4.2.2* to *4.2.4* are pressures induced by free movement of the tank liquids as a result of ship motions.

4.2.1.2 The given pressures do not include the effect of impact pressures due to high velocity impacts with tank boundaries or internal structures. For tanks with a maximum effective sloshing breadth, b_{slh}, greater than 0.56B or a maximum effective sloshing length, l_{slh}, greater than 0.13L at any filling height from 0.05h_{max} to 0.95h_{max}, an additional impact assessment is to be carried out in accordance with the individual Classification Society procedures. The effective sloshing lengths and breadths, l_{slh} and b_{slh}, are calculated using the equations in *4.2.2.1* and *4.2.3.1* respectively.

4.2.2 Sloshing pressure due to longitudinal liquid motion

4.2.2.1 The sloshing pressure in way of transverse tight and wash bulkheads due to longitudinal liquid motion, $P_{slh-lng}$, for a particular filling height, is to be taken as:

$$P_{slh-lng} = \rho g l_{slh} f_{slh}\left[0.4 - \left(0.39 - \frac{1.7 l_{slh}}{L}\right)\frac{L}{350}\right] \quad \text{kN/m}^2$$

Where:

ρ density of liquid in the tank, in tonnes/m^3, and is not to be taken as less than 1.025

l_{slh} effective sloshing length, at considered filling height as given in *4.2.2.3* and *4.2.2.4* for transverse tight bulkheads and transverse wash bulkheads respectively, in m

f_{slh} $= 1 - 2\left(0.7 - \frac{h_{fill}}{h_{max}}\right)^2$

L rule length, in m, as defined in *Section 4/1.1.1.1*

h_{fill} filling height, measured from inner bottom, in m, see *Figure 7.4.1*

h_{max} maximum tank height excluding small hatchways, measured from inner bottom, in m, see *Figure 7.4.1*

g acceleration due to gravity, 9.81 m/s^2

4.2.2.2 The sloshing pressure due to longitudinal liquid motion, $P_{slh-lng}$, is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling heights from 0.05h_{max} to 0.95h_{max}, in 0.05h_{max} increments.

4.2.2.3 For calculation of sloshing pressures in way of transverse tight bulkheads, the effective sloshing length, l_{slh}, is to be taken as:

$$l_{slh} = \frac{(1 + n_{wash-t}\alpha_{wash-t})(1 + f_{wf}\alpha_{wf})l_{tk-h}}{(1 + n_{wash-t})(1 + f_{wf})} \quad \text{m}$$

Where:

n_{wash-t} number of transverse wash bulkheads in the tank

α_{wash-t} transverse wash bulkhead coefficient,

$$= \frac{A_{opn\text{-}wash\text{-}t}}{A_{tk\text{-}t\text{-}h}}$$

see *Figure 7.4.1*

α_{wf} transverse web frame coefficient,

$$= \frac{A_{opn\text{-}wf\text{-}h}}{A_{tk\text{-}t\text{-}h}}$$

see *Figure 7.4.2*

for tanks with changing shape along the length and/or with web frames of different shape the transverse web frame coefficient, α_{wf}, may be taken as the weighted average of all web frame locations in the tank given as

$$= \frac{\sum_{i=1}^{n} \frac{A_{opn\text{-}wf\text{-}h-i}}{A_{tk\text{-}t\text{-}h-i}}}{n_{wf}}$$

$A_{opn\text{-}wash\text{-}t}$ total area of openings in the transverse section in way of the wash bulkhead below the considered filling height, in m^2

$A_{tk\text{-}t\text{-}h}$ total transverse cross sectional area of the tank below the considered filling height, in m^2

$A_{opn\text{-}wf\text{-}h}$ the total area of openings in the transverse section in way of the web frame below the considered filling height, in m^2

f_{wf} factor to account for number of transverse web frames and transverse wash bulkheads in the tank:

$= n_{wf}/(1 + n_{wash-t})$

n_{wf} number of transverse web frames, excluding wash bulkheads, in the tank

l_{tk-h} length of cargo tank, at considered filling height, in m

Figure 7.4.1
Transverse Wash Bulkhead Coefficient

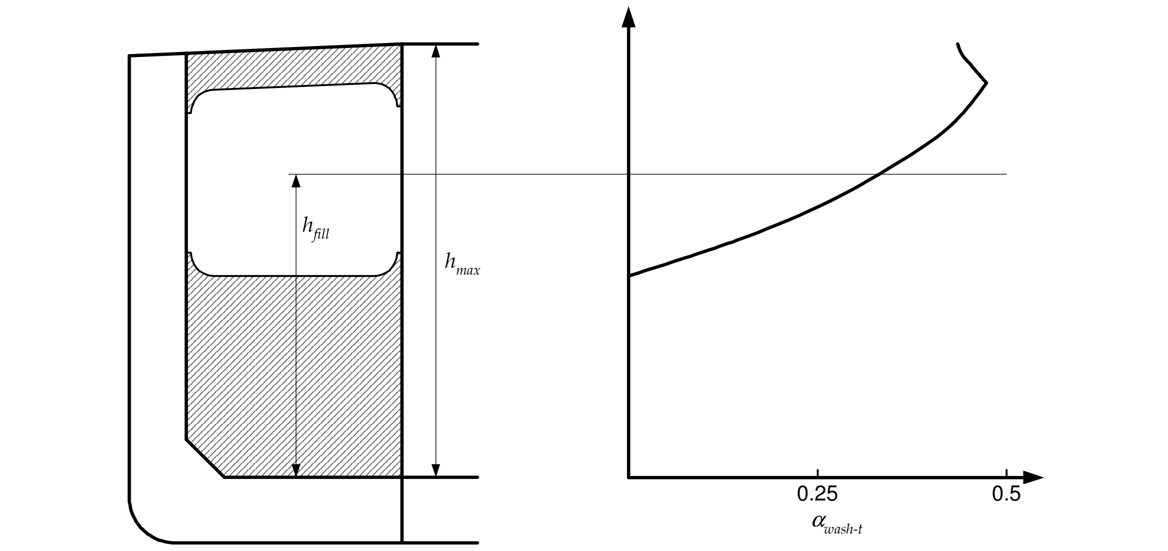


Figure 7.4.2
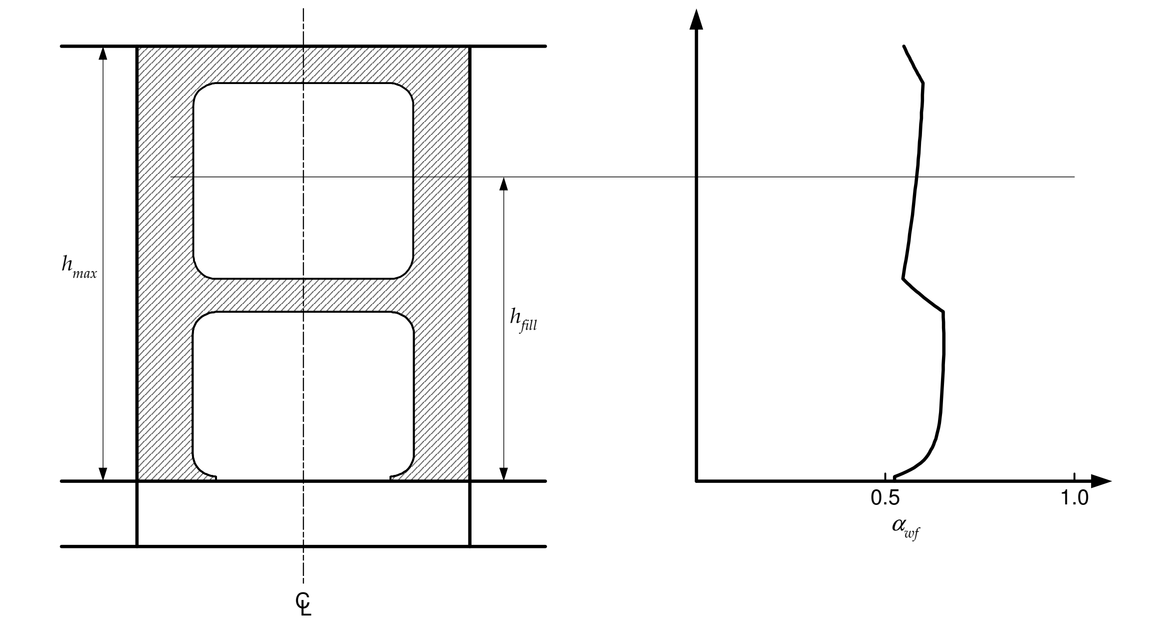
Transverse Web Frame Coefficient



4.2.2.4 For calculation of sloshing pressures in way of transverse wash bulkheads, the effective sloshing length, l_{slh}, is to be taken as:

$$l_{slh} = \frac{[1+(n_{wash-t}-1)\alpha_{wash-t}](1+f_{wf}\alpha_{wf})l_{tk-h}}{(1+n_{wash-t})(1+f_{wf})} \quad \text{m}$$

Where:

n_{wash-t} number of transverse wash bulkheads in the tank

α_{wash-t} transverse wash bulkhead coefficient,

$$= \frac{A_{opn-wash-t}}{A_{tk-t-h}}$$

see *Figure 7.4.1*

α_{wf} transverse web frame coefficient,

$$= \frac{A_{opn\text{-}wf\text{-}h}}{A_{tk\text{-}t\text{-}h}}$$

see *Figure 7.4.2*

for tanks with changing shape along the length and/or with web frames of different shape the transverse web frame coefficient, $\alpha_{wf,}$ may be taken as the weighted average of all web frame locations in the tank given as

$$= \frac{\sum_{i=1}^{n} \frac{A_{opn\text{-}wf\text{-}h-i}}{A_{tk\text{-}t\text{-}h-i}}}{n_{wf}}$$

$A_{opn\text{-}wash\text{-}t}$ the total area of openings in the transverse section in way of the wash bulkhead below the considered filling height, in m²

$A_{tk\text{-}t\text{-}h}$ total transverse cross sectional area of the tank below the considered filling height, in m²

$A_{opn\text{-}wf\text{-}h}$ the total area of openings in the transverse section in way of the web frame below the considered filling height, in m²

f_{wf} factor to account for number of transverse web frames and transverse wash bulkheads in the tank:

$=n_{wf}/(1 + n_{wash\text{-}t})$

n_{wf} number of transverse web frames, excluding wash bulkheads, in the tank

$l_{tk\text{-}h}$ length of cargo tank, at considered filling height, in m

4.2.2.5 For tanks with internal web frames the sloshing pressure acting on a web frame adjacent to a transverse tight or wash bulkhead, $P_{slh\text{-}wf}$, provided it is located within 0.25 l_{slh} from the bulkhead, is to be taken as:

$$P_{slh-wf} = P_{slh-lng}\left(1 - \frac{s_{wf}}{l_{slh}}\right)^2 \quad \text{kN/m}^2$$

Where:

$P_{slh\text{-}lng}$ sloshing pressure acting on bulkhead due to longitudinal liquid motion, as given in *4.2.2.1*

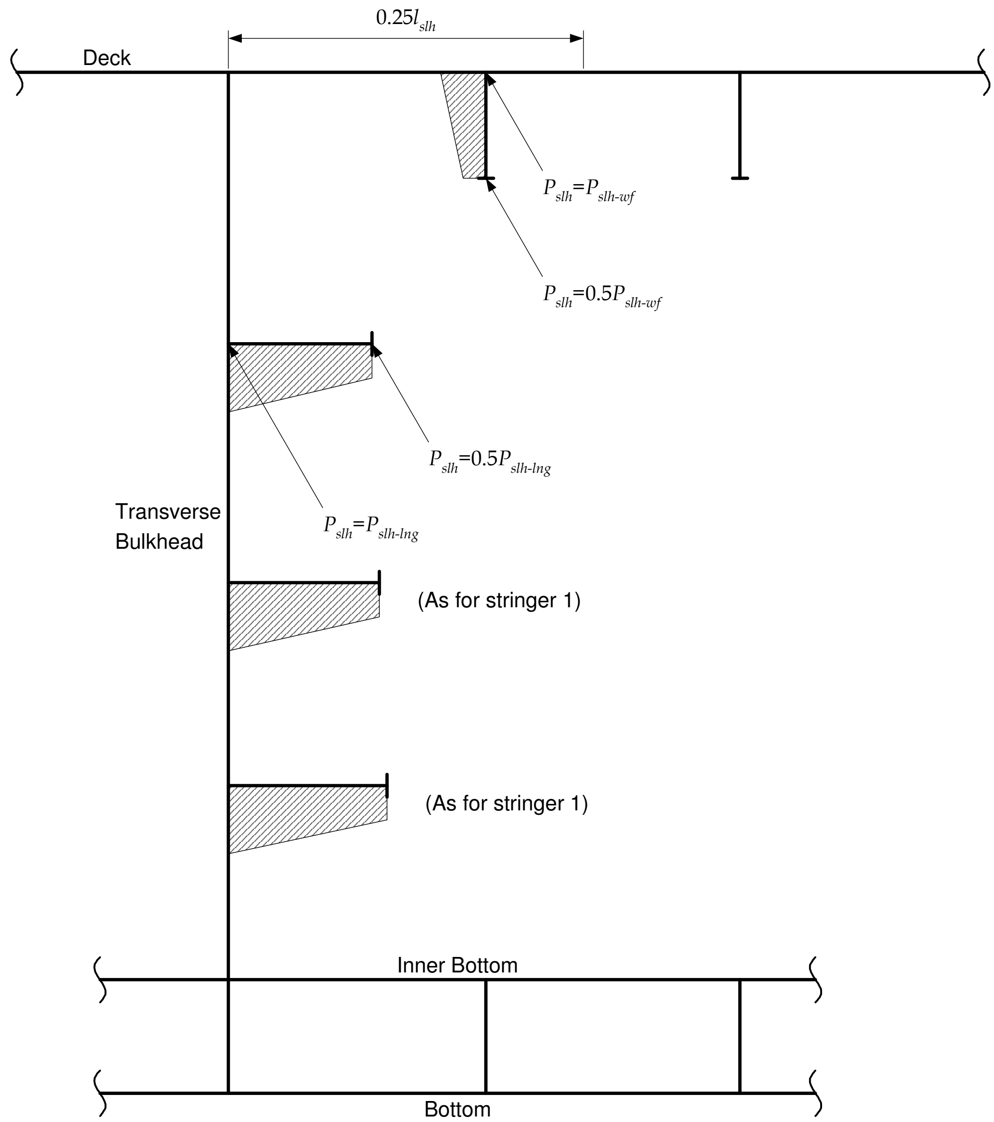
s_{wf} distance from bulkhead to web frame under consideration, in m

l_{slh} effective sloshing length, at considered filling height as defined in *4.2.2.3* and *4.2.2.4* for transverse tight and wash bulkheads respectively, in m

The distribution of pressure across the web frame is given in *Figure 7.4.3.*

4.2.2.6 For tanks with internal bulkhead stringers and/or web frames, the distribution of sloshing pressure, P_{slh}, across these members is shown in *Figure 7.4.3.*

Figure 7.4.3
Sloshing Pressure Distribution on Stringers and Web Frames



4.2.3 Sloshing pressure due to transverse liquid motion

4.2.3.1 The sloshing pressure in way of longitudinal tight and wash bulkheads due to transverse liquid motion, P_{slh-t}, for a particular filling height, is to be taken as:

$$P_{slh-t} = 7\rho g f_{slh}\left(\frac{b_{slh}}{B} - 0.3\right)GM^{0.75} \quad \text{kN/m}^2$$

Where:

ρ density of liquid in the tank, in tonnes/m^3, and is not to be taken as less than 1.025

b_{slh} effective sloshing breadth, see *4.2.3.3* and *4.2.3.4* for longitudinal tight bulkheads and longitudinal wash bulkheads respectively, not to be taken less than $0.3B$, in m.

GM metacentric height, is to be taken as $0.33B$ for calculation of sloshing pressures in ballast tanks and $0.24B$ for calculation of sloshing pressure in cargo tanks

f_{slh} $= 1 - 2\left(0.7 - \dfrac{h_{fill}}{h_{max}}\right)^2$

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

h_{fill} filling height, measured from inner bottom, in m, see *Figure 7.4.1*

h_{max} maximum tank height excluding small hatchways, measured from inner bottom, in m, see *Figure 7.4.1*

g acceleration due to gravity, 9.81m/s²

4.2.3.2 The sloshing pressure due to transverse liquid motion, P_{slh-t}, is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling heights from $0.05h_{max}$ to $0.95h_{max}$, in $0.05h_{max}$ increments.

4.2.3.3 For calculation of sloshing pressures in way of longitudinal tight bulkheads the effective sloshing breadth, b_{slh}, is to be taken as:

$$b_{slh} = \frac{(1 + n_{wash-lng}\alpha_{wash-lng})(1 + f_{grd}\alpha_{grd})b_{tk-h}}{(1 + n_{wash-lng})(1 + f_{grd})} \quad \text{m}$$

Where:

$n_{wash-lng}$ number of longitudinal wash bulkheads in the tank

$\alpha_{wash-lng}$ longitudinal wash bulkhead coefficient

$= \dfrac{A_{opn-wash-lng}}{A_{tk-lng-h}}$

α_{grd} girder coefficient

$= \dfrac{A_{opn-grd-h}}{A_{tk-lng-h}}$

$A_{opn-wash-lng}$ total area of openings in the longitudinal section in way of the wash bulkhead below the considered filling height, in m²

$A_{tk-lng-h}$ total longitudinal cross sectional area of the tank below the considered filling height, in m²

$A_{opn-grd-h}$ total area of openings in the longitudinal section below the considered filling height, in m²

f_{grd} factor to account for longitudinal girders and longitudinal wash bulkheads in the tank:

$= n_{grd}/(1 + n_{wash-lng})$

n_{grd} number of longitudinal girders, excluding longitudinal wash bulkheads, in the tank

b_{tk-h} tank breadth at considered filling height, in m

4.2.3.4 For calculation of sloshing pressures in way of longitudinal wash bulkheads the effective sloshing breadth, b_{slh}, is to be taken as:

$$b_{slh} = \frac{[1 + (n_{wash-lng} - 1)\alpha_{wash-lng}](1 + f_{grd}\alpha_{grd})b_{tk-h}}{(1 + n_{wash-lng})(1 + f_{grd})} \quad \text{m}$$

Where:

$n_{wash-lng}$ number of longitudinal wash bulkheads in the tank

$\alpha_{wash-lng}$ longitudinal wash bulkhead coefficient

$$= \frac{A_{opn-wash-lng}}{A_{tk-lng-h}}$$

α_{grd} girder coefficient

$$= \frac{A_{opn-grd-h}}{A_{tk-lng-h}}$$

$A_{opn-wash-lng}$ total area of openings in the longitudinal section in way of the wash bulkhead below the considered filling height, in m²

$A_{tk-lng-h}$ total longitudinal cross sectional area of the tank below the considered filling height, in m²

$A_{opn-grd-h}$ total area of openings in the longitudinal section below the considered filling height, in m²

f_{grd} factor to account for longitudinal girders and longitudinal wash bulkheads in the tank:

$= n_{grd}/(1 + n_{wash-lng})$

n_{grd} number of longitudinal girders, excluding longitudinal wash bulkheads, in the tank

b_{tk-h} tank breadth at considered filling height, in m

4.2.3.5 For tanks with internal longitudinal girders or webframes, the sloshing pressure on the girder/webframe adjacent to a longitudinal wash bulkhead, $P_{slh-grd}$, provided it is located within $0.25b_{slh}$ from the bulkhead, is to be taken as:

$$P_{slh-grd} = P_{slh-t}\left(1 - \frac{s_{grd}}{b_{slh}}\right)^2 \quad \text{kN/m}^2$$

Where:

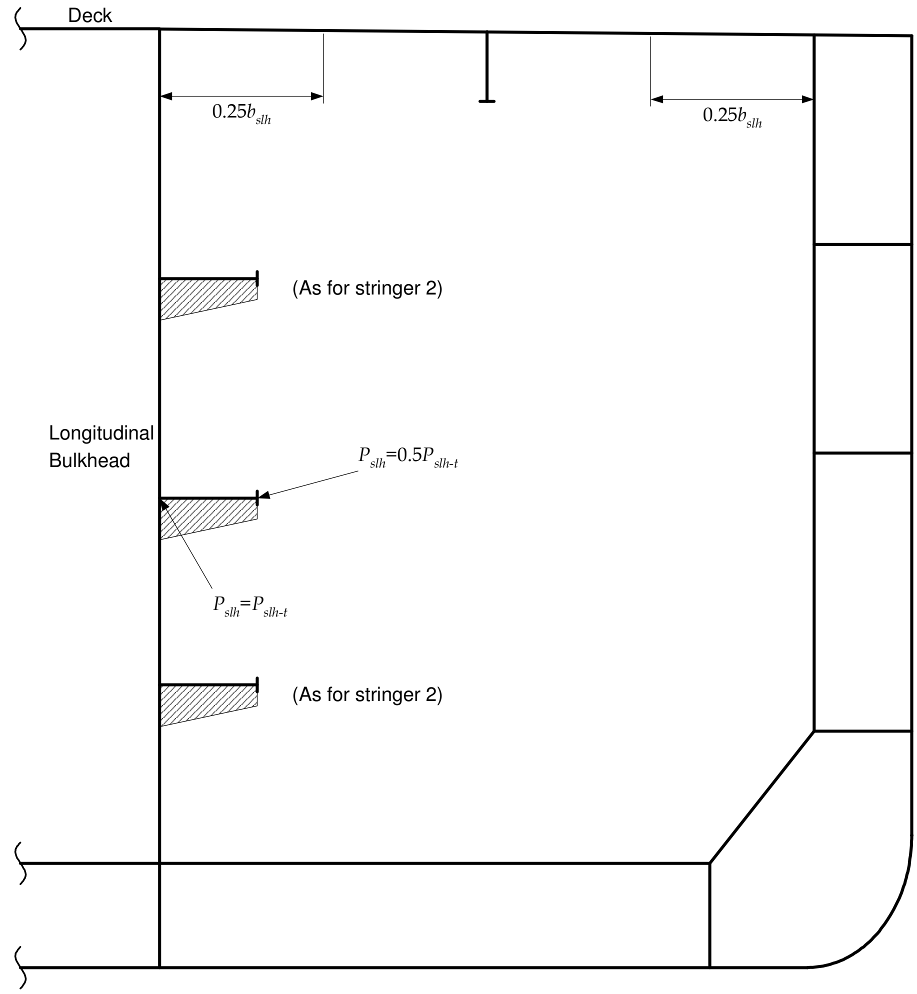
P_{slh-t} sloshing pressure acting on bulkhead due to transverse liquid motion, in kN/m², see *4.2.3.1*

s_{grd} distance from longitudinal bulkhead to longitudinal girder being considered, in m

b_{slh} effective sloshing breadth, see *4.2.3.3* and *4.2.3.4* for longitudinal tight bulkheads and longitudinal wash bulkheads respectively, in m

4.2.3.6 For tanks with internal longitudinal stringers and or girders/webframes, the distribution of sloshing pressure across these members is shown in *Figure 7.4.4*.

Figure 7.4.4
Pressure Distribution on Stringers and Longitudinal Girders



4.2.4 Minimum sloshing pressure

4.2.4.1 The minimum sloshing pressure, $P_{slh\text{-}min}$, in cargo and ballast tanks except tanks of cellular construction is to be taken as 20kN/m^2.

4.2.4.2 The minimum sloshing pressure, $P_{slh\text{-}min}$, in cellular construction ballast tanks is to be taken as 12kN/m^2.

4.3 Bottom Slamming Loads

4.3.1 Application and limitations

4.3.1.1 The slamming loads in this section apply to ships with $C_b \geq 0.7$ and bottom slamming draught $\geq 0.01L$ and $\leq 0.045L$.

4.3.2 Slamming pressure

4.3.2.1 The bottom slamming pressure, P_{slm}, is to be taken as the greater of:

$$P_{slm-mt} = f_{slm}\,130\,g\,c_{slm-mt}\,e^{c_1} \quad \text{kN/m}^2 \quad \text{for empty ballast tanks}$$

$$P_{slm-full} = f_{slm}\,130\,g\,c_{slm-full}\,e^{c_1} - c_{av}\,\rho g z_{ball} \quad \text{kN/m}^2 \quad \text{for full ballast tanks}$$

Where:

g	acceleration due to gravity, 9.81 m/s^2
f_{slm}	longitudinal slamming distribution factor, see *Figure 7.4.5*, is to be taken as: 0 at 0.5L 1 at $[0.175 - 0.5(C_{bl} - 0.7)]L$ from F.P. 1 at $[0.1 - 0.5(C_{bl} - 0.7)]L$ from F.P. 0.5 at, and forward of F.P. intermediate values to be obtained by linear interpolation.
C_{bl}	block coefficient, C_b, as defined in *Section 4/1.1.9.1*, but not to be taken less than 0.7 or greater than 0.8
$c_{slm\text{-}mt}$	slamming coefficient for empty ballast tanks $= 5.95 - 10.5\left(\frac{T_{FP-mt}}{L}\right)^{0.2}$
$c_{slm\text{-}full}$	slamming coefficient for full ballast tanks $= 5.95 - 10.5\left(\frac{T_{FP-full}}{L}\right)^{0.2}$
c_1	is to be taken as: 0 for $L \leq 180$m $= -0.0125(L-180)^{0.705}$ for $L > 180$m
$T_{FP\text{-}mt}$	design slamming ballast draught at F.P. with ballast tanks within the bottom slamming region empty as defined in *4.3.2.3,* in m
$T_{FP\text{-}full}$	design slamming ballast draught at F.P. with ballast tanks within the bottom slamming region full as defined in *4.3.2.4,* in m
c_{av}	dynamic load coefficient, to be taken as 1.25
L	rule length, in m, as defined in *Section 4/1.1.1.1*
z_{ball}	vertical distance from tank top to load point, in m

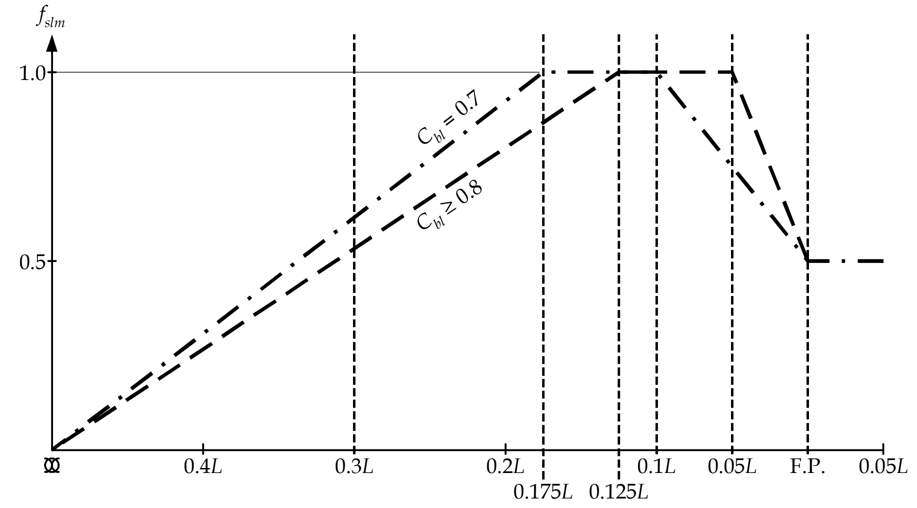
4.3.2.2 The designer is to provide the design slamming draughts $T_{FP\text{-}mt}$ and $T_{FP\text{-}full}$.

4.3.2.3 The design slamming draught at the F.P., $T_{FP\text{-}mt}$, is not to be greater than the minimum draught at the F.P. indicated in the loading manual for all seagoing conditions wherein the ballast tanks within the bottom slamming region are empty. This includes any loading conditions with tanks inside the bottom slamming region that use the "sequential" ballast water exchange method.

4.3.2.4 The design slamming draught at the F.P., $T_{FP\text{-}full}$, is not to be greater than the minimum draught at the F.P. indicated in the loading manual for any seagoing conditions wherein the ballast tanks within the bottom slamming region are full. This includes any loading condition with tanks inside the bottom slamming region that use the "flow-through" ballast water exchange method.

4.3.2.5 The loading guidance information is to clearly indicate the design slamming draughts and the ballast water exchange method used for each ballast tank, see *Section 8/1.1*.

Figure 7.4.5
Longitudinal Distribution of Slamming Pressure



4.4 Bow Impact Loads

4.4.1 Application and limitations

4.4.1.1 The bow impact pressure applies to the side structure in the area forward of 0.1L aft of F.P. and between the waterline at draught T_{bal} and the highest deck at side.

4.4.2 Bow impact pressure

4.4.2.1 The bow impact pressure, P_{im}, is to be taken as:

$$P_{im} = 1.025 f_{im} c_{im} V_{im}^2 \sin \gamma_{wl} \quad \text{kN/m}^2$$

Where:

f_{im} 0.55 at 0.1L aft of F.P.
0.9 at 0.0125L aft of F.P.
1.0 at and forward of F.P.
intermediate values to be obtained by linear interpolation

V_{im} impact speed, in m/s
$= 0.514 V_{fwd} \sin \alpha_{wl} + \sqrt{L}$

V_{fwd} forward speed, in knots
= 0.75V but is not to be taken as less than 10

V service speed, in knots, as defined in *Section 4/1.1.8.1*

α_{wl} local waterline angle at the position considered, but is not to be taken as less than 35 degrees, see *Figure 7.4.6*.

γ_{wl} local bow impact angle measured normal to the shell from the horizontal to the tangent line at the position considered but is not to be less than 50 degrees, see *Figure 7.4.6*.

c_{im}	1.0	for positions between draughts T_{bal} and T_{sc}
	$= \sqrt{1+\cos^2[90\frac{(h_{fb}-2h_o)}{h_{fb}}]}$	for positions above draught T_{sc}

h_{fb} vertical distance from the waterline at draught T_{sc} to the highest deck at side, see *Figure 7.4.6,* in m

h_o vertical distance from the waterline at draught T_{sc}, to the position considered, see *Figure 7.4.6*, in m

L rule length, in m, as defined in *Section 4/1.1.1.1*

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{bal} minimum design ballast draught, in m, for the normal ballast condition as defined in *Section 4/1.1.5.2*

WL_j waterline at the position considered, see *Figure 7.4.6*

Guidance Note

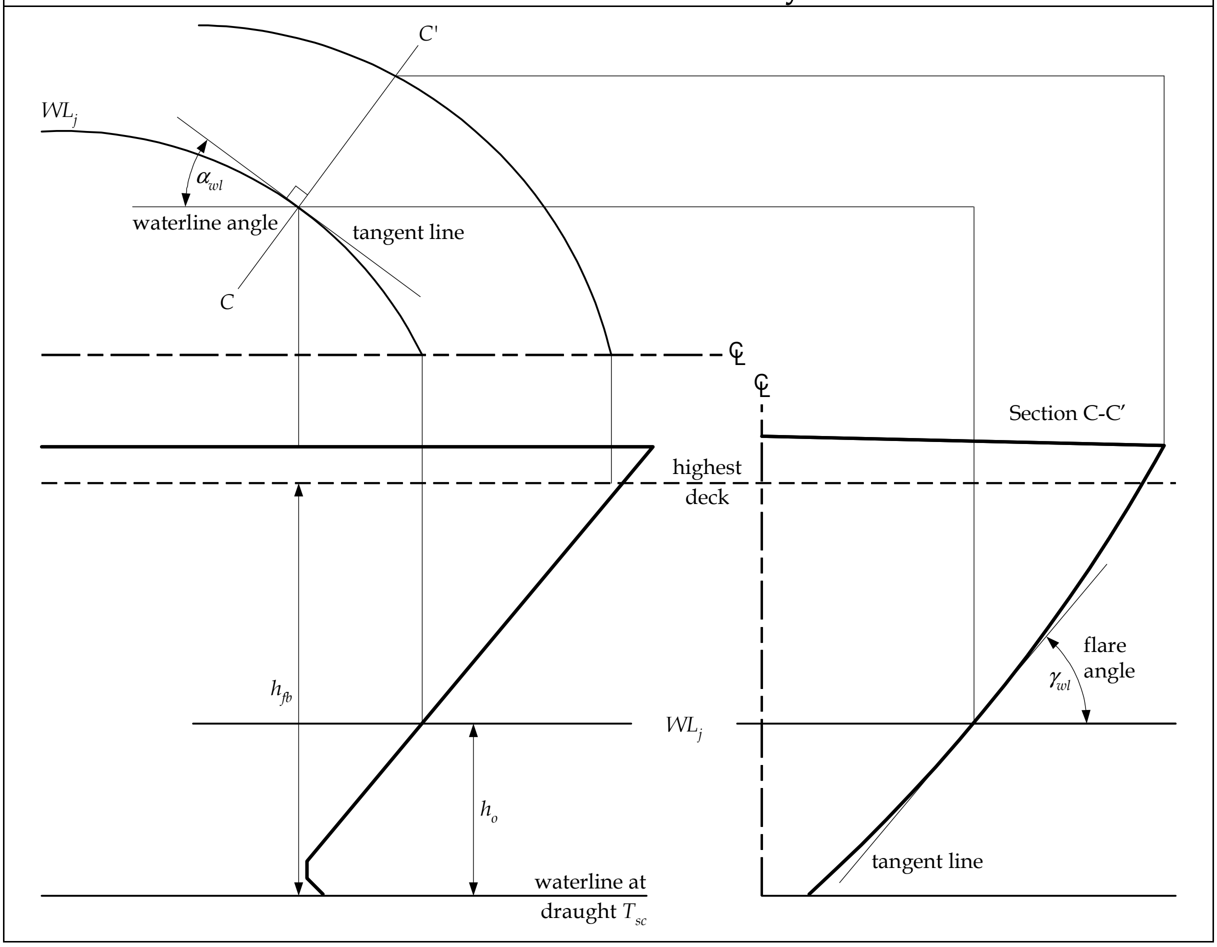
Where local bow impact angle measured normal to the shell, γ_{wl}, is not available, this angle may be taken as:

γ_{wl} $= \tan^{-1}\left(\frac{\tan\beta_{pl}}{\cos\alpha_{wl}}\right)$

Where

β_{pl} local body plan angle at the position considered from the horizontal to the tangent line, but is not to be less than 35 degrees

Figure 7.4.6
Definition of Bow Geometry



5 ACCIDENTAL LOADS

5.1 Flooded Condition

5.1.1 Local Pressure

5.1.1.1 The pressure in compartments and tanks in flooded condition or damaged condition is to be taken as $P_{in-flood}$, see *2.2.3.4.*

6 COMBINATION OF LOADS

6.1 General

6.1.1 Application

6.1.1.1 The design load combinations *S*, *S + D*, and *A* are to be used for scantling calculations for the scantling requirements and strength assessment (by FEM). design load combinations are defined in *Section 2/4.2.2* and the relevant loads and load combination are to be taken as given in *6.2*.

6.1.1.2 The dynamic loads, *D*, consist of several dynamic load cases. For each dynamic load case, the envelope load values as given in *Sub-Section 3* are multiplied with dynamic load combination factors to give simultaneously acting dynamic loads. The procedures for calculating the simultaneously acting dynamic loads are given in *6.3*. The dynamic load combination factors are given in *6.4* for strength assessment (by FEM) and in *6.5* for scantling requirements.

6.2 Design Load Combination

6.2.1 General

6.2.1.1 The design load combinations are given in *Table 7.6.1*.

RCN 1 to July 2010 version (effective from 1 July 2012)

Table 7.6.1 (Continued)
Design Load Combinations

Note:

1. Separate load requirements may be specified in strength assessment (FEM) and scantling requirements.

Where:

$M_{v\text{-}total}$	design vertical bending moment, in kNm	
$M_{sw\text{-}perm\text{-}harb}$	permissible hull girder hogging and sagging still water bending moment envelopes for harbour/sheltered water operation, in kNm	see *2.1.1*
$M_{sw\text{-}perm\text{-}sea}$	permissible hull girder hogging and sagging still water bending moment envelopes for seagoing operation, in kNm	see *2.1.1*
M_{wv}	vertical wave bending moment for a considered dynamic load case, in kNm	see *6.3.2.1*
$M_{h\text{-}total}$	design horizontal bending moment, in kNm	
M_h	horizontal wave bending moment for a considered dynamic load case, in kNm	see *6.3.3.1*
Q	design vertical shear force, in kN	
$Q_{sw\text{-}perm\text{-}harb}$	permissible hull girder positive and negative still water shear force limits for harbour/sheltered water operation, in kN	see *2.1.3*
$Q_{sw\text{-}perm\text{-}sea}$	permissible hull girder positive and negative still water shear force limits for seagoing operation, in kN	see *2.1.3*
Q_{wv}	vertical wave shear force for a considered dynamic load case, in kN	see *6.3.4.1*
P_{ex}	design sea pressure, in kN/m²	
P_{hys}	static sea pressure at considered draught, in kN/m²	see *2.2.2.1*
$P_{wv\text{-}dyn}$	dynamic wave pressure for a considered dynamic load case, in kN/m²	see *6.3.5*
$P_{wdk\text{-}dyn}$	green sea load for a considered dynamic load case, in kN/m²	see *6.3.6*
P_{in}	design tank pressure, in kN/m²	
$P_{in\text{-}test}$	tank testing pressure, in kN/m²	see *2.2.3.5*
$P_{in\text{-}air}$	static tank pressure in the case of overfilling or filling during flow through ballast water exchange, in kN/m²	see *2.2.3.2*
P_{drop}	added overpressure due to liquid flow through air pipe or overflow pipe, in kN/m²	see *2.2.3.3*
P_{valve}	setting of pressure relief valve, in kN/m²	see *2.2.3.5*
$P_{in\text{-}tk}$	static tank pressure, in kN/m²	see *2.2.3.1*
$P_{in\text{-}dyn}$	dynamic tank pressure for a considered dynamic load case, in kN/m²	see *6.3.7*
$P_{in\text{-}flood}$	pressure in compartments and tanks in flooded or damaged condition, in kN/m²	see *2.2.3.4*
P_{stat}	static pressure on decks and inner bottom, in kN/m²	see *2.2.4.1*
P_{dk}	design deck pressure, in kN/m²	
$P_{dk\text{-}dyn}$	dynamic deck pressure on decks, inner bottom and hatch covers for a considered dynamic load case, in kN/m²	see *6.3.8.1*
F_{stat}	load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, in kN	see *2.2.5.1*
$F_{dk\text{-}dyn}$	dynamic load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, in kN	see *6.3.8.2*

6.3 Application of Dynamic Loads

6.3.1 Heading correction factor and dynamic load combination factors

6.3.1.1 The heading correction factor, f_β, is to be taken as:

f_β = 0.8 for beam sea dynamic load cases

= 1.0 for all other dynamic load cases

6.3.1.2 The dynamic load combination factors used for the calculations of the simultaneously acting dynamic loads, are to be taken as given in *Table 7.6.2* for strength assessment by FEM, see *6.4*. Dynamic load factors are to be taken as given in *Table 7.6.4* to *Table 7.6.9* for scantling assessment, see *6.5*.

6.3.2 Vertical wave bending moment for a considered dynamic load case

6.3.2.1 The simultaneously acting vertical wave bending moment, M_{wv}, is to be taken as:

$$M_{wv} = f_\beta f_{mv} M_{wv-hog} \quad \text{kNm} \qquad \text{for } f_{mv} \geq 0$$

$$M_{wv} = -f_\beta f_{mv} M_{wv-sag} \quad \text{kNm} \qquad \text{for } f_{mv} < 0$$

Where:

M_{wv-hog} hogging vertical wave bending moment, in kNm, as defined in *3.4.1.1*

M_{wv-sag} sagging vertical wave bending moment, in kNm, as defined in *3.4.1.1*

f_{mv} dynamic load combination factor for vertical wave bending moment for considered dynamic load case, see *6.3.1.2*

f_β heading correction factor, as defined in *6.3.1.1*

6.3.3 Horizontal wave bending moment for a considered dynamic load case

6.3.3.1 The simultaneously acting horizontal wave bending moment, M_h, is to be taken as:

$$M_h = f_\beta f_{mh} M_{wv-h} \quad \text{kNm}$$

Where:

M_{wv-h} horizontal wave bending moment, in kNm, as defined in *3.4.2*

f_{mh} dynamic load combination factor for horizontal wave bending moment for considered dynamic load case, see *6.3.1.2*

f_β heading correction factor, as defined in *6.3.1.1*

6.3.4 Vertical wave shear force for a considered dynamic load case

6.3.4.1 The simultaneously acting vertical wave shear force, Q_{wv}, is to be taken as:

$$Q_{wv} = f_\beta f_{qv} Q_{wv-pos} \quad \text{kN} \qquad \text{for } f_{qv} \geq 0$$

$$Q_{wv} = -f_\beta f_{qv} Q_{wv-neg} \quad \text{kN} \qquad \text{for } f_{qv} < 0$$

Where:

Q_{wv-pos} envelope positive vertical wave shear force, in kN, as defined in *3.4.3*

Q_{wv-neg} envelope negative vertical wave shear force, in kN, as defined in *3.4.3*

f_{qv} dynamic load combination factor for vertical wave shear force for considered dynamic load case, see *6.3.1.2*

f_β heading correction factor, as defined in *6.3.1.1*

6.3.5 Dynamic wave pressure distribution for a considered dynamic load case

6.3.5.1 The simultaneously acting dynamic wave pressure, $P_{wv\text{-}dyn}$, for the port and starboard side within the cargo tank region for a considered dynamic load case is to be taken as follows, but not to be less than $-\rho_{sw} g(T_{LC} - z)$ below still waterline or less than 0 above still waterline:

$$P_{wv-dyn} = P_{ctr} + \frac{|y|}{0.5B_{local}}\left(P_{bilge} - P_{ctr}\right)$$ between centreline and start of bilge

$$P_{wv-dyn} = P_{bilge} + \frac{z}{T_{LC}}\left(P_{WL} - P_{bilge}\right)$$ between end of bilge and still waterline

$$P_{wv-dyn} = P_{WL} - 10(z - T_{LC})$$ for side-shell above still waterline

intermediate values of $P_{wv\text{-}dyn}$ around the bilge are to be obtained by linear interpolation along the vertical distance

Where:

P_{ctr} dynamic wave pressure at bottom centreline, to be taken as:
$= f_{ctr} P_{ex-max}$ kN/m²

P_{bilge} dynamic wave pressure at z = 0 and $y = B_{local}/2$, to be taken as:
$= f_{bilge} P_{ex-max}$ kN/m²

P_{WL} dynamic wave pressure at waterline, to be taken as:
$= f_{WL} P_{ex-max}$ kN/m²

$P_{ex\text{-}max}$ envelope maximum dynamic wave pressure, in kN/m², as defined in *3.5.2.2*

f_{WL} dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see *6.3.1.2*

f_{bilge} dynamic load combination factor for dynamic wave pressure at bilge for considered dynamic load case, see *6.3.1.2*

f_{ctr} dynamic load combination factor for dynamic wave pressure at centreline for considered dynamic load case, see *6.3.1.2*

B_{local} local breadth at waterline for considered draught , in m

T_{LC} draught in the loading condition being considered, in m

y transverse coordinate, in m

z vertical coordinate, in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

6.3.5.2 The simultaneously acting dynamic wave pressure for the port and starboard side outside the cargo region, $P_{wv\text{-}dyn}$, for a considered dynamic load case is to be obtained by linear interpolation between P_{ctr} and P_{WL}, but not to be taken less than $-\rho_{sw} g(T_{LC} - z)$ below still waterline or less than 0 above still waterline.

$$P_{wv-dyn} = P_{ctr} + \frac{z}{T_{LC}}\left(P_{WL} - P_{ctr}\right)$$ between bottom centreline and still waterline

$$P_{wv-dyn} = P_{WL} - 10(z - T_{LC})$$ above still waterline

Where:

P_{ctr}	dynamic wave pressure at bottom centreline, and is to be taken as: $f_{ctr} P_{ex-\max}$ kN/m^2
P_{WL}	dynamic wave pressure at still waterline, and is to be taken as: $f_{WL} P_{ex-\max}$ kN/m^2
P_{ex-max}	envelope maximum dynamic wave pressure, in kN/m^2, as defined in *3.5.2.2*
f_{WL}	dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see *6.3.1.2*
f_{ctr}	dynamic load combination factor for dynamic wave pressure at centreline for considered dynamic load case, see *6.3.1.2*
T_{LC}	draught in the loading condition being considered, in m
z	vertical coordinate, in m
ρ_{sw}	density of sea water, 1.025tonnes/m^3
g	acceleration due to gravity, 9.81m/s^2

6.3.5.3 *Figure 7.6.1* to *Figure 7.6.3* illustrates simultaneously acting dynamic wave pressures.

Figure 7.6.1
Dynamic Wave Pressure for Head Sea Dynamic Load Cases

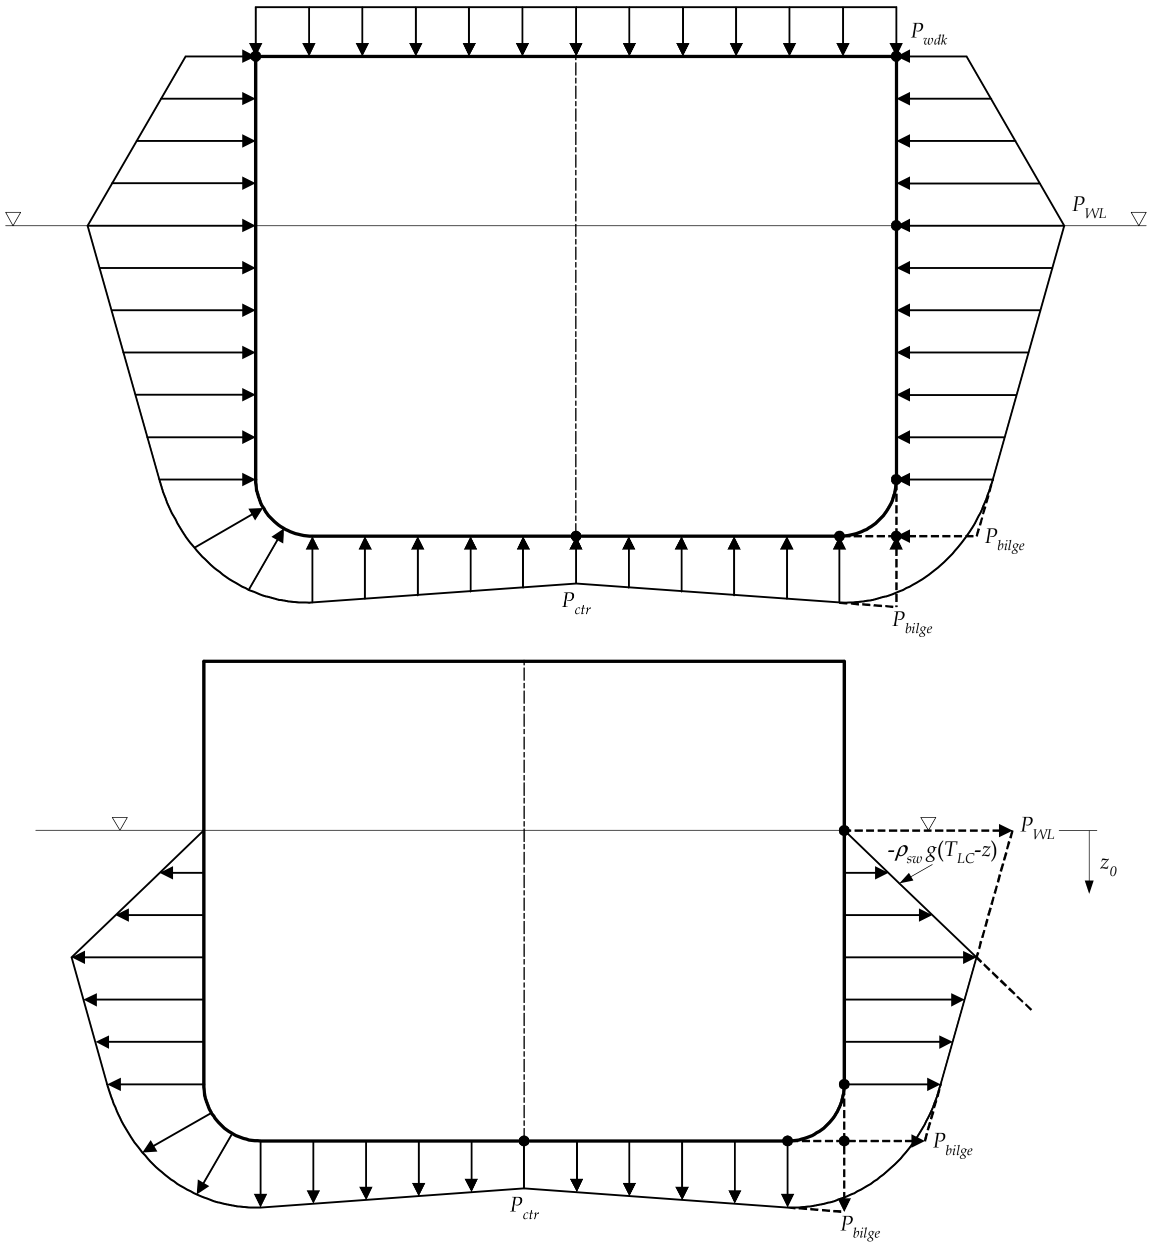

Figure 7.6.2
Dynamic Wave Pressure for Beam and Oblique Sea Dynamic Load Cases

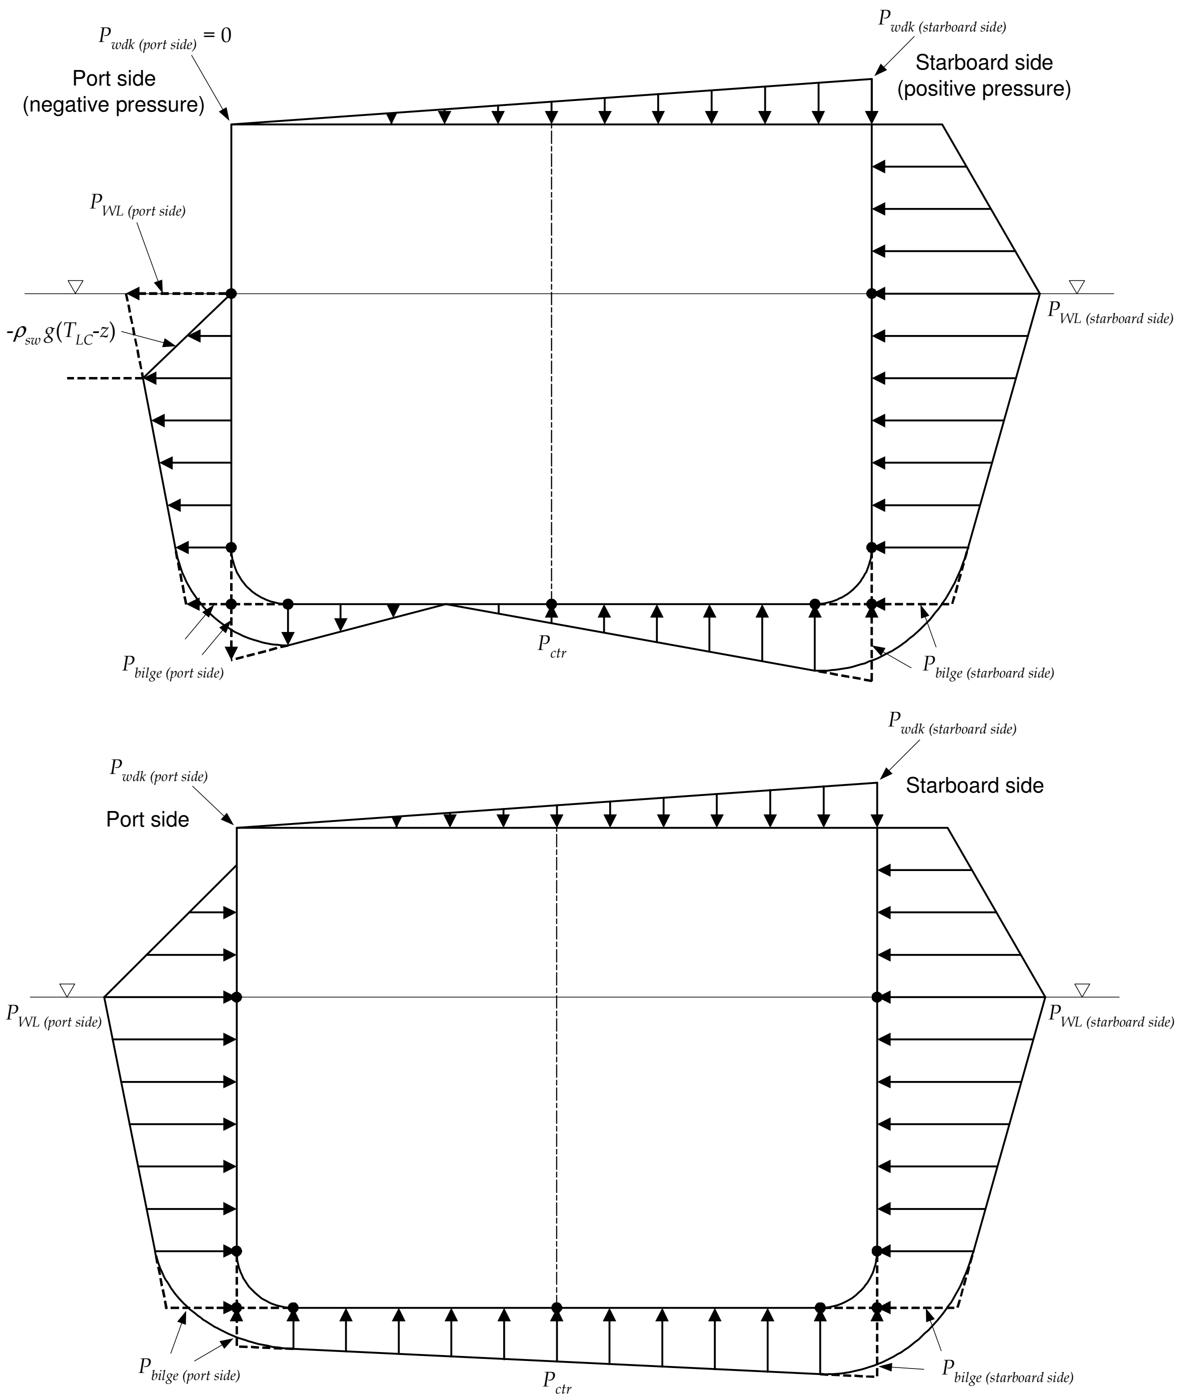

Figure 7.6.3
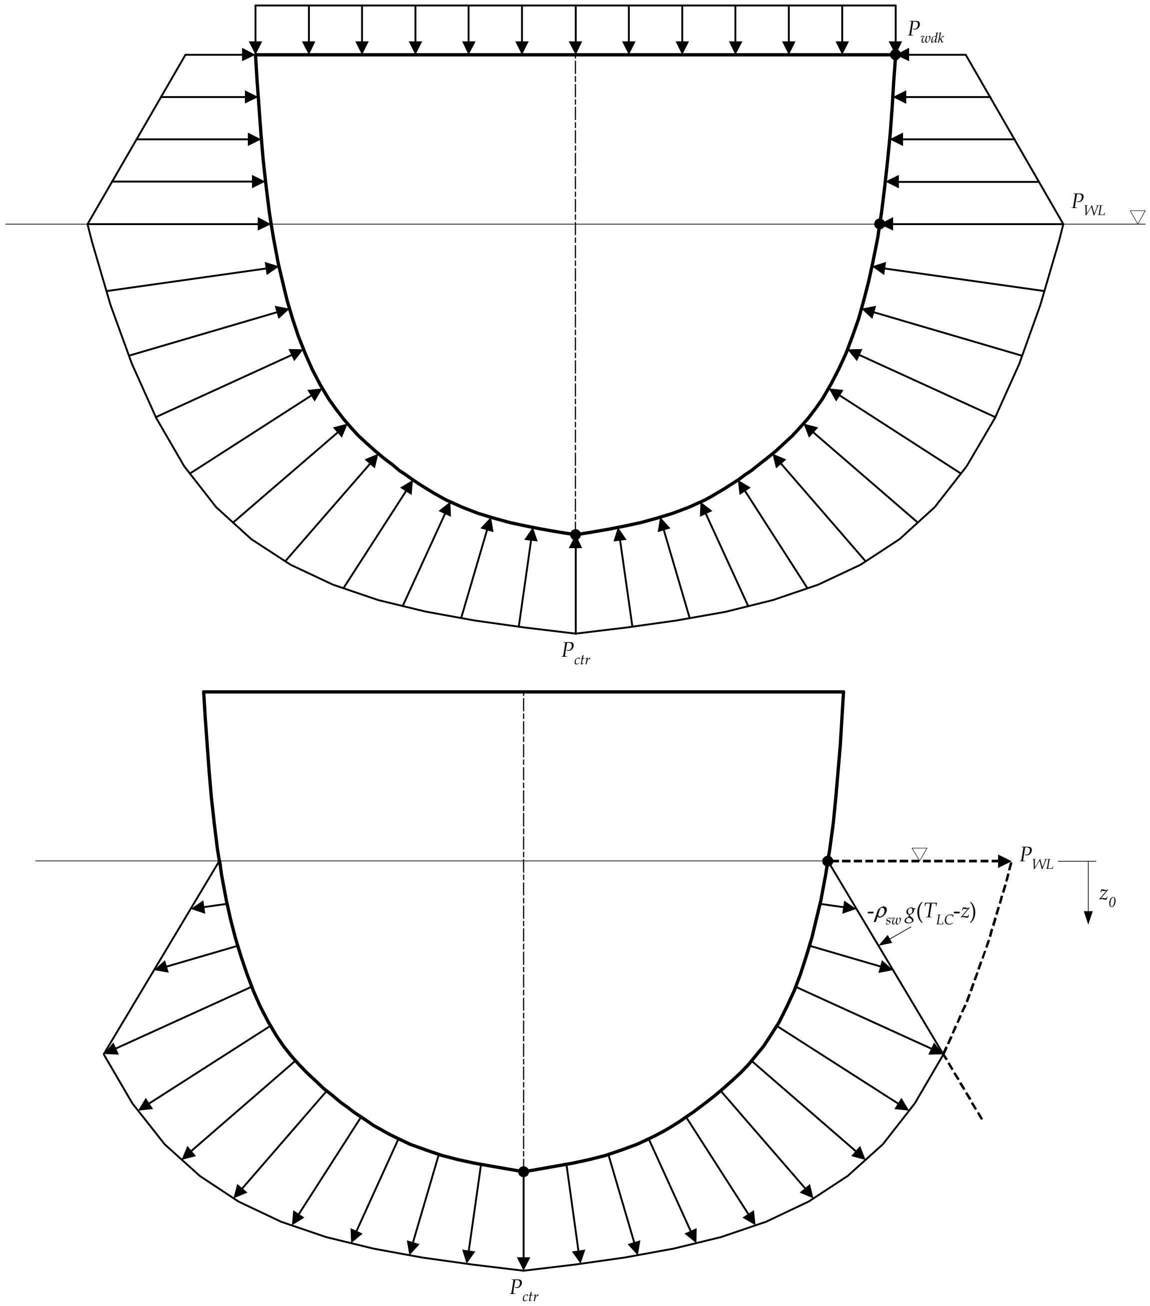
Pressure Distribution for Wave Crest and Wave Trough for Forward and Aft



6.3.6 Green sea load for a considered dynamic load case

6.3.6.1 The simultaneously acting green sea load on the weather deck, $P_{wdk-dyn}$, for strength assessment is obtained by linear interpolation between P_{wdk-pt} and $P_{wdk-stb}$:

The green sea load at the port side, P_{wdk-pt}, is to be taken as the greater of:

$$P_{wdk-pt} = f_{1-dk}\left(f_{WL} f_{op} P_{1-WL} - 10 z_{dk-T}\right) \quad \text{kN/m}^2$$

$$P_{wdk-pt} = 0.8\left(f_{WL} P_{2-WL} - 10 z_{dk-T}\right) \quad \text{kN/m}^2$$

P_{wdk-pt} is not to be taken as less than 34.3 kN/m² when f_{WL} = 1.0 and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

The green sea load at the starboard side, $P_{wdk-stb}$, is to be taken as the greater of:

$$P_{wdk-stb} = f_{1-dk}\left(f_{WL} f_{op} P_{1-WL} - 10 z_{dk-T}\right) \quad \text{kN/m}^2$$

$$P_{wdk-stb} = 0.8\left(f_{WL} P_{2-WL} - 10 z_{dk-T}\right) \quad \text{kN/m}^2$$

$P_{wdk-stb}$ is not to be taken as less than 34.3 kN/m^2 when f_{WL} = 1.0 and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

P_{wdk-pt} and $P_{wdk-stb}$ are not to be taken as less than 0.

Where:

f_{1-dk} $= 0.8 + \dfrac{L}{750}$

f_{op} = 1.0 at and forward of $0.2L$ from A.P.
= 0.8 at and aft of A.P.
intermediate values to be obtained by linear interpolation

P_{1-WL} P_1 pressure at still waterline for considered draught, in kN/m^2, see *3.5.2.1*

P_{2-WL} P_2 pressure at still waterline for considered draught, in kN/m^2, see *3.5.2.1*

f_{WL} dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see *6.3.1.2*

z_{dk-T} distance from the deck to the still waterline at the applicable draught for the loading condition being considered, in m

L rule length, in m, as defined in *Section 4/1.1.1.1*

6.3.6.2 The simultaneously acting green sea load on the weather deck, $P_{wdk-dyn}$, for scantling requirements is to be taken as the greater of:

$$P_{wdk-dyn} = f_{1-dk}\left(f_{WL} f_{op} P_{1-WL} - 10 z_{dk-T}\right) \quad \text{kN/m}^2$$

but is not to be taken as less than 34.3kN/m^2 when f_{WL} = 1.0 and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

$$P_{wdk-dyn} = 0.8 f_{2-dk}\left(f_{WL} P_{2-WL} - 10 z_{dk-T}\right) \quad \text{kN/m}^2$$

but is not to be taken as less than 34.3kN/m^2 when f_{WL} = 1.0 and f_{2-dk} =1.0 and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

$P_{wdk-dyn} = 0$

Where:

f_{1-dk} $= 0.8 + \dfrac{L}{750}$

f_{2-dk} $= 0.5 + \dfrac{|y|}{B_{wdk}}$

f_{op} = 1.0 at and forward of $0.2L$ from A.P.
= 0.8 at and aft of A.P.
intermediate values to be obtained by linear interpolation

P_{1-WL} P_1 pressure at still waterline for considered draught, in kN/m^2

$P_{2\text{-}WL}$	P_2 pressure at still waterline for considered draught, in kN/m²
f_{WL}	dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see *6.3.1.2*
y	transverse coordinate, in m
$z_{dk\text{-}T}$	distance from the deck at side to the still waterline at the applicable draught for the loading condition being considered, in m
B_{wdk}	local breadth at the weather deck, in m
L	rule length, in m, as defined in *Section 4/1.1.1.1*

6.3.7 Dynamic tank pressure for a considered dynamic load case

6.3.7.1 The simultaneously acting dynamic tank pressure, $P_{in\text{-}dyn}$, for tanks in the cargo region, is to be taken as:

$$P_{in-dyn} = f_\beta \left(f_v P_{in-v} + f_t P_{in-t} + f_{lng} P_{in-lng} \right) \quad \text{kN/m}^2$$

Where:

$P_{in\text{-}v}$ — envelope dynamic tank pressure due to vertical acceleration as defined in *3.5.4.1* with reference point z_0 taken as:

(a) top of tank

(b) top of air pipe/overflow for ballast tanks designed for BWE by flow-through method

see *Figure 7.6.4*, in kN/m²

$P_{in\text{-}t}$ — envelope dynamic tank pressure due to transverse acceleration as defined in *3.5.4.2* with reference point y_0 taken as:

(a) tank top towards port side for $f_t > 0$

(b) tank top towards starboard side for $f_t < 0$

see *Figure 7.6.5*, in kN/m²

$P_{in\text{-}lng}$ — envelope dynamic tank pressure due to longitudinal acceleration as defined in *3.5.4.3* with reference point x_0 taken as:

(a) forward bulkhead for $f_{lng} > 0$

(b) aft bulkhead of the tank for $f_{lng} < 0$

see *Figure 7.6.6*, in kN/m²

f_v — dynamic load combination factor for vertical acceleration for considered dynamic load case. f_v is to be taken as appropriate to the tank location, see *6.3.1.2*

f_t — dynamic load combination factor for transverse acceleration for considered dynamic load case, see *6.3.1.2*

f_{lng} — dynamic load combination factor for longitudinal acceleration for considered dynamic load case. f_{lng} is to be taken as most appropriate dependent on tank location, see *6.3.1.2*

f_β — heading correction factor, as defined in *6.3.1.1*

x_0 — longitudinal coordinate of reference point, in m

y_0 transverse coordinate of reference point, in m

z_0 vertical coordinate of reference point, in m

Note

1. For a non-parallel tank, y_0 should be selected from either forward or aft bulkhead corresponding to the reference point x_0. If the longitudinal load combination factor $f_{lng} = 0$, y_0 should be selected from the bulkhead with the greater breadth.
2. The vertical, transverse and longitudinal acceleration is to be taken at the centre of gravity of the tank under consideration.

6.3.7.2 The simultaneously acting dynamic tank pressure for tanks outside the cargo region, P_{in-dyn}, is to be taken as:

$$P_{in-dyn} = f_\beta \left(f_{v-mid} P_{in-v} + \left| f_t P_{in-t} \right| + \left| f_{lng} P_{in-lng} \right| \right) \quad \text{kN/m}^2$$

Where:

P_{in-v} envelope dynamic wave pressure due to vertical acceleration as given in *3.5.4.1* with reference point z_0 taken as:

(a) top of tank

(b) top of air pipe for ballast tanks design for BWE by flow through

see *Figure 7.6.5*, in kN/m^2

P_{in-t} envelope dynamic tank pressure due to transverse acceleration as given in *3.5.4.2* using $(y_0 - y)$ as extreme breadth of tank, in kN/m^2

P_{in-lng} envelope dynamic tank pressure due to longitudinal acceleration as given in *3.5.4.3* using $(x_0 - x)$ as extreme length of tank, in kN/m^2

f_{v-mid} dynamic load combination factor for vertical acceleration for considered dynamic load case, see *6.3.1.2*

f_t dynamic load combination factor for transverse acceleration for considered dynamic load case, see *6.3.1.2*

f_{lng} dynamic load combination factor for longitudinal acceleration for considered dynamic load case, see *6.3.1.2*

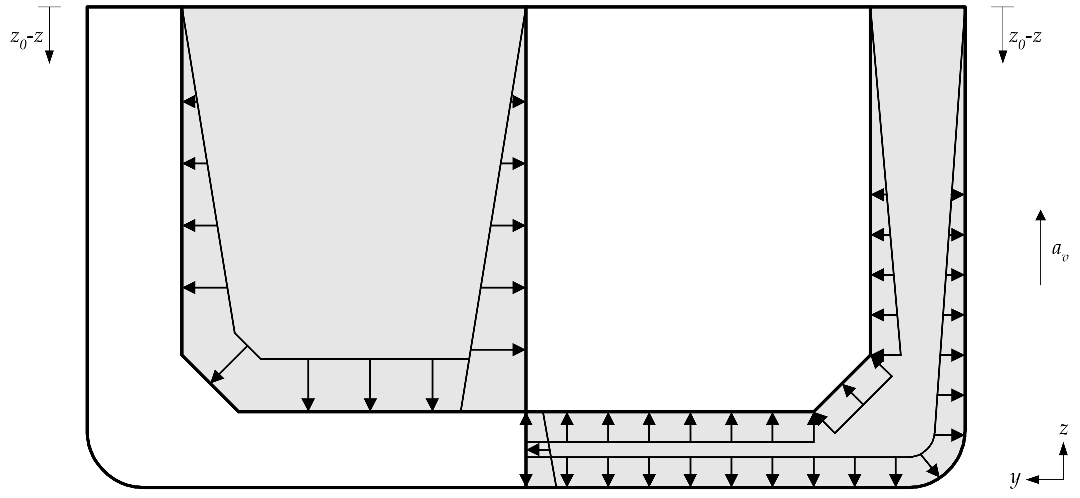
f_β heading correction factor, as defined in *6.3.1.1*

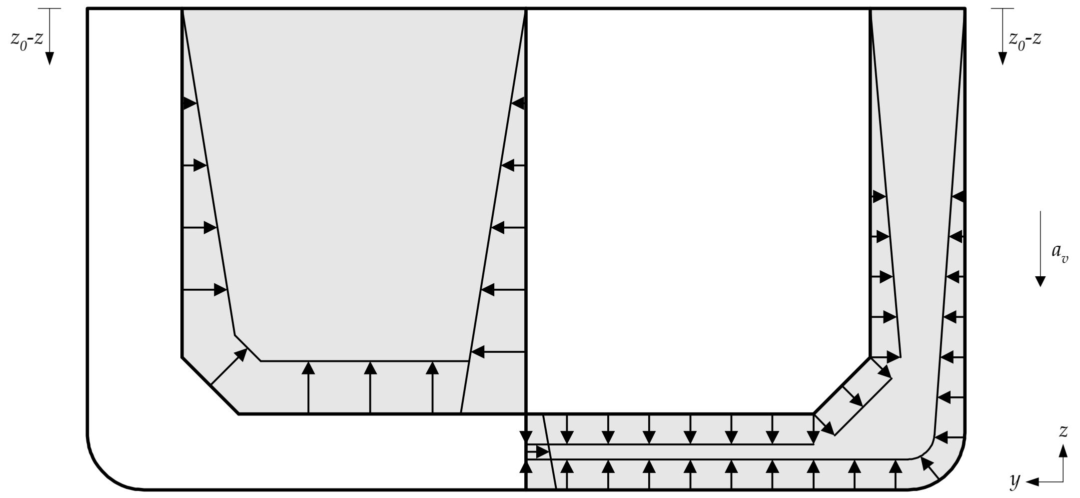
x_0 longitudinal coordinate of reference point, in m

y_0 transverse coordinate of reference point, in m

z_0 vertical coordinate of reference point, in m

Figure 7.6.4
Dynamic Tank Pressure in Cargo Tank (Left) and Ballast Tank (Right) due to Positive and Negative Vertical Tank Acceleration

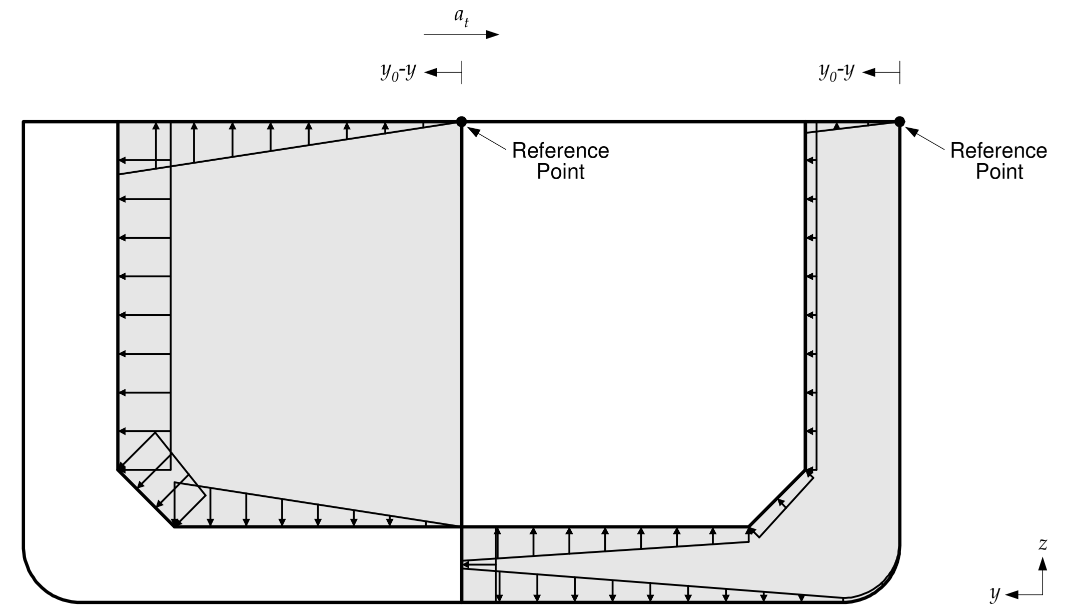




Note

For ballast tank which is designed for ballast water exchange by flow-through method, reference point z_0 is to be taken as top of air pipe/overflow of the tank.

Figure 7.6.5
Dynamic Tank Pressure in Cargo Tank (Left) and Ballast Tank (Right) due to Negative and Positive Transverse Tank Acceleration



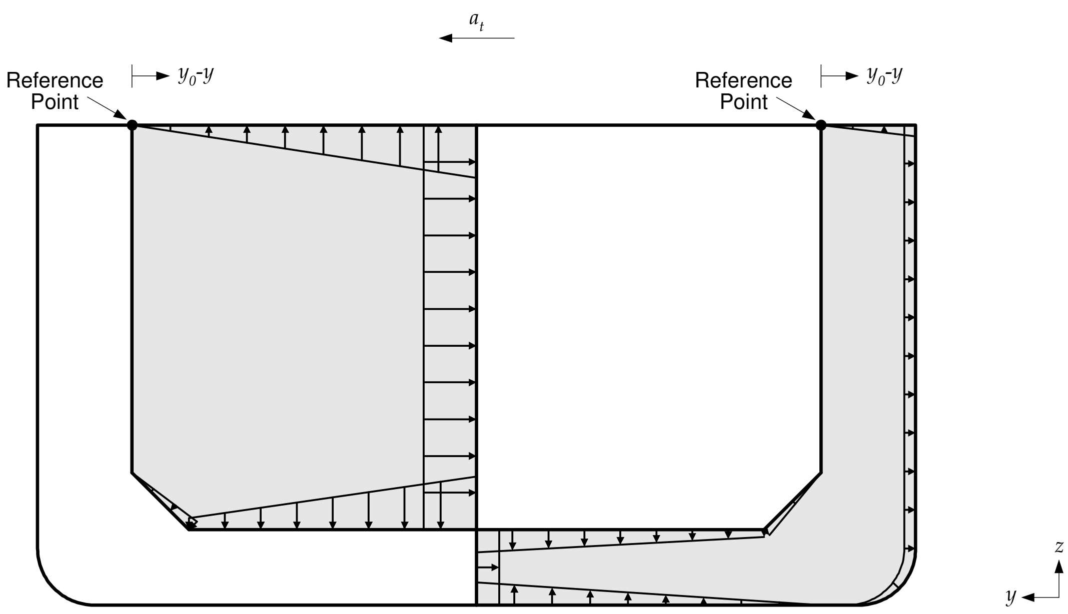


Figure 7.6.6
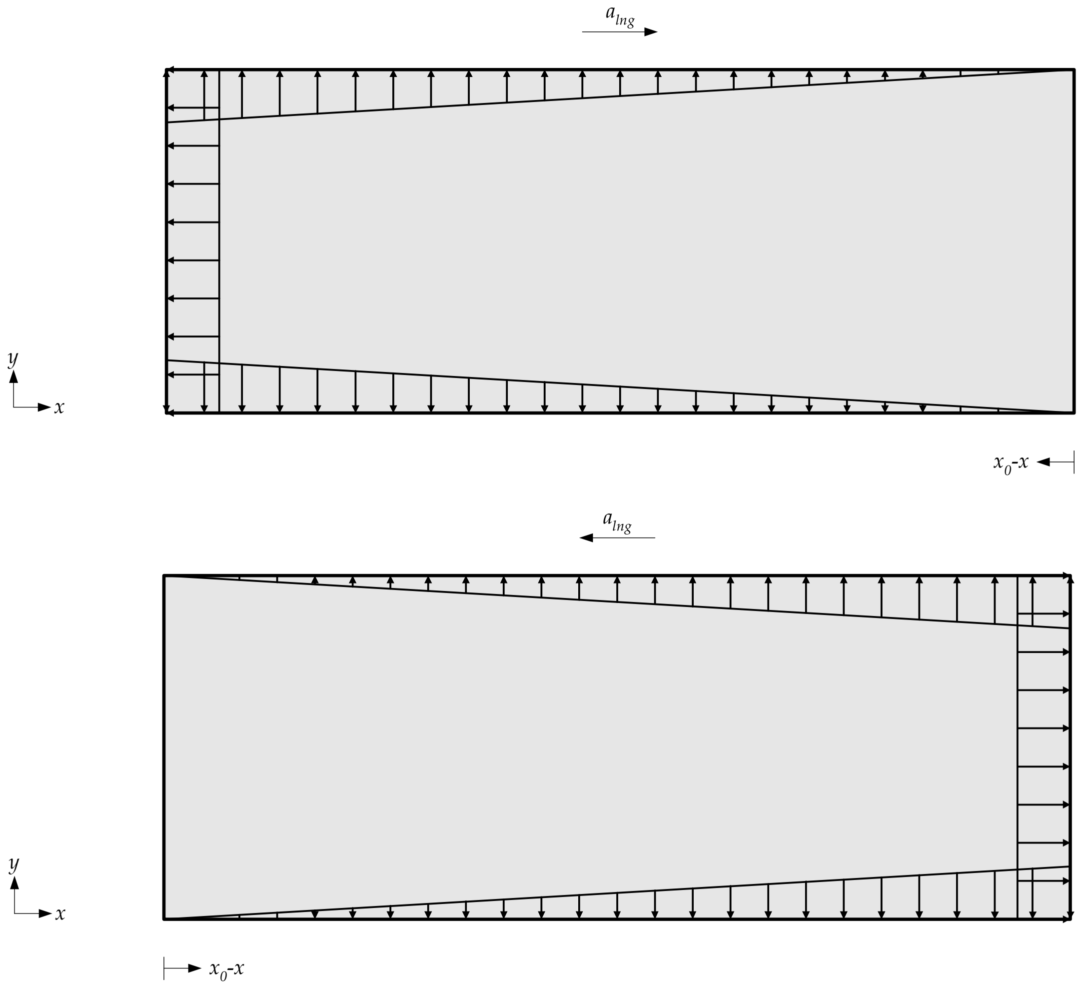
Dynamic Tank Pressure in Tanks due to Positive and Negative Longitudinal Acceleration



6.3.8 Dynamic deck loads for a considered dynamic load case

6.3.8.1 The simultaneously acting dynamic deck load for uniformly distributed load, $P_{dk\text{-}dyn}$, on the enclosed upper deck, where a forecastle or poop is fitted, and also on all lower decks, is to be taken as:

$$P_{dk-dyn} = f_\beta f_{v-mid} P_{deck-dyn} \quad \text{kN/m}^2$$

Where:

$P_{deck\text{-}dyn}$ envelope dynamic deck pressure on decks, inner bottom and hatch covers, in kN/m^2, as defined in *3.5.5.1*

$f_{v\text{-}mid}$ dynamic load combination factor for vertical acceleration for considered dynamic load case, see *6.3.1.2*

f_β heading correction factor, as defined in 6.3.1.1

6.3.8.2 The simultaneously acting dynamic vertical force for heavy units, $F_{dk\text{-}dyn}$, acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, is to be taken as:

$$F_{dk-dyn} = f_\beta f_{v-mid} F_v \quad \text{kN}$$

Where:

F_v envelope vertical dynamic load from heavy units, in kN, as defined in *3.5.6*

f_{v-mid} dynamic load combination factor for vertical acceleration for the considered dynamic load case, see *Table 7.6.2* and *Table 7.6.4* to *7.6.9*

f_β heading correction factor, as defined in *6.3.1.1*

6.4 Dynamic Load Cases and Dynamic Load Combination Factors for Strength Assessment

6.4.1 General

6.4.1.1 For strength assessment (FEM) the dynamic load cases given in *Table 7.6.2* are to be applied in accordance with the requirements of *Appendix B* for Design Load Combination *S + D*. The simultaneously acting dynamic load cases are to be derived using the dynamic load combination factors given in *Table 7.6.2*.

Table 7.6.2
Dynamic Load Cases for Strength Assessment (by FEM)

	P_{ctr}	f_{ctr}	-0.7	0.7	0.3	-0.3	0.9	0.9	0.5	0.5

Where:

Symbols are as defined in *3.3*, *6.3.5.1*, *Table 7.6.1* and below:

f_{v-mid} dynamic load combination factor associated with the vertical acceleration of a centre cargo and ballast tank

f_{v-pt} dynamic load combination factor associated with the vertical acceleration of a port cargo and side ballast tank

f_{v-stb} dynamic load combination factor associated with the vertical acceleration of a starboard cargo and side ballast tank

Note:

1. Load parameters and locations to be used for the calculations are to be taken as specified in *Appendix B/2.4.1*

6.5 Dynamic Load Cases and Dynamic Load Combination for Scantling Requirements

6.5.1 General

6.5.1.1 For the scantling requirements the dynamic load cases are to be applied in accordance with the design load sets given in *Table 8.2.7* through *Table 8.2.9* for the design load combination $S + D$. The simultaneously acting dynamic load cases are to be derived using the dynamic load combination factors given in *Table 7.6.4* to *Table 7.6.9*.

6.5.1.2 The Dynamic Load Combination Factor (DLCF) table to be used depends on the longitudinal position being considered and is specified in *Figure 7.6.7* and *Table 7.6.3*.

6.5.1.3 Each dynamic load case in the DLCF tables maximises one or more dynamic load components. The minimised dynamic load components are to be calculated by multiplying all the dynamic load combination factors for a dynamic load case by -1.0. The scantling requirements are to be evaluated for all maximised and minimised dynamic load cases.

6.5.1.4 Load parameters to be used for the calculations are to be taken as specified in *Table 8.2.8* and *Table 8.2.9*.

Figure 7.6.7
Illustration of Structural Regions

Common Structural Rules for Double Hull Oil Tankers

Sections 8 to 12

July 2013

Lloyd's Register

SECTION 8

SCANTLING REQUIREMENTS

1 LONGITUDINAL STRENGTH

1.1 Loading Guidance

1.1.1 General

1.1.1.1 All ships are to be provided with loading guidance information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations. The loading guidance information is to include an approved Loading Manual and Loading Computer System complying with the requirements given in *1.1.2* and *1.1.3* respectively.

1.1.1.2 The loading guidance information is to be based on the final data of the ship.

1.1.1.3 Modifications resulting in changes to the main data of the ship (lightship weight, buoyancy distribution, tank volumes or usage, etc), require the Loading Manual to be updated and re-approved, and subsequently the Loading Computer System to be updated and re-approved. However, new loading guidance need not be re-submitted provided that the resulting draughts, still water bending moments and shear forces do not differ from the originally approved data by more than 2%.

1.1.1.4 The loading guidance is to be prepared in a language understood by the users. If this language is not English, a translation into English shall be included. When applicable a document translating the language of the input and output data for the Loading Computer System into English is to be provided.

1.1.1.5 The loading guidance information is to include the following statement, to ensure the crew are aware of the operational limitations for minimum draught forward:

The scantlings are approved for a minimum draught forward, at F.P. In sea conditions where slamming is likely to occur, the forward draught is not to be less than the following:

(a) *…m with double bottom ballast tanks No(s)... filled*, or

(b) *…m with double bottom ballast tanks No(s)… empty*

1.1.2 Loading Manual

1.1.2.1 The Loading Manual is a document that:

(a) describes the loading conditions on which the design and approval of the ship has been based for seagoing- and harbour/sheltered water operation

(b) describes the results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional and lateral loads

(c) describes relevant operational limitations as given in *1.1.2.7.*

1.1.2.2 The following loading conditions and design loading and ballast conditions upon which the approval of the hull scantlings is based are, as a minimum, to be included in the Loading Manual:

(a) Seagoing conditions including both departure and arrival conditions

- homogeneous loading conditions including a condition at the scantling draft (homogeneous loading conditions shall not include filling of dry and clean ballast tanks at departure condition)

RCN 1 to July 2010 version (effective from 1 July 2012)

- a normal ballast condition where:
    - the ballast tanks may be full, partially full or empty. Where partially full options are exercised, the conditions in *1.1.2.5* are to be complied with

- all cargo tanks are to be empty including cargo tanks suitable for the carriage of water ballast at sea
- the propeller is to be fully immersed, and
- the trim is to be by the stern and is not to exceed 0.015L, where L is as defined in Section 4/1.1.1

- a heavy ballast condition where:
  - the draught at the forward perpendicular is not to be less than that for the normal ballast condition
  - ballast tanks in the cargo tank region or aft of the cargo tank region may be full, partially full or empty. Where the partially full options are exercised, the conditions in 1.1.2.5 are to be complied with
  - the fore peak water ballast tank is to be full. If upper and lower fore peak water ballast tanks are fitted, the lower is required to be full. The upper fore peak tank may be full, partially full or empty.
  - If upper and lower fore peak tanks are fitted and only one of them is designated as water ballast tank, the other may be empty.

  RCN 2 to July 2008 version (effective from 1 July 2010)
  - all cargo tanks are to be empty including cargo tanks suitable for the carriage of water ballast at sea
  - the propeller is to be fully immersed
  - the trim is to be by the stern and is not to exceed 0.015L, where L, is as defined in *Section 4/1.1.1*
- any specified non-uniform distribution of loading
- conditions with high density cargo including the maximum design cargo density, when applicable
- mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions
- conditions covering ballast water exchange procedures with the calculations of the intermediate conditions just before and just after ballasting and/or deballasting any ballast tank

Harbour/sheltered water conditions

- conditions representing typical complete loading and unloading operations
- docking condition afloat
- propeller inspection afloat condition, in which the propeller shaft centre line is at least $D_{prop}/4$ above the waterline in way of the propeller, where D_{prop} is the propeller diameter

(b) Additional design conditions

- a design ballast condition in which all segregated ballast tanks in the cargo tank region are full and all other tanks are empty including fuel oil and fresh water tanks.

Guidance Note
The design condition specified in (c) is for assessment of hull strength and is not intended for ship operation. This condition will also be covered by the *IMO 73/78 SBT* condition provided the corresponding condition in the Loading Manual only includes ballast in segregated ballast tanks in the cargo tank region.

(RCN 1, effective from 1 April 2007) (RCN 2, effective from 1 July 2008)

1.1.2.3 The calculation for the departure conditions are to be based on full tanks according to the applicable stability regulations for filling of tanks; note bunker tanks are not

to be taken less than 95% full and other consumables are to be taken at 100%

capacity. Arrival conditions are to be based on 10% of the maximum capacity of bunker, fresh water and stores.

1.1.2.4 Where the amount and disposition consumables at any intermediate stage of the voyage are considered more severe than of those described in *1.1.2.3*, calculations for such intermediate conditions are also to be submitted for approval.

1.1.2.5 Ballast loading conditions involving partially filled peak and/or other ballast tanks in any departure, arrival or intermediate condition are not permitted to be used as design loading conditions unless, for all filling levels between empty and full, the resulting stress levels are within the stress and buckling acceptance criteria. For design purposes this criteria will be satisfied if the stress levels are within the stress and buckling acceptance criteria for loading conditions with the appropriate tanks full, empty and partially filled at intended level in any departure, arrival or intermediate condition. The corresponding full, empty and partially filled tank conditions are to be considered as design conditions for calculation of the still water bending moment and shear force, but these do not need to comply with propeller immersion and trim requirements as specified in *1.1.2.2(a)*. Where multiple ballast tanks are intended to be partially filled, all combinations of full, empty or partially filled at intended levels for those tanks are to be investigated. These requirements are not applicable to ballast water exchange using the sequential method.

(RCN 2, effective from 1 July 2008)

1.1.2.6 In cargo loading conditions, the requirements for partially filled ballast tanks as specified in 1.1.2.5 are applicable to the peak ballast tanks only.

(RCN 2, effective from 1 July 2008)

1.1.2.7 The Loading Manual is to include the design basis and operational limitations upon which the approval of the hull scantlings are based. The information listed in *Table 8.1.1* is to be included in the Loading Manual.

1.1.2.8 The approval of the hull scantlings is based on the rule defined loading patterns and the loading conditions given in the Loading Manual.

Table 8.1.1
Design Parameters

Parameter
Permissible limits of still water bending moments (seagoing operation and harbour/sheltered water operation)
Permissible limits of still water shear forces (seagoing operation and harbour/sheltered water operation)
Scantling draught, T_{sc}
Design minimum ballast draught at midships, T_{bal}
Design slamming draught forward with forward double bottom ballast tanks filled, $T_{FP-full}$
Design slamming draught forward with forward double bottom ballast tanks empty, T_{FP-mt}
Maximum allowable cargo density
Maximum cargo density in any loading condition in Loading Manual
Description of the ballast exchange operations including any limitations
Design speed

1.1.2.9 The following additional loading conditions are to be included in the Loading Manual if the ship is specifically approved and intended to be operated in such conditions:

(a) sea-going ballast conditions including water ballast carried in one or more cargo tanks which are intended for use in emergency situations as allowed by MARPOL Regulation 13. (Ship approved for loading pattern A8 of *Table B.2.3* or B7 of *Table B.2.4*)

(b) seagoing loading conditions where the net static upward load on the double bottom exceeds that given with the combination of an empty cargo tank and a mean ship's draught of $0.9T_{sc}$

(c) seagoing loading conditions with cargo tanks less than 25% full with the combination of mean ship's draught greater than $0.9T_{sc}$

(d) seagoing loading conditions where the net static downward load on the double bottom exceeds that given with the combination of a full cargo tank at a cargo density of 1.025 tonnes/m^3 and a mean ship's draught of $0.6T_{sc}$

(e) for ships arranged with cross ties in the centre cargo tank , seagoing loading conditions showing a non-symmetric loading pattern where the difference in filling level between corresponding port and starboard wing cargo tanks exceeds 25% of the filling height in the wing cargo tank (Ship approved for loading pattern A7 of *Table B.2.3*)

1.1.2.10 This sub-section is not intended to prevent any other loading conditions to be included in the Loading Manual, nor is it intended to replace in any way the required Loading Manual/Instrument.

1.1.2.11 A tanker may in actual operation be loaded differently from the design loading conditions specified in the Loading Manual, provided limitations for longitudinal and local strength as defined in the Loading Manual and Loading Instrument onboard and applicable stability requirements are not exceeded.

1.1.3 Loading computer system

1.1.3.1 The loading computer system, is to be a system, which unless stated otherwise is digital and that can easily and quickly ascertain whether operational limitations are exceeded for any loading condition.

1.1.3.2 The loading computer system is to be approved based on the Rules of the individual Classification Society.

1.1.3.3 The loading computer system is to be capable of producing any specific loading condition and verify that these comply with all the operational limitations given in *1.1.2.2*, and provide plots including input and output.

1.1.3.4 If any of the operational limitations are not checked, the user is to be properly informed when using the system, and by the plots provided, so that each such item is verified by other means. The loading computer system is as a minimum to verify that the following are satisfied:

(a) draught limitations

(b) still water bending moments and shear forces are reported at the specified locations/read-out points.

1.1.3.5 The final test conditions for the loading computer are to be based on conditions given in the final Loading Manual. The test conditions are subject to approval and the shear forces and bending moments calculated by the loading computer system, at each read out point, are to be within $0.02Q_{sw\text{-}perm}$ or $0.02M_{sw\text{-}perm}$ of the results given

in the loading manual, where $Q_{sw\text{-}perm}$ and $M_{sw\text{-}perm}$ are the assigned permissible shear force and bending moment at each read out point respectively.

1.1.3.6 Before a loading computer system is accepted, all relevant aspects of the computer, including but not limited to the following, are to be demonstrated to the Surveyor:

(a) verification that the final data of the ship has been used

(b) verification that the relevant limits for all read-out points are correct

(c) that the operation of the system after installation onboard, is in accordance with the approved test conditions

(d) that the approved test conditions are available onboard

(e) that an operational manual is available onboard.

1.2 Hull Girder Bending Strength

1.2.1 General

1.2.1.1 The net vertical hull girder section modulus, $Z_{v\text{-}net50}$, is to be equal to or greater than the requirements given by *1.2.2.2* and *1.2.3.2*. The net vertical hull girder moment of inertia, $I_{v\text{-}net50}$, as defined in *Section 4/2.6.1.1* is to be equal to or greater than the requirement given by *1.2.2.1*.

1.2.1.2 Scantlings of all continuous longitudinal members of the hull girder based on moment of inertia and section modulus requirement in *1.2.2.1* and *1.2.2.2* are to be maintained within 0.4L midships.

1.2.1.3 The hull girder section modulus requirements in *1.2.3* apply along the full length of the hull girder, from A.P. to F.P.

1.2.1.4 Structural members included in the hull girder section modulus are to satisfy the buckling criteria given in *1.4*.

1.2.2 Minimum requirements

1.2.2.1 At the midship cross section the net vertical hull girder moment of inertia about the horizontal neutral axis, $I_{v\text{-}net50}$, is not to be less than the rule minimum vertical hull girder moment of inertia, $I_{v\text{-}min}$, defined as:

$$I_{v-min} = 2.7 C_{wv} L^3 B (C_b + 0.7) \cdot 10^{-8} \quad \text{m}^4$$

Where:

C_{wv} wave coefficient as defined in *Table 8.1.2*

L rule length, in m, as defined in *Section 4/1.1.1.1*

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

C_b block coefficient, as defined in *Section 4/1.1.9.1* but is not to be taken as less than 0.70

Table 8.1.2
Wave Coefficient C_{wv}

rule length	C_{wv}
$150 \le L \le 300$	$10.75 - [(300 - L) / 100]^{3/2}$
$300 < L < 350$	10.75
$350 \le L \le 500$	$10.75 - [(L - 350) / 150]^{3/2}$

1.2.2.2 At the midship cross section the net vertical hull girder section modulus, Z_{v-min}, at the deck and keel is not to be less than the rule minimum hull girder section modulus, Z_{v-min}, defined as:

$$Z_{v-min} = 0.9kC_{wv}L^2B(C_b + 0.7) \cdot 10^{-6} \quad \text{m}^3$$

Where:

k	higher strength steel factor, as defined in *Section 6/1.1.4*
C_{wv}	wave coefficient as defined in *Table 8.1.2*
L	rule length, in m, as defined in *Section 4/1.1.1.1*
B	moulded breadth, in m, as defined in *Section 4/1.1.3.1*
C_b	block coefficient, as defined in *Section 4/1.1.9.1* but is not to be taken as less than 0.70 *RCN 1 to July 2010 version (effective from 1 July 2012)*

1.2.2.3 The net hull girder section modulus at keel, $Z_{v-net50-kl}$, is to be calculated in accordance with *Section 4/2.6.1.2* and taking z at the keel.

1.2.2.4 The net hull girder section modulus at deck, $Z_{v-net50-dk}$, is to be calculated in accordance with *Section 4/2.6.1.2* and taking z at the effective deck height, see *1.2.2.5*.

1.2.2.5 The effective deck height from the horizontal neutral axis for the hull girder section modulus, z_{dk-eff}, is to be taken as:

$$z_{dk-eff} = z_{dk-side} - z_{NA-net50} \quad \text{m}$$

When no effective longitudinal strength members are positioned above a line extending from moulded deck line at side to a position $(z_{dk-side} - z_{NA-net50})/0.9$ from the neutral axis at the centreline

$$z_{dk-eff} = (z_y - z_{NA-net50})\left(0.9 + 0.2\frac{y_{cl}}{B}\right) \quad \text{m}$$

When any effective longitudinal strength members are positioned above a line extending from moulded deck line at side to a position $(z_{dk-side} - z_{NA-net50})/0.9$ from the neutral axis at the centreline

Where:

z_y	distance from the baseline to top of the continuous strength member at a distance y from the centreline, in m, giving the largest value of z_{dk-eff}, see *Figure 8.1.1*
$z_{NA-net50}$	distance from baseline to horizontal neutral axis, in m, see *Figure 8.1.1*
y_{cl}	distance from the top of the continuous strength member to the centreline of the ship, in m, giving the largest value of z_{dk-eff}, see *Figure 8.1.1*
B	moulded breadth, in m, as defined in *Section 4/1.1.3.1*
$z_{dk-side}$	distance from the baseline to the moulded deck line at side, in m, see *Figure 8.1.1*

Figure 8.1.1
Position for Calculation of Section Modulus Deck

(b) Ship with large camber

1.2.3 Hull girder requirement on total design bending moment

1.2.3.1 The net vertical hull girder section modulus requirement as defined in *1.2.3.2* is to be assessed for both hogging and sagging conditions.

1.2.3.2 The net hull girder section modulus about the horizontal neutral axis, $Z_{v\text{-}net50}$, is not to be less than the rule required hull girder section modulus, $Z_{v\text{-}req}$, based on the

permissible still-water bending moment and design wave bending moment defined as:

$$Z_{v-req} = \frac{\left|M_{sw-perm} + M_{wv-v}\right|}{\sigma_{perm}} 10^{-3} \quad \text{m}^3$$

Where:

$M_{sw-perm}$ permissible hull girder hogging or sagging still water bending moment as given in *Table 8.1.3*, in kNm

M_{wv-v} hogging or sagging vertical wave bending moment, in kNm as given in *Table 8.1.3*

σ_{perm} permissible hull girder bending stress as given in *Table 8.1.3*, in N/mm^2

Table 8.1.3
Loads and Corresponding Acceptance Criteria for Hull Girder Bending Assessment

Design load combination	**Still water bending moment, $M_{sw-perm}$**	**Wave bending moment, M_{wv-v}**	**Permissible hull girder bending stress, σ_{perm} (1)**	
(S)	$M_{sw-perm-harb}$	0	$143/k$	within $0.4L$ amidships
			$105/k$	at and forward of $0.9L$ from A.P. and at and aft of $0.1L$ from A.P.
(S + D)	$M_{sw-perm-sea}$	M_{wv-v}	$190/k$	within $0.4L$ amidships
			$140/k$	at and forward of $0.9L$ from A.P. and at and aft of $0.1L$ from A.P

Where:

$M_{sw-perm-harb}$ permissible hull girder hogging and sagging still water bending moment for harbour/sheltered water operation, in kNm, as defined in *Section 7/2.1.1*

$M_{sw-perm-sea}$ permissible hull girder hogging and sagging still water bending moment for seagoing operation, in kNm, as defined in *Section 7/2.1.1*

M_{wv-v} hogging and sagging vertical wave bending moments, in kNm, as defined in *Section 7/3.4.1*

M_{wv-v} is to be taken as:

M_{wv-hog} for assessment with respect to hogging vertical wave bending moment

M_{wv-sag} for assessment with respect to sagging vertical wave bending moment

k higher strength steel factor, as defined in *Section 6/1.1.4*

Note

1. σ_{perm} is to be linearly interpolated between values given.

1.3 Hull Girder Shear Strength

1.3.1 General

1.3.1.1 The hull girder shear strength requirements apply along the full length of the hull girder, from A.P to F.P.

1.3.2 Assessment of hull girder shear strength

1.3.2.1 The net hull girder shear strength capacity, $Q_{v-net50}$, as defined in *1.3.2.2* is not to be less than the required vertical shear force, Q_{v-req}, as indicated in the following:

$$Q_{v-req} = Q_{sw-perm} + Q_{wv} \quad \text{kN}$$

Where:

$Q_{sw-perm}$ permissible hull girder positive or negative still water shear force as given in *Section 7/2.1.3,* in kN

Q_{wv} vertical wave positive or negative shear force as defined in *Section 7/3.4.3,* in kN

1.3.2.2 The permissible positive and negative still water shear forces for seagoing and harbour/sheltered water operations, $Q_{sw-perm-sea}$ and $Q_{sw-perm-harb}$ are to satisfy:

$$Q_{sw-perm} \leq Q_{v-net50} - Q_{wv-pos} \quad \text{kN}$$

for maximum permissible positive shear force

$$Q_{sw-perm} \geq -Q_{v-net50} - Q_{wv-neg} \quad \text{kN}$$

for minimum permissible negative shear force

Where:

$Q_{sw-perm}$ permissible hull girder still water shear force as given in *Table 8.1.4,* in kN

$Q_{v-net50}$ net hull girder vertical shear strength to be taken as the minimum for all plate elements that contribute to the hull girder shear capacity

$$= \frac{\tau_{ij-perm} t_{ij-net50}}{1000 q_v} \quad \text{kN}$$

$\tau_{ij-perm}$ permissible hull girder shear stress, τ_{perm}, as given in *Table 8.1.4*, in N/mm^2 , for plate *ij*

Q_{wv-pos} positive vertical wave shear force, in kN, as defined in *Table 8.1.4*

Q_{wv-neg} negative vertical wave shear force, in kN, as defined in *Table 8.1.4*

$t_{ij-net50}$ equivalent net thickness, t_{net50}, for plate ij, in mm. For longitudinal bulkheads between cargo tanks, t_{net50} is to be taken as $t_{sfc-net50}$ and t_{str-k} as appropriate, see *1.3.3.1* and *1.3.4.1*

t_{net50} net thickness of plate, in mm

$$= t_{grs} - 0.5 t_{corr}$$

t_{grs} gross plate thickness, in mm. The gross plate thickness for corrugated bulkheads is to be taken as the minimum of t_{w-grs} and t_{f-grs}, in mm

t_{w-grs} gross thickness of the corrugation web, in mm

$t_{f\text{-}grs}$	gross thickness of the corrugation flange, in mm
t_{corr}	corrosion addition, in mm, as defined in *Section 6/3.2*
q_v	unit shear flow per mm for the plate being considered and based on the net scantlings. Where direct calculation of the unit shear flow is not available, the unit shear flow may be taken equal to:

$$= f_i \left(\frac{q_{1-net50}}{I_{v-net50}} \right) \cdot 10^{-9} \qquad mm^{-1}$$

f_i	shear force distribution factor for the main longitudinal hull girder shear carrying members being considered. For standard structural configurations f_i is as defined in *Figure 8.1.2*
$q_{1\text{-}net50}$	first moment of area, in cm^3 ,about the horizontal neutral axis of the effective longitudinal members between the vertical level at which the shear stress is being determined and the vertical extremity, taken at the section being considered. The first moment of area is to be based on the net thickness, t_{net50} *RCN 1 to July 2010 version (effective from 1 July 2012)*
$I_{v\text{-}net50}$	net vertical hull girder section moment of inertia, in m^4, as defined in *Section 4/2.6.1.1*

Table 8.1.4
Loads and Corresponding Acceptance Criteria for Hull Girder Shear Assessment

Design load combination	Still water shear force, $Q_{sw\text{-}perm}$	Vertical wave shear force, Q_{wv}	Permissible shear stress, τ_{perm}
Harbour/sheltered water operations (S)	$Q_{sw\text{-}perm\text{-}harb}$	0	105/k for plate ij
Seagoing operations (S + D)	$Q_{sw\text{-}perm\text{-}sea}$	Q_{wv}	120/k for plate ij

Where:

$Q_{sw\text{-}perm\text{-}harb}$	permissible positive or negative hull girder still water shear force for harbour operation, in kN, as defined in *Section 7/2.1.3*
$Q_{sw\text{-}perm\text{-}sea}$	permissible positive or negative hull girder still water shear force for seagoing operation, in kN, as defined in *Section 7/2.1.3*
Q_{wv}	positive or negative vertical wave shear, in kN, as defined in *Section 7/3.4.3*. Q_{vw} is to be taken as: $Q_{wv\text{-}pos}$ for assessment with respect to maximum positive permissible still water shear force $Q_{wv\text{-}neg}$ for assessment with respect to minimum negative permissible still water shear force
plate ij	for each plate j, index i denotes the structural member of which the plate forms a component
k	higher strength steel factor, as defined in *Section 6/1.1.4*

Figure 8.1.2
Shear Force Distribution Factors

Hull configuration	f_i **factors**
Outside cargo region (no longitudinal bulkhead) 	Side shell $f_1 = 0.5$
Outside cargo region (centreline bulkhead) 	Side shell $f_1 = 0.231 + 0.076 \frac{A_{1-net50}}{A_{3-net50}}$ Longitudinal bulkhead $f_3 = 0.538 - 0.152 \frac{A_{1-net50}}{A_{3-net50}}$
One centreline bulkhead 	Side shell $f_1 = 0.055 + 0.097 \frac{A_{1-net50}}{A_{2-net50}} + 0.020 \frac{A_{2-net50}}{A_{3-net50}}$ Inner hull $f_2 = 0.193 - 0.059 \frac{A_{1-net50}}{A_{2-net50}} + 0.058 \frac{A_{2-net50}}{A_{3-net50}}$ Longitudinal bulkhead $f_3 = 0.504 - 0.076 \frac{A_{1-net50}}{A_{2-net50}} - 0.156 \frac{A_{2-net50}}{A_{3-net50}}$
Two longitudinal bulkheads 	Side shell $f_1 = 0.028 + 0.087 \frac{A_{1-net50}}{A_{2-net50}} + 0.023 \frac{A_{2-net50}}{A_{3-net50}}$ Inner hull $f_2 = 0.119 - 0.038 \frac{A_{1-net50}}{A_{2-net50}} + 0.072 \frac{A_{2-net50}}{A_{3-net50}}$ Longitudinal bulkhead $f_3 = 0.353 - 0.049 \frac{A_{1-net50}}{A_{2-net50}} - 0.095 \frac{A_{2-net50}}{A_{3-net50}}$

Where:

i index for the structural member under consideration:
- 1, for the side shell
- 2, for the inner hull
- 3, for the longitudinal bulkhead

$A_{i-net50}$ net area as defined in *Section 4/2.6.4* and based on deduction of $0.5t_{corr}$, of the structural member, *i*, at one side of the section under consideration. The area $A_{3-net50}$ for the centreline bulkhead is not to be reduced for symmetry around the centreline.

1.3.3 Shear force correction for longitudinal bulkheads between cargo tanks

1.3.3.1 For longitudinal bulkheads between cargo tanks the effective net plating thickness of the plating above the inner bottom, $t_{sfc\text{-}net50}$ for plate *ij*, used for calculation of hull girder shear strength, $Q_{v\text{-}net50}$, is to be corrected for local shear distribution and is given by:

$$t_{sfc-net50} = t_{grs} - 0.5t_{corr} - t_{\Delta} \quad \text{mm}$$

Where:

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

t_{Δ} thickness deduction for plate *ij*, in mm, as defined in *1.3.3.2*

1.3.3.2 The vertical distribution of thickness reduction for shear force correction is assumed to be triangular as indicated in *Figure 8.1.3.* The thickness deduction, t_{Δ}, to account for shear force correction is to be taken as:

$$t_{\Delta} = \frac{\delta Q_3}{h_{blk}\tau_{ij-perm}}\left(1 - \frac{x_{blk}}{0.5l_{tk}}\right)\left(2 - \frac{2(z_p - h_{db})}{h_{blk}}\right) \quad \text{mm}$$

Where:

δQ_3 shear force correction for longitudinal bulkhead as defined in *1.3.3.3* and *1.3.3.5* for ships with one or two longitudinal bulkheads respectively, in kN.

l_{tk} length of cargo tank, in m

h_{blk} height of longitudinal bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead, as shown in *Figure 8.1.3*

x_{blk} the minimum longitudinal distance from section considered to the nearest cargo tank transverse bulkhead, in m. To be taken positive and not greater than $0.5l_{tk}$

z_p the vertical distance from the lower edge of plate *ij* to the base line, in m. Not to be taken as less than h_{db}

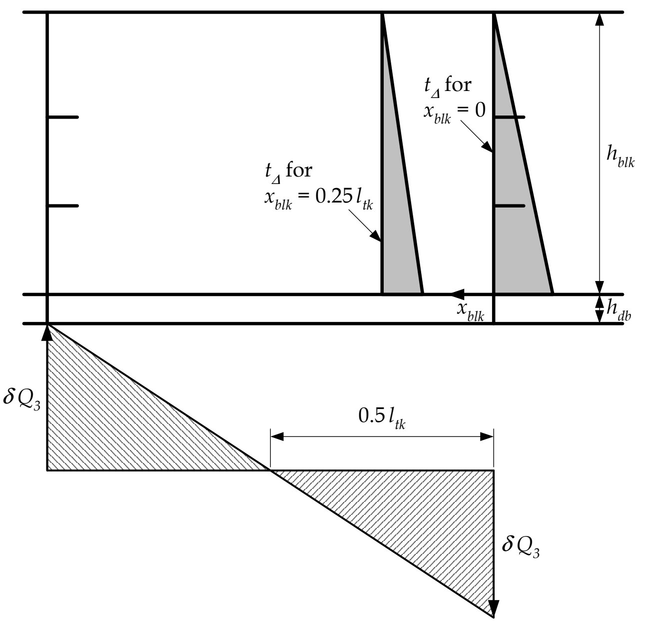
h_{db} height of double bottom, in m, as shown in *Figure 8.1.3*

$\tau_{ij-perm}$ permissible hull girder shear stress, τ_{perm}, in N/mm^2 for plate *ij*

$= 120/k_{ij}$

k_{ij} higher strength steel factor, *k*, for plate *ij* as defined in *Section 6/1.1.4*

Figure 8.1.3
Shear Force Correction for Longitudinal Bulkheads



1.3.3.3 For ships with a centreline bulkhead between the cargo tanks, the shear force correction in way of transverse bulkhead, δQ_3, is to be taken as:

$$\delta Q_3 = 0.5 K_3 F_{db} \quad \text{kN}$$

Where:

K_3 correction factor, as defined in *1.3.3.4*

F_{db} maximum resulting force on the double bottom in a tank, in kN, as defined in *1.3.3.7*

1.3.3.4 For ships with a centreline bulkhead between the cargo tanks, the correction factor, K_3, in way of transverse bulkheads is to be taken as:

$$K_3 = \left[0.40\left(1 - \frac{1}{1+n}\right) - f_3\right]$$

Where:

n number of floors between transverse bulkheads

f_3 shear force distribution factor, see *Figure 8.1.2*

1.3.3.5 For ships with two longitudinal bulkheads between the cargo tanks, the shear force correction, δQ_3, is to be taken as:

$$\delta Q_3 = 0.5 K_3 F_{db} \quad \text{kN}$$

Where:

K_3 correction factor, as defined in *1.3.3.6*

F_{db} maximum resulting force on the double bottom in a tank, in kN, as defined in *1.3.3.7*

1.3.3.6 For ships with two longitudinal bulkheads between the cargo tanks, the correction factor, K_3, in way of transverse bulkhead is to be taken as:

$$K_3 = \left[0.5\left(1 - \frac{1}{1+n}\right)\left(\frac{1}{r+1}\right) - f_3 \right]$$

Where:

n number of floors between transverse bulkheads

r ratio of the part load carried by the wash bulkheads and floors from longitudinal bulkhead to the double side and is given by:

$$r = \frac{1}{\left[\frac{A_{3-net50}}{A_{1-net50} + A_{2-net50}} + \frac{2\times 10^4 b_{80}(n_s + 1)A_{3-net50}}{l_{tk}(n_s A_{T-net50} + R)} \right]}$$

Note: for preliminary calculations, r may be taken as 0.5

l_{tk} length of cargo tank, between transverse bulkheads in the side cargo tank, in m

b_{80} 80% of the distance from longitudinal bulkhead to the inner hull longitudinal bulkhead, in m, at tank mid length

$A_{T-net50}$ net shear area of the transverse wash bulkhead, including the double bottom floor directly below, in the side cargo tank, in cm^2, taken as the smallest area in a vertical section. $A_{T-net50}$ is to be calculated with net thickness given by t_{grs} - $0.5t_{corr}$

$A_{1-net50}$ net area, as shown in *Figure 8.1.2,* in m^2

$A_{2-net50}$ net area, as shown in *Figure 8.1.2,* in m^2

$A_{3-net50}$ net area, as shown in *Figure 8.1.2,* in m^2

f_3 shear force distribution factor, as shown in *Figure 8.1.2*

n_S number of wash bulkheads in the side cargo tank

R total efficiency of the transverse primary support members in the side tank

$$R = \left(\frac{n - n_s}{2} - 1\right)\frac{A_{Q-net50}}{\gamma} \quad \text{cm}^2$$

$$\gamma = 1 + \frac{300 b_{80}{}^2 A_{Q-net50}}{I_{psm-net50}}$$

$A_{Q-net50}$ net shear area, in cm^2, of a transverse primary support member in the wing cargo tank, taken as the sum of the net shear areas of floor, cross ties and deck transverse webs. $A_{Q-net50}$ is to be calculated using the net thickness given by t_{grs} - $0.5t_{corr.}$ The net shear area is to be calculated at the mid span of the members.

$I_{psm-net50}$ net moment of inertia for primary support members, in cm^4, of a transverse primary support member in the wing cargo tank, taken as the sum of the moments of inertia of transverses and cross ties. It is to be calculated using the net thickness given by t_{grs} - $0.5t_{corr.}$ The net moment of inertia is to be calculated at the mid span of the member including an attached plate width equal to the primary support member spacing

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

1.3.3.7 The maximum resulting force on the double bottom in a tank, F_{db}, is to be taken as:

$$F_{db} = g\left|W_{CT} + W_{CWBT} - \rho_{sw} b_2 l_{tk} T_{mean}\right| \quad \text{kN}$$

Where:

W_{CT} weight of cargo, in tonnes, as defined in *Table 8.1.5*

W_{CWBT} weight of ballast, in tonnes, as defined in *Table 8.1.5*

b_2 breadth, in m, as defined in *Table 8.1.5*

l_{tk} length of cargo tank, between watertight transverse bulkheads in the wing cargo tank, in m

T_{mean} draught at the mid length of the tank for the loading condition considered, in m.

g acceleration due to gravity, 9.81 m/s²

ρ_{sw} density of sea water, 1.025 tonnes/m³

Table 8.1.5
Design Conditions for Double Bottoms

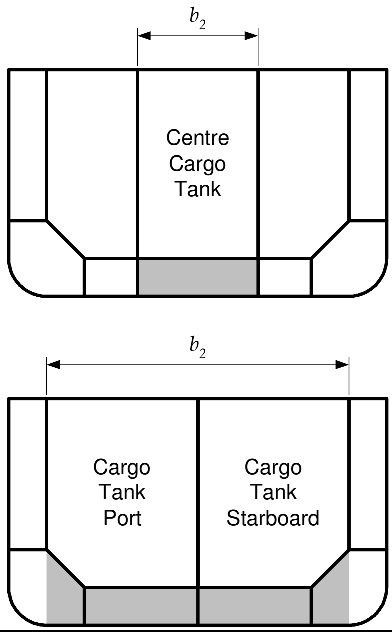
Structural Configuration	W_{CT}	W_{CWBT}	b_2
Ships with one longitudinal bulkhead	weight of cargo in cargo tanks, in tonnes, using a minimum specific gravity of 1.025 tonnes/m³	weight of ballast between port and starboard inner sides, in tonnes	maximum breadth between port and starboard inner sides at mid length of tank, in m, as shown in *Figure 8.1.4*
Ships with two longitudinal bulkheads	weight of cargo in the centre tank, in tonnes, using a minimum specific gravity of 1.025 tonnes/m³	weight of ballast below the centre cargo tank, in tonnes	maximum breadth of the centre cargo tank at mid length of tank, in m, as shown in *Figure 8.1.4*

1.3.3.8 The maximum resulting force on the double bottom in a tank, F_{db}, is in no case to be less than that given by the rule minimum conditions given in *Table 8.1.6*.

Table 8.1.6
Rule Minimum Conditions for Double Bottoms

Structural Configuration	Positive/negative force, F_{db}	Minimum condition
Ships with one longitudinal bulkhead	Max positive net vertical force, F_{db}+	$0.9T_{sc}$ and empty cargo and ballast tanks
	Max negative net vertical force, F_{db}-	$0.6T_{sc}$ and full cargo tanks and empty ballast tanks
Ships with two longitudinal bulkheads	Max positive net vertical force, F_{db}+	$0.9T_{sc}$ and empty cargo and ballast tanks
	Max negative net vertical force, F_{db}-	$0.6T_{sc}$ and full centre cargo tank and empty ballast tanks

Figure 8.1.4
Tank Breadth to be Included for Different Tanker Types



1.3.4 Shear force correction due to loads from transverse bulkhead stringers

1.3.4.1 In way of transverse bulkhead stringer connections, within areas as specified in *Figure 8.1.6*, the equivalent net thickness of plate used for calculation of the hull girder shear strength, t_{str-k}, where the index k refers to the identification number of the stringer, is not to be taken greater than:

$$t_{str-k} = t_{sfc-net50}\left(1 - \frac{\tau_{str}}{\tau_{ij-perm}}\right) \quad \text{mm}$$

Where:

$t_{sfc-net50}$ effective net plating thickness, in mm, as defined in *1.3.3.1* and calculated at the transverse bulkhead for the height corresponding to the level of the stringer

$\tau_{ij-perm}$ permissible hull girder shear stress, τ_{perm}, for plate ij

$= 120/k_{ij}$ N/mm^2

k_{ij} higher strength steel factor, k, for plate ij as defined in *Section 6/1.1.4*

τ_{str} $= \dfrac{Q_{str\text{-}k}}{l_{str} t_{sfc-net50}}$ N/mm²

l_{str} connection length of stringer, in m, see *Figure 8.1.5*

$Q_{str\text{-}k}$ shear force on the longitudinal bulkhead from the stringer in loaded condition with tanks abreast full

$$= 0.8 F_{str\text{-}k}\left(1 - \frac{z_{str} - h_{db}}{h_{blk}}\right) \quad \text{kN}$$

RCN 1 to July 2010 version (effective from 1 July 2012)

$F_{str\text{-}k}$ total stringer supporting force, in kN, as defined in *1.3.4.2*

h_{db} the double bottom height, in m, as shown in *Figure 8.1.6*

h_{blk} height of bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead, as shown in *Figure 8.1.6*

z_{str} the vertical distance from baseline to the considered stringer, in m.

1.3.4.2 The total stringer supporting force, $F_{str\text{-}k}$, in way of a longitudinal bulkhead is to be taken as:

$$F_{str-k} = \frac{P_{str} b_{str} (h_k + h_{k-1})}{2} \quad \text{kN}$$

Where:

P_{str} pressure on stringer, in kN/m², to be taken as: $10h_{tt}$

h_{tt} the height from the top of the tank to the midpoint of the load area between $h_k/2$ below the stringer and $h_{k-1}/2$ above the stringer, in m

h_k the vertical distance from the considered stringer to the stringer below. For the lowermost stringer, it is to be taken as 80 % of the average vertical distance to the inner bottom, in m

h_{k-1} the vertical distance from the considered stringer to the stringer above. For the uppermost stringer, it is to be taken as 80 % of the average vertical distance to the upper deck, in m

b_{str} load breadth acting on the stringer, in m, see *Figure 8.1.7* and *8.1.8*

Figure 8.1.5
Effective Connection Length of Stringer

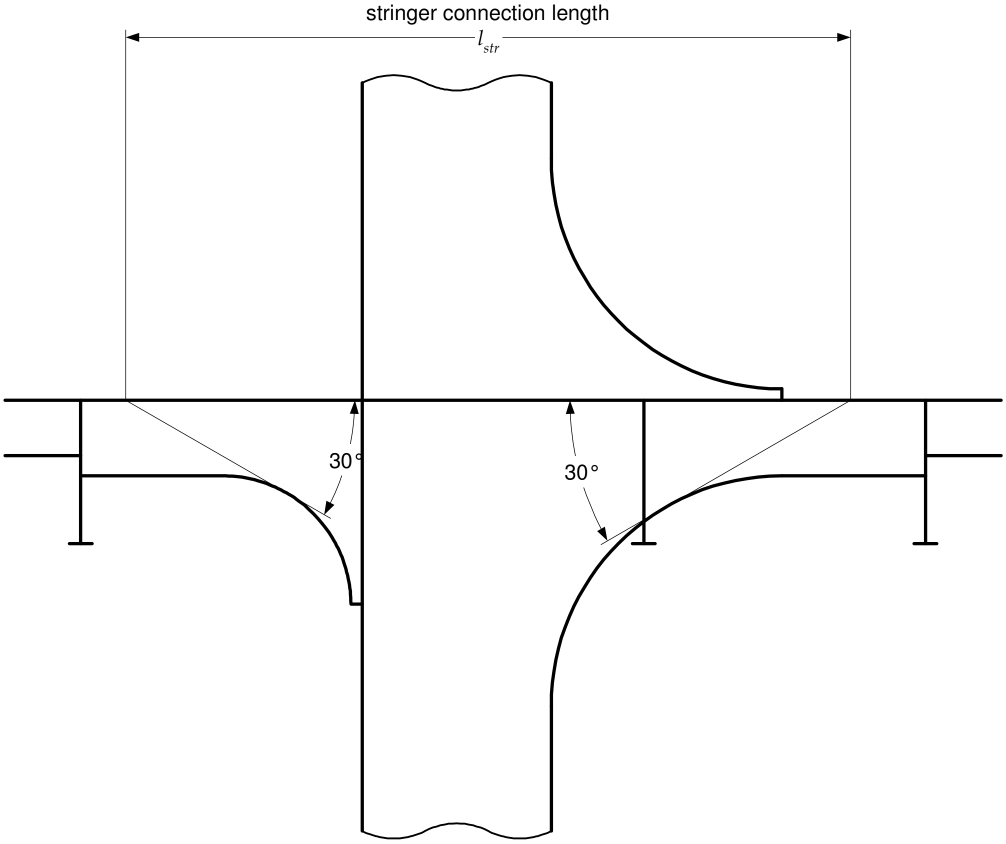


Figure 8.1.6
Region for Stringer Correction, t_{ij}, for a Tanker with Three Stringers

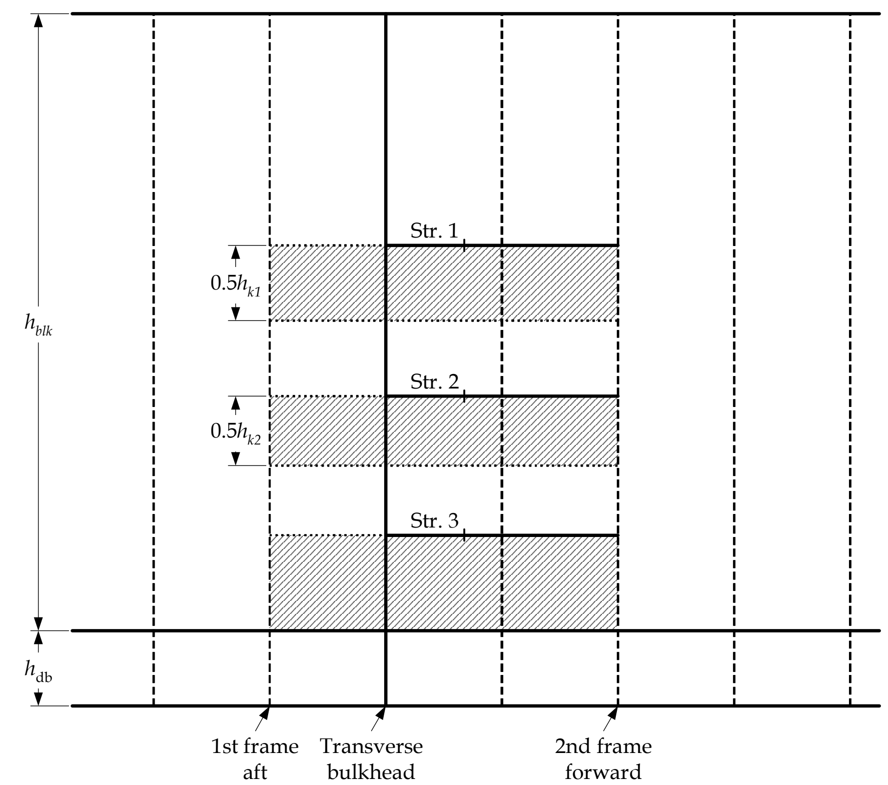

Figure 8.1.7
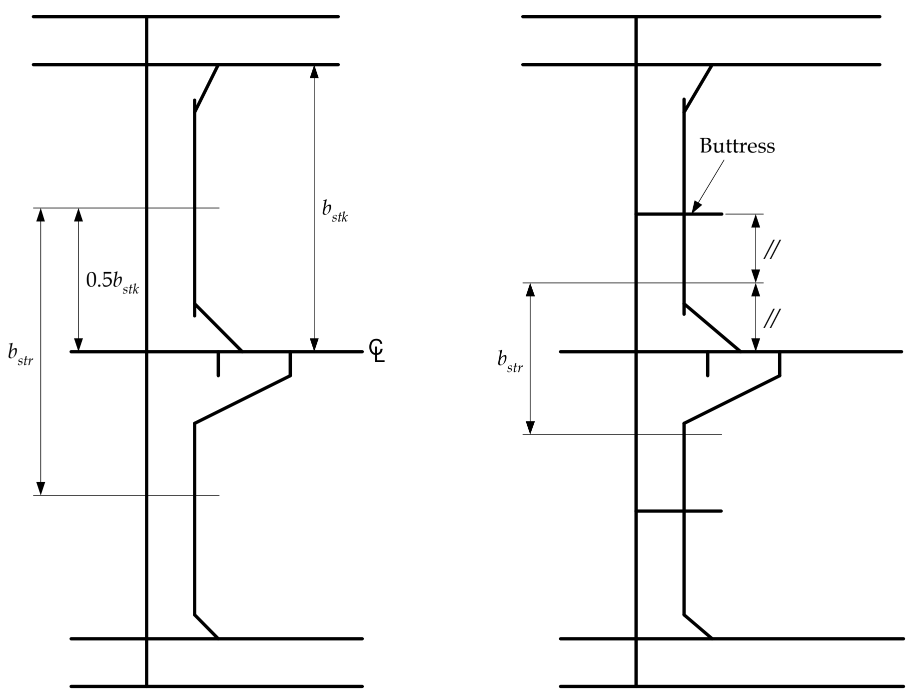
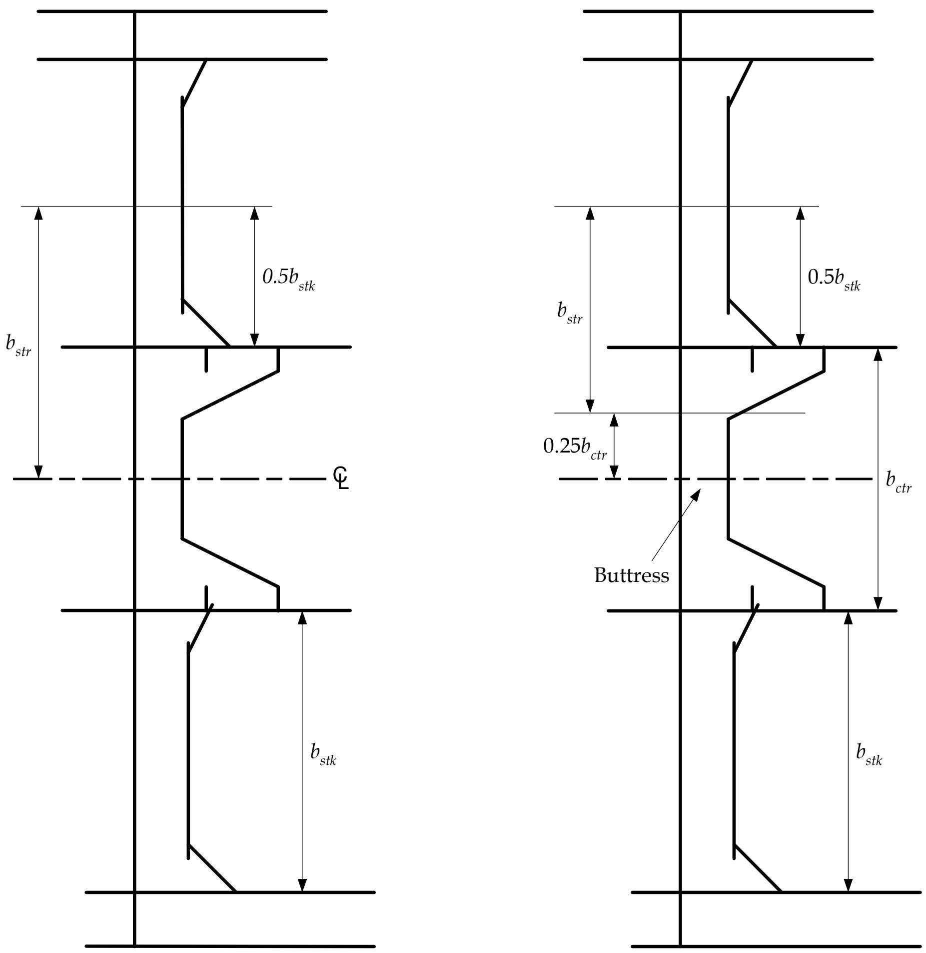
Load Breadth of Stringers for Ships with a Centreline Bulkhead



1.3.4.3 Where reinforcement is provided to meet the above requirement, the reinforced area based on t_{str-k} is to extend longitudinally for the full length of the stringer connection and a minimum of one frame spacing forward and aft of the bulkhead. The reinforced area shall extend vertically from above the stringer level and down to $0.5h_k$ below the stringer, where h_k, the vertical distance from the considered stringer to the stringer below is as defined in *1.3.4.2*. For the lowermost stringer the plate thickness requirement t_{str-k} is to extend down to the inner bottom, see *Figure 8.1.6*.

Figure 8.1.8
Load Breadth of Stringers for Ships with Two Inner Longitudinal Bulkheads



Notes
1. b_{stk} is the breadth of wing cargo tank, in m.
2. b_{ctr} is the breadth of centre cargo tank, in m.

1.4 Hull Girder Buckling Strength

1.4.1 General

1.4.1.1 These requirements apply to plate panels and longitudinals subject to hull girder compression and shear stresses. These stresses are to be based on the permissible values for still water bending and shear forces given in *Section 7/2.1,* and wave bending moments and shear forces given in *Section 7/3.4*.

1.4.1.2 The hull girder buckling strength requirements apply along the full length of the ship, from A.P to F.P.

1.4.1.3 For the purposes of assessing the hull girder buckling strength in this sub-section, the following are to be considered separately:

(a) axial hull girder compressive stress to satisfy requirements in *1.4.2.6* and *1.4.2.8*

(b) hull girder shear stress to satisfy requirements in *1.4.2.7*.

1.4.2 Buckling assessment

1.4.2.1 The buckling assessment of plate panels and longitudinals is to be determined according to *Section 10/3.1* with hull girder stresses calculated on net hull girder sectional properties.

1.4.2.2 The buckling strength for the buckling assessment is to be derived using local net scantlings, t_{net}, as follows:

$$t_{net} = t_{grs} - 1.0t_{corr} \quad \text{mm}$$

Where:

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

1.4.2.3 The hull girder compressive stress due to bending, $\sigma_{hg-net50}$, for the buckling assessment is to be calculated using net hull girder sectional properties and is to be taken as the greater of the following:

$$\sigma_{hg-net50} = \left| \frac{(z - z_{NA-net50})(M_{sw-perm-sea} + M_{wv-v})}{I_{v-net50}} \right| 10^{-3} \quad \text{N/mm}^2$$

$$\sigma_{hg-net50} = \frac{30}{k} \quad \text{N/mm}^2$$

Where:

$M_{sw-perm-sea}$ permissible still water bending moment for seagoing operation, in kNm, as defined in *Section 7/2.1.1,* with signs as given in *1.4.2.4*

M_{wv-v} hogging and sagging vertical wave bending moments, in kNm, as defined in *Section 7/3.4.1*, with signs as given in *1.4.2.4*

M_{wv-v} is to be taken as:

M_{wv-hog} for assessment with the hogging still water bending moment

M_{wv-sag} for assessment with the sagging still water bending moment

z distance from the structural member under consideration to the baseline, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral, in m, see *Figure 8.1.1*

$I_{v-net50}$ net vertical hull girder section moment of inertia, in m^4, as defined in *Section 4/2.6.1.1*

k higher strength steel factor, as defined in *Section 6/1.1.4.1*

1.4.2.4 The sagging bending moment values of $M_{sw-perm-sea}$ and M_{wv-v} are to be taken for members above the neutral axis. The hogging bending moment values are to be taken for members below the neutral axis.

1.4.2.5 The design hull girder shear stress for the buckling assessment, $\tau_{hg-net50}$, is to be calculated based on net hull girder sectional properties and is to be taken as:

$$\tau_{hg-net50} = \left| \left(Q_{sw-perm-sea} + Q_{wv} \right) \left(\frac{1000 q_v}{t_{ij-net50}} \right) \right| \quad \text{N/mm}^2$$

Where:

$Q_{sw-perm-sea}$ positive and negative still water permissible shear force for seagoing operation, in kN, as defined in *Section 7/2.1.3*

Q_{wv} positive or negative vertical wave shear, in kN, as defined in *Section 7/3.4.3.*

Q_{vw} is to be taken as:

Q_{wv-pos} for assessment with the positive permissible still water shear force

Q_{wv-neg} for assessment with the negative permissible still water shear force

$t_{ij-net50}$ net thickness for the plate *ij*, in mm

$= t_{ij-grs} - 0.5 t_{corr}$

t_{ij-grs} gross plate thickness of plate *ij*, in mm. The gross plate thickness for corrugated bulkheads is to be taken as the minimum of t_{w-grs} and t_{f-grs}, in mm

t_{w-grs} gross thickness of the corrugation web, in mm

t_{f-grs} gross thickness of the corrugation flange, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

q_v unit shear per mm for the plate being considered as defined in *1.3.2.2*

Note

1. Maximum of the positive shear (still water + wave) and negative shear (still water + wave) is to be used as the basis for calculation of design shear stress
2. All plate elements ij that contribute to the hull girder shear capacity are to be assessed. See also *Table 8.1.4* and *Figure 8.1.2*
3. The gross rule required thicknesses is to be calculated considering shear force correction.
4. For longitudinal bulkheads between cargo tanks, $t_{ij-net50}$ is to be taken as $t_{sfc-net50}$ and t_{str-k} as appropriate.

RCN 2 to July 2008 version (effective from 1 July 2010)

1.4.2.6 The compressive buckling strength, of plate panels, is to satisfy the following criteria:

$\eta \leq \eta_{allow}$

Where:

η buckling utilisation factor

$\frac{\sigma_{hg-net50}}{\sigma_{cr}}$

$\sigma_{hg-net50}$ hull girder compressive stress based on net hull girder sectional properties, in N/mm² as defined in *1.4.2.3*

σ_{cr} critical compressive buckling stress, σ_{xcr} or σ_{ycr} as appropriate, in N/mm², as specified in *Section 10/3.2.1.3*. The critical compressive buckling stress is to be calculated for the effects of hull girder compressive stress only. The effects of other membrane stresses and lateral pressure are to be ignored. The net thickness given as $t_{grs} - t_{corr}$ as described in *Section 6/3.3.2.2* is to be used for the calculation of σ_{cr}.

η_{allow} allowable buckling utilisation factor:

= 1.0 for plate panels at or above 0.5*D*

= 0.90 for plate panels below 0.5*D*

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

(RCN 1, effective from 1 April 2007)

1.4.2.7 The shear buckling strength, of plate panels, is to satisfy the following criteria:

$\eta \leq \eta_{allow}$

Where:

η buckling utilisation factor

$\frac{\tau_{hg-net50}}{\tau_{cr}}$

$\tau_{hg-net50}$ design hull girder shear stress, in N/mm², as defined in *1.4.2.5*

τ_{cr} critical shear buckling stress, in N/mm², as specified in *Section 10/3.2.1.3*. The critical shear buckling stress is to be calculated for the effects of hull girder shear stress only. The effects of other membrane stresses and lateral pressure are to be ignored. The net thickness given as $t_{grs} - t_{corr}$ as described in *Section 6/3.3.2.2* is to be used for the calculation of τ_{cr}

η_{allow} allowable buckling utilisation factor

= 0.95

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

1.4.2.8 The compressive buckling strength of longitudinal stiffeners is to satisfy the following criteria:

$\eta \leq \eta_{allow}$

Where:

η greater of the buckling utilisation factors given in *Section 10/3.3.2.1* and *Section 10/3.3.3.1*. The buckling utilisation factor is to be calculated for the effects of hull girder compressive stress only. The effects of other membrane stresses and lateral pressure are to be ignored.

η_{allow} allowable buckling utilisation factor:

= 1.0 for stiffeners at or above 0.5D

= 0.90 for stiffeners below 0.5D

(RCN 1, effective from 1 April 2007)

1.5 Hull Girder Fatigue Strength

1.5.1 General

1.5.1.1 The following provides a simplified fatigue control measure against the dynamic hull girder stresses in the longitudinal deck structure.

1.5.1.2 The requirements in *1.5.1.3* are not mandatory, but are recommended to be applied in the early design phase in order to give an indication of the required hull girder section modulus for compliance with the mandatory fatigue requirements specified in *Section 9/3* and *Appendix C*.

1.5.1.3 The fatigue life for the deck structure as required by *Section 9/3* and *Appendix C* is normally satisfied providing the net vertical hull girder section modulus at the moulded deck line at side, $Z_{v\text{-}net50}$, as defined in *Section 4/2.6.1.1*, is not less than the required hull girder section modulus, $Z_{v\text{-}fat}$, defined as:

$$Z_{v-fat} = \frac{M_{wv-hog} - M_{wv-sag}}{1000 R_{al}} \quad \text{m}^3$$

Where:

$M_{wv\text{-}hog}$ hogging vertical wave bending moment for fatigue, in kNm, as defined in *Section 7/3.4.1*

$M_{wv\text{-}sag}$ sagging vertical wave bending moment for fatigue, in kNm, as defined in *Section 7/3.4.1*

R_{al} allowable stress range, in N/mm²

= 0.17L + 86 for class F-details

= 0.15L + 76 for class F2-details

L rule length, in m, as defined in *Section 4/1.1.1.1*

1.6 Tapering and Structural Continuity of Longitudinal Hull Girder Elements

1.6.1 Tapering based on minimum hull girder section property requirements

1.6.1.1 Scantlings of all continuous longitudinal members of the hull girder based on the moment of inertia and section modulus requirements given in *1.2.2* are to be maintained within 0.4L of amidships.

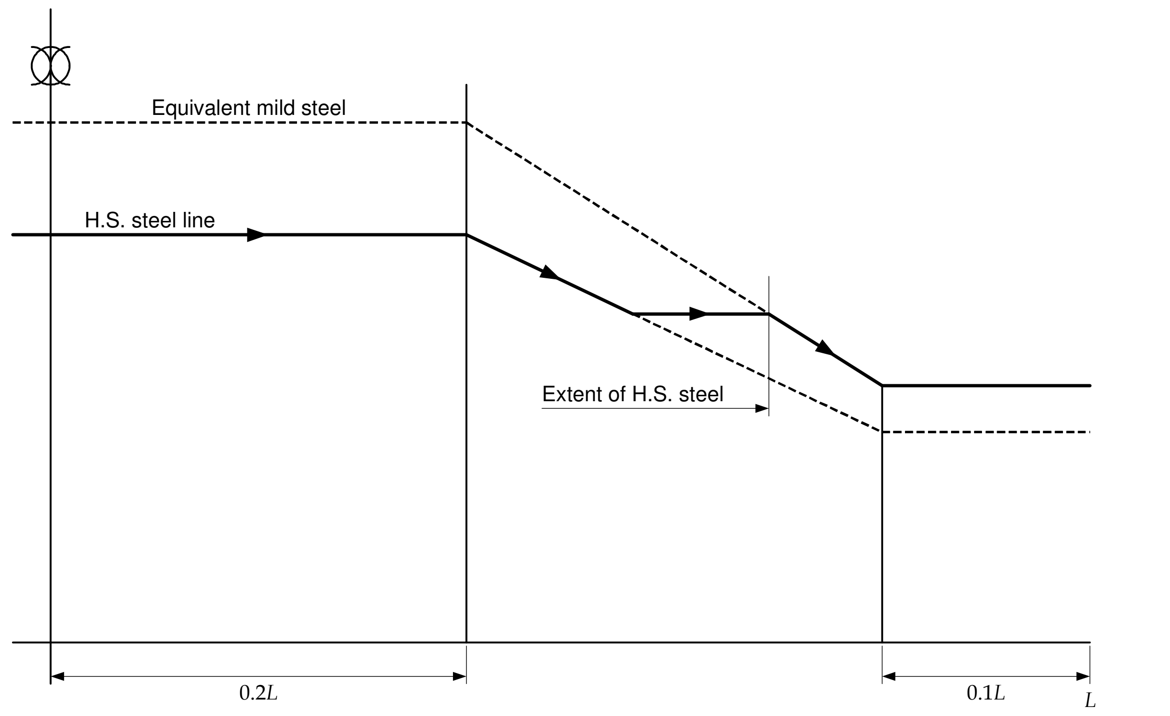
1.6.1.2 Scantlings outside of 0.4L amidships as required by the rule minimum moment of inertia and section modulus as given in *1.2.2* may be gradually reduced to the local

requirements at the ends provided the hull girder bending and buckling requirements, along the full length of the ship, as given in *1.2.3* and *1.4* are complied with. For tapering of higher strength steel, see *1.6.2* and *1.6.3*..

1.6.2 Longitudinal extent of higher strength steel

1.6.2.1 Where used, the application of higher strength steel is to be continuous over the length of the ship up to locations where the longitudinal stress levels are within the allowable range for mild steel structure, see *Figure 8.1.9*.

Figure 8.1.9
Longitudinal Extent of Higher Strength Steel



1.6.3 Vertical extent of higher strength steel

1.6.3.1 The vertical extent of higher strength steel, z_{hts}, used in the deck or bottom and measured from the moulded deck line at side or keel is not to be taken less than the following, see also *Figure 8.1.10*.

$$z_{hts} = z_1\left(1-\frac{\sigma_{perm}}{\sigma_1}\right) \quad \text{m}$$

RCN 1 to July 2010 version (effective from 1 July 2012)

Where:

z_1 distance from horizontal neutral axis to moulded deck line or keel respectively, in m

σ_1 to be taken as σ_{dk} or σ_{kl} for the hull girder deck and keel respectively, in N/mm²

σ_{dk} hull girder bending stress at moulded deck line given by:

$$= \frac{\left|M_{sw-perm-sea} + M_{wv-v}\right|}{I_{v-net50}}(z_{dk-side} - z_{NA-net50})\cdot 10^{-3} \quad \text{N/mm}^2$$

σ_{kl} hull girder bending stress at keel given by:

$$= \frac{\left|M_{sw-perm-sea} + M_{wv-v}\right|}{I_{v-net50}} (z_{NA-net50} - z_{kl}) \cdot 10^{-3} \quad \text{N/mm}^2$$

σ_{perm} permissible hull girder bending stress as given in Table 8.1.3 for design load combination S+D, in N/mm^2

RCN 1 to July 2010 version (effective from 1 July 2012)

$M_{sw-perm-sea}$ permissible hull girder still water bending moment for seagoing operation, in kNm, as defined in *Section 7/2.1.1*

M_{wv-v} hogging and sagging vertical wave bending moments, in kNm, as defined in *Section 7/3.4.1*

M_{wv-v} is to be taken as:

M_{wv-hog} for assessment with respect to hogging vertical wave bending moment

M_{wv-sag} for assessment with respect to sagging vertical wave bending moment

$I_{v-net50}$ net vertical hull girder moment of inertia, in m^4, as defined in *Section 4/2.6.1.1*

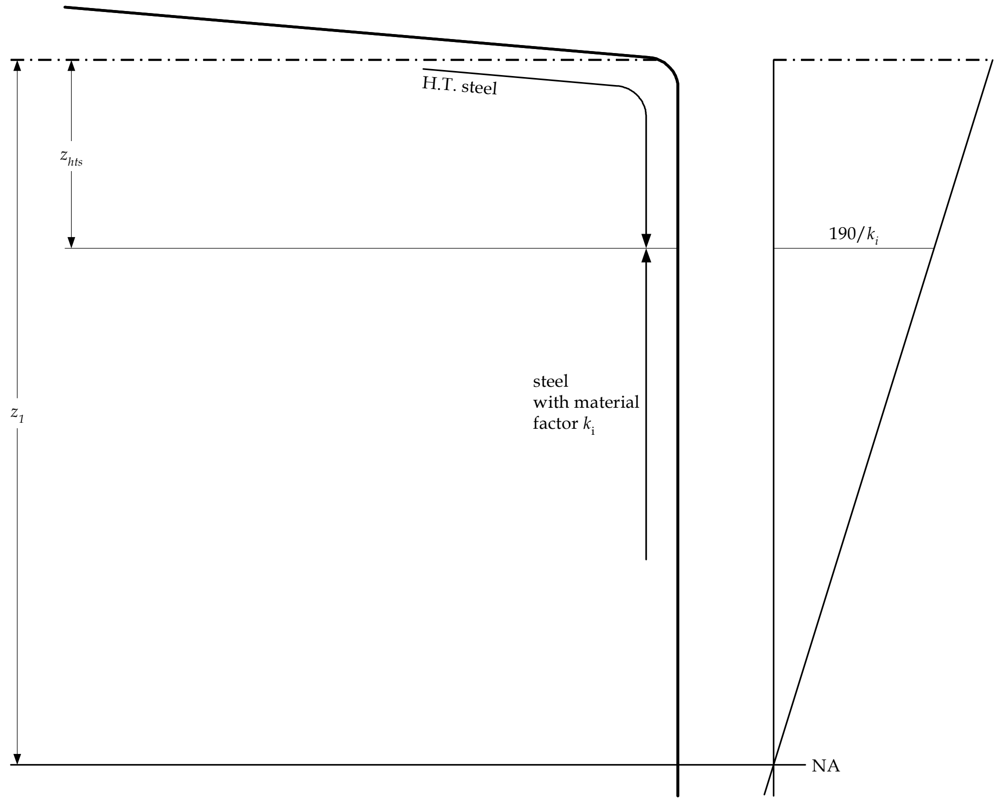
$z_{dk-side}$ distance from baseline to moulded deck line at side, in m

z_{kl} vertical distance from the baseline to the keel, in m

$z_{NA-net50}$ distance from baseline to horizontal neutral axis, in m

k_i higher strength steel factor for the area i defined in *Figure 8.1.10*. The factor, k, is defined in *Section 6/1.1.4*

Figure 8.1.10
Vertical Extent of Higher Strength Steel



1.6.4 Tapering of plate thickness due to hull girder shear requirement

1.6.4.1 Longitudinal tapering of shear reinforcement is permitted, provided that for any longitudinal position the requirements given in *1.3.2* are complied with. Control of the shear strength at intermediate positions is to be carried out by linear interpolation of permissible shear limits at the bulkhead and in the middle of the tank.

1.6.5 Structural continuity of longitudinal bulkheads

1.6.5.1 Suitable scarphing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes. In particular longitudinal bulkheads are to be terminated at an effective transverse bulkhead and large transition brackets shall be fitted in line with the longitudinal bulkhead.

1.6.6 Structural continuity of longitudinal stiffeners

1.6.6.1 Where longitudinal stiffeners terminate, and are replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover.

1.6.6.2 Where a deck longitudinal stiffener is cut, in way of an opening, compensation is to be arranged to ensure structural continuity of the area. The compensation area is to extend well beyond the forward and aft end of the opening and not be less than the area of the longitudinal that is cut. Stress concentration in way of the stiffener termination and the associated buckling strength of the plate and panel are to be considered.

2 CARGO TANK REGION

2.1 General

2.1.1 Application

2.1.1.1 The requirements of this Sub-Section apply to the hull structure within the cargo tank region of the ship, for the shell, deck, inner bottom and bulkhead plating, stiffeners and primary support members.

2.1.2 Basis of scantlings

2.1.2.1 The net scantlings described in this Sub-Section are related to gross scantlings as follows:

(a) for application of the minimum thickness requirements specified in *2.1.5* and *2.1.6*, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*

(b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*

(c) for primary support members, the gross shear area, gross section modulus, and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion addition specified in *Section 6/3*

(d) for application of the buckling requirements of *Section 10/3*, the gross thickness and gross cross-sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

2.1.3 Evaluation of scantlings

2.1.3.1 The following scantling requirements are based on the assumption that all structural joints and welded details are designed and fabricated, such that they are to be compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details during the design of highly stressed regions are to be considered. Structural design details are to comply with the requirements given in *Section 4/3*.

2.1.3.2 The scantlings are to be assessed to ensure that the strength criteria are satisfied at all longitudinal positions, where applicable.

2.1.3.3 Local scantling increases are to be applied where applicable to cover local variations, such as increased spacing, increased stiffener spans and green sea pressure loads. Local scantling increases may also be required to cover fore end strengthening requirements, see *Section 8/3*.

2.1.4 General scantling requirements

2.1.4.1 The hull structure is to comply with the applicable requirements of:

(a) hull girder longitudinal strength, see *Section 8/1*

(b) strength against sloshing and impact loads, see *Section 8/6*

(c) hull girder ultimate strength, see *Section 9*

(d) strength assessment (FEM), see *Section 9*

(e) fatigue strength, see Section 9/3

(f) buckling and ultimate strength, see *Section 10.*

2.1.4.2 The net section modulus, shear areas and other sectional properties of the local and primary support members are to be determined in accordance with *Section 4/2*.

2.1.4.3 The section modulus, shear areas and other sectional properties of the local and primary support members apply to the areas clear of the end brackets.

2.1.4.4 The spans of the local and primary support members are defined in *Section 4/2.1*.

2.1.4.5 The moments of inertia for the primary support members are to be determined in association with the effective attached plating at the mid span as specified in *Section 4/2.3.2.3*.

2.1.4.6 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure the free flow to the suction pipes and escape of air to the vents. See also *Section 4/3*.

2.1.4.7 All shell frames and tank boundary stiffeners are in general to be continuous, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4* and *4/3.2.5*.

2.1.4.8 Enlarged stiffeners (with or without web stiffening) used for Permanent Means of Access (PMA) are to comply with the following requirements:

a) Buckling strength including proportion (slenderness ratio) requirements for primary support members as follows:

- For stiffener web, see *Section 10/2.3.1.1 (a), 10/3.2.*
- For stiffener flange, see *Section 10/2.3.1.1 (b), 10/2.3.3.1.*
- For web stiffeners, see *Section 10/2.3.2.1, 10/2.3.2.2, 10/3.3.*

Note: Note 1 of table 10.2.1 is not applicable.

b) Buckling strength of longitudinal PMA platforms without web stiffeners may also be ensured using the criteria for local support members in *Section 10/2.2* and *Section 10/3.3,* including Note 1 of *Table 10.2.1,* provided shear buckling strength of web is verified in line with *Section 10/3.2.*

c) All other requirements for local support members as follows:

- Corrosion additions: requirements for local support members
- Minimum thickness: requirements for local support members
- Fatigue: requirements for local support members

Note: For primary support members (or part of it) used as a PMA platform the requirements for primary support members are to be applied.

2.1.5 Minimum thickness for plating and local support members

2.1.5.1 The thickness of plating and stiffeners in the cargo tank region is to comply with the appropriate minimum thickness requirements given in *Table 8.2.1*.

Table 8.2.1
Minimum Net Thickness for Plating and Local Support Members in the Cargo Tank Region

Scantling Location			Net Thickness (mm)
Plating	**Shell**	Keel plating	$6.5+0.03L_2$
		Bottom shell/bilge/side shell	$4.5+0.03L_2$
	Upper Deck		$4.5+0.02L_2$
	Other structure	Hull internal tank boundaries	$4.5+0.02L_2$
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	$4.5+0.01L_2$
Local support members	Local support members on tight boundaries		$3.5+0.015L_2$
	Local support members on other structure		$2.5+0.015L_2$
Tripping brackets			$5.0+0.015L_2$

Where:
L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

RCN 1 to July 2008 version (effective from 1 February 2010)

2.1.6 Minimum thickness for primary support members

2.1.6.1 The thickness of web plating and face plating of primary support members in the cargo tank region is to comply with the appropriate minimum thickness requirements given in *Table 8.2.2*.

Table 8.2.2
Minimum Net Thickness for Primary Support Members in Cargo Tank Region

Scantling Location	Net Thickness (mm)
Double bottom centreline girder	$5.5+0.025L_2$
Other double bottom girders	$5.5+0.02L_2$
Double bottom floors, web plates of side transverses and stringers in double hull	$5.0+0.015L_2$
Web and flanges of vertical web frames on longitudinal bulkheads, horizontal stringers on transverse bulkhead, deck transverses (above and below upper deck) and cross ties.	$5.5+0.015L_2$

Where:
L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

2.2 Hull Envelope Plating

2.2.1 Keel plating

2.2.1.1 Keel plating is to extend over the flat of bottom for the complete length of the ship. The breadth, b_{kl}, is not to be less than:

$$b_{kl} = 800 + 5L_2 \quad \text{mm}$$

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but not to be taken greater than 300m

2.2.1.2 The thickness of the keel plating is to comply with the requirements given in *2.2.2*.

2.2.2 Bottom shell plating

2.2.2.1 The thickness of the bottom shell plating is to comply with the requirements in *Table 8.2.4*.

2.2.3 Bilge plating

2.2.3.1 The thickness of bilge plating is not to be less than that required for the adjacent bottom shell, see *2.2.2.1,* or adjacent side shell plating, see *2.2.4.1*, whichever is the greater.

2.2.3.2 The net thickness of bilge plating, t_{net}, without longitudinal stiffening is not to be less than:

$$t_{net} = \frac{\sqrt[3]{r^2 S_t P_{ex}}}{100} \quad \text{mm}$$

Where:

P_{ex} design sea pressure for the design load set 1 calculated at the lower turn of bilge, in kN/m²

r effective bilge radius

$= r_0 + 0.5(a+b)$ mm

r_0 radius of curvature, in mm. See *Figure 8.2.1*

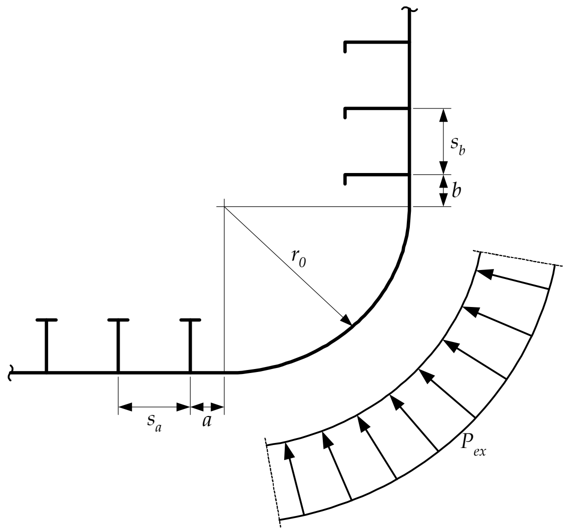
S_t distance between transverse stiffeners, webs or bilge brackets, in m

a distance between the lower turn of bilge and the outermost bottom longitudinal, in mm, see *Figure 8.2.1* and *2.3.1.2*. Where the outermost bottom longitudinal is within the curvature, this distance is to be taken as zero.

b distance between the upper turn of bilge and the lowest side longitudinal, in mm, see *Figure 8.2.1* and *2.3.1.2*. Where the lowest side longitudinal is within the curvature, this distance is to be taken as zero.

Where plate seam is located in the straight plate just below the lowest stiffener on the side shell, any increased thickness required for the bilge plating does not have to extend to the adjacent plate above the bilge provided that the plate seam is not more than $s_b/4$ below the lowest side longitudinal. Similarly for flat part of adjacent bottom plating, any increased thickness for the bilge plating does not have to be applied provided that the plate seam is not more than $s_a/4$ beyond the outboard bottom longitudinal. Regularly longitudinally stiffened bilge plating is to be assessed as a stiffened plate. The bilge keel is not considered as “longitudinal stiffening” for the application of this requirement.

Figure 8.2.1
Unstiffened Bilge Plating



2.2.3.3 Where bilge longitudinals are omitted, the bilge plate thickness outside 0.4L amidships will be considered in relation to the support derived from the hull form and internal stiffening arrangements. In general, outside of 0.4L amidships the bilge plate scantlings and arrangement are to comply with the requirements of ordinary side or bottom shell plating in the same region. Consideration is to be given where there is increased loading in the forward region.

2.2.4 Side shell plating

2.2.4.1 The thickness of the side shell plating is to comply with the requirements in *Table 8.2.4*.

2.2.4.2 The net thickness, t_{net}, of the side plating within the range as specified in *2.2.4.3* is not to be less than:

$$t_{net} = 26\left(\frac{s}{1000}+0.7\right)\left(\frac{BT_{sc}}{\sigma_{yd}^{\ 2}}\right)^{0.25} \quad \text{mm}$$

Where:

s	stiffener spacing, in mm, as defined in *Section 4/2.2*
B	moulded breadth, in m as defined in *Section 4/1.1.3.1*
T_{sc}	scantling draught, in m, as defined in *Section 4/1.1.5.5*
σ_{yd}	specified minimum yield stress of the material, in N/mm^2

2.2.4.3 The thickness in *2.2.4.2* is to be applied to the following extent of the side shell plating, see *Figure 8.2.2*:

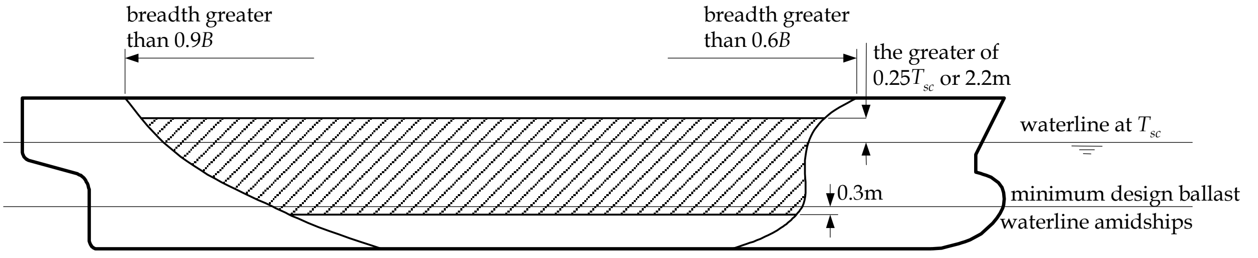
(a) longitudinal extent:

- between a section aft of amidships where the breadth at the waterline exceeds 0.9B, and a section forward of amidships where the breadth at the waterline exceeds 0.6B

(b) vertical extent:

- between 300mm below the minimum design ballast waterline, T_{bal}, amidships to 0.25T_{sc} or 2.2m, whichever is greater, above the draught T_{sc}.

Figure 8.2.2
Extent of Side Shell Plating



2.2.5 Sheer strake

2.2.5.1 The sheer strake is to comply with the requirements in *2.2.4*.

2.2.5.2 The welding of deck fittings to rounded sheer strakes is to be avoided within 0.6*L* of amidships.

2.2.5.3 Where the sheer strake extends above the deck stringer plate, the top edge of the sheer strake is to be kept free from notches and isolated welded fittings, and is to be smooth with rounded edges Grinding may be required if the cutting surface is not smooth. Drainage openings with a smooth transition in the longitudinal direction may be permitted.

2.2.6 Deck plating

2.2.6.1 The thickness of the deck plating is to comply with the requirements given in *Table 8.2.4*.

2.3 Hull Envelope Framing

2.3.1 General

2.3.1.1 The bottom shell, inner bottom and deck are to be longitudinally framed in the cargo tank region. The side shell, inner hull bulkheads and longitudinal bulkheads are generally to be longitudinally framed. Where the side shell is longitudinally framed, the inner hull bulkheads are to be similarly constructed. Suitable alternatives which take account of resistance to buckling will be specially considered.

2.3.1.2 Where longitudinals are omitted in way of the bilge, a longitudinal is to be fitted at the bottom and at the side close to the position where the curvature of the bilge plate starts. The distance between the lower turn of bilge and the outermost bottom longitudinal, *a*, is generally not to be greater than one-third of the spacing between the two outermost bottom longitudinals, s_a. Similarly, the distance between the upper turn of the bilge and the lowest side longitudinal, *b*, is generally not to be greater than one-third of the spacing between the two lowest side longitudinals, s_b. *See Figure 8.2.1*.

(RCN 2, effective from 1 July 2008)

2.3.1.3 The longitudinals are to comply with the requirements of continuity given in *Section 4/3.2*.

2.3.2 Scantling criteria

2.3.2.1 The section modulus, and thickness, of the hull envelope framing is to comply with the requirements given in *Tables 8.2.5* and *8.2.6*.

2.3.2.2 Where the side shell longitudinal or the vertical stiffener is inclined to the longitudinal or vertical axis, respectively, the span is to be taken in accordance with *Section 4/2.1.3*.

2.3.2.3 For curved stiffeners, the span is to be taken in accordance with *Section 4/2.1.3*.

2.4 Inner Bottom

2.4.1 Inner bottom plating

2.4.1.1 The thickness of the inner bottom plating is to comply with the requirements given in *Table 8.2.4*.

2.4.1.2 In way of a welded hopper knuckle, the inner bottom is to be scarfed to ensure adequate load transmission to surrounding structure and reduce stress concentrations.

2.4.1.3 In way of corrugated bulkhead stools, where fitted, particular attention is to be given to the through-thickness properties, and arrangements for continuity of strength, at the connection of the bulkhead stool to the inner bottom. For requirements for plates with specified through-thickness properties, see *Section 6/1.1.5*.

2.4.2 Inner bottom longitudinals

2.4.2.1 The section modulus and web plate thickness of the inner bottom longitudinals are to comply with the requirements given in *Tables 8.2.5* and *8.2.6*.

2.5 Bulkheads

2.5.1 General

2.5.1.1 The inner hull and longitudinal bulkheads are generally to be longitudinally framed, and plane. Corrugated bulkheads are to comply with the requirements given in *2.5.6*.

2.5.1.2 Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way are to be adequate for the loads imparted to the bulkheads by the hydraulic forces in the pipes.

2.5.2 Longitudinal tank boundary bulkhead plating

2.5.2.1 The thickness of the longitudinal tank boundary bulkhead plating is to comply with the requirements given in *Table 8.2.4*.

2.5.2.2 Inner hull and longitudinal bulkheads are to extend as far forward and aft as practicable and are to be effectively scarfed into the adjoining structure.

2.5.3 Hopper side structure

2.5.3.1 Knuckles in the hopper tank plating are to be supported by side girders and stringers, or by a deep longitudinal.

2.5.4 Transverse tank boundary bulkhead plating

2.5.4.1 The thickness of the transverse tank boundary bulkhead plating is to comply with the requirements given in *Table 8.2.4*.

2.5.5 Tank boundary bulkhead stiffeners

2.5.5.1 The section modulus and web thickness of stiffeners, on longitudinal or transverse tank boundary bulkheads, are to comply with the requirements given in *Tables 8.2.5* and *8.2.6*.

2.5.6 Corrugated bulkheads

2.5.6.1 The scantling requirements relating to corrugated bulkheads defined in *2.5.6* and *2.5.7* are net requirements. The gross scantling requirements are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

2.5.6.2 In general, corrugated bulkheads are to be designed with the corrugation angles, ϕ, between 55 and 90 degrees, see *Figure 8.2.3*.

2.5.6.3 The global strength of corrugated bulkheads, lower stools and upper stools, where fitted, and attachments to surrounding structures are to be verified with the cargo tank FEM model in the midship region, see *Section 9/2*. The global strength of corrugated bulkheads outside of midship region are to be considered based on results from the cargo tank FEM model and using the appropriate pressure for the bulkhead being considered. Additional FEM analysis of cargo tank bulkheads forward and aft of the midship region may be necessary if the bulkhead geometry, structural details and support arrangement details differ significantly from bulkheads within the mid cargo tank region.

2.5.6.4 The net thicknesses, t_{net}, of the web and flange plates of corrugated bulkheads are to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$t_{net} = 0.0158\, b_p \sqrt{\frac{|P|}{C_a\, \sigma_{yd}}} \quad \text{mm}$$

Where:

P design pressure for the design load set being considered, calculated at the load point defined in *Section 3/5.1*, in kN/m²

b_p breadth of plate:

= b_f for flange plating, in mm. See *Figure 8.2.3*

= b_w for web plating, in mm. See *Figure 8.2.3*

C_a permissible bending stress coefficient:

= 0.75 for acceptance criteria set AC1

= 0.90 for acceptance criteria set AC2

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.5.6.5 Where the corrugated bulkhead is built with flange and web plate of different thickness, then the thicker net plating thickness, $t_{m\text{-}net}$, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$t_{m-net} = \sqrt{\frac{0.0005\, b_p^{\,2}\, |P|}{C_a\, \sigma_{yd}} - t_{n-net}^{\,2}} \quad \text{mm}$$

Where:

t_{n-net} net thickness of the thinner plating, either flange or web, in mm

b_p breadth of thicker plate, either flange or web, in mm

P design pressure for the design load set being considered, calculated at the load point defined in *Section 3/5.1*, in kN/m²

C_a permissible bending stress coefficient:

= 0.75 for acceptance criteria set AC1

= 0.90 for acceptance criteria set AC2

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.5.7 Vertically corrugated bulkheads

2.5.7.1 In addition to the requirements of *2.5.6*, vertically corrugated bulkheads are also to comply with the requirements of *2.5.7*.

2.5.7.2 The net plate thicknesses as required by *2.5.7.5* and *2.5.7.6* are to be maintained for two thirds of the corrugation length, l_{cg}, from the lower end, where l_{cg} is as defined in *2.5.7.3*. Above that, the net plate thickness may be reduced by 20%.

2.5.7.3 The net web plating thickness of the lower 15% of the corrugation, t_{w-net}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool, see *2.5.7.9*.

$$t_{w-net} = \frac{1000\left|Q_{cg}\right|}{d_{cg}\, C_{t-cg}\, \tau_{yd}} \quad \text{mm}$$

Where:

Q_{cg} design shear force imposed on the web plating at the lower end of the corrugation

$$= \frac{s_{cg}\, l_{cg}\, |3P_l + P_u|}{8000} \quad \text{kN}$$

P_l design pressure for the design load set being considered, calculated at the lower end of the corrugation, in kN/m²

P_u design pressures for the design load set being considered, calculated at the upper end of the corrugation, in kN/m²

s_{cg} spacing of corrugation, in mm. See *Figure 8.2.3*

l_{cg} length of corrugation, which is defined as the distance between the lower stool and the upper stool or the upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

d_{cg} depth of corrugation, in mm. See *2.5.7.4* and *Figure 8.2.3*

C_{t-cg} permissible shear stress coefficient

= 0.75 for acceptance criteria set AC1

= 0.90 for acceptance criteria set AC2

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.5.7.4 The depth of the corrugation, d_{cg}, is not to be less than:

$$d_{cg} = \frac{1000\, l_{cg}}{15} \quad \text{mm}$$

Where:

l_{cg} length of corrugation, which is defined as the distance between the lower stool or the inner bottom if no lower stool is fitted and the upper stool or the upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

2.5.7.5 The net thicknesses of the flanges of corrugated bulkheads, $t_{f\text{-}net}$, for two thirds of the corrugation length from the lower end are to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool, see *2.5.7.9*.

$$t_{f-net} = \frac{0.00657\, b_f \sqrt{\sigma_{bdg-max}}}{C_f} \quad \text{mm}$$

Where:

$\sigma_{bdg\text{-}max}$ maximum value of the vertical bending stresses in the flange. The bending stress is to be calculated at the lower end and at the mid span of the corrugation length

$= \dfrac{1000 M_{cg}}{Z_{cg-act-net}}$ N/mm²

M_{cg} as defined in *2.5.7.6*

$Z_{cg\text{-}act\text{-}net}$ actual net section modulus at the lower end and at the mid length of the corrugation, in cm³

b_f breadth of flange plating, in mm. See *Figure 8.2.3*

b_w breadth of web plating, in mm. See *Figure 8.2.3*

C_f coefficient

$= 7.65 - 0.26 \left(\dfrac{b_w}{b_f}\right)^2$

2.5.7.6 The net section modulus at the lower and upper ends and at the mid length of the corrugation ($l_{cg}/2$) of a unit corrugation, $Z_{cg\text{-}net}$, are to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by the following.

RCN 2 to July 2008 version (effective from 1 July 2010)

$$Z_{cg-net} = \frac{1000\,M_{cg}}{C_{s-cg}\,\sigma_{yd}} \quad \text{cm}^3$$

Where:

M_{cg} $= \dfrac{C_i |P| s_{cg}\, l_o^{\,2}}{12000}$ kNm

P $= \dfrac{P_u + P_l}{2}$ kN/m²

P_l, P_u design pressure for the design load set being considered, calculated at the lower and upper ends of the corrugation, respectively, in kN/m²:

(a) for transverse corrugated bulkheads, the pressures are to be calculated at a section located at $b_{tk}/2$ from the longitudinal bulkheads of each tank

(b) for longitudinal corrugated bulkheads, the pressures are to be calculated at the ends of the tank, i.e., the intersection of the forward and aft transverse bulkheads and the longitudinal bulkhead

b_{tk} maximum breadth of tank under consideration measured at the bulkhead, in m

s_{cg} spacing of corrugation, in mm. See *Figure 8.2.3*

l_o effective bending span of the corrugation, measured from the mid depth of the lower stool to the mid depth of the upper stool, or upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

l_{cg} length of corrugation, which is defined as the distance between the lower stool and the upper stool or the upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

C_i the relevant bending moment coefficients as given in *Table 8.2.3*

C_{s-cg} permissible bending stress coefficient

at the mid length of the corrugation length, l_{cg}:

= c_e, but not to be taken as greater than 0.75 for acceptance criteria set AC1

= c_e, but not to be taken as greater than 0.90 for acceptance criteria set AC2

at the lower and upper ends of corrugation length, l_{cg}:

= 0.75 for acceptance criteria set AC1

= 0.90 for acceptance criteria set AC2

c_e $= \dfrac{2.25}{\beta} - \dfrac{1.25}{\beta^2}$ for $\beta \geq 1.25$

= 1.0 for $\beta < 1.25$

β $= \dfrac{b_f}{t_{f-net}} \sqrt{\dfrac{\sigma_{yd}}{E}}$

b_f breadth of flange plating, in mm, see *Figure 8.2.3*

$t_{f\text{-}net}$ net thickness of the corrugation flange, in mm

E modulus of elasticity, in N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.2.3
Values of C_i

Bulkhead	**At lower end of l_{cg}**	**At mid length of l_{cg}**	**At upper end of l_{cg}**
Transverse Bulkhead	C_1	C_{m1}	$0.65C_{m1}$
Longitudinal Bulkhead	C_3	C_{m3}	$0.65C_{m3}$

Where:

C_1 $= a_1 + b_1\sqrt{\dfrac{A_{dt}}{b_{dk}}}$ but is not to be taken as less than 0.60

$= a_1 - b_1\sqrt{\dfrac{A_{dt}}{b_{dk}}}$ for transverse bulkhead with no lower stool, but is not to be taken as less than 0.55

a_1 $= 0.95 - \dfrac{0.41}{R_{bt}}$

= 1.0 for transverse bulkhead with no lower stool

b_1 $= -0.20 + \dfrac{0.078}{R_{bt}}$

= 0.13 for transverse bulkhead with no lower stool

C_{m1} $= a_{m1} + b_{m1}\sqrt{\dfrac{A_{dt}}{b_{dk}}}$ but is not to be taken as less than 0.55

$= a_{m1} - b_{m1}\sqrt{\dfrac{A_{dt}}{b_{dk}}}$ for transverse bulkhead with no lower stool, but is not to be taken as less than 0.60

a_{m1} $= 0.63 + \dfrac{0.25}{R_{bt}}$

= 0.85 for transverse bulkhead with no lower stool

b_{m1} $= -0.25 - \dfrac{0.11}{R_{bt}}$

= 0.34 for transverse bulkhead with no lower stool

C_3 $= a_3 + b_3\sqrt{\dfrac{A_{dl}}{l_{dk}}}$ but is not to be taken as less than 0.60

$= a_3 - b_3\sqrt{\dfrac{A_{dl}}{l_{dk}}}$ for longitudinal bulkhead with no lower stool, but is not to be taken as less than 0.55

a_3 $= 0.86 - \dfrac{0.35}{R_{bl}}$

= 1.0 for longitudinal bulkhead with no lower stool

RCN 1 to July 2010 version (effective from 1 July 2012)

Table 8.2.3 (Continued)
Values of C_i

b_3	$= -0.17 + \frac{0.10}{R_{bl}}$	
	$= 0.13$	for longitudinal bulkhead with no lower stool
C_{m3}	$= a_{m3} + b_{m3}\sqrt{\frac{A_{dl}}{l_{dk}}}$	but is not to be taken as less than 0.55
	$= a_{m3} - b_{m3}\sqrt{\frac{A_{dl}}{l_{dk}}}$	for longitudinal bulkhead with no lower stool, but is not to be taken as less than 0.60
a_{m3}	$= 0.32 + \frac{0.24}{R_{bl}}$	
	$= 0.85$	for longitudinal bulkhead with no lower stool
b_{m3}	$= -0.12 - \frac{0.10}{R_{bl}}$	
	$= 0.19$	for longitudinal bulkhead with no lower stool
R_{bt}	$= \frac{A_{bt}}{b_{ib}}\left(1+\frac{l_{ib}}{b_{ib}}\right)\left(1+\frac{b_{av-t}}{h_{st}}\right)$	for transverse bulkheads
R_{bl}	$= \frac{A_{bl}}{l_{ib}}\left(1+\frac{l_{ib}}{b_{ib}}\right)\left(1+\frac{b_{av-l}}{h_{sl}}\right)$	for longitudinal bulkheads
A_{dt}	cross sectional area enclosed by the moulded lines of the transverse bulkhead upper stool, in m^2 = 0 if no upper stool is fitted	
A_{dl}	cross sectional area enclosed by the moulded lines of the longitudinal bulkhead upper stool, in m^2 = 0 if no upper stool is fitted	
A_{bt}	cross sectional area enclosed by the moulded lines of the transverse bulkhead lower stool, in m^2	
A_{bl}	cross sectional area enclosed by the moulded lines of the longitudinal bulkhead lower stool, in m^2	
b_{av-t}	average width of transverse bulkhead lower stool, in m. See *Figure 8.2.3*	
b_{av-l}	average width of longitudinal bulkhead lower stool, in m. See *Figure 8.2.3*	
h_{st}	height of transverse bulkhead lower stool, in m. See *Figure 8.2.3*	
h_{sl}	height of longitudinal bulkhead lower stool, in m. See *Figure 8.2.3*	
b_{ib}	breadth of cargo tank at the inner bottom level between hopper tanks, or between the hopper tank and centreline lower stool, in m. See *Figure 8.2.3*	
b_{dk}	breadth of cargo tank at the deck level between upper wing tanks, or between the upper wing tank and centreline deck box or between the corrugation flanges if no upper stool is fitted, in m. See *Figure 8.2.3*	
l_{ib}	length of cargo tank at the inner bottom level between transverse lower stools, in m. See *Figure 8.2.3*	
l_{dk}	length of cargo tank at the deck level between transverse upper stools or between the corrugation flanges if no upper stool is fitted, in m. See *Figure 8.2.3*	

RCN 2 to July 2008 version (effective from 1 July 2010)
RCN 1 to July 2010 version (effective from 1 July 2012)

2.5.7.7 For tanks with effective sloshing breadth, b_{slh}, greater than $0.56B$ or effective sloshing length l_{slh}, greater than $0.13L$, additional sloshing analysis is to be carried out to assess the section modulus of the unit corrugation in accordance with the requirements of the individual Classification Society.

2.5.7.8 For ships with a moulded depth, see *Section 4/1.1.4*, equal to or greater than 16m, a lower stool is to be fitted in compliance with the following requirements:

(a) general:

- the height and depth are not to be less than the depth of the corrugation
- the lower stool is to be fitted in line with the double bottom floors or girders
- the side stiffeners and vertical webs (diaphragms) within the stool structure are to align with the structure below, as far as is practicable, to provide appropriate load transmission to structures within the double bottom.

(b) stool top plating:

- the net thickness of the stool top plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation
- the extension of the top plate beyond the corrugation is not to be less than the as-built flange thickness of the corrugation.

(c) stool side plating and internal structure:

- within the region of the corrugation depth from the stool top plate the net thickness of the stool side plate is not to be less than 90% of that required by *2.5.7.2* for the corrugated bulkhead flange at the lower end and is to be of at least the same material yield strength
- the net thickness of the stool side plating and the net section modulus of the stool side stiffeners is not to be less than that required by *2.5.2*, *2.5.4* and *2.5.5* for transverse or longitudinal bulkhead plating and stiffeners
- the ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool
- continuity is to be maintained, as far as practicable, between the corrugation web and supporting brackets inside the stool. The bracket net thickness is not to be less than 80% of the required thickness of the corrugation webs and is to be of at least the same material yield strength
- scallops in the diaphragms in way of the connections of the stool sides to the inner bottom and to the stool top plate are not permitted.

2.5.7.9 For ships with a moulded depth, see *Section 4/1.1.4,* less than 16m, the lower stool may be eliminated provided the following requirements, in addition to the requirements of *2.5.7.6*, are complied with:

RCN 2 to July 2008 version (effective from 1 July 2010)

(a) general:

- double bottom floors or girders are to be fitted in line with the corrugation flanges for transverse or longitudinal bulkheads, respectively
- brackets/carlings are to be fitted below the inner bottom and hopper tank in line with corrugation webs. Where this is not practicable gusset plates with shedder plates are to be fitted, see item (c) below and *Figure 8.2.3*
- the corrugated bulkhead and its supporting structure is to be assessed by Finite Element (FE) analysis in accordance with *Section 9/2*. In addition the local scantlings requirements of *2.5.6.4* and *2.5.6.5* and the minimum corrugation depth requirement of *2.5.7.4* are to be applied.

(b) inner bottom and hopper tank plating:

- the inner bottom and hopper tank in way of the corrugation is to be of at least the same material yield strength as the attached corrugation, and 'Z' grade steels as given in Section 6/1.1.5 are to be used unless plate through thickness properties are documented for approval.

RCN 1 to July 2008 version (effective from 1 February 2010)

RCN 1 to July 2010 version (effective from 1 July 2012)

(c) supporting structure:

- within the region of the corrugation depth below the inner bottom the net thickness of the supporting double bottom floors or girders is not to be less than the net thickness of the corrugated bulkhead flange at the lower end and is to be of at least the same material yield strength
- the upper ends of vertical stiffeners on supporting double bottom floors or girders are to be bracketed to adjacent structure
- brackets/carlings arranged in line with the corrugation web are to have a depth of not less than 0.5 times the corrugation depth and a net thickness not less than 80% of the net thickness of the corrugation webs and are to be of at least the same material yield strength
- cut outs for stiffeners in way of supporting double bottom floors and girders in line with corrugation flanges are to be fitted with full collar plates
- where support is provided by gussets with shedder plates, the height of the gusset plate, see h_g in *Figure 8.2.3*, is to be at least equal to the corrugation depth, and gussets with shedder plates are to be arranged in every corrugation. The gusset plates are to be fitted in line with and between the corrugation flanges. The net thickness of the gusset and shedder plates are not to be less than 100% and 80%, respectively, of the net thickness of the corrugation flanges and are to be of at least the same material yield strength. Also see *2.5.7.11*.
- scallops in brackets, gusset plates and shedder plates in way of the connections to the inner bottom or corrugation flange and web are not permitted.

2.5.7.10 In general, an upper stool is to be fitted in compliance with the following requirements:

(a) general:

- where no upper stool is fitted, finite element analysis is to be carried out to demonstrate the adequacy of the details and arrangements of the bulkhead support structure to the upper deck structure
- side stiffeners and vertical webs (diaphragms) within the stool structure are to align with adjoining structure to provide for appropriate load transmission
- brackets are to be arranged in the intersections between the upper stool and the structure on deck

(b) stool bottom plating:

- the net thickness of the stool bottom plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation
- the extension of the bottom plate beyond the corrugation is not to be less than the attached as-built flange thickness of the corrugation.

(c) stool side plating and internal structure:

- within the region of the corrugation depth above the stool bottom plate the net thickness of the stool side plate is to be not less than 80% of that required by *2.5.7.2* for the corrugated bulkhead flange at the upper end where the same material is used. If material of different yield strength is used the required thickness is to be adjusted by the ratio of the two material factors (k). k is defined in *Section 6/1.1.4.1*
- the net thickness of the stool side plating and the net section modulus of the stool side stiffeners is not to be less than that required by *2.5.2*, *2.5.4* and *2.5.5* for the transverse or longitudinal bulkhead plating and stiffeners
- the ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool
- scallops in the diaphragms in way of the connections of the stool sides to the deck and to the stool bottom plate are not permitted.

2.5.7.11 Where gussets with shedder plates or shedder plates (slanting plates) are fitted at the end connection of the corrugation to the lower stool or to the inner bottom, appropriate means are to be provided to prevent the possibility of gas pockets being formed by these plates.

2.5.7.12 Welding for all connections and joints is to comply with *Section 6/5*.

2.5.8 Non-tight bulkheads

2.5.8.1 Non-tight bulkheads (wash bulkheads), where fitted, are to be in line with transverse webs, bulkheads or similar structures. They are to be of plane construction, horizontally or vertically stiffened, and are to comply with the sloshing requirements given in *6.2*. In general, openings in the non-tight bulkheads are to have generous radii and their aggregate area is not to be less than 10% of the area of the bulkhead.

Figure 8.2.3
Definition of Parameters for Corrugated Bulkhead
(Tankers with Longitudinal Bulkhead at Centreline)

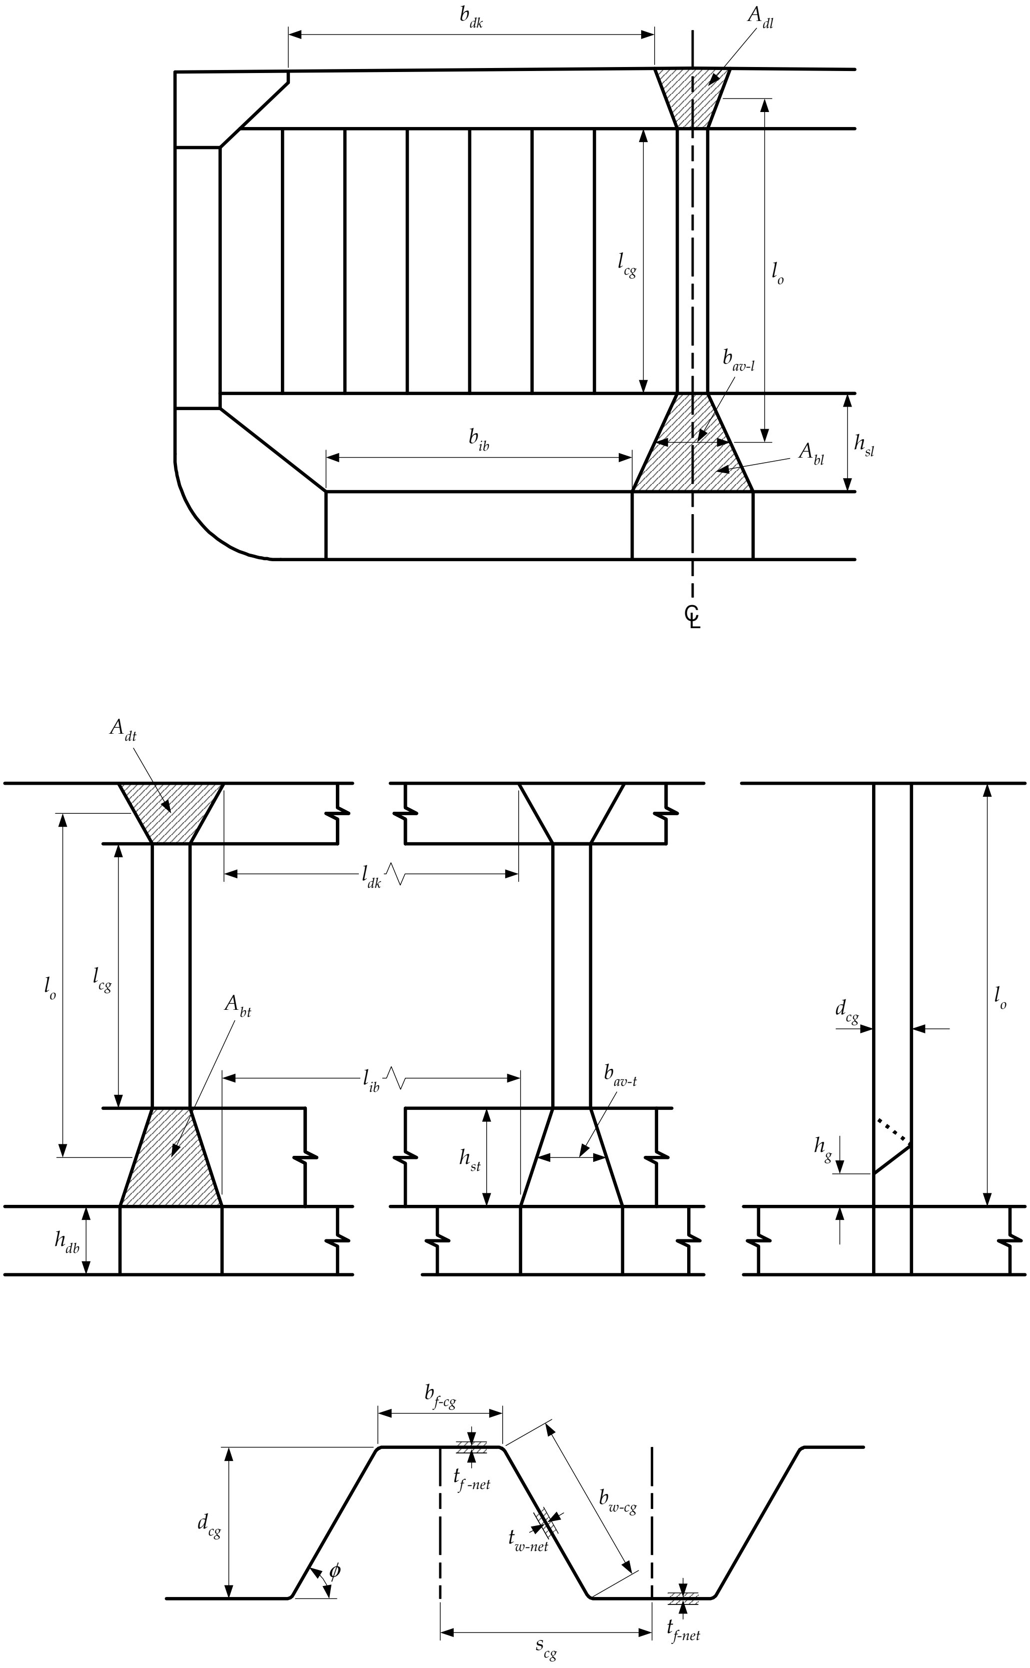


Table 8.2.4
Thickness Requirements for Plating

The minimum net thickness, t_{net}, is to be taken as the greatest value for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$t_{net} = 0.0158\, a_p\, s \sqrt{\frac{|P|}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

P design pressure for the design load set being considered and calculated at the load calculation point defined in *Section 3/5.1*, in kN/m²

α_p correction factor for the panel aspect ratio

$$= 1.2 - \frac{s}{2100\, l_p} \quad \text{but is not to be taken as greater than 1.0}$$

s as defined in *Section 4/2.2*, in mm

l_p length of plate panel, to be taken as the spacing of primary support members, S, unless carlings are fitted, in m

σ_{yd} specified minimum yield stress of the material, in N/mm²

C_a permissible bending stress coefficient for the design load set being considered

$$= \beta_a - \alpha_a \frac{|\sigma_{hg}|}{\sigma_{yd}} \quad \text{but not to be taken greater than } C_{a-max}$$

Acceptance Criteria Set	Structural Member		β_a	α_a	C_{a-max}
AC1	Longitudinal Strength Members	Longitudinally stiffened plating	0.9	0.5	0.8
		Transversely or vertically stiffened plating	0.9	1.0	0.8
	Other members		0.8	0	0.8
AC2	Longitudinal Strength Members	Longitudinally stiffened plating	1.05	0.5	0.95
		Transversely or vertically stiffened plating	1.05	1.0	0.95
	Other members, including watertight boundary plating		1.0	0	1.0

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the load calculation point defined in *Section 3/5.1.2*

$$= \left(\frac{(z - z_{NA-net50})\, M_{v-total}}{I_{v-net50}} - \frac{y\, M_{h-total}}{I_{h-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at the longitudinal position under consideration for the design load set being considered, in kNm. The still water bending moment, $M_{sw-perm}$, is to be taken with the same sign as the simultaneously acting wave bending moment, M_{wv}, see *Table 7.6.1*

$M_{h-total}$ design horizontal bending moment at the longitudinal position under consideration for the design load set being considered, in kNm

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.1*, in m⁴

$I_{h-net50}$ net horizontal hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.2*, in m⁴

y transverse coordinate of load calculation point, in m

z vertical coordinate of the load calculation point under consideration, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in *Section 4/2.6.1*, in m

Table 8.2.5
Section Modulus Requirements for Stiffeners

The minimum net section modulus, Z_{net}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$Z_{net} = \frac{|P| s\, l_{bdg}^{\ 2}}{f_{bdg}\, C_s\, \sigma_{yd}} \quad \text{cm}^3$$

Where:

P design pressure for the design load set being considered and calculated at the load calculation point defined in *Section 3/5.2*, in kN/m²

f_{bdg} bending moment factor:
for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having as fixed ends:
= 12 for horizontal stiffeners
= 10 for vertical stiffeners
for stiffeners with reduced end fixity see *Sub-section 7.*

l_{bdg} effective bending span, in m, as defined in *Section 4/2.1.1*

s as defined in *Section 4/2.2*, in mm

σ_{yd} specified minimum yield stress of the material, see also *Section 3/5.2.6.5*, in N/mm²

C_s permissible bending stress coefficient for the design load set being considered, to be taken as:

Sign of Hull Girder Bending Stress, σ_{hg}	Side Pressure Acting On	Acceptance Criteria
Tension (+ve)	Stiffener side	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{\sigma_{yd}}$ but not to be taken greater than C_{s-max}
Compression (-ve)	Plate side	
Tension (+ve)	Plate side	$C_s = C_{s-max}$
Compression (-ve)	Stiffener side	

Acceptance Criteria Set	Structural Member	β_s	α_s	C_{s-max}
AC1	Longitudinal strength member	0.85	1.0	0.75
	Transverse or vertical member	0.75	0	0.75
AC2	Longitudinal strength member	1.0	1.0	0.9
	Transverse or vertical member	0.9	0	0.9
	Watertight boundary Stiffeners	0.9	0	0.9

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the reference point defined in *Section 3/5.2.2.5*

$$= \left(\frac{(z - z_{NA-net50})\, M_{v-total}}{I_{v-net50}} - \frac{y\, M_{h-total}}{I_{h-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at longitudinal position under consideration for the design load set being considered, in kNm.
$M_{v-total}$ is to be calculated in accordance with *Table 7.6.1* using the permissible hogging or sagging still water bending moment, $M_{sw-perm}$, to be taken as:

Stiffener Location	$M_{sw-perm}$	
	Pressure acting on Plate Side	**Pressure acting on Stiffener Side**
Above Neutral Axis	Sagging SWBM	Hogging SWBM
Below Neutral Axis	Hogging SWBM	Sagging SWBM

$M_{h-total}$ design horizontal bending moment at longitudinal position under consideration for the design load set being considered, see *Table 7.6.1*, in kNm

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.1*, in m⁴

$I_{h-net50}$ net horizontal hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.2*, in m⁴

y transverse coordinate of the reference point defined in *Section 3/5.2.2.5*, in m

z vertical coordinate of the reference point defined in *Section 3/5.2.2.5*, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in *Section 4/2.6.1*, in m

Table 8.2.6
Web Thickness Requirements for Stiffeners

The minimum net web thickness, t_{w-net}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$t_{w-net} = \frac{f_{shr} \left| P \right| s \, l_{shr}}{d_{shr} \, C_t \, \tau_{yd}} \quad \text{mm}$$

Where:

P	design pressure for the design load set being considered and calculated at the load calculation point defined in *Section 3/5.1*, in kN/m²
f_{shr}	shear force distribution factor: for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having as fixed ends: = 0.5 for horizontal stiffeners = 0.7 for vertical stiffeners for stiffeners with reduced end fixity, see *Sub-section 7*
d_{shr}	as defined in *Section 4/2.4.2.2*, in mm
C_t	permissible shear stress coefficient for the design load set being considered, to be taken as: = 0.75 for acceptance criteria set AC1 = 0.90 for acceptance criteria set AC2
s	as defined in *Section 4/2.2,* in mm
l_{shr}	effective shear span, in m, see *Section 4/2.1.2*
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm²
σ_{yd}	specified minimum yield stress of the material, in N/mm²

Table 8.2.7
Design Load Sets for Plating and Local Support Members

Structural Member		Design Load Set (1, 2, 3)	Load Component	Draught	Comment	Diagrammatic Representation
Keel, Bottom Shell, Bilge, Side Shell, Sheer strake		1	P_{ex}	T_{sc}	Sea pressure only			2	P_{ex}	T_{sc}		
		7	$P_{in} - P_{ex}$	T_{bal}	Net pressure difference between water ballast pressure and sea pressure			8	$P_{in} - P_{ex}$	$0.25T_{sc}$		
Deck	In way of cargo tanks	1	P_{ex}	T_{sc}	Green sea pressure only or other loads on deck			3	P_{in}	$0.6T_{sc}$	Cargo pressure only			4	P_{in}	-		
		11	$P_{in\text{-}flood}$	-		
	In way of other tanks	1	P_{ex}	T_{sc}	Green sea pressure only or other loads on deck			5	P_{in}	T_{bal}	Water ballast or other liquid pressure only			6	P_{in}	$0.25T_{sc}$		
		11	$P_{in\text{-}flood}$	-		
	Any location	9	P_{dk}	T_{bal}	Distributed or concentrated loads only. Simultaneously occurring green sea pressure may be ignored			10	P_{dk}	-		
Inner Bottom, Inner hull, Hopper side		3	P_{in}	$0.6T_{sc}$	Cargo pressure only			4	P_{in}	-		
		5	P_{in}	T_{bal}	Water ballast or other liquid pressure only			6	P_{in}	$0.25T_{sc}$		
		11	$P_{in\text{-}flood}$	-		
Longitudinal Bulkhead, Centreline Bulkhead		3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent cargo tank empty. Two cases are to be evaluated: 1. Inner empty, outer full 2. Inner full, outer empty			4	P_{in}	-		
		11	$P_{in\text{-}flood}$	-

Where:

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{bal} minimum design ballast draught, in m, as defined in *Section 4/1.1.5.2*

Notes

1. Specification of design load combination, load component, acceptance criteria and other load parameters for each design load set are given in *Table 8.2.8*
2. When the ship's configuration cannot be described by the above, then the applicable Design Load Sets to determine the scantling requirements of structural boundaries are to be selected so as to specify a full tank on one side with the adjacent tank or space empty. The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. See Note 4 and *Table 8.2.8*.
3. The boundaries of void and dry space not forming part of the hull envelope are to be evaluated using Design Load Set 11. See Note 2.
4. Design load sets (DLS) for some structural members not covered by the above:
   For the boundaries of a stool water ballast tank with the cargo tank:
   - DLSs 5, 6 and 11 are to be applied for pressure from the WB tank side
   - DLSs 3, 4 and 11 for pressure from the cargo tank side

   For a double bottom girder separating two water ballast tanks or separating a water ballast and fuel oil tank:
   - DLSs 5, 6 and 11 are to be applied for pressure from each side in turn

   For the boundary of a stool void space to the cargo tank:
   - DLSs 3, 4 and 11 for pressure from the cargo tank side
   - DLS 11 for pressure from the void space side

Table 8.2.8
Specification of Design Load Combination, Acceptance Criteria and other Load Parameters for each Design Load Set

Where:

PSM	Primary Support Members
LSM	Local Support Members
DLCF	Dynamic Load Combination Factors
P_{in} P_{ex} P_{dk} $P_{in\text{-}flood}$	as given in *Table 7.6.1* and as shown in *Table 8.2.7* or *Table 8.2.9*
B	moulded breadth, in m, as defined in *Section 4/1.1.3.1*

Note

1. Structural members are to be designed using all design load sets which are applicable. This table gives the pressure load component of the design load set. The hull girder bending moments are given in *Tables 8.2.4* and *8.2.5* for local support members.
2. This column specifies which column in the design load combination table is to be applied for each design load set, see *Table 7.6.1*. Where *S* denotes the static design load combination, *S+D* denotes the static plus dynamic design load combination and *A* denotes the accidental design load combination.
3. This column specifies which dynamic load combination factor table is to be used for the deviation of the pressure components and global load components, see *Table 7.6.1*

2.6 Primary Support Members

2.6.1 General

2.6.1.1 The scantlings of the primary support members in the cargo tank region for the extents shown in *Figure 8.2.4* are to be in accordance with the requirements of *2.6.1.2* to *2.6.1.7*.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.6.1.2 The section modulus and shear area criteria for primary support members contained in *2.6* apply to structural configurations shown in *Figure 2.3.1* and are applicable to the following structural elements:

(a) floors and girders within the double bottom;

(b) deck transverses fitted below the upper deck;

(c) side transverses within double side structure;

(d) vertical web frames on longitudinal bulkheads with or without cross ties;

(e) horizontal stringers on transverse bulkheads, except those fitted with buttresses or other intermediate supports; and

(f) cross ties in wing cargo and centre cargo tanks.

RCN 2 to July 2008 version (effective from 1 July 2010)

2.6.1.3 The scantlings of primary support members are to be verified by the Finite Element (FE) cargo tank structural analysis defined in *Section 9/2*.

2.6.1.4 The section modulus and/or shear area of a primary support member and/or the cross sectional area of a primary support member cross tie may be reduced to 85% of the prescriptive requirements provided that the reduced scantlings comply with the FE cargo tank structural analysis and with *2.1.6*.

2.6.1.5 In general, primary support members are to be arranged in one plane to form continuous transverse rings. Brackets forming connections between primary support members of the ring are to be designed in accordance with *Section 4/3.3.3*.

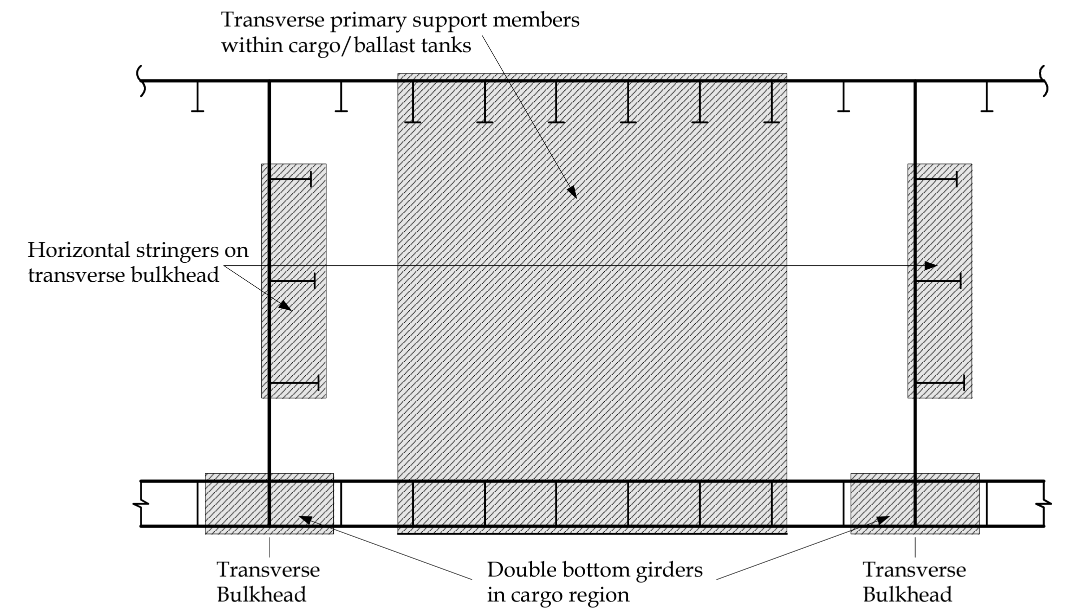
2.6.1.6 Webs of the primary support members are to be stiffened in accordance with *Section 10/2.3*.

2.6.1.7 Webs of the primary support members are to have a depth of not less than given by the requirements of *2.6.4.1*, *2.6.6.1* and *2.6.7.1*, as applicable. Lesser depths may be accepted where equivalent stiffness is demonstrated. See *3/5.3.3.4*. Primary support members that have open slots for stiffeners are to have a depth not less than 2.5 times the depth of the slots.

2.6.1.8 The scantlings of the first primary support members from the transverse bulkhead are to be in accordance with *Section 8/7, 2.6.1.3, 2.6.1.4, 2.6.1.5, 2.6.1.6, 2.6.4.3* and *2.6.4.4*. In the application of *2.6.4.3* and *2.6.4.4* only the design green sea pressure is to be considered.

RCN 2 to July 2008 version (effective from 1 July 2010)

Figure 8.2.4
Depiction of Applicable Extents



2.6.2 Design load sets and permissible stress coefficients for primary support members

2.6.2.1 The design load sets for the evaluation of the primary support members are given in *Table 8.2.9*.

2.6.2.2 The permissible bending and shear stress coefficients for the evaluation of the primary support members are given in *Table 8.2.10*.

Table 8.2.9
Design Load Sets for Primary Support Members

Structural Member	Design Load Set (1, 5, 6)	Load Component	Draught	Comment	Diagrammatic Representation
Double bottom floors and girders (3)	1	P_{ex}	$0.9T_{sc}$ (2)	Sea pressure only		2	P_{ex}	T_{sc}		
	12	$P_{in} - P_{ex}$	$0.6T_{sc}$	Net pressure difference between cargo pressure and sea pressure		13	$P_{in} - P_{ex}$	(4)		
Side transverses (3)	1	P_{ex}	$0.9T_{sc}$	Sea pressure only		2	P_{ex}	T_{sc}		
	3	P_{in}	$0.6T_{sc}$	Cargo pressure only		4	P_{in}	-		
Deck transverses	1	P_{ex}	T_{sc}	Green sea pressure only or other loads on deck		3	P_{in}	$0.6T_{sc}$	Cargo pressure only		4	P_{in}	-		
Vertical web frames on longitudinal bulkheads	3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent cargo tank empty		4	P_{in}	-		
	3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent cargo tank empty		4	P_{in}	-		
Horizontal stringers on transverse bulkhead	3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent forward or aft cargo tank empty. Two cases are to be evaluated: 1. forward empty/aft full 2. forward full/aft empty		4	P_{in}	-		
	11	$P_{in\text{-}flood}$	-		
Cross ties in centre tanks	3	$\frac{P_{in-pt} + P_{in-stb}}{2}$	$0.6T_{sc}$	Full wing cargo tanks, centre tank empty.		4	P_{in}	-		
Cross ties in wing tanks	14	$\frac{P_{in} + P_{ex}}{2}$	T_{sc}	Full centre tank, wing cargo tanks empty.		15	$\frac{P_{in} + P_{ex}}{2}$	$0.6T_{sc}$		
	16	$\frac{P_{in} + P_{ex}}{2}$	T_{sc}		

Table 8.2.9 (Continued)
Design Load Sets for Primary Support Members

Where:

P_{in-pt} design pressure from port side wing cargo tank, in kN/m²

P_{in-stb} design pressure from starboard side wing cargo tank, in kN/m²

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{bal} minimum design ballast draught, in m, as defined in *Section 4/1.1.5.2*

Notes

1. Specification of design load combination, load component, acceptance criteria set and other load parameters for each design load set are given in *Table 8.2.8.*

2. See *1.1.2.9(b)*

3. Draughts specified for bottom floors, girders and side transverses are based on operational limits specified in *1.1.2*. Where the optional loading conditions exceed the minimum Rule required loading conditions the draughts will be subject to special consideration.

4. For tankers with two oil-tight longitudinal bulkheads, the draught is to be taken as $0.25T_{sc}$. For tankers with a centreline bulkhead, the draught is to be taken as $0.33T_{sc}$.

5. When the ship's configuration cannot be described by the structural members or structural configurations identified above, then the applicable Design Load Sets to determine the scantling requirements of primary support member are to be selected so as to specify all applicable cases from the following:
   - a full tank on one side of the member with the tank or space on the other side empty
   - a full tank on one side of the member with the external pressure minimised
   - external pressure maximised with the adjacent tank or space empty

   The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the net pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. Design Load Set 11 may also need to be applied, depending on the particular structural configuration. See Note 4 on *Table 8.2.7* and *Table 8.2.8.*

6. For a void or dry space, the pressure component from the void side is to be ignored, except where Design Load Set 11 needs to be applied.

Table 8.2.10
Permissible Stress Coefficients, C_{s-pr} and C_{t-pr}, for Primary Support Members

Acceptance criteria set	Permissible bending stress coefficient, C_{s-pr}	Permissible shear stress coefficient, C_{t-pr}
AC1	0.70	0.70
AC2	0.85	0.85

2.6.3 Floors and girders in double bottom

2.6.3.1 Continuous double bottom girders are to be arranged at the centreline or duct keel, at the hopper side and in way of longitudinal bulkheads and bulkhead stools. Plate floors are to be arranged in way of transverse bulkheads and bulkhead stools.

2.6.3.2 The net shear area, $A_{shr-net50}$, of the floors at any position in the floor is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force

$= f_{shr} P\, S\, l_{shr}$ kN

f_{shr} shear force distribution factor

$= f_{shr-i}\left(1 - \frac{2y_i}{l_{shr}}\right)$ but not to be taken as less than 0.2

f_{shr-i} shear force distribution factor at the end of the span, l_{shr}, as given in *Table 8.2.11*

l_{shr} effective shear span, of the double bottom floor, in m, as shown in *Figure 8.2.6.* In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in *Section 4/2.1.5*. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in *Figure 8.2.6.*

y_i distance from the considered cross-section of the floor to the nearest end of the effective shear span, l_{shr}, in m

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

P design pressure for the design load set being considered, calculated at mid point of effective shear span, l_{shr}, of a floor located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m^2

C_{t-pr} permissible shear stress coefficient for primary support member as given in *Table 8.2.10*

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm^2

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Table 8.2.11
Shear Force Distribution Factors of Floors

Structural Configuration	Centre tank (f_{shr3} in *Figure 8.2.5*)	Wing Tank	
		At inboard end (f_{shr2} in *Figure 8.2.5*)	At hopper knuckle end (f_{shr1} in *Figure 8.2.5*)
Ships with centreline longitudinal bulkhead	-	0.4	0.6
Ships with two longitudinal bulkheads	0.5	0.50	0.65

Floor Shear Force Distribution Factors of Floors

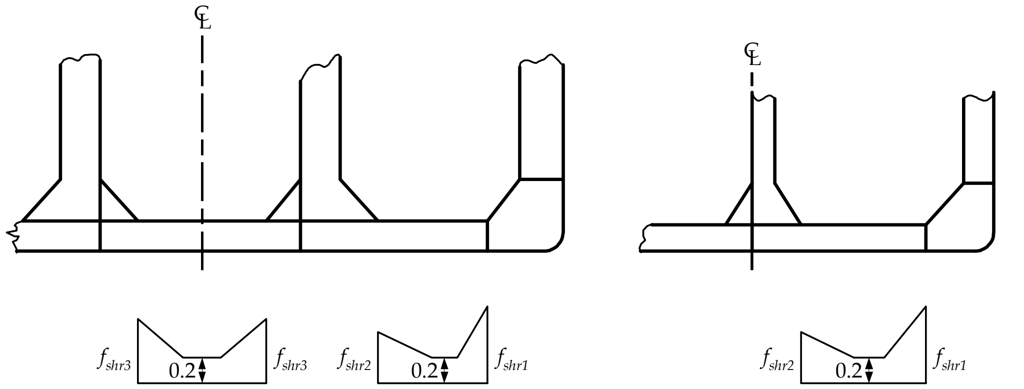

Figure 8.2.6
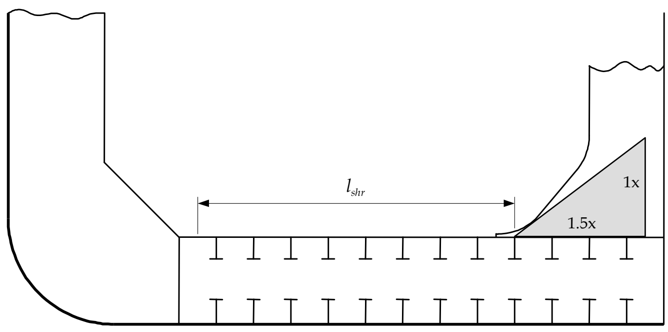
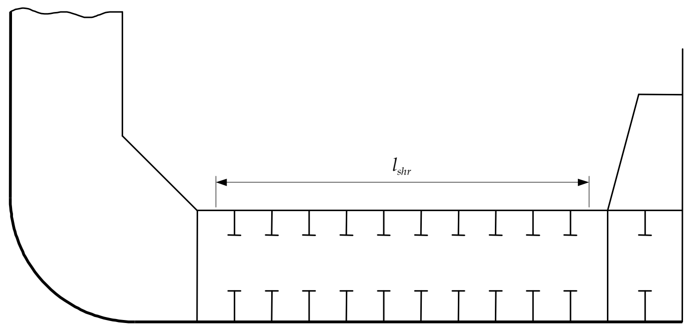
Effective Shear Span of Floors



Typical arrangement with hopper and end bracket



Typical arrangement with hopper and stool

2.6.3.3 For double bottom centre girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr-net50}$, of the double bottom centre girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force

$= 0.21\, n_1\, n_2\, P\, l_{shr}^{\;2}$ kN

l_{shr} effective shear span, of the double bottom floor, in m, as shown in *Figure 8.2.6.* In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in *Section 4/2.1.5*. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in *Figure 8.2.6.*

P design pressure for the design load set being considered, calculated at mid point of effective shear span, l_{shr}, of a floor

located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m²

n_1 $= 0.00935\left(\frac{l_{shr}}{S}\right)^2 - 0.163\left(\frac{l_{shr}}{S}\right) + 1.289$

n_2 $= 1.3 - \left(\frac{S}{12}\right)$

S double bottom floor spacing, in m, as defined in *Section 4/2.2.2*

C_{t-pr} permissible shear stress coefficient for primary support member as given in *Table 8.2.10*

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.6.3.4 For double bottom side girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr-net50}$, of the double bottom side girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force

$= 0.14\, n_3\, n_4\, P\, l_{shr}^2$ kN

n_3 $= 1.072 - 0.0357\left(\frac{l_{shr}}{S}\right)$

n_4 $= 1.2 - \left(\frac{S}{18}\right)$

l_{shr} effective shear span, of the double bottom floor, in m, as shown in *Figure 8.2.6*. In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in *Section 4/2.1.5*. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in *Figure 8.2.6.*

S double bottom floor spacing, in m, as defined in *Section 4/2.2.2*

P design pressure for the design load set being considered, calculated at mid point of effective shear span, l_{shr}, of a floor located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m²

C_{t-pr} permissible shear stress coefficient for primary support member as given in *Table 8.2.10*

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.6.4 Deck transverses

2.6.4.1 The web depth of deck transverses is not to be less than:

(a) $0.20\ l_{bdg-dt}$ for deck transverses in the wing cargo tanks of ships with two longitudinal bulkheads

(b) $0.13\ l_{bdg-dt}$ for deck transverses in the centre cargo tanks of ships with two longitudinal bulkheads. The web depth of deck transverses in the centre cargo tank is not to be less than 90% of that of the deck transverses in the wing cargo tank

(c) $0.10\ l_{bdg-dt}$ for the deck transverses of ships with a centreline longitudinal bulkhead.

(d) See also *2.6.1.7*

Where:

l_{bdg-dt} effective bending span of the deck transverse, in m, see *Section 4/2.1.4* and *Figure 8.2.7*, but is not to be taken as less than 60% of the breadth of the tank at the location being considered

2.6.4.2 The moment of inertia of the deck transverses, with associated deck plating, is to comply with *Section 10/2.3.2.3* to control the overall deflection of the deck structure.

2.6.4.3 The net section modulus of deck transverses is not to be less than $Z_{in-net50}$ and $Z_{ex-net50}$ as given by the following. The net section modulus of the deck transverses in the wing cargo tanks is also not to be less than required for the deck transverses in the centre tanks.

$$Z_{in-net50} = \frac{1000\,M_{in}}{C_{s-pr}\,\sigma_{yd}} \quad \text{cm}^3$$

$$Z_{ex-net50} = \frac{1000\,M_{ex}}{C_{s-pr}\,\sigma_{yd}} \quad \text{cm}^3$$

Where:

M_{in} design bending moment due to cargo pressure, in kNm, to be taken as:

(a) for deck transverses in wing cargo tanks of ships with two longitudinal bulkheads, and for deck transverses in cargo tanks of ships with a centreline longitudinal bulkhead:

$= 0.042\,\varphi_t\,P_{in-dt}\,S\,l_{bdg-dt}^{\ 2} + M_{st}$ but is not to be taken as less than M_o

(b) for deck transverses in centre cargo tank of ships with two longitudinal bulkheads:

$= 0.042\,\varphi_t\,P_{in-dt}\,S\,l_{bdg-dt}^{\ 2} + M_{vw}$ but is not to be taken as less than M_o

M_{st} bending moment transferred from the side transverse

$= c_{st}\,\beta_{st}\,P_{in-st}\,S\,l_{bdg-st}^{\ 2}$ kNm

where a cross tie is fitted in a wing cargo tank and $l_{bdg-st-ct}$ is greater than $0.7l_{bdg-st}$, then l_{bdg-st} in the above formula may be

taken as $l_{bdg\text{-}st\text{-}ct}$.

M_{vw} bending moment transferred from the vertical web frame on the longitudinal bulkhead

$= c_{vw}\,\beta_{vw}\,P_{in-vw}\,S\,l_{bdg-vw}{}^{2}$ kNm

where $l_{bdg\text{-}vw\text{-}ct}$ is greater than $0.7l_{bdg\text{-}vw}$, then $l_{bdg\text{-}vw}$ in the above formula may be taken as $l_{bdg\text{-}vw\text{-}ct}$.

for vertically corrugated bulkheads, M_{vw} is to be taken equal to bending moment in upper end of corrugation over the spacing between deck transverses

M_0 minimum bending moment

$= 0.083\,P_{in-dt}\,S\,l_{bdg-dt}{}^{2}$ kNm

M_{ex} design bending moment due to green sea pressure

$= 0.067\,P_{ex-dt}\,S\,l_{bdg-dt}{}^{2}$ kNm

$P_{in\text{-}dt}$ design cargo pressure for the design load set being considered, calculated at mid point of effective bending span, $l_{bdg\text{-}dt}$, of the deck transverse located at mid tank, in kN/m²

$P_{in\text{-}st}$ corresponding design cargo pressure in wing cargo tank for the design load set being considered, calculated at the mid point of effective bending span, $l_{bdg\text{-}st}$, of the side transverse located at mid tank, in kN/m²

$P_{in\text{-}vw}$ corresponding design cargo pressure in the centre cargo tank of ships with two longitudinal bulkheads for the design load set being considered, calculated at mid point of effective bending span, $l_{bdg\text{-}vw}$, of the vertical web frame on the longitudinal bulkhead located at mid tank, in kN/m²

$P_{ex\text{-}dt}$ design green sea pressure for the design load set being considered, calculated at mid point of effective bending span, $l_{bdg\text{-}dt}$, of the deck transverse located at mid tank, in kN/m²

φ_t $= 1 - 5\left(\dfrac{y_{toe}}{l_{bdg-dt}}\right)$ but is not to be taken as less than 0.6

y_{toe} distance from the end of effective bending span, $l_{bdg\text{-}dt}$, to the toe of the end bracket of the deck transverse, in m

β_{st} $= 0.9\left(\dfrac{l_{bdg-st}}{l_{bdg-dt}}\right)\left(\dfrac{I_{dt}}{I_{st}}\right)$ but is not to be taken as less than 0.10 or greater than 0.65

β_{vw} $= 0.9\left(\dfrac{l_{bdg-vw}}{l_{bdg-dt}}\right)\left(\dfrac{I_{dt}}{I_{vw}}\right)$ but is not to be taken as less than 0.10 or greater than 0.50

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

$l_{bdg\text{-}dt}$ effective bending span of the deck transverse, in m, see *Section 4/2.1.4* and *Figure 8.2.7*, but is not to be taken as less than 60% of the breadth of the tank at the location being considered

l_{bdg-st} effective bending span of the side transverse, in m, between the deck transverse and the bilge hopper, see *Section 4/2.1.4* and *Figure 8.2.7*

$l_{bdg-st-ct}$ effective bending span of the side transverse, in m, between the deck transverse and the mid depth of the cross tie, where fitted in wing cargo tank, see *Section 4/2.1.4*

l_{bdg-vw} effective bending span of the vertical web frame on the longitudinal bulkhead, in m, between the deck transverse and the bottom structure, see *Section 4/2.1.4* and *Figure 8.2.7*.

$l_{bdg-vw-ct}$ effective bending span of the vertical web frame on longitudinal bulkhead, in m, between the deck transverse and the mid depth of the cross tie, see *Section 4/2.1.4*

I_{dt} net moment of inertia of the deck transverse with an effective breadth of attached plating specified in *Section 4/2.3.2.3*, in cm^4

I_{st} net moment of inertia of the side transverse with an effective breadth of attached plating specified in *Section 4/2.3.2.3*, in cm^4

I_{vw} net moment of inertia of the longitudinal bulkhead vertical web frame with an effective breadth of attached plating specified in *Section 4/2.3.2.3*, in cm^4

c_{st} as defined in *Table 8.2.12*

c_{vw} as defined in *Table 8.2.12*

C_{s-pr} permissible bending stress coefficient for primary support member as given in *Table 8.2.10*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Table 8.2.12
Values of c_{st} and c_{vw} for Deck Transverses

Structural Configuration			c_{st}	c_{vw}
Ships with centreline longitudinal bulkhead			0.056	-
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M_{vw} based on $l_{bdg-vw-ct}$	-	0.044
		M_{st} based on l_{bdg-st} or M_{vw} based on l_{bdg-vw}	0.044	0.016
	Cross ties in wing cargo tanks	M_{st} based on $l_{bdg-st-ct}$ or M_{vw} based on $l_{bdg-vw-ct}$	0.044	0.044
		M_{st} based on l_{bdg-st} or M_{vw} based on l_{bdg-vw}	0.041	0.015

2.6.4.4 The net shear area of deck transverses is not to be less than $A_{shr-in-net50}$ and $A_{shr-ex-net50}$ as given by:

$$A_{shr-in-net50} = \frac{10 Q_{in}}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

$$A_{shr-ex-net50} = \frac{10 Q_{ex}}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

Where:

Q_{in} design shear force due to cargo pressure

$= 0.65\, P_{in-dt}\, S\, l_{shr} + c_1\, D\, b_{ctr}\, S\, \rho\, g$ kN

Q_{ex} design shear force due to green sea pressure

$= 0.65\, P_{ex-dt}\, S\, l_{shr}$ kN

P_{in-dt} design cargo pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-dt}, of the deck transverse located at mid tank, in kN/m^2

P_{ex-dt} design green sea pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-dt}, of the deck transverse located at mid tank, in kN/m^2

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

l_{shr} effective shear span, of the deck transverse, in m, see *Section 4/2.1.5*

l_{bdg-dt} effective bending span of the deck transverse, in m, see *Section 4/2.1.4* and *Figure 8.2.7*, but is not to be taken as less than 60% of the breadth of the tank at the location being considered

c_1 = 0.04 in way of wing cargo tanks of ships with two longitudinal bulkheads

= 0.00 in way of centre tank of ships with two longitudinal bulkheads

= 0.00 for ships with a centreline longitudinal bulkhead

D moulded depth, in m, as defined in *Section 4/1.1.4*

b_{ctr} breadth of the centre tank, in m

ρ density of liquid in the tank, in tonnes/m^3, not to be taken less than 1.025, see *Section 2/3.1.8*

g acceleration due to gravity, 9.81 m/s^2

C_{t-pr} permissible shear stress coefficient for primary support member as given in *Table 8.2.10*

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm^2

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Figure 8.2.7
Definition of Spans of Deck, Side Transverses, Vertical Web Frames on Longitudinal Bulkheads and Horizontal Stringers on Transverse Bulkheads

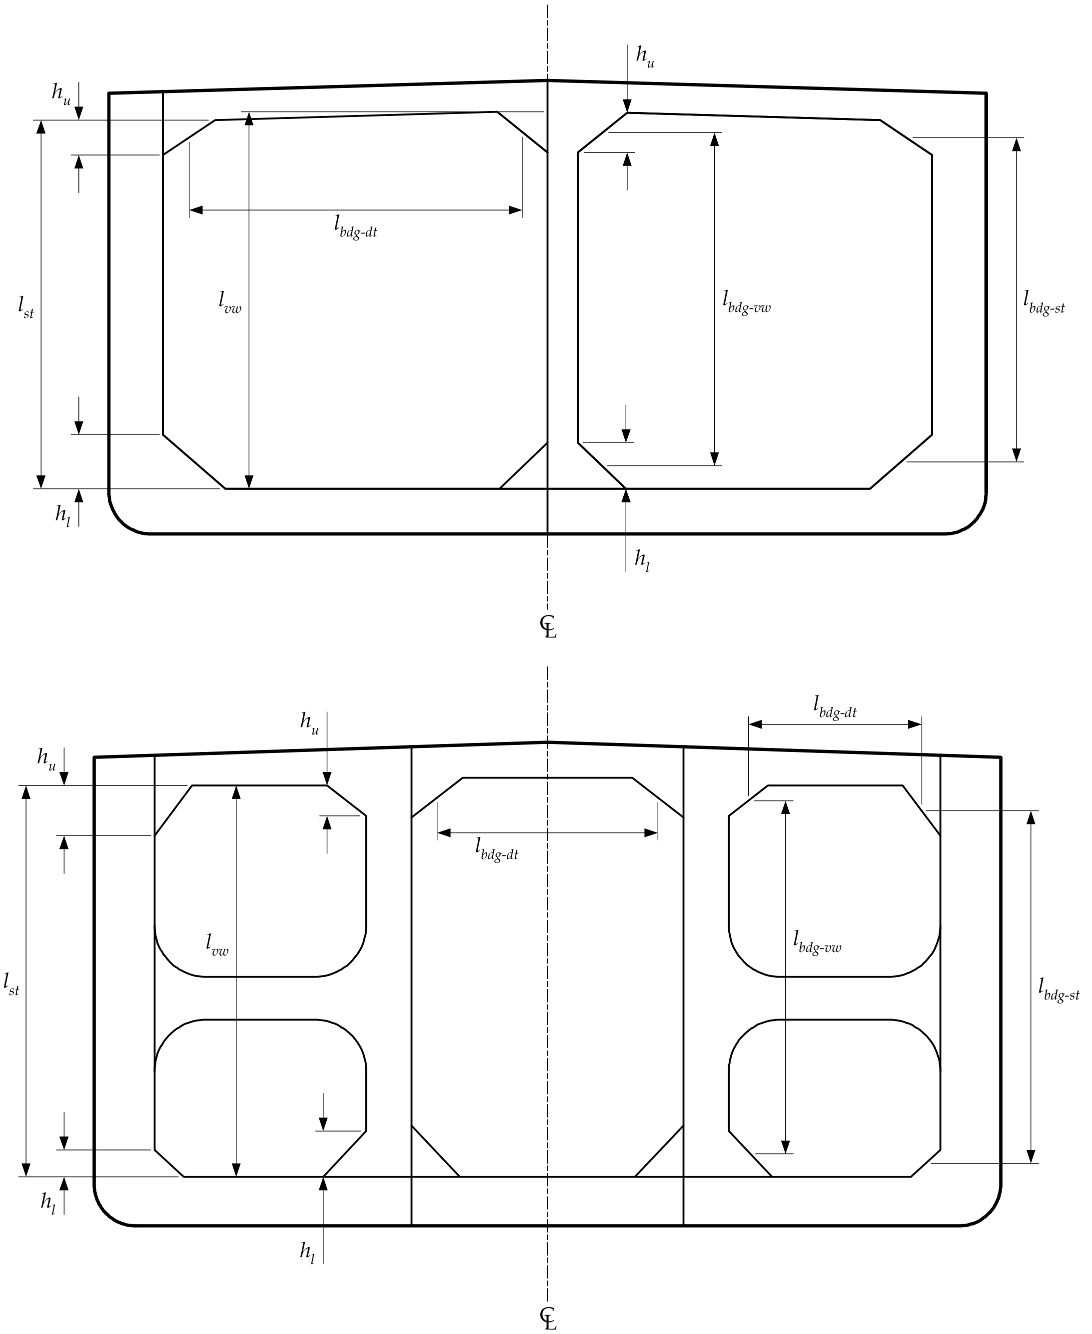


Figure 8.2.7 (Continued)
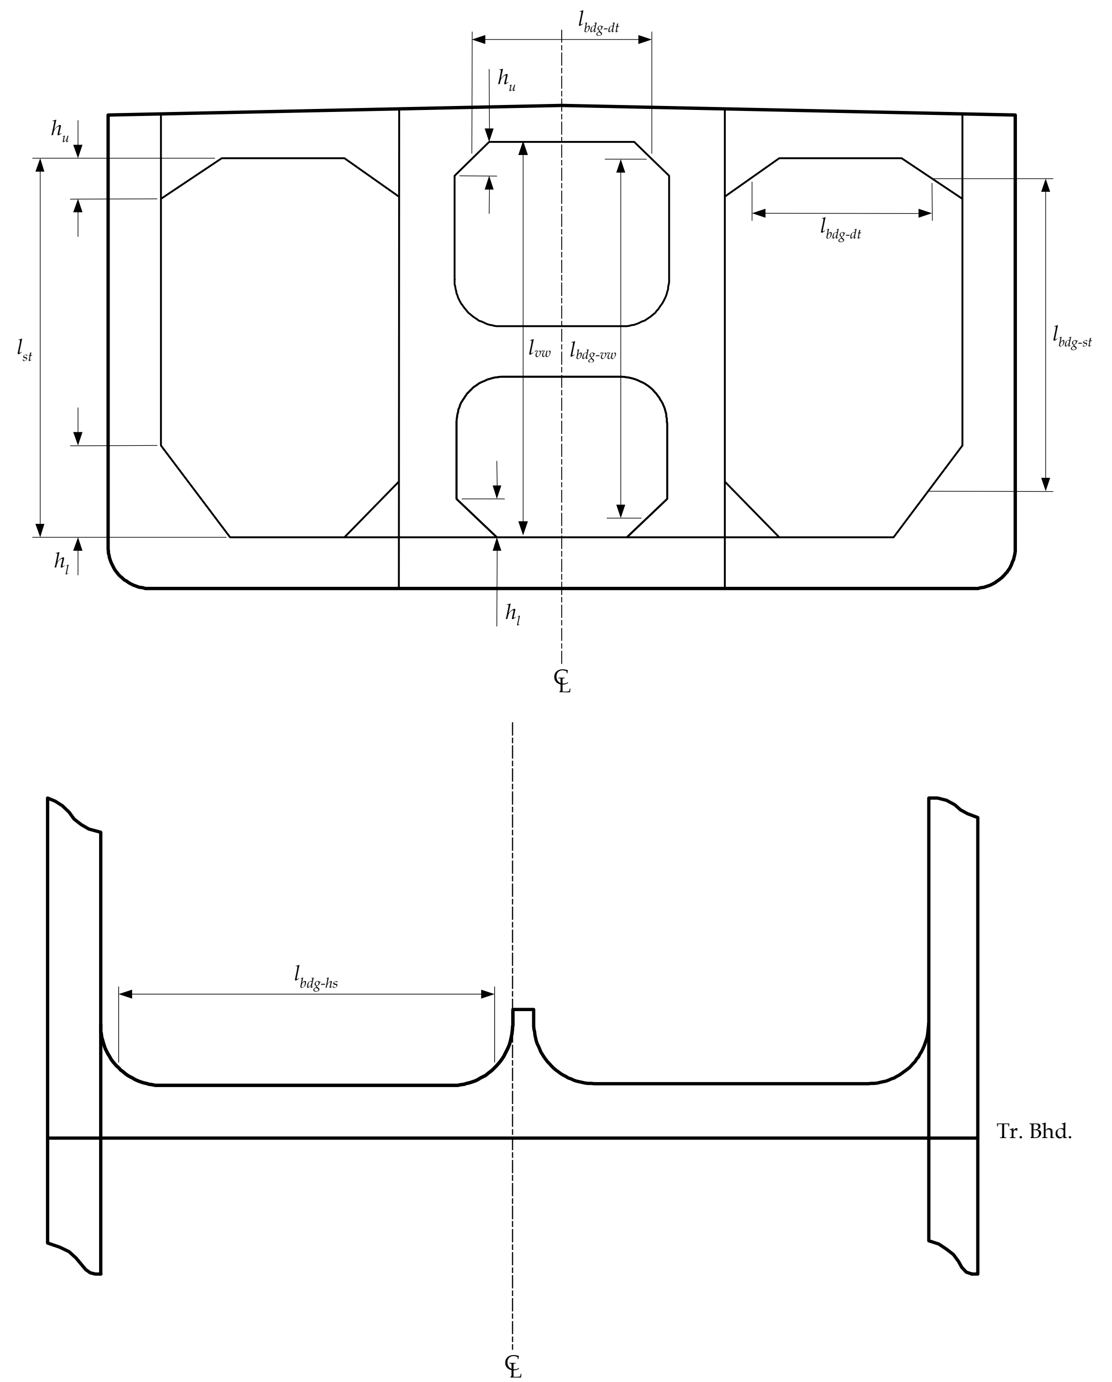
Definition of Spans of Deck, Side Transverses, Vertical Web Frames on Longitudinal Bulkheads and Horizontal Stringers on Transverse Bulkheads



2.6.5 Side transverses

2.6.5.1 The net shear area, $A_{shr\text{-}net50}$, of side transverses is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr}\ \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force as follows, in kN:

= Q_u for upper part of the side transverse

= Q_l for lower part of the side transverse

Q_u = $S\,[c_u\, l_{st}\, (P_u + P_l) - h_u\, P_u]$

where a cross tie is fitted in a wing cargo tank and $l_{st\text{-}ct}$ is greater than $0.7 l_{st}$, then l_{st} in the above formula is to be taken as $l_{st\text{-}ct}$.

Q_l to be taken as the greater of the following:

(a) $S\,[c_l\, l_{st}\, (P_u + P_l) - h_l\, P_l]$

(b) $0.35\, c_l\, S\, l_{st}\, (P_u + P_l)$

(c) $1.2\, Q_u$

where a cross tie is fitted in a wing cargo tank and $l_{st\text{-}ct}$ is greater than $0.7 l_{st}$, then l_{st} in the above formula is to be taken as $l_{st\text{-}ct}$.

P_u design pressure for the design load set being considered, in kN/m^2, calculated at mid tank as follows:

(a) where deck transverses are fitted below deck, P_u is to be calculated at mid height of upper bracket of the side transverse, h_u

(b) where deck transverses are fitted above deck, P_u is to be calculated at the elevation of the deck at side, except in cases where item (c) applies

(c) where deck transverses are fitted above deck and the inner hull longitudinal bulkhead is arranged with a top wing structure as follows:

- the breadth at top of the wing structure is greater than 1.5 times the breadth of the double side and
- the angle along a line between the point at base of the slope plate at its intersection with the inner hull longitudinal bulkhead and the point at the intersection of top wing structure and deck is 30 degrees or more to vertical

P_u is to be calculated at mid depth of the top wing structure

P_l corresponding design pressure for the design load set being considered, calculated at mid height of bilge hopper, h_l, located at mid tank, in kN/m^2.

l_{st} length of the side transverse, in m, and is to be taken as follows:

(a) where deck transverses are fitted below deck, l_{st} is the length between the flange of the deck transverse and the inner bottom, see *Figure 8.2.7*

(b) where deck transverses are fitted above deck, l_{st} is the length between the elevation of the deck at side and the inner bottom

$l_{st\text{-}ct}$ length of the side transverse, in m, and is to be taken as follows:

(a) where deck transverses are fitted below deck, l_{st} is the length between the flange of the deck transverse and mid depth of cross tie, where fitted in wing cargo tank

(b) where deck transverses are fitted above deck, l_{st} is the length between the elevation of the deck at side and mid depth of the cross tie, where fitted in wing cargo tank

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

h_u effective length of upper bracket of the side transverse, in m, and is to be taken as follows:

(a) where deck transverses are fitted below deck, h_u is as shown in Figure 8.2.7 and as described in *Section 4/2.1.5*.

(b) where deck transverses are fitted above deck, h_u is to be taken as 0.0, except in cases where item (c) applies.

(c) where deck transverses are fitted above deck and the inner hull longitudinal bulkhead is arranged with a top wing structure as follows:

- the breadth at top of the wing structure is greater than 1.5 times the breadth of the double side, and
- the angle along a line between the point at base of the slope plate at its intersection with the inner hull longitudinal bulkhead and the point at the intersection of top wing structure and the deck is 30 degrees or more to vertical

h_u is to be taken as the distance between the deck at side and the lower end of slope plate of the top wing structure.

h_l height of bilge hopper, in m, as shown in *Figure 8.2.7*

c_u and c_l as defined in *Table 8.2.13*

C_{t-pr} permissible shear stress coefficient for primary support member as given in *Table 8.2.10*

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

<table>

</table>

2.6.5.2 The shear area over the length of the side transverse is to comply with the following:

(a) the required shear area for the upper part is to be maintained over the upper $0.2\,l_{shr}$

(b) the required shear area for the lower part is to be maintained over the lower $0.2\,l_{shr}$

(c) where Q_u and Q_l are determined based on l_{st-ct}, the required shear area for the lower part is also to be maintained below the cross tie

(d) for ships without cross ties in the wing cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid span

(e) for ships with cross ties in the wing cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts

Note

When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress

Where:

l_{shr} effective shear span of the side transverse, in m

$= l_{st} - h_u - h_l$ where Q_u and Q_l are determined based on l_{st}

$= l_{st-ct} - h_u$ where Q_u and Q_l are determined based on l_{st-ct}

l_{st}, l_{st-ct}, h_u, h_l, Q_u and Q_l as defined in *2.6.5.1*

2.6.6 Vertical web frames on longitudinal bulkhead

2.6.6.1 The web depth of the vertical web frame on the longitudinal bulkhead is not to be less than:

(a) $0.14\,l_{bdg-vw}$ for ships with a centreline longitudinal bulkhead

(b) $0.09\,l_{bdg-vw}$ for ships with two longitudinal bulkheads

(c) see also *2.6.1.7*

Where:

l_{bdg-vw} effective bending span of the vertical web frame on the longitudinal bulkhead, see *2.6.6.2* and *Figure 8.2.7*

2.6.6.2 The net section modulus, Z_{net50}, of the vertical web frame is not to be less than:

$$Z_{net50} = \frac{1000\,M}{C_{s-pr}\,\sigma_{yd}} \quad \text{cm}^3$$

Where:

M design bending moment, in kNm, as follows:

$= c_u P S l_{bdg-vw}{}^2$ for upper part of the web frame

$= c_l P S l_{bdg-vw}{}^2$ for lower part of the web frame

where a cross tie is fitted and $l_{bdg-vw-ct}$ is greater than $0.7 l_{bdg-vw}$, then l_{bdg-vw} in the above formula is to be taken as $l_{bdg-vw-ct}$.

P design pressure for the design load set being considered, calculated at mid point of the effective bending span, l_{bdg-vw}, of the vertical web frame located at mid tank, in kN/m²

l_{bdg-vw} effective bending span of the vertical web frame on the longitudinal bulkhead, between the deck transverse and the bottom structure, in m, see *Section 4/2.1.4* and *Figure 8.2.7*.

$l_{bdg-vw-ct}$ effective bending span of the vertical web frame on longitudinal bulkhead, between the deck transverse and mid depth of the cross tie on ships with two longitudinal bulkheads, in m, see *Section 4/2.1.4*

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

C_{s-pr} permissible bending stress coefficient as given in *Table 8.2.10*

σ_{yd} specified minimum yield stress of the material, in N/mm²

c_u and c_l as defined in *Table 8.2.14*

Table 8.2.14
Values of c_u and c_l for Vertical Web Frame on Longitudinal Bulkheads

Structural Configuration			c_u	c_l
Ships with a centreline longitudinal bulkhead			0.057	0.071
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M based on $l_{bdg-vw-ct}$	0.057	0.071
		M based on l_{bdg-vw}	0.012	0.028
	Cross ties in wing cargo tanks	M based on $l_{bdg-vw-ct}$	0.057	0.071
		M based on l_{bdg-vw}	0.016	0.032

2.6.6.3 The section modulus over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following:

(a) the required section modulus for the upper part is to be maintained over the upper $0.2\,l_{bdg-vw}$ or $0.2\,l_{bdg-vw-ct}$, as applicable

(b) the required section modulus for the lower part is to be maintained over the lower $0.2\,l_{bdg-vw}$ or $0.2\,l_{bdg-vw-ct}$, as applicable

(c) where the required section modulus is determined based on $l_{bdg-vw-ct}$, the required section modulus for the lower part is also to be maintained below the cross tie

(d) the required section modulus between the upper and lower parts is to be reduced linearly to 70% of the required section modulus for the lower part at mid span

Note

When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

Where:

l_{bdg-vw} and $l_{bdg-vw-ct}$ as defined in *2.6.6.2*

2.6.6.4 The net shear area, $A_{shr-net50}$, of the vertical web frame is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force as follows, in kN:

$= Q_u$ for upper part of the web frame

$= Q_l$ for lower part of the web frame

Q_u $= S\ [c_u\, l_{vw}\, (P_u + P_l) - h_u\, P_u]$

where a cross tie is fitted in a centre or wing cargo tank and l_{vw-ct} is greater than $0.7l_{vw}$, then l_{vw} in the above formula is to be taken as l_{vw-ct}.

Q_l to be taken as the greater of the following:

(a) $S[c_l\, l_{vw}\, (P_u + P_l) - h_l\, P_l]$

(b) $c_w\, S\, c_l\, l_{vw}\, (P_u + P_l)$

(c) $1.2\, Q_u$

where a cross tie is fitted in a centre or wing cargo tank and l_{vw-ct} is greater than $0.7l_{vw}$, then l_{vw} in the above formula is to be taken as l_{vw-ct}.

P_u design pressure for the design load set being considered, calculated at mid height of upper bracket of the vertical web frame, h_u, located at mid tank, in kN/m^2

P_l design pressure for the design load set being considered, calculated at mid height of lower bracket of the vertical web frame, h_l, located at mid tank, in kN/m^2

l_{vw} length of the vertical web frame, in m, between the flange of the deck transverse and the inner bottom, see *Figure 8.2.7*

l_{vw-ct} length of the vertical web frame, in m, between the flange of the deck transverse and mid depth of the cross tie, where fitted

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

h_u effective length of upper bracket of the vertical web frame, in m, as shown in *Figure 8.2.7* and as described in *Section 4/2.1.5*

h_l effective length of lower bracket of the vertical web frame, in m,

as shown in *Figure 8.2.7* and as described in *Section 4/2.1.5*

c_u and c_l as defined in *Table 8.2.15*

c_w 0.57 for ships with a centreline longitudinal bulkhead

0.50 for ships with two longitudinal bulkheads

C_{t-pr} permissible shear stress coefficient for primary support member as given in *Table 8.2.10*

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.2.15
Values of c_u and c_l for Vertical Web Frame on Longitudinal Bulkhead

Structural Configuration		c_u	c_l
Ships with a centreline longitudinal bulkhead		0.17	0.28
Ships with two longitudinal bulkheads	Q_u or Q_l based on l_{vw-ct}		
	Q_u or Q_l based on l_{vw}	0.075	0.18

2.6.6.5 The shear area over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following:

(a) the required shear area for the upper part is to be maintained over the upper $0.2\,l_{shr}$

(b) the required shear area for the lower part is to be maintained over the lower $0.2\,l_{shr}$

(c) where Q_u and Q_l are determined based on l_{vw-ct}, the required shear area for the lower part is also to be maintained below the cross tie

(d) for ships without cross ties in the wing or centre cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid span

(e) for ships with cross ties in the wing or centre cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts

Note

When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

Where:

l_{shr} effective shear span of the side transverse

$= l_{vw} - h_u - h_l$ where Q_u and Q_l are determined based on l_{vw}

$= l_{vw-ct} - h_u$ where Q_u and Q_l are determined based on l_{vw-ct}

l_{vw}, l_{vw-ct}, h_u, h_l, Q_u and Q_l as defined in *2.6.6.4*

2.6.7 Horizontal stringers on transverse bulkheads

2.6.7.1 The web depth of horizontal stringers on transverse bulkhead is not to be less than:

(a) $0.28\, l_{bdg\text{-}hs}$ for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads

(b) $0.20\, l_{bdg\text{-}hs}$ for horizontal stringers in centre tanks of ships with two longitudinal bulkheads, but the web depth of horizontal stringers in centre tank is not to be less than required depth for a horizontal stringer in wing cargo tanks

(c) $0.20\, l_{bdg\text{-}hs}$ for horizontal stringers of ships with a centreline longitudinal bulkhead

(d) see also *2.6.1.7*.

Where:

$l_{bdg\text{-}hs}$ effective bending span of the horizontal stringer, in m, but is not to be taken as less than 50% of the breadth of the tank at the location being considered, see *Section 4/2.1.4* and *Figure 8.2.7*

2.6.7.2 The net section modulus, Z_{net50}, of the horizontal stringer over the end $0.2 l_{bdg\text{-}hs}$ is not to be less than:

$$Z_{net50} = \frac{1000\, M}{C_{s-pr}\, \sigma_{yd}} \quad \text{cm}^3$$

Where:

M design bending moment:

$= c\, P\, S\, l_{bdg-hs}{}^2$ kNm

P design pressure for the design load set being considered, calculated at mid point of effective bending span, $l_{bdg\text{-}hs}$, and at mid point of the spacing, S, of the horizontal stringer, in kN/m^2

S sum of the half spacing (distance between stringers) on each side of the horizontal stringer under consideration, in m

$l_{bdg\text{-}hs}$ effective bending span of the horizontal stringer, in m, but is not to be taken as less than 50% of the breadth of the tank at the location being considered, see *Section 4/2.1.4* and *Figure 8.2.7*

c
- 0.073 for horizontal stringers in cargo tanks of ships with a centreline bulkhead
- 0.083 for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads
- 0.063 for horizontal stringers in the centre tank of ships with two longitudinal bulkheads

$C_{s\text{-}pr}$ permissible bending stress coefficient as given in *Table 8.2.10*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

2.6.7.3 The required section modulus at mid effective bending span is to be taken as 70% of that required at the ends, intermediate values are to be obtained by linear

interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

2.6.7.4 The net shear area, $A_{shr-net50}$, of the horizontal stringer over the end 0.2 l_{shr} is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr}\,\tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force

$= 0.5\,P\,S\,l_{shr}$ kN

P design pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-hs}, and at mid point of the spacing, S, of the horizontal stringer, in kN/m²

S sum of the half spacing (distance between stringers), on each side of the horizontal stringer under consideration, in m

l_{shr} effective shear span of the horizontal stringer, in m, see *Section 4/2.1.5*

C_{t-pr} permissible shear stress coefficient as given in *Table 8.2.10*

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.6.7.5 The required shear area at mid effective shear span is to be taken as 50% of that required in the ends, intermediate values are to be obtained by linear interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

2.6.8 Cross ties

2.6.8.1 The maximum applied design axial load on cross ties, W_{ct}, is to be less than or equal to the permissible load, $W_{ct-perm}$, as given by:

$$W_{ct} \le W_{ct-perm}$$

Where:

W_{ct} applied axial load

$= P\,b_{ct}\,S$ kN

$W_{ct-perm}$ permissible load

$= 0.1\,A_{ct-net50}\,\eta_{ct}\,\sigma_{cr}$ kN

P maximum design pressure for all the applicable design load sets being considered, calculated at centre of the area supported by the cross tie located at mid tank, in kN/m²

b_{ct} where cross tie is fitted in centre cargo tank:

$= 0.5\,l_{bdg-vw}$

where cross ties are fitted in wing cargo tanks:

$= 0.5\,l_{bdg-vw}$, for design cargo pressure from the centre cargo

tank

$= 0.5\, l_{bdg-st}$ for design sea pressure

l_{bdg-vw} effective bending span of the vertical web frame on the longitudinal bulkhead, in m, see *Section 4/2.1.4* and *Figure 8.2.7*.

l_{bdg-st} effective bending span of the side transverse, in m, see *Section 4/2.1* and *Figure 8.2.7*.

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

η_{ct} utilisation factor, to be taken as:

$= 0.65$ for acceptance criteria set AC1

$= 0.75$ for acceptance criteria set AC2

RCN 1 to July 2008 version (effective from 1 February 2010)

σ_{cr} critical buckling stress in compression of the cross tie, in N/mm^2, as calculated using the net sectional properties in accordance with *Section 10/3.5.1*, where the effective length of the cross tie is to be taken as follows, in m:

(a) for cross tie in centre tank:

distance between the flanges of longitudinal stiffeners on the starboard and port longitudinal bulkheads to which the cross tie's horizontal stiffeners are attached

(b) for cross tie in wing tank:

distance between the flanges of longitudinal stiffeners on the longitudinal bulkhead to which the cross tie's horizontal stiffeners are attached, and the inner hull plating

$A_{ct-net50}$ net cross sectional area of the cross tie, in cm^2

2.6.8.2 Special attention is to be paid to the adequacy of the welded connections for the transmission of the forces, and also to the stiffening arrangements, in order to provide effective means for transmission of the compressive forces into the webs. Particular attention is to be paid to the welding at the toes of all end brackets of the cross ties.

2.6.8.3 Horizontal stiffeners are to be located in line with, and attached to, the longitudinals at the ends of the cross ties.

2.6.9 Primary support members located beyond 0.4*L* amidships

2.6.9.1 If a cargo tank FE analysis is not available for the region outside of 0.4*L* amidships, the requirements given in *2.6.9.2* and *2.6.9.3* may be used to obtain the scantlings of primary support members located beyond 0.4*L* of amidships. Scantlings used for the 0.4*L* amidships are to be those required by *Sections 8/2* and *Section 9/2*, see *2.6.1.3* and *2.6.1.4*.

2.6.9.2 The net section modulus of primary support members, $Z_{end-net50}$, located beyond 0.4*L* of amidships is not to be less than:

$$Z_{end-net50} = \frac{Z_{mid-net50}\,\sigma_{yd-mid}\,M_{end}}{\sigma_{yd-end}\,M_{mid}} \qquad \text{cm}^3$$

Where:

M_{end} bending moment, in kNm, for the structural member under consideration located beyond 0.4*L* amidships, calculated in accordance with corresponding requirements of *2.6.3* to *2.6.8* and using the design pressure specified for the given location

M_{mid} bending moment, in kNm, for the corresponding structural member and location of cross section, amidships, obtained from the corresponding requirements of *2.6.2* to *2.6.8*

$Z_{mid-net50}$ net section modulus at the flange of the corresponding structural member and location of cross section amidships, in cm^3

σ_{yd-end} specified minimum yield stress of the flange of the structural member under consideration located beyond 0.4*L* amidships, in N/mm^2

σ_{yd-mid} specified minimum yield stress of the flange of the structural member under consideration amidships, in N/mm^2

2.6.9.3 The net shear area for primary support members, $A_{shr-end-net50}$, located beyond 0.4*L* amidships is not to be less than:

$$A_{shr-end-net50} = \frac{A_{shr-mid-net50}\,\tau_{yd-mid}\,Q_{end}}{\tau_{yd-end}\,Q_{mid}} \qquad \text{cm}^2$$

Where:

Q_{end} shear force, in kN, for the structural member under consideration located beyond 0.4*L* of amidships, calculated in accordance with the corresponding requirements of *2.6.3* to *2.6.8* and using the design pressure, specified for the given location

Q_{mid} shear force, in kN, for the corresponding structural member and corresponding location of cross section, amidships, obtained from the requirements of *2.6.2* to *2.6.8*

$A_{shr-mid-net50}$ shear area of corresponding structural member and location of cross section amidships, in cm^2

τ_{yd-end} $= \dfrac{\sigma_{yd-end}}{\sqrt{3}}$

τ_{yd-mid} $= \dfrac{\sigma_{yd-mid}}{\sqrt{3}}$

σ_{yd-end} specified minimum yield stress of the structural member under consideration located beyond 0.4*L* amidships, in N/mm^2

σ_{yd-mid} specified minimum yield stress of the structural member under consideration amidships, in N/mm^2

3 FORWARD OF THE FORWARD CARGO TANK

3.1 General

3.1.1 Application

3.1.1.1 The requirements of this Sub-Section apply to structure forward of the forward end of the foremost cargo tank. Where the forward end of the foremost cargo tank is aft of 0.1*L* of the ship's length, measured from the F.P., special consideration will be given to the applicability of these requirements and the requirements of *Section 8/2*.

3.1.1.2 The net scantlings described in this Sub-Section are related to gross scantlings as follows:

(a) for application of the minimum thickness requirements of *3.1.4*, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

(b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in Section 6/3

(c) for primary support members, the gross shear area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion additions specified in Section 6/3

(d) for application of buckling requirements of Section 10/2 the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

3.1.2 General scantling requirements

3.1.2.1 The hull structure is to comply with the applicable requirements of:

(a) hull girder longitudinal strength, see Section 8/1

(b) strength against sloshing and impact loads, see Section 8/6

(c) buckling/ultimate strength, see *Section 10*.

3.1.2.2 The deck plating thickness and supporting structure are to be suitably reinforced in way of the anchor windlass and other deck machinery, and in way of cranes, masts and derrick posts. See *Section 11/3*.

3.1.2.3 The net section modulus, shear area and other sectional properties of local and primary support members are to be determined in accordance with *Section 4/2*.

3.1.2.4 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support members are to be applied as required in the notes to *Table 8.3.5*.

3.1.2.5 The scantling criteria are based on assumptions that all structural joints and welded details are designed and fabricated such that they are compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details during the design of highly stressed regions are to be considered. Structural design details are to comply with the requirements in *Section 4/3*.

3.1.2.6 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure free flow to the suction pipes and the escape of air to the vents.

Arrangements are to be made for draining the spaces above deep tanks. See also *Section 4/3*.

3.1.2.7 Web stiffeners are to be fitted on primary support members at each longitudinal on the side and bottom shell. Alternative arrangements may be accepted where adequacy of stiffener end connections and strength of adjoining web and bulkhead plating is demonstrated.

3.1.3 Structural continuity

3.1.3.1 Scantlings of the shell envelope, upper deck and inner bottom are to be tapered towards the forward end. See also *1.6*.

3.1.3.2 In the transition zone aft of the fore peak into the forward cargo tank, due consideration is to be given to the arrangement of major longitudinal members in order to avoid abrupt changes in section. Structures within the fore peak, such as flats, decks, horizontal ring frames or side stringers, are to be scarphed effectively into the structure aft into the cargo tank. Where such structures are in line with longitudinal members aft of the forward cargo tank bulkhead fitting of tapered transition brackets may be used.

3.1.3.3 Where inner hull or longitudinal bulkhead structures terminate at the forward bulkhead of the forward cargo tank, adequate backing structure is to be provided together with tapering brackets to ensure continuity of strength.

3.1.3.4 Longitudinal framing of the strength deck is to be carried as far forward as practicable.

3.1.3.5 All shell frames and tank boundary stiffeners are to be continuous, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4* and *4/3.2.5*.

3.1.4 Minimum thickness

3.1.4.1 In addition to the thickness, section modulus and stiffener web shear area requirements as given in this Sub-Section, the thickness of plating and stiffeners in the forward region are to comply with the appropriate minimum thickness requirements given in *Table 8.3.1*.

3.2 Bottom Structure

3.2.1 Plate keel

3.2.1.1 A flat plate keel is to extend as far forward as practical and is to satisfy the scantling requirements given in *2.2.1*.

3.2.2 Bottom shell plating

3.2.2.1 The thickness of the bottom shell plating is to comply with the requirements in *3.9.2.1*.

3.2.3 Bottom longitudinals

3.2.3.1 Bottom longitudinals are to be carried as far forward as practicable. Beyond this, suitably stiffened frames are to be fitted.

3.2.3.2 The section modulus and thickness of the bottom longitudinals are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

Table 8.3.1
Minimum Net Thickness of Structure Forward of the Forward Cargo Tank

Scantling Location			Net Thickness (mm)
Plating	**Shell**	Keel plating	See *2.1.5.1*
		Bottom shell/bilge/side shell plating	See *2.1.5.1*
	Upper Deck		See *2.1.5.1*
	Other structure	Hull internal tank boundaries	See *2.1.5.1*
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	See *2.1.5.1*
		Pillar bulkheads	7.5
		Breasthooks	6.5
Floors and bottom girders			$5.5 + 0.02L_2$
Web plating of primary support members			$6.5 + 0.015L_2$
Local support members			See *2.1.5.1*
Tripping brackets			See *2.1.5.1*

Where:

L_2 rule length, L, in m, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

RCN 1 to July 2008 version (effective from 1 February 2010)

3.2.4 Bottom floors

3.2.4.1 Bottom floors are to be fitted at each web frame location. The minimum depth of the floor at the centreline is to be not to be less than the required depth of the double bottom of the cargo tank region. See *Section 5/3.2.1.1*.

3.2.5 Bottom girders

3.2.5.1 A supporting structure is to be provided at the centreline either by extending the centreline girder to the stem or by providing a deep girder or centreline bulkhead.

3.2.5.2 Where a centreline girder is fitted, the minimum depth and thickness is not to be less than that required for the depth of the double bottom in the cargo tank region, and the upper edge is to be stiffened. Where a centreline wash bulkhead is fitted, the lowest strake is to have thickness not less than required for a centreline girder.

3.2.5.3 Where a longitudinal wash bulkhead supports bottom transverses, the details and arrangements of openings in the bulkhead are to be configured to avoid areas of high stresses in way of the connection of the wash bulkhead with bottom transverses.

3.2.6 Plate stems

3.2.6.1 Plate stems are to be supported by stringers and flats, and by intermediate breasthook diaphragms spaced not more than 1500mm apart, measured along the stem. Where the stem radius is large, a centreline support structure is to be fitted.

3.2.6.2 Between the minimum design ballast draught, T_{bal} at the stem and the scantling draught, T_{sc}, the plate stem net thickness, $t_{stem\text{-}net}$, is not to be less than:

$$t_{stem-net} = \frac{L_2 \sqrt{\frac{235}{\sigma_{yd}}}}{12}$$ mm, but need not be taken as greater than 21mm

Where:

L_2 rule length, L, in m, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Above the scantling draught the thickness of the stem plate may be tapered to the requirements for the shell plating at the upper deck.

Below the minimum design ballast draught the thickness of the stem plate may be tapered to the requirements for the plate keel.

3.2.7 Floors and girders in spaces aft of the collision bulkhead

3.2.7.1 Floors and girders which are aft of the collision bulkhead and forward of the forward cargo tank, are to comply with the requirements in *3.2.4* and *3.2.5* and are to comply with the shear area requirements in *3.9.3.3*.

3.3 Side Structure

3.3.1 Side shell plating

3.3.1.1 The thickness of the side shell plating is to comply with the requirements in *3.9.2.1*. Where applicable, the thickness of the side shell plating is to comply with the requirements in *2.2.4.2*.

3.3.1.2 Where a forecastle is fitted, the side shell plating requirements are to be applied to the plating extending to the forecastle deck elevation.

3.3.2 Side shell local support members

3.3.2.1 Longitudinal framing of the side shell is to be carried as far forward as practicable.

3.3.2.2 The section modulus and thickness of the hull envelope framing is to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

3.3.2.3 End connections of longitudinals at transverse bulkheads are to provide adequate fixity, lateral support, and where not continuous are to be provided with soft-nosed brackets. Brackets lapped onto the longitudinals are not to be used.

3.3.3 Side shell primary support structure

3.3.3.1 In general, the spacing of web frames, S as defined in *Section 4/2.2.2*, is to be taken as:

$S = 2.6 + 0.005L_2$ m, but not to be taken greater than 3.5m

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but is not to be taken greater than 300m

3.3.3.2 In general, the transverse framing forward of the collision bulkhead stringers are to be spaced approximately 3.5m apart. Stringers are to have an effective span not greater than 10m, and are to be adequately supported by web frame structures. Aft of the collision bulkhead, where transverse framing is adopted, the spacing of stringers may be increased.

3.3.3.3 Perforated flats are to be fitted to limit the effective span of web frames to not greater than 10m.

3.3.3.4 The scantlings of web frames supporting longitudinal frames, and stringers and/or web frames supporting transverse frames in the forward region are to be determined from *3.9.3*, with the following additional requirements:

(a) where no cross ties are fitted:

- the required section modulus of the web frame is to be maintained for 60% of the effective span for bending, measured from the lower end. The value of the bending moment used for calculation of the required section modulus of the remainder of the web frame may be appropriately reduced, but not greater than 20%
- the required shear area of the lower part of the web frame is to be maintained for 60% of the shear span measured from the lower end.

(b) where one cross tie is fitted:

- the effective spans for bending and shear of a web frame or stringer are to be taken ignoring the presence of the cross tie. The shear forces and bending moments may be reduced to 50% of the values that are calculated ignoring the presence of the cross ties. For a web frame, the required section modulus and shear area of the lower part of the web frame is to be maintained up to the cross tie, and the required section modulus and shear area of the upper part of the web frame is to be maintained for the section above the cross tie
- cross ties are to satisfy the requirements of *2.6.8* using the design loads specified in *Table 8.3.8.*

(c) configurations with multiple cross ties are to be specially considered, in accordance with *3.3.3.4(d)*

(d) where complex grillage structures are employed the suitability of the scantlings of the primary support members is to be determined by more advanced calculation methods.

3.3.3.5 The web depth of primary support members is not to be less than 14% of the bending span and is to be at least 2.5 times as deep as the slots for stiffeners if the slots are not closed.

3.4 Deck Structure

3.4.1 Deck plating

3.4.1.1 The thickness of the deck plating is to comply with the requirements in *3.9.2.1* with the applicable lateral pressure, green sea and deck loads.

3.4.1.2 (void)

RCN 1 to July 2008 version (effective from 1 February 2010)

3.4.2 Deck stiffeners

3.4.2.1 The section modulus and thickness of deck stiffeners are to comply with the requirements in *3.9.2.2* and *3.9.2.3*, with the applicable lateral pressure, green sea and deck loads.

3.4.3 Deck primary support structure

3.4.3.1 The section modulus and shear area of primary support members are to comply with the requirements in *3.9.3*.

3.4.3.2 The web depth of primary support members is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is bending span as defined in *Section 4/2.1.4* or in case of a grillage structure, the distance between connections to other primary support members.

RCN 1 to July 2008 version (effective from 1 February 2010)

3.4.3.3 In way of concentrated loads from heavy equipment, the scantlings of the deck structure are to be determined based on the actual loading. See also *Section 11/3*.

3.4.4 Pillars

3.4.4.1 Pillars are to be fitted in the same vertical line wherever possible and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

3.4.4.2 Tubular and hollow square pillars are to be attached at their heads and heels by efficient brackets or doublers/insert plates, where applicable, to transmit the load effectively. Pillars are to be attached at their heads and heels by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be distributed by brackets or other equivalent means.

3.4.4.3 Pillars in tanks are to be of solid section. Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45% of the specified minimum yield stress of the material.

3.4.4.4 The scantlings of pillars are to comply with the requirements in *3.9.5*.

3.4.4.5 Where the loads from heavy equipment exceed the design load of *3.9.5*, the pillar scantlings are to be determined based on the actual loading.

3.5 Tank Bulkheads

3.5.1 General

3.5.1.1 Tanks may be required to have divisions or deep wash plates in order to minimise the dynamic stress on the structure.

3.5.2 Construction

3.5.2.1 In no case are the scantlings of tank boundary bulkheads to be less than the requirements for watertight bulkheads.

3.5.3 Scantlings of tank boundary bulkheads

3.5.3.1 The thickness of tank boundary plating is to comply with the requirements in *3.9.2.1*.

3.5.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

3.5.3.3 The section modulus and shear area of primary support members are to comply with the requirements in *3.9.3*.

3.5.3.4 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending, and is not to be less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 to July 2008 version (effective from 1 February 2010)

3.5.3.5 Scantlings of corrugated bulkheads are to comply with the requirements in *3.9.4*.

3.6 Watertight Boundaries

3.6.1 General

3.6.1.1 Watertight boundaries are to be fitted in accordance with *Section 5/2*.

3.6.2 Collision bulkhead

3.6.2.1 The scantlings of structural components of the collision bulkheads are to comply with the requirements in *3.6.3*, as applicable. Additionally, the collision bulkhead is to comply with the requirements in *3.6.2.2* to *3.6.2.4*.

3.6.2.2 The position of the collision bulkhead is to be in accordance with *Section 5/2.2*.

3.6.2.3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck. Where the collision bulkhead is extended above the freeboard deck, the number of openings in the extension is to be kept to a minimum compatible with the design and proper working of the ship. The openings are to be fitted with weathertight closing appliances. The collision bulkhead may be pierced by pipes necessary for dealing with the contents of tanks forward of the bulkhead, provided the pipes are fitted with valves capable of being operated from above the freeboard deck. The valves are generally to be fitted on the collision bulkhead inside the fore peak and are not to be fitted inside the cargo tank.

3.6.2.4 Compartments forward of the collision bulkhead may not be arranged for the carriage of flammable liquids.

3.6.3 Scantlings of watertight boundaries

3.6.3.1 The thickness of boundary plating is to comply with the requirements in *3.9.2.1*.

3.6.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

3.6.3.3 The section modulus and shear area of primary support members are to comply with the requirements in *3.9.3*.

3.6.3.4 Web plating of primary support members is to have a depth of not less than 10% of the unsupported span in bending, and is not to be less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 to July 2008 version (effective from 1 February 2010)

3.6.3.5 Scantlings of corrugated bulkheads are to comply with the requirements in *3.9.4*.

3.7 Superstructure

3.7.1 Forecastle structure

3.7.1.1 Forecastle structures are to be supported by girders with deep beams and web frames, and in general, arranged in complete transverse belts and supported by lines of pillars extending down into the structure below. Deep beams and girders are to be arranged, where practicable, to limit the spacing between deep beams, web frames, and/or girders to about 3.5m. Pillars are to be provided as required by *3.4.4*. Main structural intersections are to be carefully developed with special attention given to pillar head and heel connections, and to the avoidance of stress concentrations.

3.7.2 Forecastle end bulkhead

3.7.2.1 The details and scantlings of the forecastle end bulkhead are to meet the requirements of *Section 11/1.4.*

3.8 Miscellaneous Structures

3.8.1 Pillar bulkheads

3.8.1.1 Bulkheads that support girders, or pillars and longitudinal bulkheads which are fitted in lieu of girders, are to be stiffened to provide supports not less effective than required for stanchions or pillars. The acting load and the required net cross sectional area of the pillar section are to be determined using the requirements of *3.4.4*. The net moment of inertia of the stiffener is to be calculated with a width of $40t_{net}$, where t_{net} is the net thickness of plating, in mm.

3.8.1.2 Pillar bulkheads are to comply with the following requirements:

(a) the distance between bulkhead stiffeners is not to exceed 1500mm

(b) where corrugated, the depth of the corrugation is not to be less than 100mm.

3.8.2 Bulbous bow

3.8.2.1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

3.8.2.2 At the forward end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1m apart in conjunction with a deep centreline web.

3.8.2.3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.

3.8.2.4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.

3.8.2.5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames is to be fitted.

3.8.2.6 The shell plating is to be increased in thickness at the forward end of the bulb and also in areas likely to be subjected to contact with anchors and chain cables during anchor handling. The increased plate thickness is to be the same as that required for plated stems given in *3.2.6*.

3.8.3 Chain lockers

3.8.3.1 Chain lockers are to meet the requirements of *Section 11/4.2.9*.

3.8.4 Bow thruster tunnels

3.8.4.1 The net thickness of the tunnel plating, $t_{tun-net}$, is not to be less than as required for the shell plating in the vicinity of the bow thruster. In addition, $t_{tun-net}$ is not to be taken less than:

$$t_{tun-net} = 0.008 d_{tun} + 1.8 \quad \text{mm}$$

Where:

d_{tun} inside diameter of the tunnel, in mm, but not to be taken less than 970mm

3.8.4.2 Where the outboard ends of the tunnel are provided with bars or grids, the bars or grids are to be effectively secured.

3.9 Scantling Requirements

3.9.1 General

3.9.1.1 The design load sets are to be applied to the structural requirements for the local support and primary support members as given in *Table 8.3.8*. The static and dynamic load components are to be combined in accordance with *Table 7.6.1* and the procedure given in *Section 7/6.3*.

3.9.2 Plating and local support members

3.9.2.1 For plating subjected to lateral pressure, the net plating thickness, t_{net}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$t_{net} = 0.0158\alpha_p s\sqrt{\frac{|P|}{C_a\sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$= 1.2 - \dfrac{s}{2100 l_p}$, but not to be greater than 1.0

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.1.2*, in kN/m^2

s stiffener spacing, in mm , as defined in *Section 4/2.2*

l_p length of plate panel, to be taken as the spacing of primary support members, unless carlings are fitted, in m

C_a permissible bending stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.2*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Table 8.3.2
Permissible Bending Stress Coefficient for Plating

Acceptance criteria set	Structural member	C_a
AC1	All plating	0.80
AC2	Hull envelope plating	0.95
	Internal boundary plating (1)	1.00

Note

1. Collision bulkhead plating is to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1

3.9.2.2 For stiffeners subjected to lateral pressure, the net section modulus, Z_{net}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$Z_{net} = \frac{|P| s\, l_{bdg}{}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

s stiffener spacing, in mm , as defined in *Section 4/2.2*

l_{bdg} effective bending span, as defined in *Section 4/2.1.1*, in m

f_{bdg} bending moment factor:

for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having fixed ends:

12 for horizontal stiffeners

10 for vertical stiffeners

for other configurations the bending moment factor may be taken as in *Table 8.3.5.*

C_s permissible bending stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.3*

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.3
Permissible Bending Stress Coefficient for Stiffeners

Acceptance criteria set	Structural member	C_s
AC1	All stiffeners	0.75
AC2	All stiffeners (1)	0.90

Note

1. Collision bulkhead stiffeners are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1

3.9.2.3 For stiffeners subjected to lateral pressure, the net web thickness based on shear area requirements, t_{w-net}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$t_{w-net} = \frac{f_{shr} |P| s\, l_{shr}}{d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

f_{shr} shear force factor:

for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having fixed ends:

0.5 for horizontal stiffeners

0.7 for vertical stiffeners

for other configurations the shear force factor may be taken as in *Table 8.3.5.*

s stiffener spacing, in mm , as defined in *Section 4/2.2*

l_{shr} effective shear span, as defined in *Section 4/2.1.2*, in m

d_{shr} effective web depth of stiffeners, in mm, as defined in *Section 4/2.4.2.2*

C_t permissible shear stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.4*

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.4
Permissible Shear Stress Coefficient for Stiffeners

Acceptance criteria set	Structural member	C_t
AC1	All stiffeners	0.75
AC2	All stiffeners (1)	0.90

Note

1. Collision bulkhead stiffeners are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1

Table 8.3.5
Bending Moment and Shear Force Factors, f_{bdg} and f_{shr}

Load and boundary condition				Bending moment and shear force factor (based on load at mid span, where load varies)		
Position				1	2	3
Load model	1 Support	2 Field	3 Support	f_{bdg1} f_{shr1}	f_{bdg2} -	f_{bdg3} f_{shr3}
A				12.0 0.50	24.0 -	12.0 0.50
B				- 0.38	14.2 -	8.0 0.63
C				- 0.50	8.0 -	- 0.50
D				15.0 0.30	23.3 -	10.0 0.70
E				- 0.20	16.8 -	7.5 0.80

Note

1. The bending moment factor f_{bdg} for the support positions are applicable for a distance of $0.2l_{bdg}$ from the end of the effective bending span for both local and primary support members.
2. The shear force factor f_{shr} for the support positions are applicable for a distance of $0.2l_{shr}$ from the end of the effective shear span for both local and primary support members.
3. Application of f_{bdg} and f_{shr} for local support members:
   (a) the section modulus requirement of local support members is to be determined using the lowest value of f_{bdg1} , f_{bdg2} and f_{bdg3}
   (b) the shear area requirement of local support members is to be determined using the greatest value of f_{shr1} and f_{shr3}.
4. Application of f_{bdg} and f_{shr} for primary support members:
   (a) the section modulus requirement within $0.2l_{bdg}$ from the end of the effective span is generally to be determined using the applicable f_{bdg1} and f_{bdg3}, however f_{bdg} is not to be taken greater than 12
   (b) the section modulus of mid span area is to be determined using f_{bdg} =24, or f_{bdg2} from the table if lesser
   (c) the shear area requirement of end connections within $0.2l_{shr}$ from the end of the effective span is to be determined using f_{shr} = 0.5 or the applicable f_{shr1} or f_{shr3}, whichever is greater
   (d) for models A through E the value of f_{shr} may be gradually reduced outside of $0.2l_{shr}$ towards $0.5f_{shr}$ at mid span where f_{shr} is the greater value of f_{shr1} and f_{shr3}.
5. For other load models see *Table 8.7.1.*

3.9.3 Primary support members

3.9.3.1 For primary support members intersecting with or in way of curved hull sections, the effectiveness of end brackets is to include allowance for the curvature of the hull. For side transverse frames, the requirements may be reduced due to the presence of cross ties, see *3.3.3.4*.

3.9.3.2 For primary support members subjected to lateral pressure, the net section modulus, Z_{net50}, is to be taken as the greatest value for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$Z_{net50} = 1000 \frac{|P| S \, l_{bdg}^2}{f_{bdg} C_s \, \sigma_{yd}} \quad \text{cm}^3$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.3.3*, in kN/m²

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

l_{bdg} effective bending span, as defined in *Section 4/2.1.4*, in m

f_{bdg} bending moment factor, as given in *Table 8.3.5*

C_s permissible bending stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.6*

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.6
Permissible Bending Stress Coefficient for Primary Support Members

Acceptance criteria set	Structure attached to primary support member	C_s
AC1	All boundaries, including decks and flats	0.70
AC2	All boundaries, including decks and flats (1)	0.85

Note
1. Collision bulkhead primary support members are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1

3.9.3.3 For primary support members subjected to lateral pressure, the effective net shear area, $A_{shr\text{-}net50}$, is to be taken as the greatest value for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$A_{shr-net50} = 10 \frac{f_{shr} |P| S \, l_{shr}}{C_t \, \tau_{yd}} \quad \text{cm}^2$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.3.2*, in kN/m²

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

l_{shr} effective shear span, as defined in *Section 4/2.1.5*, in m

f_{shr} shear force factor, as given in *Table 8.3.5*

C_t permissible shear stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.7*

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.7
Permissible Shear Stress Coefficient for Primary Support Members

Acceptance criteria set	Structure attached to primary support member	C_t
AC1	All boundaries, including decks and flats	0.70
AC2	All boundaries, including decks and flats (1)	0.85

Note
1. Collision bulkhead primary support members are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1

3.9.3.4 Primary support members are to generally be analysed with the specific methods as described for the particular structure type. More advanced calculation methods may be necessary to ensure that nominal stress level for all primary support members are less than the permissible stresses and stress coefficients given in *3.9.3.2* and *3.9.3.3* when subjected to the applicable design load sets.

3.9.4 Corrugated bulkheads

3.9.4.1 Special consideration will be given to the approval of corrugated bulkheads where fitted.

Guidance Note

Scantling requirements of corrugated bulkheads in the cargo tank region may be used as a basis, see *2.5.6* and *2.5.7.*

3.9.5 Pillars

3.9.5.1 The maximum load on a pillar, W_{pill}, is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and is to be less than or equal to the permissible pillar load as given by the following equation, where $W_{pill-perm}$ is based on the net properties of the pillar.

$$W_{pill} \leq W_{pill-perm}$$

Where:

W_{pill} applied axial load on pillar

$= P\, b_{a-\sup}\, l_{a-\sup} + W_{pill-upr}$ kN

$W_{pill-perm}$ permissible load on a pillar

$= 0.1 A_{pill-net50}\, \eta_{pill}\, \sigma_{crb}$ kN

P design pressure for the design load set being considered, calculated at centre of the deck area supported by the pillar being considered, in kN/m²

b_{a-sup} mean breadth of area supported, in m

$l_{a\text{-}sup}$	mean length of area supported, in m
$W_{pill\text{-}upr}$	axial load from pillar or pillars above, in kN
$A_{pill\text{-}net50}$	net cross section area of the pillar, in cm^2
η_{pill}	utilisation factor for the design load set being considered: = 0.5 for acceptance criteria set AC1 = 0.6 for acceptance criteria set AC2
σ_{crb}	critical buckling stress in compression of pillar based on the net sectional properties calculated in accordance with *Section 10/3.5.1*, in N/mm^2

Table 8.3.8
Design Load Sets for Plating, Local Support Members and Primary Support Members

Type of Local Support and Primary Support Member	Design Load Set (1)	Load Component	External Draught	Comment	Diagrammatic Representation
Shell Envelope	1	P_{ex}	T_{sc}	Sea pressure only		2	P_{ex}	T_{sc}		
	5	P_{in}	T_{bal}	Tank pressure only. Sea pressure to be ignored		6	P_{in}	$0.25T_{sc}$		
External Decks	1	P_{ex}	T_{sc}	Green sea pressure only	Tank Boundaries and/or Watertight Boundaries	5	P_{in}	T_{bal}	Pressure from one side only Full tank with adjacent tank empty		6	P_{in}	$0.25T_{sc}$		
	11	$P_{in\text{-}flood}$	-		
Internal and External Decks or Flats	9	P_{dk}	T_{bal}	Distributed or concentrated loads only. Adjacent tanks empty. Green sea pressure may be ignored		10	P_{dk}	T_{bal}		

Where:

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{bal} minimum design ballast draught, in m, as defined in *Section 4/1.1.5.2*

Notes

1. The specification of design load combinations and other load parameters for the design load sets are given in *Table 8.2.8*
2. When the ship's configuration cannot be described by the above, then the applicable Design Load Sets to determine the scantling requirements of structural boundaries are to be selected so as to specify a full tank on one side with the adjacent tank or space empty. The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. See Note 4 on *Table 8.2.7* and *Table 8.2.8.*
3. The boundaries of void and dry space not forming part of the hull envelope are to be evaluated using Design Load Set 11. See Note 2.

4 MACHINERY SPACE

4.1 General

4.1.1 Application

4.1.1.1 The requirements of this Sub-Section apply to machinery spaces situated in the aft end region, aft of the aftermost cargo tank bulkhead and forward of, and including, the aft peak bulkhead.

4.1.1.2 The net scantlings described in this Sub-Section are related to gross scantlings as follows:

(a) for application the minimum thickness requirements of *4.1.5*, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions as specified in *Section 6/3*.

(b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions as specified in *Section 6/3*.

(c) for primary support members, the gross shear area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion additions as specified in *Section 6/3*.

(d) for application of buckling requirements of *Section 10/2* the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions as specified in *Section 6/3*.

4.1.2 General scantling requirements

4.1.2.1 The hull structure is to comply with the applicable requirements of:

(a) hull girder longitudinal strength, see *Section 8/1*

(b) strength against sloshing and impact loads, see *Section 8/6*

(c) buckling/ultimate strength, see *Section 10*.

4.1.2.2 The net section modulus, shear area and other sectional properties of local and primary support members are to be determined in accordance with *Section 4/2*.

4.1.2.3 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support members are to be applied as required in the notes to *Table 8.3.5*.

4.1.2.4 The scantling criteria are based on assumptions that all structural joints and welded details are designed and fabricated such that they are compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details during the design of highly stressed regions are to be considered. Structure design details are to comply with the requirements in *Section 4/3*.

4.1.2.5 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure the free flow to the suction pipes and the escape of air to the vents. Arrangements are to be made for draining the spaces above tanks. See also *Section 4/3*.

4.1.3 Structural continuity

4.1.3.1 Scantlings of the shell envelope, upper deck and inner bottom are to be properly tapered towards the aft end. See also *1.6*.

4.1.3.2 Suitable arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities when structure that contributes to the main longitudinal strength of the ship is omitted in way of the machinery space.

4.1.3.3 Where inner hull or longitudinal bulkhead structures terminate at the forward engine room bulkhead, adequate backing structure is to be provided together with tapering brackets to ensure continuity of strength.

4.1.3.4 All shell frames and tank boundary stiffeners are to be continuous throughout, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4* and *4/3.2.5*.

4.1.3.5 Longitudinal primary support members, lower decks, and bulkheads arranged in the engine room are to be aligned with similar structures in the cargo tank region, as far as practicable. Where direct alignment is not possible, suitable scarphing arrangements such as taper brackets are to be provided.

4.1.4 Arrangements

4.1.4.1 Where openings in decks/bulkheads are provided in the machinery space, the arrangements are to ensure support for deck, side, and bottom structure.

4.1.4.2 All parts of the machinery, shafting, etc., are to be supported to distribute the loads into the ship's structure. The adjacent structure is to be suitably stiffened.

4.1.4.3 Primary support members are to be positioned giving consideration to the provision of through stiffeners and in-line pillar supports to achieve an efficient structural design.

4.1.4.4 These requirements are formulated assuming conventional single screw, single engine propulsion arrangements. Twin-screw or multi-engine vessels, or vessels of higher power, may require additions to the scantlings of the structure and the area of attachments, which are proportional to the weight, power and proportions of the machinery especially where the engines are positioned relatively high in proportion to the width of the bed plate.

4.1.4.5 The foundations for main propulsion units, reduction gears, shaft and thrust bearings, and the structure supporting those foundations are to maintain the required alignment and rigidity under all anticipated conditions of loading. Consideration is to be given to the submittal of the following plans to the machinery manufacturer for review:

(a) foundations for main propulsion units

(b) foundations for reduction gears

(c) foundations for thrust bearings

(d) structure supporting (a), (b) and (c).

4.1.4.6 A cofferdam is to be provided to separate the cargo tanks from the machinery space. Pump room, ballast tanks, or fuel oil tanks may be considered as cofferdams for this purpose.

4.1.5 Minimum thickness

4.1.5.1 In addition to the requirements for thickness, section modulus and shear area, as given in *4.2* to *4.8*, the thickness of plating and stiffeners in the machinery space is to comply with applicable minimum thickness requirements given in *Table 8.4.1*.

Table 8.4.1
Minimum Net Thickness of Structure in the Machinery Space

Scantling Location			Net Thickness (mm)
Plating	**Shell**	Keel plating	See *2.1.5.1*
		Bottom shell/bilge/side shell plating	See *2.1.5.1*
	Upper deck		See *2.1.5.1*
	Other structure	Hull internal tank boundaries	See *2.1.5.1*
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	See *2.1.5.1*
		Lower decks and flats	$3.3 + 0.0067s$
		Inner bottom	$6.5 + 0.02L_2$
Bottom centreline girder			See *2.1.6.1*
Floors and bottom longitudinal girders off centreline			$5.5 + 0.02L_2$
Web plating of primary support members			$5.5 + 0.015\,L_2$
Local support members			See *2.1.5.1*
Tripping brackets			See *2.1.5.1*

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

s stiffener spacing, in mm, as defined in *Section 4/2.2*

RCN 1 to July 2008 version (effective from 1 February 2010)

4.2 Bottom Structure

4.2.1 General

4.2.1.1 In general, a double bottom is to be fitted in the machinery space. The depth of the double bottom is to be at least the same as required in the cargo tank region, see *Section 5/3.2.1*. Where the depth of the double bottom in the machinery space differs from that in the adjacent spaces, continuity of the longitudinal material is to be maintained by sloping the inner bottom over a suitable longitudinal extent. Lesser double bottom height may be accepted in local areas provided that the overall strength of the double bottom structure is not thereby impaired.

(RCN 2, effective from 1 July 2008)

4.2.2 Bottom shell plating

4.2.2.1 The keel plate breadth is to comply with the requirements in *Section 8/2.2.1.1*.

4.2.2.2 The thickness of the bottom shell plating (including keel plating) is to comply with the requirements in *4.8.1.1*.

4.2.3 Bottom shell stiffeners

4.2.3.1 The section modulus and thickness of bottom shell stiffeners are to comply with the requirements in *4.8.1.2* and *4.8.1.3*.

4.2.4 Girders and floors

4.2.4.1 The double bottom is to be arranged with a centreline girder.

(RCN 2, effective from 1 July 2008)

4.2.4.2 Full depth bottom girders are to be arranged in way of the main machinery to effectively distribute its weight, and to ensure rigidity of the structure. The girders are to be carried as far forward and aft as practicable, and suitably supported at their ends to provide distribution of loads from the machinery. The girders are to be tapered beyond their required extent.

4.2.4.3 Where fitted, side girders are to align with the bottom side girders in the adjacent space.

4.2.4.4 Where the double bottom is transversely framed, plate floors are to be fitted at every frame.

4.2.4.5 Where the double bottom is longitudinally framed, plate floors are to be fitted at every frame under the main engine and thrust bearing. Outboard of the engine and bearing seatings, the floors may be fitted at alternate frames.

4.2.4.6 Where heavy equipment is mounted directly on the inner bottom, the thickness of the floors and girders is to be suitably increased.

4.2.5 Inner bottom plating

4.2.5.1 Where main engines or thrust bearings are bolted directly to the inner bottom, the net thickness of the inner bottom plating is to be at least 19mm. Hold-down bolts are to be arranged as close as possible to floors and longitudinal girders. Plating thickness and the arrangements of hold-down bolts are also to consider the manufacturer's recommendations.

4.2.6 Sea chests

4.2.6.1 Where the inner bottom or double bottom structure forms part of a sea chest, the thickness of the plating is not to be less than that required for the shell at the same location, taking into account the maximum unsupported width of the plating.

4.3 Side Structure

4.3.1 General

4.3.1.1 The scantlings of the side shell plating and longitudinals are to be properly tapered from the midship region towards the aft end.

4.3.1.2 A suitable scarphing arrangement of the longitudinal framing is to be arranged where the longitudinal framing terminates and is replaced by transverse framing.

4.3.1.3 Stiffeners and primary support members are to be supported at their ends.

4.3.2 Side shell plating

4.3.2.1 The thickness of the side shell plating is to comply with the requirements in *4.8.1.1*. Where applicable, the thickness of the side shell plating is to comply with the requirements in *2.2.4.2*.

4.3.3 Side shell local support members

4.3.3.1 The section modulus and thickness of side longitudinal and vertical stiffeners are to comply with the requirements in *4.8.1.2* and *4.8.1.3*.

4.3.3.2 (void)

4.3.3.3 End connections of longitudinals at transverse bulkheads are to provide fixity, lateral support, and when not continuous are to be provided with soft-nosed brackets. Brackets lapped onto the longitudinals are not to be fitted.

4.3.4 Side shell primary support members

4.3.4.1 Web frames are to be connected at the top and bottom to members of suitable stiffness, and supported by deck transverses.

4.3.4.2 The spacing of web frames in way of transversely framed machinery spaces is generally not to exceed five transverse frame spaces.

4.3.4.3 The section modulus and shear area of primary support members are to comply with the requirements in *4.8.2*.

4.3.4.4 The web depth is to be not less than 2.5 times the web depth of the adjacent frames if the slots are not closed.

4.3.4.5 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending.

4.4 Deck Structure

4.4.1 General

4.4.1.1 All openings are to be framed. Attention is to be paid to structural continuity. Abrupt changes of shape, section or plate thickness are to be avoided.

4.4.1.2 The corners of the machinery space openings are to be of suitable shape and design to minimise stress concentrations.

4.4.1.3 In way of machinery openings, deck or flats are to have sufficient strength where they are intended as effective supports for side transverse frames or web frames.

4.4.1.4 Where a transverse framing system is adopted, deck stiffeners are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Where fitted, deck transverses are to be arranged in line with web frames to provide end fixity and transverse continuity of strength.

4.4.1.5 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in line with web frames in association with pillars or pillar bulkheads.

4.4.1.6 Machinery casings are to be supported by a suitable arrangement of deck transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required. These are to be arranged in line with deck transverses.

4.4.1.7 The structural scantlings are to be not less than the requirement for tank boundaries if the deck forms the boundary of a tank.

4.4.1.8 The structural scantlings are to be not less than the requirement for watertight bulkheads if the deck forms the boundary of a watertight space.

4.4.2 Deck scantlings

4.4.2.1 The plate thickness of deck plating is to comply with the requirements in *4.8.1.1*.

4.4.2.2 The section modulus and thickness of deck stiffeners are to comply with the requirements in *4.8.1.2* and *4.8.1.3*.

4.4.2.3 The web depth of deck stiffeners is to be not less than 60mm.

4.4.2.4 The section modulus and shear area of primary support members are to comply with the requirements in *4.8.2*.

4.4.2.5 The web depth of primary support members is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is bending span as defined in *Section 4/2.1.4* or in case of a grillage structure the distance between connections to other primary support members.

RCN 1 to July 2008 version (effective from 1 February 2010)

4.4.2.6 In way of concentrated loads from heavy equipment, the scantlings of the deck structure are to be determined based on the actual loading.

4.4.3 Pillars

4.4.3.1 Pillars are to be fitted in the same vertical line wherever possible, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

4.4.3.2 Tubular and hollow square pillars are to be attached at their heads and heels by efficient brackets, or doublers/insert plates, where applicable, to transmit the load effectively. Pillars are to be attached at their heads and heels by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be distributed by brackets or other equivalent means.

4.4.3.3 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars.

4.4.3.4 Pillars in tanks are to be of solid section. Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45%of the specified minimum yield stress of the material.

4.4.3.5 The scantlings of pillars are to comply with the requirements in *4.8.4*.

4.4.3.6 Where the pillar loads from heavy equipment exceed the design load required by *4.8.4*, the pillar scantlings are to be determined based on the actual loading.

4.5 Machinery Foundations

4.5.1 General

4.5.1.1 Main engines and thrust bearings are to be effectively secured to the hull structure by foundations of strength that is sufficient to resist the various gravitational, thrust, torque, dynamic, and vibratory forces which may be imposed on them.

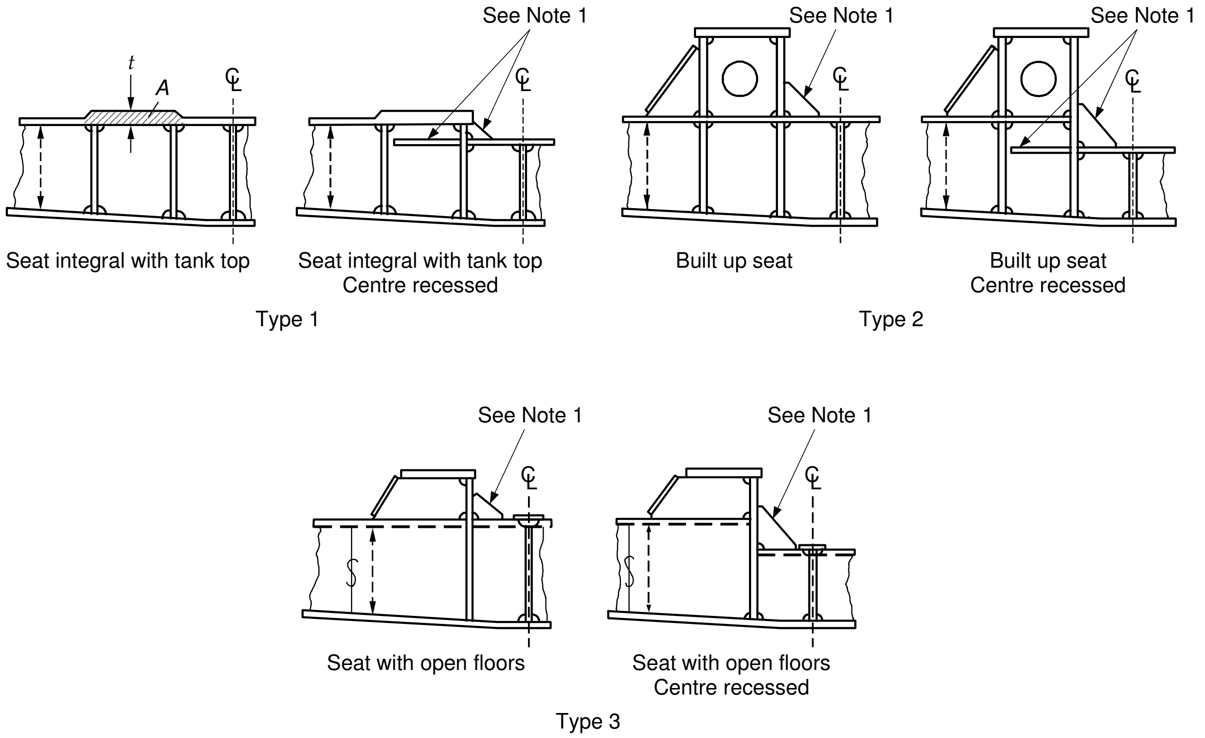
4.5.1.2 In the case of higher power internal combustion engines or turbine installations, the foundations are generally to be integral with the double bottom structure. Consideration is to be given to substantially increase the inner bottom plating thickness in way of the engine foundation plate or the turbine gear case, and the thrust bearing, see *Figure 8.4.1*, Type 1.

4.5.1.3 For main machinery supported on foundations of Type 2, as shown in *Figure 8.4.1*, the forces from the engine into the adjacent structure are to be distributed as

uniformly as possible. Longitudinal members supporting the foundation are to be aligned with girders in the double bottom, and transverse stiffening is to be arranged in line with the floors, see *Figure 8.4.1*, Type 2.

4.5.1.4 For ships with open floors in the machinery space, the foundations are generally to be arranged above the level of the top of the floors and securely bracketed, see *Figure 8.4.1*, Type 3.

Figure 8.4.1
Machinery Foundations



Note

1. Brackets are to be as large as possible. Brackets may be omitted to avoid interference with the girders of the engine foundation, in accordance with recommendations of the engine manufacturer.

4.5.2 Foundations for internal combustion engines and thrust bearings

4.5.2.1 In determining the scantlings of foundations for internal combustion engines and thrust bearings, consideration is to be given to the general rigidity of the engine and to its design characteristics with regard to out of balance forces.

4.5.2.2 Generally two girders are to be fitted in way of the foundation for internal combustion engines and thrust bearings.

Guidance Note

In general, the gross thickness of foundation top plates is not to be less than 45mm, where the maximum continuous output of the propulsion machinery is 3500kw or greater.

4.5.3 Auxiliary foundations

4.5.3.1 Auxiliary machinery is to be secured on foundations that are of suitable size and arrangement to distribute the loads from the machinery evenly into the supporting structure.

4.6 Tank Bulkheads

4.6.1 General

4.6.1.1 Tanks may be required to have divisions or deep wash plates to minimise the dynamic stress on the structure.

4.6.2 Construction

4.6.2.1 In no case are the scantlings of tank boundary bulkheads to be less than the requirements for watertight bulkheads.

4.6.3 Scantlings of tank boundary bulkheads

4.6.3.1 The thickness of tank boundary plating is to comply with the requirements in *4.8.1.1*.

4.6.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in *4.8.1.2* and *4.8.1.3*.

4.6.3.3 The section modulus and shear area of primary support members are to comply with the requirements in *4.8.2*.

4.6.3.4 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 to July 2008 version (effective from 1 February 2010)

4.7 Watertight Boundaries

4.7.1 General

4.7.1.1 Watertight boundaries within the machinery space are to be fitted in accordance with *Section 5/2*.

4.7.2 Scantlings of watertight boundaries

4.7.2.1 The thickness of watertight boundary plating is to comply with the requirements in *4.8.1.1*.

4.7.2.2 The section modulus and thickness of stiffeners are to comply with the requirements in *4.8.1.2* and *4.8.1.3*.

4.7.2.3 The section modulus and shear area of primary support members are to comply with the requirements in *4.8.2*.

4.7.2.4 Web plating of primary support members is to have a depth of not less than 10% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 to July 2008 version (effective from 1 February 2010)

4.8 Scantling Requirements

4.8.1 Plating and local support members

4.8.1.1 For plating subjected to lateral pressure the net plating thickness is to comply with the requirements in *3.9.2.1*, but using the permissible bending stress coefficient, C_a, defined in *Table 8.4.2*.

4.8.1.2 For stiffeners subjected to lateral pressure the net section modulus requirement is to comply with the requirements in *3.9.2.2*, but using the permissible bending stress coefficient, C_s, defined in *Table 8.4.3*.

4.8.1.3 For stiffeners subjected to lateral pressure the net web thickness based on shear area requirements is to comply with the requirements in *3.9.2.3*.

Table 8.4.2
Permissible Bending Stress Coefficient for Plating

The permissible bending stress coefficient, C_a, for the design load set being considered is to be taken as:

$$C_a = \beta_a - \alpha_a \frac{|\sigma_{hg}|}{\sigma_{yd}}$$ but not to be taken greater than C_{a-max}

Where:

β_a, α_a, C_{a-max}

<table>
<tr><th>Acceptance Criteria Set</th><th colspan="2">Structural Member</th><th>β_a</th><th>α_a</th><th>C_{a-max}</th></tr>
<tr><td rowspan="3">AC1</td><td rowspan="2">Longitudinal Strength Members</td><td>Longitudinally stiffened plating</td><td>0.9</td><td>0.5</td><td>0.8</td></tr>
<tr><td>Transversely or vertically stiffened plating</td><td>0.9</td><td>1.0</td><td>0.8</td></tr>
<tr><td colspan="2">Other members</td><td>0.8</td><td>0</td><td>0.8</td></tr>
<tr><td rowspan="3">AC2</td><td rowspan="2">Longitudinal Strength Members</td><td>Longitudinally stiffened plating</td><td>1.05</td><td>0.5</td><td>0.95</td></tr>
<tr><td>Transversely or vertically stiffened plating</td><td>1.05</td><td>1.0</td><td>0.95</td></tr>
<tr><td colspan="2">Other members, including watertight boundary plating</td><td>1.0</td><td>0</td><td>1.0</td></tr>
</table>

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the load calculation point defined in *Section 3/5.1.2*

$$= \frac{(z - z_{NA-net50})\, M_{v-total}}{I_{v-net50}} 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at the longitudinal position under consideration for the design load set being considered, in kNm. The still water bending moment, $M_{sw-perm}$, is to be taken with the same sign as the simultaneously acting wave bending moment, M_{wv}, see *Table 7.6.1*

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.1*, in m^4

z vertical coordinate of the load calculation point under consideration, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in *Section 4/2.6.1*, in m

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Table 8.4.3
Permissible Bending Stress Coefficient for Stiffeners

The permissible bending stress coefficient C_s is to be taken as:

Sign of Hull Girder Bending Stress, σ_{hg}	Side that Pressure is Acting On	Acceptance Criteria
Tension (+ve)	Stiffener side	$C_s = \beta_s - \alpha_s \dfrac{\lvert\sigma_{hg}\rvert}{\sigma_{yd}}$ but not to be taken greater than C_{s-max}
Compression (-ve)	Plate side	
Tension (+ve)	Plate side	$C_s = C_{s-max}$
Compression (-ve)	Stiffener side	

Where:

β_s , α_s , C_{s-max} permissible bending stress factors and are to be taken as:

Acceptance Criteria Set	Structural Member	β_s	α_s	C_{s-max}
AC1	Longitudinally effective stiffeners	0.85	1.0	0.75
	Other stiffeners	0.75	0	0.75
AC2	Longitudinally effective stiffeners	1.0	1.0	0.9
	Other stiffeners	0.9	0	0.9
	Watertight boundary stiffeners	0.9	0	0.9

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the reference point defined in *Section 3/5.2.2.5*

$$= \left(\frac{(z - z_{NA-net50})\, M_{v-total}}{I_{v-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at longitudinal position under consideration for the design load set being considered, in kNm

$M_{v-total}$ is to be calculated in accordance with *Table 7.6.1* using the sagging or hogging still water bending moment

Stiffener Location	$M_{sw-perm}$	
	Pressure acting on Plate Side	**Pressure acting on Stiffener Side**
Above Neutral Axis	Sagging SWBM	Hogging SWBM
Below Neutral Axis	Hogging SWBM	Sagging SWBM

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.1*, in m^4

z vertical coordinate of the reference point defined in *Section 3/5.2.2.5*, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in *Section 4/2.6.1*, in m

σ_{yd} specified minimum yield stress of the material, in N/mm^2

4.8.2 Primary support members

4.8.2.1 For primary support members intersecting with or in way of curved hull sections, the effectiveness of end brackets is to include allowance for the curvature of the hull.

4.8.2.2 For primary support members subjected to lateral pressure the net section modulus requirement is to comply with the requirements in *3.9.3.2*.

4.8.2.3 For primary support members subjected to lateral pressure the net cross sectional area of the web is to comply with the requirements in *3.9.3.3*.

4.8.2.4 Primary support members are to generally be analysed with the specific methods as described for the particular structure type. More advanced calculation methods may be required to ensure that nominal stress level for all primary support members are less than permissible stresses and stress coefficients given in *3.9.3.2* and *3.9.3.3* when subjected to the applicable design load sets.

4.8.3 Corrugated bulkheads

4.8.3.1 Special consideration will be given to the approval of corrugated bulkheads where fitted.

Guidance Note

Scantling requirements of corrugated bulkheads in the cargo tank region may be used as a basis, see *2.5.6* and *2.5.7.*

4.8.4 Pillars

4.8.4.1 The maximum load on a pillar is to be less than the permissible pillar load as given by the requirements in *3.9.5*.

5 AFT END

5.1 General

5.1.1 Application

5.1.1.1 The requirements of this Sub-Section apply to structure located between the aft peak bulkhead and the aft end of the ship.

5.1.1.2 The requirements of this Sub-Section do not apply to the following:

(a) rudder horns

(b) structures which are not integral with the hull, such as rudders, steering nozzles and propellers

(c) other appendages permanently attached to the hull.

Where such items are fitted, the requirements of the individual Classification Society are to be complied with.

5.1.1.3 The net scantlings described in *5.1* to *5.7* are related to gross scantlings as follows:

(a) for application the minimum thickness requirements of *5.1.4*, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3.*

(b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*

(c) for primary support members, the gross shear area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion additions specified in *Section 6/3*

(d) for application of buckling requirements of *Section 10/2* the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

5.1.2 General scantling requirements

5.1.2.1 The hull structure is to comply with the applicable requirements of:

(a) hull girder longitudinal strength, see *Section 8/1*

(b) strength against sloshing and impact loads, see *Section 8/6*

(c) buckling/ultimate strength, see *Section 10*.

5.1.2.2 The deck plating thickness and supporting structure are to be suitably reinforced for the steering gear, mooring windlasses, and other deck machinery. See *Section 11/3*.

5.1.2.3 The net section modulus, shear area and other sectional properties of local and primary support members are to be determined in accordance with *Section 4/2.*

5.1.2.4 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support members are to be applied as required in the notes to *Table 8.3.5*.

5.1.2.5 The scantling criteria are based on assumptions that all structural joints and welded details are designed and fabricated such that they are compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details

during the design of highly stressed regions are to be considered. Structure design details are to comply with the requirements in *Section 4/3*.

5.1.2.6 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure the free flow to the suction pipes and the escape of air to the vents. Arrangements are to be made for draining the spaces above deep tanks. See also *Section 4/3*.

5.1.3 Structural continuity

5.1.3.1 Scantlings of the shell envelope, upper deck and inner bottom are to be tapered towards the aft end. See also *1.6*.

5.1.3.2 In transition zones forward of the aft peak into the machinery space, due consideration is to be given to the tapering of primary support members.

5.1.3.3 Longitudinal framing of the strength deck is to be carried aft to the stern.

5.1.3.4 All shell frames and tank boundary stiffeners are in general to be continuous, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4* and *4/3.2.5*.

5.1.4 Minimum thickness

5.1.4.1 In addition to the thickness, section modulus and stiffener web shear area requirements as given in *5.2* to *5.7*, the thickness of plating and stiffeners in the aft end region is to comply with the appropriate minimum thickness requirements given in *Table 8.5.1*.

RCN 1 to July 2008 version (effective from 1 February 2010)

5.2 Bottom Structure

5.2.1 General

5.2.1.1 Floors are to be fitted at each frame space in the aft peak and carried to a height at least above the stern tube. Where floors do not extend to flats or decks they are to be stiffened by flanges at their upper end.

5.2.1.2 The centreline bottom girder is to extend as far aft as is practicable and is to be attached to the stern frame.

5.2.2 Aft peak floors and girders

5.2.2.1 The height of stiffeners, h_{stf}, on the floors and girders are to be not less than:

$h_{stf} = 80.0\, l_{stf}$ mm, for flat bar stiffeners

$h_{stf} = 70.0\, l_{stf}$ mm, for bulb profiles and flanged stiffeners

Where:

l_{stf} length of stiffener as shown in *Figure 8.5.1*, in m

5.2.2.2 In conjunction with the requirements of *5.2.2.1*, stiffeners are to be provided with end brackets as follows:

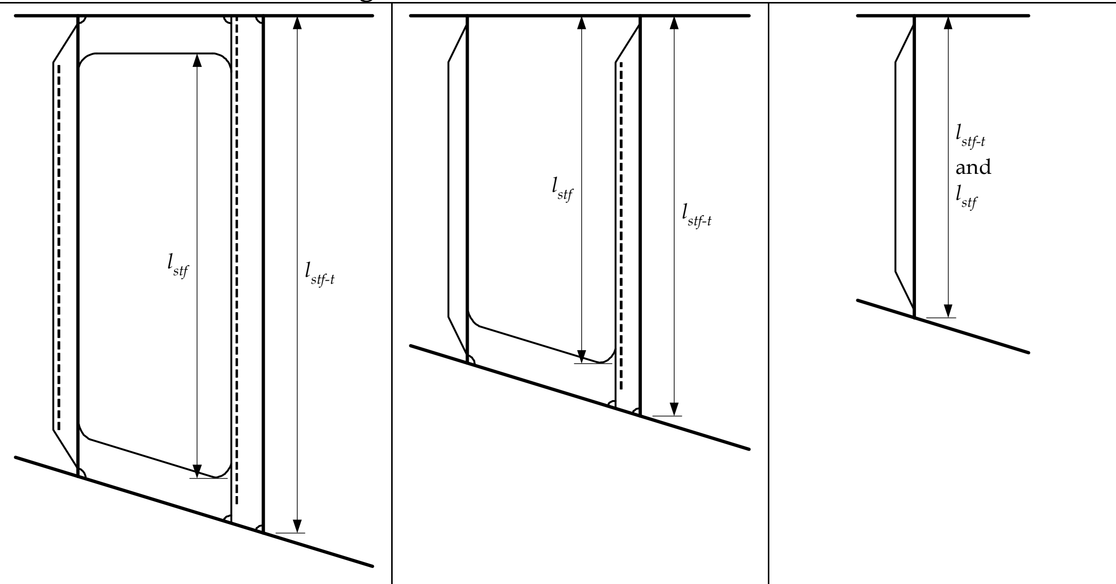
(a) brackets are to be fitted at the lower and upper ends when l_{stf-t} exceeds 4m

(b) brackets are to be fitted at the lower end when l_{stf-t} exceeds 2.5m.

Where:

l_{stf-t} total length of stiffener as shown in *Figure 8.5.1*, in m

Figure 8.5.1
Stiffening of Floors and Girders in the Aft Peak



a) when $l_{stf-t} > 4$ b) when $l_{stf-t} > 2.5$ c) when $l_{stf-t} \leq 2.5$

5.2.2.3 Heavy plate floors are to be fitted in way of the aft face of the horn and in line with the webs in the rudder horn. They may be required to be carried up to the first deck or flat. In this area, cut outs, scallops or other openings are to be kept to a minimum.

5.2.3 Stern frames

5.2.3.1 Stern frames may be fabricated from steel plates or made of cast steel. For applicable material specifications and steel grades see *Table 6.1.3*. Stern frames of other material or construction will be specially considered.

5.2.3.2 Scantlings below the propeller boss on stern frames for single screw vessels are to comply with the requirements in *5.2.3.3* or *5.2.3.4*, as applicable.

5.2.3.3 Fabricated stern frames are to satisfy the following criteria:

(a) $t_{grs} \geq 2.25\sqrt{L}$ mm

(b) $w_{stn} \geq 450$ mm

(c) $$t_{grs} \geq \frac{C_f L^{1.5}}{w_{stn}^{\;2}\sqrt{1+\left(\frac{2l_{stn}}{w_{stn}}\right)^2}} \quad \text{mm}$$

Where:

t_{grs} gross thickness of side plating, in mm

w_{stn} width of stern frame, in mm, see *Figure 8.5.2a*

l_{stn} length of stern frame, in mm, see *Figure 8.5.2a*

L rule length, as defined in *Section 4/1.1.1.1*

C_f = 9600

5.2.3.4 Cast stern frames are to satisfy the following criteria:

(a) $t_{1-grs} \geq 3.0\sqrt{L}$ mm, but not to be less than 25mm

(b) $t_{2-grs} \geq 1.25 t_{1-grs}$ mm

(c) $$\frac{(t_{1-grs} + t_{2-grs})}{2} \geq \frac{C_f L^{1.5}}{w_{stn}^{\;2}\sqrt{1+\left(\frac{2l_{stn}}{w_{stn}}\right)^2}}$$

Where:

$t_{1\text{-}grs}$ gross thickness of casting at end, in mm, see *Figure 8.5.2b*

$t_{2\text{-}grs}$ gross thickness of casting at mid length, in mm, see *Figure 8.5.2b*

w_{stn} width of stern frame, in mm, see *Figure 8.5.2b*

l_{stn} length of stern frame, in mm, see *Figure 8.5.2b*

L rule length, as defined in *Section 4/1.1.1.1*

C_f = 8400

The thickness of butt welding to shell plating may be tapered below t_1 with a length of taper that is at least three times the offset. The castings are to be cored out to avoid large masses of thick material likely to contain defects and are to maintain a

relatively uniform section throughout. Suitable radii are to be provided in way of changes in section.

5.2.3.5 Above the propeller boss, the scantlings are to be in accordance with *5.2.3.2* to *5.2.3.4* except that in the upper part of the propeller aperture, where the hull form is full and centreline supports are provided, the thickness may be reduced to 80% of the applicable requirements in *5.2.3.2* to *5.2.3.4*.

5.2.3.6 Where round bars are used at the aft edge of stern frames, their scantlings and connection details are to facilitate welding.

5.2.3.7 Ribs or horizontal brackets of thickness not less than $0.8t_{grs}$ or $0.8t_{1\text{-}grs}$ are to be provided at suitable intervals, where t_{grs} and $t_{1\text{-}grs}$ are as defined in *5.2.3.3* and *5.2.3.4*. When t_{grs} or $t_{1\text{-}grs}$ is reduced in accordance with *5.2.3.5*, a proportionate reduction in the thickness of ribs or horizontal brackets may be made.

5.2.3.8 Rudder gudgeons are to be an integral part of the stern frame and are to meet the requirements of the individual Classification Society.

Figure 8.5.2
Stern Frame

b Cast

5.3 Shell Structure

5.3.1 Shell plating

5.3.1.1 The net thickness of the side shell and transom plating, t_{net}, is to comply with the requirements in *3.9.2.1* and is not to be less than:

$$t_{net} = 0.035(L_2 - 42) + 0.009s \quad \text{mm}$$

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

s stiffener spacing, in mm, as defined in *Section 4/2.2*

5.3.1.2 The net plating thickness of shell, t_{net}, attached to the stern frame is to comply with the requirements in *3.9.2.1* and is not to be less than:

$$t_{net} = 0.094(L_2 - 43) + 0.009s \quad \text{mm}$$

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

s stiffener spacing, in mm, as defined in *Section 4/2.2*

5.3.1.3 In way of the boss and heel plate, the shell net plating thickness, t_{net}, is not to be less than:

$$t_{net} = 0.105(L_2 - 47) + 0.011s \quad \text{mm}$$

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

s stiffener spacing, in mm, as defined in *Section 4/2.2*

5.3.1.4 Within the extents specified in *2.2.4.3*, the thickness of the side shell plating is to comply with the requirements in *2.2.4.2*.

5.3.1.5 Heavy shell plates are to be fitted locally in way of the heavy plate floors as required by *5.2.2.3*. Outboard of the heavy floors, the heavy shell plates may be reduced in thickness in as gradual a manner as practicable. Where the horn plating is radiused into the shell plating, the radius at the shell connection, r, is not to be less than:

$$r = 150 + 0.8L_2 \quad \text{mm}$$

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

5.3.2 Shell local support members

5.3.2.1 The section modulus and thickness of the hull envelope framing are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

5.3.3 Shell primary support members

5.3.3.1 The requirements of *5.3.3* apply to single side skin construction supported by system of vertical webs and/or horizontal stringers or flats.

5.3.3.2 Where a longitudinal framing system is adopted, longitudinals are to be supported by vertical primary support members extending from the floors to the upper deck. Deck transverses are to be fitted in line with the web frames.

5.3.3.3 Where a transverse framing system is adopted, frames are to be supported by horizontal primary support members spanning between the vertical primary support members.

5.3.3.4 The scantlings of web frames supporting; longitudinal framing, stringers and transverse framing are to be determined from *3.9.3*.

5.3.3.5 The web depth of primary support members is not to be less than 14% of the bending span and is to be at least 2.5 times as deep as the slots for stiffeners if the slots are not closed.

5.4 Deck Structure

5.4.1 Deck plating

5.4.1.1 The thickness of the deck plating is to comply with the requirements in *3.9.2.1*.

5.4.1.2 (void)

RCN 1 to July 2008 version (effective from 1 February 2010)

5.4.2 Deck stiffeners

5.4.2.1 The section modulus and thickness of deck stiffeners are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

5.4.3 Deck primary support members

5.4.3.1 The section modulus and shear area of primary support members are to comply with the requirements in *3.9.3*.

5.4.3.2 The web depth of primary support members is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is bending span as defined in *Section 4/2.1.4* or in case of a grillage structure the distance between connections to other primary support members.

RCN 1 to July 2008 version (effective from 1 February 2010)

5.4.3.3 In way of concentrated loads from heavy equipment, the scantlings of the deck structure are to be determined based on the actual loading. See also *Section 11/3*.

5.4.4 Pillars

5.4.4.1 Pillars are to be fitted in the same vertical line wherever possible and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

5.4.4.2 Tubular and hollow square pillars are to be attached at their heads and heels by efficient brackets, or doublers/insert plates, where applicable, to transmit the load effectively. Pillars are to be attached at their heads and heels by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be distributed by brackets or other equivalent means.

5.4.4.3 Pillars in tanks are to be of solid section. Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45%of the specified minimum yield stress of the material.

5.4.4.4 The scantlings of pillars are to comply with the requirements in *3.9.5*.

5.4.4.5 Where the loads from heavy equipment exceed the design load of *3.9.5*, the pillar scantlings are to be determined based on the actual loading.

5.5 Tank Bulkheads

5.5.1 General

5.5.1.1 Tanks may be required to have divisions or deep wash structures to minimise the dynamic stress on the structure.

5.5.2 Construction

5.5.2.1 In no case are the scantlings of tank boundary bulkheads to be less than the requirements for watertight bulkheads.

5.5.3 Scantlings of tank boundary bulkheads

5.5.3.1 The thickness of tank boundary plating is to comply with the requirements in *3.9.2.1*.

5.5.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

5.5.3.3 The section modulus and shear area of primary support members are to comply with the requirements in *3.9.3*.

5.5.3.4 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 to July 2008 version (effective from 1 February 2010)

5.6 Watertight Boundaries

5.6.1 General

5.6.1.1 Watertight boundaries are to be fitted in accordance with *Section 5/2*.

5.6.1.2 The number of openings in watertight bulkheads is to be kept to a minimum compatible with the design and operation of the ship. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity.

5.6.2 Aft peak bulkhead

5.6.2.1 An aft peak bulkhead complying with *Section 5/2.3* is to be provided.

5.6.2.2 The scantlings of structural components of the aft peak bulkhead are to comply with the requirements in *5.5* and *5.6.3*, as applicable.

5.6.3 Scantlings of watertight boundaries

5.6.3.1 The thickness of boundary plating is to comply with the requirements in *3.9.2.1*.

5.6.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in *3.9.2.2* and *3.9.2.3*.

5.6.3.3 The section modulus and shear area of primary support members are to comply with the requirements in *3.9.3*.

5.6.3.4 Web plating of primary support members is to have a depth of not less than 10% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 to July 2008 version (effective from 1 February 2010)

5.7 Miscellaneous Structures

5.7.1 Pillar bulkheads

5.7.1.1 Bulkheads that support girders, or pillars and longitudinal bulkheads which are fitted in lieu of girders, are to be stiffened to provide supports not less effective than required for stanchions or pillars. The acting load and the required net cross sectional area of the pillar section is to be determined using the requirements of *5.4.4*. The net moment of inertia of the stiffener is to be calculated with a width of $40t_{net}$ of the plating, where t_{net} is net plating thickness in mm.

5.7.1.2 Pillar bulkheads are to meet the following requirements:

(a) the distance between bulkhead stiffeners is not to exceed 1500mm

(b) where corrugated, the depth of the corrugation is not to be less than 100mm.

5.7.2 Rudder trunk

5.7.2.1 The scantlings of the rudder trunk are to be in accordance with the shell plating and framing in *5.3.1* and *5.3.2*. Where the rudder trunk is open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline to prevent water from entering the steering gear compartment.

5.7.3 Stern thruster tunnels

5.7.3.1 The net thickness of the tunnel plating, $t_{tun-net}$, is not to be less than required for shell plating in the vicinity of the thruster. In addition $t_{tun-net}$ is not to be taken less than:

$$t_{tun-net} = 0.008 d_{tun} + 1.8 \quad \text{mm}$$

Where:

d_{tun} inside diameter of the tunnel, in mm, but not to be taken less than 970 mm

5.7.3.2 Where the outboard ends of the tunnel are provided with bars or grids, the bars or grids are to be effectively secured.

6 EVALUATION OF STRUCTURE FOR SLOSHING AND IMPACT LOADS

6.1 General

6.1.1 Application

6.1.1.1 The requirements of this Sub-Section cover the strengthening requirements for localised sloshing loads that may occur in tanks carrying liquid and local impact loads that may occur in the forward structure. The sloshing and impact loads to be applied in *6.2* to *6.4* are described in *Section 7/4*.

6.1.1.2 The net scantlings described in this Sub-Section are related to gross scantlings as follows:

(a) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*

(b) for primary support members, the gross sectional area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the full corrosion additions specified in *Section 6/3*.

6.1.2 General scantling requirements

6.1.2.1 The requirements of *6.2* to *6.4* are to be applied in addition to the applicable requirements in *Section 8*.

6.1.2.2 Local scantling increases due to impact or sloshing loads are to be made with due consideration given to details and avoidance of hard spots, notches and other harmful stress concentrations.

6.2 Sloshing in Tanks

6.2.1 Scope and limitations

6.2.1.1 The requirements of *6.2* specify the scantling requirements for boundary and internal structure of tanks subject to sloshing loads, as given in *Section 7/4.2*, due to the free movement of liquid in tanks.

6.2.1.2 The structure of cargo tanks, slop tanks, ballast tanks and large deep tanks, e.g. fuel oil bunkering tanks and main fresh water tanks, are to be assessed for sloshing. Small tanks do not need to be assessed for sloshing pressures.

6.2.1.3 All cargo and ballast tanks are to have scantlings suitable for unrestricted filling heights.

6.2.1.4 The following structural members are to be assessed:

(a) plates and stiffeners forming boundaries of tanks

(b) plates and stiffeners on wash bulkheads

(c) web plates and web stiffeners of primary support members located in tanks

(d) tripping brackets supporting primary support members in tanks.

6.2.1.5 For tanks with effective sloshing breadth, b_{slh}, greater than $0.56B$ or effective sloshing length, l_{slh}, greater than $0.13L$, an additional sloshing impact assessment is to be carried out in accordance with the individual Classification Society's procedures. The effective sloshing length, l_{slh}, and breadth, b_{slh}, are defined in *Section 7/4.2.2* and *Section 7/4.2.3* respectively.

6.2.2 Application of sloshing pressure

6.2.2.1 The following tanks are to be assessed for the design sloshing pressures $P_{slh-lng}$ and P_{slh-t} in accordance with *6.2.2.2* to *6.2.2.5*:

(a) cargo and slop tanks

(b) fore peak and aft peak ballast tanks

(c) other tanks which allow free movement of liquid, except as follows:

- where the effective sloshing length is less than 0.03*L*, calculations involving $P_{slh-lng}$ are not required and
- where the effective sloshing breadth is less than 0.32*B*, calculations involving P_{slh-t} are not required.

The design sloshing pressure for other tanks mentioned in *6.2.1.2* is to be taken as the minimum sloshing pressure, $P_{slh-min}$, as defined in *Section 7/4.2.4.*

6.2.2.2 The design sloshing pressure due to longitudinal liquid motion, $P_{slh-lng}$, as defined in *Section 7/4.2.2.1* is to be applied to the following members as shown in *Figure 8.6.1*:

(a) transverse tight bulkheads

(b) transverse wash bulkheads

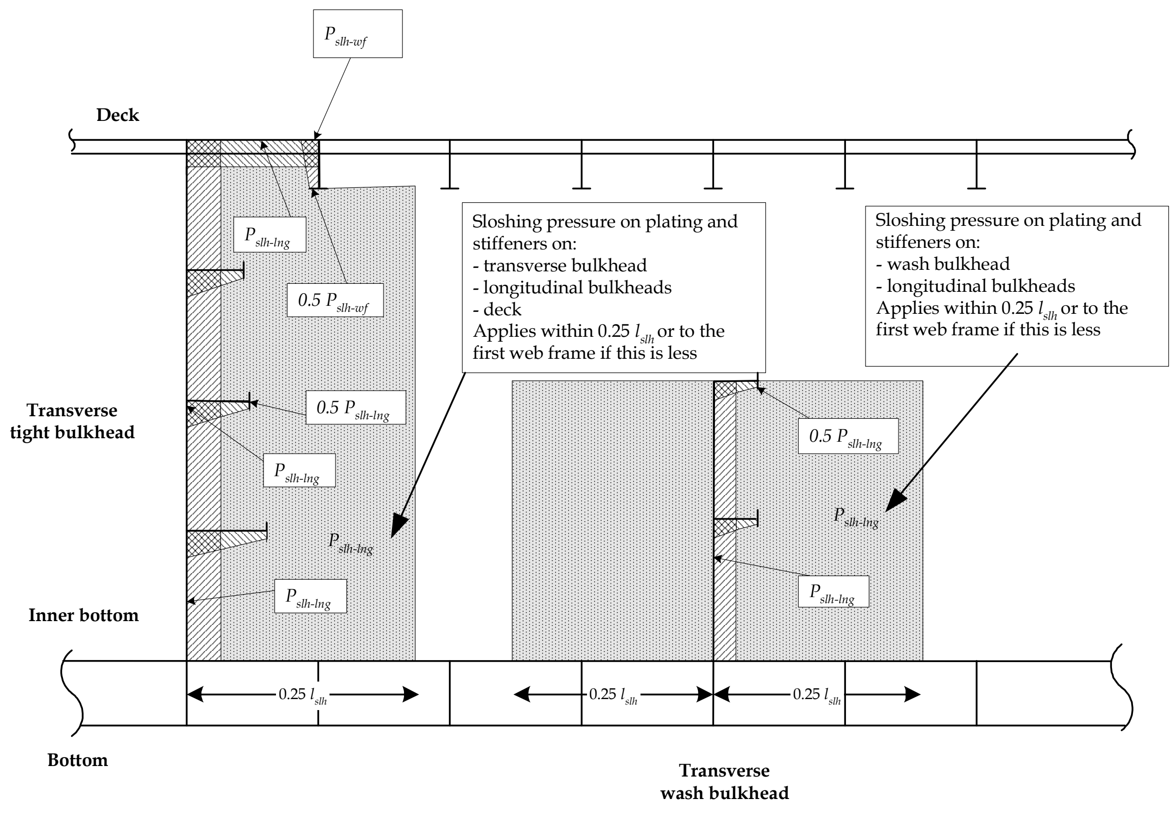
(c) stringers on transverse tight and wash bulkheads

(d) plating and stiffeners on the longitudinal bulkheads, deck and inner hull which are between the transverse bulkhead and the first web frame from the bulkhead or the bulkhead and $0.25l_{slh}$, whichever is lesser.

6.2.2.3 In addition to *6.2.2.2,* the first web frame next to a transverse tight or wash bulkhead if the web frame is located within $0.25l_{slh}$ from the bulkhead, as shown in *Figure 8.6.1,* is to be assessed for the web frame reflected sloshing pressure, P_{slh-wf}, as defined in *Section 7/4.2.2.5*.

6.2.2.4 The minimum sloshing pressure, $P_{slh-min}$, as defined in *Section 7/4.2.4* is to be applied to all other members.

Figure 8.6.1
Application of Sloshing Loads due to Longitudinal Liquid Motion



6.2.2.5 The design sloshing pressure due to transverse liquid motion, P_{shl-t}, as defined in *Section 7/4.2.3.1,* is to be applied to the following members as shown in *Figure 8.6.2*:

(a) longitudinal tight bulkhead

(b) longitudinal wash bulkhead

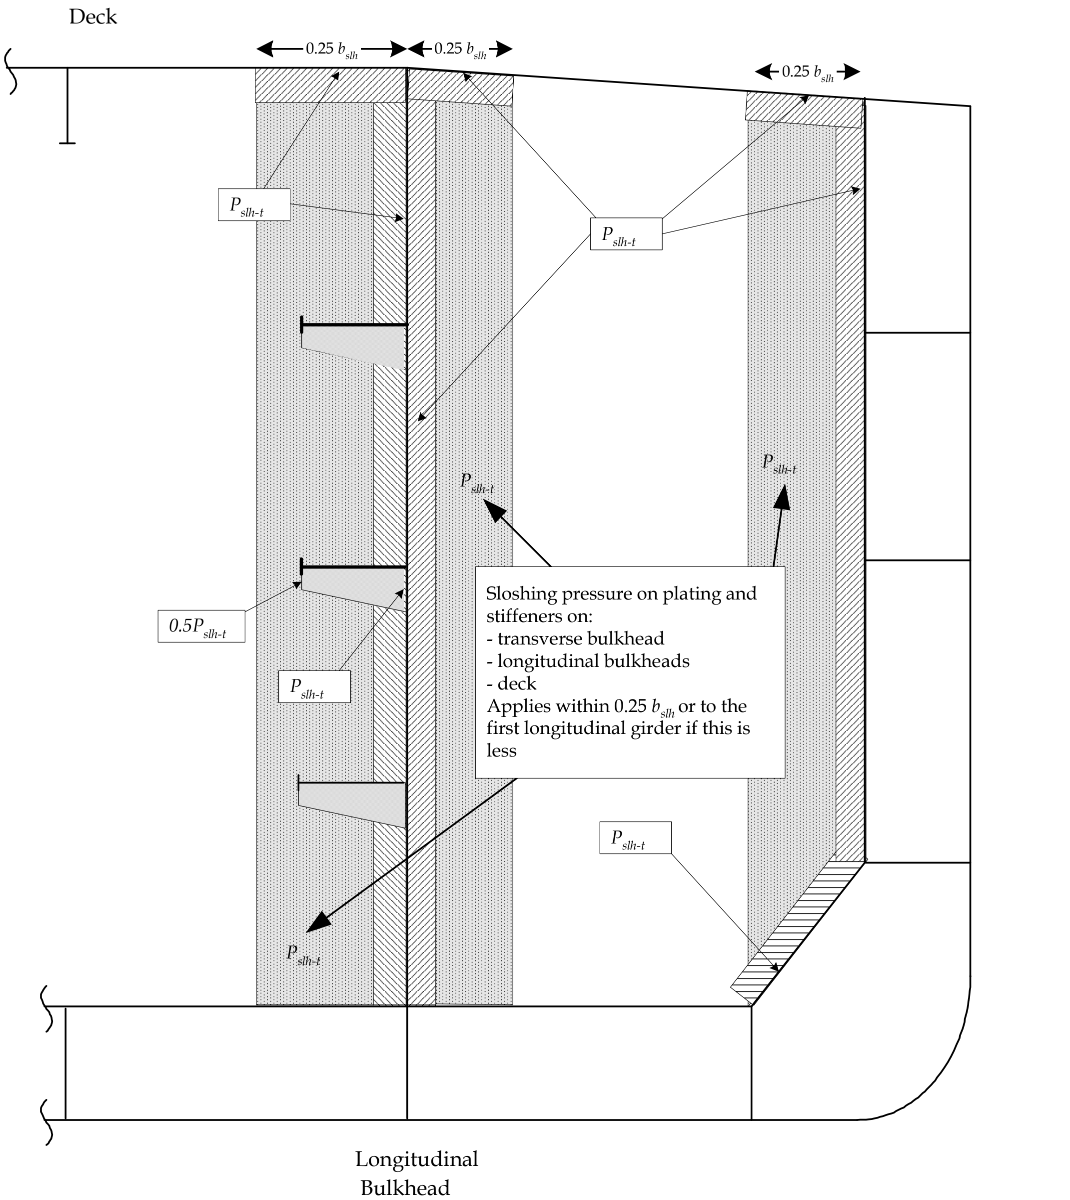
(c) horizontal stringers on longitudinal tight and wash bulkheads

(d) plating and stiffeners on the transverse tight bulkheads including stringers and deck which are between the longitudinal bulkhead and the first girder from the bulkhead or the bulkhead and $0.25b_{slh}$ whichever is lesser.

RCN 2 to July 2008 version (effective from 1 July 2010)

6.2.2.6 In addition to *6.2.2.5*, the first girder next to longitudinal tight or wash bulkhead if the girder is located within $0.25b_{slh}$ from the longitudinal bulkhead, as shown in *Figure 8.6.2*, is to be assessed for the reflected sloshing pressure, $P_{slh-grd}$ as defined in *Section 7/4.2.3.5*.

Figure 8.6.2
Application of Sloshing Loads due to Transverse Liquid Motion



6.2.2.7 The minimum sloshing pressure, $P_{slh-min}$, as defined in *Section 7/4.2.4*, is to be applied to all other members.

6.2.2.8 The sloshing pressures due to transverse and longitudinal fluid motion are assumed to act independently. Structural members are therefore to be evaluated based on the greatest sloshing pressure due to longitudinal and transverse fluid motion.

6.2.3 Sloshing assessment of plating forming tank boundaries and wash bulkheads

RCN 2 to July 2008 version (effective from 1 July 2010)

6.2.3.1 The net thickness of plating forming tank boundaries and wash bulkheads, t_{net}, subjected to sloshing pressures is not to be less than:

$$t_{net} = 0.0158\alpha_p\, s\sqrt{\frac{P_{slh}}{C_a\sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$= 1.2 - \dfrac{s}{2100\, l_p}$ but not to be taken as greater than 1.0

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_p length of plate panel, to be taken as the spacing of primary support members, S, unless carlings are fitted, in m

P_{slh} the greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$ or $P_{slh\text{-}min}$ as specified in *6.2.2*

C_a permissible plate bending stress coefficient as given in *Table 8.6.1*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

RCN 2 to July 2008 version (effective from 1 July 2010)

6.2.4 Sloshing assessment of stiffeners on tank boundaries and wash bulkheads

RCN 2 to July 2008 version (effective from 1 July 2010)

6.2.4.1 The net section modulus, Z_{net}, of stiffeners on tank boundaries and wash bulkheads subjected to sloshing pressures is not to be less than:

$$Z_{net} = \frac{P_{slh}\ s\ l_{bdg}^{\ 2}}{f_{bdg}\ C_s\ \sigma_{yd}} \quad \text{cm}^3$$

Where:

l_{bdg} effective bending span, of stiffener, as defined in *Section 4/2.1*, in m

C_s permissible bending stress coefficient as given in *Table 8.6.2*

P_{slh} the greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$ or $P_{slh\text{-}min}$ as specified in *6.2.2*

s stiffener spacing, in mm, as defined in *Section 4/2.2*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

f_{bdg} bending moment factor:

= 12 for stiffeners fixed against rotation at each end. This is generally to be applied for scantlings of all continuous stiffeners

= 8 for stiffeners with one or both ends not fixed against rotation. This is generally to be applied to discontinuous stiffeners

for other configurations the bending moment factor may be taken as given in *Table 8.3.5*

RCN 2 to July 2008 version (effective from 1 July 2010)

6.2.5 Sloshing assessment of primary support members

6.2.5.1 Web plating, web stiffeners and tripping brackets on stringers, girders and web frames in cargo and ballast tanks are to be assessed based on sloshing pressures as given in *6.2.2*.

6.2.5.2 The web plating net thickness of primary support members, t_{net}, is not to be less than:

$$t_{net} = 0.0158\alpha_p s\sqrt{\frac{P_{slh}}{C_a\sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$= 1.2 - \dfrac{s}{2100 l_p}$ but not to be taken as greater than 1.0

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_p length of plate panel, mean spacing between local support members on the long edges of the panel, typically between tripping brackets, in m

P_{slh} the greater of $P_{slh-lng}$, P_{slh-t}, P_{slh-wf}, $P_{slh-grd}$ or $P_{slh-min}$ as specified in *6.2.2*. The pressure is to be calculated at the load application point, defined in *Section 3/5.1.2*, taking into account the distribution over the height of the member, as shown in *Figure 8.6.1*

C_a permissible plate bending stress coefficient as given in *Table 8.6.1*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

6.2.5.3 The net section modulus, Z_{net}, of each individual stiffener on the web plating of primary support members subjected to sloshing pressures is not to be less than:

$$Z_{net} = \frac{P_{slh}\ s\ l_{bdg}^{\ 2}}{f_{bdg}\ C_s\ \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{slh} the greater of $P_{slh-lng}$, P_{slh-t}, P_{slh-wf}, $P_{slh-grd}$ or $P_{slh-min}$ as specified in *6.2.2*. The pressure is to be calculated at the load application point taking into account the distribution over the height of the member, as shown in *Figure 8.6.1* and *8.6.2*.

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_{bdg} effective bending span, in m, of web stiffener as defined in *Section 4/2.1*

C_s permissible bending stress coefficient as given in *Table 8.6.2*

f_{bdg} bending moment factor

= 12 for stiffeners fixed against rotation at each end. This is generally to be applied for scantlings of all continuous stiffeners

= 8 for stiffeners with one or both ends not fixed against rotation. This is generally to be applied to discontinuous stiffeners

for other configurations the bending moment factor may be taken as given in *Table 8.3.5*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

6.2.5.4 The net section modulus, Z_{net}, in way of the base of tripping brackets supporting primary support members in cargo and ballast tanks is not to be less than:

$$Z_{net} = \frac{1000\, P_{slh}\; s_{trip}\; l_{trip}^2}{2\, C_s\, \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{slh} the greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$, $P_{slh\text{-}wf}$, $P_{slh\text{-}grd}$ and $P_{slh\text{-}min}$ as defined in *6.2.2*. The average pressure may be calculated at mid point of the tripping bracket taking into account the distribution as shown in *Figure 8.6.1* and *8.6.2*

s_{trip} mean spacing, between tripping brackets or other primary support members or bulkheads, in m

l_{trip} length of tripping bracket, see *Figure 8.6.3,* in m

C_s permissible bending stress coefficient for tripping brackets = 0.75

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.2.5.4bis The effective breadth of the attached plate to be used for calculating the section modulus of the tripping bracket supporting primary support members is to be taken as 1/3 the length of the tripping bracket, l_{trip}, as given in *8/6.2.5.4*.

RCN 2 to July 2008 version (effective from 1 July 2010)

6.2.5.5 The net shear area, $A_{shr\text{-}net}$, after deduction of cut-outs and slots, of tripping brackets supporting primary support members in cargo and ballast tanks is not to be less than:

$$A_{shr-net} = 10\frac{P_{slh}\; s_{trip}\; l_{trip}}{C_t\, \tau_{yd}} \quad \text{cm}^2$$

Where:

P_{slh} the greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$, $P_{slh\text{-}wf}$, $P_{slh\text{-}grd}$ and $P_{slh\text{-}min}$ as defined in *6.2.2*. The average pressure may be calculated at mid point of the tripping bracket taking into account the distribution as shown in *Figure 8.6.1* and *8.6.2*

s_{trip} mean spacing, between tripping brackets or other primary support members or bulkheads, in m

l_{trip} length of tripping bracket, see *Figure 8.6.3,* in m

C_t permissible shear stress coefficient, as given in *Table 8.6.3*

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

Figure 8.6.3
Effective Length of Tripping Bracket

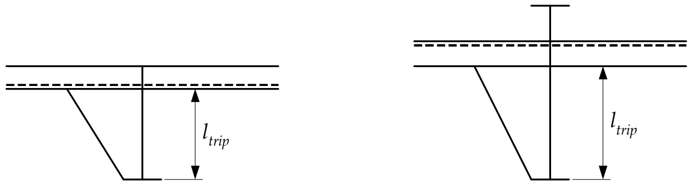


Table 8.6.1
Allowable Plate Bending Stress Coefficient, C_a, for Assessment of Sloshing on Plates

The permissible bending stress coefficient for the design load set being considered is to be taken as:

$$C_a = \beta_a - \alpha_a \frac{|\sigma_{hg}|}{\sigma_{yd}}$$ but not to be taken greater than C_{a-max}

Where:

α_a, β_a, C_{a-max} permissible bending stress factors and are to be taken as follows

<table>
<tr><th>Acceptance Criteria Set</th><th colspan="2">Structural Member</th><th>β_a</th><th>α_a</th><th>C_{a-max}</th></tr>
<tr><td rowspan="3">AC1</td><td rowspan="2">Longitudinal strength members in the cargo tank region including but not limited to :

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the load calculation point defined in *Section 3/5.1.2*

$$= \left(\frac{(z - z_{NA-net50})\, M_{sw-perm-sea}}{I_{v-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

z vertical coordinate of the load calculation point under consideration, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in *Section 4/2.6.1*, in m

$M_{sw-perm-sea}$ permissible hull girder hogging and sagging still water bending moment for seagoing operation at the location being considered, in kNm. The greatest of the sagging and hogging bending moment is to be used, see *Section 7/2.1.*

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.1*, in m^4

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Table 8.6.2
Allowable Bending Stress Coefficient, C_s, for Assessment of Sloshing on Stiffeners

The permissible bending stress coefficient for the design load set being considered is to be taken as:

$$C_s = \beta_s - \alpha_s \frac{|\sigma_{hg}|}{\sigma_{yd}}$$ but not to be taken greater than C_{s-max}

Where:

α_s, β_s, C_{s-max} permissible bending stress factors and are to be taken as follows:

Acceptance Criteria Set	Structural Member		β_s	α_s	C_{s-max}
AC1	Longitudinal strength members in the cargo tank region including but not limited to: - deck stiffeners - stiffeners on longitudinal bulkheads - stiffeners on longitudinal girders and stringers within the cargo tank region	Longitudinal stiffeners	0.85	1.0	0.75
		Transverse or vertical stiffeners	0.7	0	0.7
	Other strength members including: - stiffeners on transverse bulkheads - stiffeners on transverse stringers and web frames - stiffeners on tank boundaries and primary support members outside the cargo tank region		0.75	0	0.75

σ_{hg} hull girder bending stress for the design load set being considered at the reference point defined in *Section 3/5.2.2.5*

$$= \left(\frac{(z - z_{NA-net50})\,M_{sw-perm-sea}}{I_{v-net50}}\right)10^{-3} \quad \text{N/mm}^2$$

z vertical coordinate of the reference point defined in *Section 3/5.2.2.5*, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in *Section 4/2.6.1*, in m

$M_{sw-perm-sea}$ permissible hull girder hogging and sagging still water bending moment for seagoing operation at the location being considered, in kNm.

Stiffener Location	$M_{sw-perm-sea}$	
	Pressure acting on Plate Side	**Pressure acting on Stiffener Side**
Above Neutral Axis	Sagging SWBM	Hogging SWBM

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in *Section 4/2.6.1*, in m^4

σ_{yd} specified minimum yield stress of the material, in N/mm^2

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 8.6.3
Permissible Shear Stress Coefficient

Acceptance Criteria Set	Structural member	C_t
AC1	Tripping brackets	0.75

6.3 Bottom Slamming

6.3.1 Application

6.3.1.1 Where the minimum draughts forward, $T_{FP\text{-}mt}$ or $T_{FP\text{-}full}$, as specified in *Section 7/4.3.2.1*, is less than 0.045*L*, the bottom forward is to be additionally strengthened to resist bottom slamming pressures.

6.3.1.2 The draughts for which the bottom has been strengthened are to be indicated on the shell expansion plan and loading guidance information, see *1.1*.

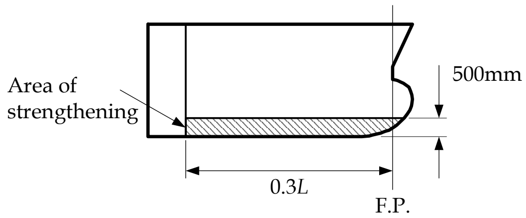
6.3.1.3 The scantlings described in *6.3* are net scantlings, which are related to gross scantlings as described in *6.1.1.2*. The section modulus and shear area of the primary support members is to be determined as specified in *Section 4/2.5*.

6.3.1.4 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The cross sectional shear areas of primary support members are to be applied as required by *6.3.7.3* and *6.3.7.4*.

6.3.2 Extent of strengthening

6.3.2.1 The strengthening is to extend forward of 0.3*L* from the F.P. over the flat of bottom and adjacent plating with attached stiffeners up to a height of 500mm above the baseline, see *Figure 8.6.4*.

Figure 8.6.4
Extent of strengthening against bottom slamming



6.3.2.2 Outside the region strengthened to resist bottom slamming the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

6.3.3 Design to resist bottom slamming loads

6.3.3.1 The design of end connections of stiffeners in the bottom slamming region is to ensure end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with *Section 4/3.2.3*. Where it is not practical to comply with this requirement the net plastic section modulus, $Z_{pl\text{-}alt\text{-}net}$, for alternative end fixity arrangements is not to be less than:

$$Z_{pl\text{-}alt\text{-}net} = \frac{16 Z_{pl-net}}{f_{bdg}} \quad \text{cm}^3$$

Where:

$Z_{pl\text{-}net}$ net plastic section modulus, in cm^3, as required by *6.3.5.1*

f_{bdg} bending moment factor

$$= 8\left(1 + \frac{n_s}{2}\right)$$

n_s = 0 for both ends with low end fixity (simply supported)
= 1 for one end equivalent to built in and one end simply supported

6.3.3.2 Scantlings and arrangements at primary support members, including bulkheads, are to comply with *6.3.7*.

6.3.4 Hull envelope plating

6.3.4.1 The net thickness of the hull envelope plating, t_{net}, is not to be less than:

$$t_{net} = \frac{0.0158\,\alpha_p\, s}{C_d}\sqrt{\frac{P_{slm}}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$= 1.2 - \frac{s}{2100 l_p}$ but not to be taken as greater than 1.0

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_p length of plate panel, to be taken as the spacing between primary support members (see *Section 4/2.2.2*) or panel breakers, in m

P_{slm} bottom slamming pressure as given in *Section 7/4.3* and calculated at the load calculation point defined in *Section 3/5.1.2*, in kN/m^2

C_d plate capacity correction coefficient
= 1.3

C_a permissible bending stress coefficient
= 1.0 for acceptance criteria set AC3

σ_{yd} specified minimum yield stress of the material, in N/mm^2

6.3.5 Hull envelope stiffeners

6.3.5.1 The net plastic section modulus, Z_{pl-net}, of each individual stiffener, is not to be less than:

$$Z_{pl-net} = \frac{P_{slm}\, s l_{bdg}^{\;2}}{f_{bdg}\, C_s\, \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{slm} bottom slamming pressure as given in *Section 7/4.3* and calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m^2

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_{bdg} effective bending span, as defined in *Section 4/2.1.1*, in m

f_{bdg} bending moment factor

$$= 8\left(1 + \frac{n_s}{2}\right)$$

n_s = 2.0 for continuous stiffeners or where stiffeners are bracketed at both ends

see *6.3.3.1* for alternative arrangements

C_s permissible bending stress coefficient

= 0.9 for acceptance criteria set AC3

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.3.5.2 The net web thickness, t_{w-net}, of each longitudinal is not to be less than:

$$t_{w-net} = \frac{P_{slm}\, s l_{shr}}{2 d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

Where:

l_{shr} effective shear span, as defined in *Section 4/2.1.2*, in m

s stiffener spacing, in mm, as defined in *Section 4/2.2*

P_{slm} bottom slamming pressure as given in *Section 7/4.3* and calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

d_{shr} effective web depth of stiffener, in mm, as defined in *Section 4/2.4.2.2*

C_t permissible shear stress coefficient

= 1.0 for acceptance criteria set AC3

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.3.5.3 The slenderness ratio of each longitudinal is to comply with *Section 10/2.*

6.3.6 Definition of idealised bottom slamming load area for primary support members

6.3.6.1 The scantlings of items in *6.3.7* are based on the application of the slamming pressure defined in *Section 7/4.3* to an idealised area of hull envelope plating, the slamming load area, A_{slm}, given by:

$$A_{slm} = \frac{1.1 L B C_b}{1000} \quad \text{m}^2$$

Where:

L rule length, as defined in *Section 4/1.1.1.1*

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

C_b block coefficient, as defined in *Section 4/1.1.9.1*

6.3.7 Primary support members

6.3.7.1 The size and number of openings in web plating of the floors and girders is to be minimised considering the required shear area as given in *6.3.7.2*.

6.3.7.2 The net shear area, $A_{shr-net50}$, of each primary support member web at any position along its span is not to be less than:

$$A_{shr-net50} = 10 \frac{Q_{slm}}{C_t \tau_{yd}} \quad \text{cm}^2$$

Where:

Q_{slm} the greatest shear force due to slamming for the position being considered, in kN, based on the application of a patch load, F_{slm} to the most onerous location, as determined in accordance with *6.3.7.3*

C_t permissible shear stress coefficient
= 0.9 for acceptance criteria set AC3

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.3.7.3 For simple arrangements of primary support members, where the grillage affect may be ignored, the shear force, Q_{slm}, is given by:

$$Q_{slm} = f_{pt} f_{dist} F_{slm} \quad \text{kN}$$

Where:

f_{pt} Correction factor for the proportion of patch load acting on a single primary support member
$= 0.5\left(f_{slm}^{\ 3} - 2 f_{slm}^{\ 2} + 2\right)$

f_{slm} patch load modification factor
$= 0.5 \frac{b_{slm}}{S}$, but not to be greater than 1.0

f_{dist} factor for the greatest shear force distribution along the span, see *Figure 8.6.5*

F_{slm} $= P_{slm}\, l_{slm}\, b_{slm}$

P_{slm} bottom slamming pressure as given in *Section 7/4.3* and calculated at the load calculation point defined in *Section 3/5.3.2*, in kN/m²

l_{slm} extent of slamming load area along the span
$= \sqrt{A_{slm}}$ m, but not to be greater than l_{shr}

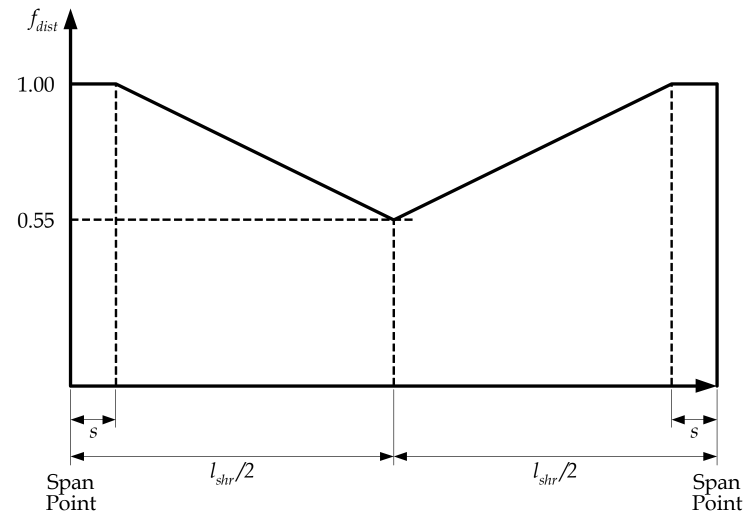
l_{shr} effective shear span, as defined in *Section 4/2.1.5*, in m

b_{slm} breadth of impact area supported by primary support member
$= \sqrt{A_{slm}}$ m, but not to be greater than S

A_{slm} as defined in *6.3.6.1*

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

Figure 8.6.5
Distribution of f_{dist} along the Span of Simple Primary Support Members



Where:

s	stiffener spacing
l_{shr}	effective shear span, in m, as defined in *Section 4/2.1.5*

6.3.7.4 For complex arrangements of primary support members, the greatest shear force, Q_{slm}, at any location along the span of each primary support member is to be derived by direct calculation in accordance with *Table 8.6.4*.

Table 8.6.4
Direct Calculation Methods for Derivation of Q_{slm}

Type of analysis	Beam theory	Double bottom grillage
Model extent	Overall span of member between effective bending supports	Longitudinal extent to be one cargo tank length Transverse extent to be between inner hopper knuckle and centreline
Assumed end fixity of floors	Fixed at ends	Floors and girders to be fixed at boundaries of the model

Note
1. The envelope of greatest shear force along each primary support member is to be derived by applying the load patch to a number of locations along the span, see *6.3.7.2*.

6.3.7.5 The net web thickness, $t_{w\text{-}net}$, of primary support members adjacent to the shell is not to be less than:

$$t_{w-net} = \frac{s_w}{70}\sqrt{\frac{\sigma_{yd}}{235}} \text{ mm}$$

RCN 1 to July 2010 version (effective from 1 July 2012)

Where:

s_w plate breadth, in mm, taken as the spacing between the web stiffening

σ_{yd} specified minimum yield stress of the material, in N/mm^2

6.3.8 Connection of longitudinals to primary support members

6.3.8.1 Longitudinals are, in general, to be continuous. Where this not practicable end brackets complying with *4/3.2.3* are to be provided.

6.3.8.2 The scantlings in way of the end connections of each longitudinal are to comply with the requirements of *Section 4/3.4*.

6.4 Bow Impact

6.4.1 Application

6.4.1.1 The side structure in the area forward of 0.1L from the F.P. is to be strengthened against bow impact pressures.

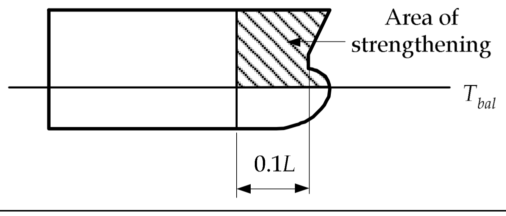
6.4.1.2 The scantlings described in *6.4* are net scantlings, which are related to gross scantlings as described in *6.1.1.2*.

6.4.1.3 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus of the primary support member is to apply along the bending span clear of end brackets and cross sectional areas of the primary support member is to be applied at the ends/supports and may be gradually reduced along the span and clear of the ends/supports following the distribution of f_{dist} indicated in *Figure 8.6.5*.

6.4.2 Extent of strengthening

6.4.2.1 The strengthening is to extend forward of 0.1L from the F.P. and vertically above the minimum design ballast draught, T_{bal}, defined in *Section 4/1.1.5.2*. See *Figure 8.6.6*.

Figure 8.6.6
Extent of Strengthening Against Bow Impact



6.4.2.2 Outside the strengthening region as given in *6.4.2.1* the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

6.4.3 Design to resist bow impact loads

6.4.3.1 In the bow impact region, longitudinal framing is to be carried as far forward as practicable.

6.4.3.2 The design of end connections of stiffeners in the bow impact region are to ensure end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with *Section 4/3.2.3*. Where it is not practical to

comply with this requirement the net plastic section modulus, $Z_{pl-alt-net}$, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt-net} = \frac{16 Z_{pl-net}}{f_{bdg}} \quad \text{cm}^3$$

Where:

Z_{pl-net} effective net plastic section modulus, required by *6.4.5,* in cm^3

f_{bdg} bending moment factor

$= 8\left(1 + \frac{n_s}{2}\right)$

n_s = 0 for both ends with low end fixity (simply supported)

= 1.0 for one end equivalent to built in and one end simply supported

6.4.3.3 Scantlings and arrangements at primary support members, including decks and bulkheads, are to comply with *6.4.7*. In areas of greatest bow impact load the adoption of web stiffeners arranged perpendicular to the hull envelope plating and the provision of double sided lug connections are, in general to be applied.

6.4.3.4 The main stiffening direction of decks and bulkheads supporting shell framing is to be arranged parallel to the span direction of the supported shell frames, to protect against buckling.

6.4.4 Side shell plating

6.4.4.1 The net thickness of the side shell plating, t_{net}, is not to be less than:

$$t_{net} = 0.0158\, a_p\, s \sqrt{\frac{P_{im}}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$= 1.2 - \frac{s}{2100\, l_p}$ but is not to be taken as greater than 1.0

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_p length of plate panel, to be taken as the spacing between the primary support members, see *Section 4/2.2.2,* or panel breakers, in m

P_{im} bow impact pressure as given in *Section 7/4.4* and calculated at the load calculation point defined in *Section 3/5.1.2*, in kN/m^2

C_a permissible bending stress coefficient

= 1.0 for acceptance criteria set AC3

σ_{yd} specified minimum yield stress of the material, in N/mm^2

6.4.5 Side shell stiffeners

6.4.5.1 The effective net plastic section modulus, Z_{pl-net}, of each stiffener, in association with the effective plating to which it is attached, is not to be less than:

$$Z_{pl-net} = \frac{P_{im}\ s l_{bdg}^{\ 2}}{f_{bdg}\ C_s\ \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{im} bow impact pressure as given in *Section 7/4.4* and calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_{bdg} effective bending span, as defined in *Section 4/2.1.1*, in m

f_{bdg} bending moment factor

$$= 8\left(1 + \frac{n_s}{2}\right)$$

n_s = 2.0 for continuous stiffeners or where stiffeners are bracketed at both ends

see *6.4.3.2* for alternative arrangements

RCN 1 to July 2010 version (effective from 1 July 2012)

C_s permissible bending stress coefficient

= 0.9 for acceptance criteria set AC3

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.4.5.2 The net web thickness, t_{w-net}, of each stiffener is not to be less than:

$$t_{w-net} = \frac{P_{im}\ s l_{shr}}{2 d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

Where:

l_{shr} effective shear span, as defined in *Section 4/2.1.2*, in m

s stiffener spacing, in mm, as defined in *Section 4/2.2*

P_{im} bow impact pressure as given in *Section 7/4.4* and calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

d_{shr} effective web depth of stiffener, in mm, as defined in *Section 4/2.4.2.2*

C_t permissible shear stress coefficient

= 1.0 for acceptance criteria set AC3

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.4.5.3 The slenderness ratio of each longitudinal is to comply with *Section 10/2.*

6.4.5.4 The minimum net thickness of breasthooks/diaphragm plates, t_{w-net}, is not to be less than:

$$t_{w-net} = \frac{s}{70}\sqrt{\frac{\sigma_{yd}}{235}} \quad \text{mm}$$

Where:

s spacing of stiffeners on the web, as defined in *Section 4/2.2*, in mm. Where no stiffeners are fitted s is to be taken as the depth of the web

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.4.6 Definition of idealised bow impact load area for primary support members

6.4.6.1 The scantlings of items in *6.4.7* are based on the application of the bow impact pressure, as defined in *Section 7/4.4,* to an idealised area of hull envelope plating, where the bow impact load area, A_{slm}, is given by:

$$A_{slm} = \frac{1.1 LBC_b}{1000} \quad \text{m}^2$$

Where:

L rule length, as defined in *Section 4/1.1.1.1*

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

C_b block coefficient, as defined in *Section 4/1.1.9.1*

6.4.7 Primary support members

6.4.7.1 Primary support members in the bow impact region are to be configured to ensure effective continuity of strength and the avoidance of hard spots.

6.4.7.2 To limit the deflections under extreme bow impact loads and ensure boundary constraint for plate panels, the spacing, S, measured along the shell girth of web frames supporting longitudinal framing or stringers supporting transverse framing is not to be greater than:

$$S = 3+0.008L_2 \quad \text{m}$$

Where:

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but not to be taken greater than 300m

6.4.7.3 End brackets of primary support members are to be suitably stiffened along their edge. Consideration is to be given to the design of bracket toes to minimise abrupt changes of cross-section.

6.4.7.4 Tripping arrangements are to comply with *Section 10/2.3.3*. In addition, tripping brackets are to be fitted at the toes of end brackets and at locations where the primary support member flange is knuckled or curved.

6.4.7.5 The net section modulus of each primary support member, Z_{net50}, is not to be less than:

$$Z_{net50} = 1000 \frac{f_{bdg-pt} P_{im}\, b_{slm} f_{slm} l_{bdg}^{\ 2}}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

f_{bdg-pt} correction factor for the bending moment at the ends and considering the patch load

$$= 3 f_{slm}^{\ 3} - 8 f_{slm}^{\ 2} + 6 f_{slm}$$

f_{slm} patch load modification factor

$$= \frac{l_{slm}}{l_{bdg}}$$

l_{slm} extent of bow impact load area along the span

$= \sqrt{A_{slm}}$ m, but not to be taken as greater than l_{bdg}

A_{slm} bow impact load area, in m², as defined in *6.4.6.1*

l_{bdg} effective bending span, as defined in *Section 4/2.1.4*, in m

P_{im} bow impact pressure as given in *Section 7/4.4* and calculated at the load calculation point defined in *Section 3/5.3.1*, in kN/m²

RCN 1 to July 2010 version (effective from 1 July 2012)

b_{slm} breadth of impact load area supported by the primary support member, to be taken as the spacing between primary support members as defined in *Section 4/2.2.2*, but not to be taken as greater than l_{slm}, in m

f_{bdg} bending moment factor

= 12 for primary support members with end fixed continuous face plates, stiffeners or where stiffeners are bracketed in accordance with *Section 4/3.3* at both ends

C_s permissible bending stress coefficient

= 0.8

σ_{yd} specified minimum yield stress of the material, in N/mm²

RCN 2 to July 2008 version (effective from 1 July 2010)

6.4.7.6 The net shear area of the web, $A_{sh\text{-}net50}$, of each primary support member at the support/toe of end brackets is not to be less than:

$$A_{shr-net50} = \frac{5 f_{pt} P_{im} b_{slm} l_{shr}}{C_t \tau_{yd}} \quad \text{cm}^2$$

Where:

f_{pt} patch load modification factor

$$= \frac{l_{slm}}{l_{shr}}$$

l_{slm} extent of bow impact load area along the span

$= \sqrt{A_{slm}}$ m, but not to be taken as greater than l_{shr}

l_{shr} effective shear span, as defined in *Section 4/2.1.5*, in m

P_{im} bow impact pressure as given in *Section 7/4.4* and calculated at the load calculation point defined in *Section 3/5.3.2*, in kN/m²

b_{slm} breadth of impact load area supported by the primary support member, to be taken as the spacing between primary support members as defined in *Section 4/2.2.2*, but not to be taken as greater than l_{slm}, in m

C_t permissible shear stress coefficient

= 0.75 for acceptance criteria set AC3

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.4.7.7 The net web thickness of each primary support member, $t_{w\text{-}net}$, including decks/bulkheads in way of the side shell is not to be less than:

$$t_{w-net} = \frac{P_{im}\, b_{slm}}{\sin \varphi_w\, \sigma_{crb}} \quad \text{mm}$$

Where:

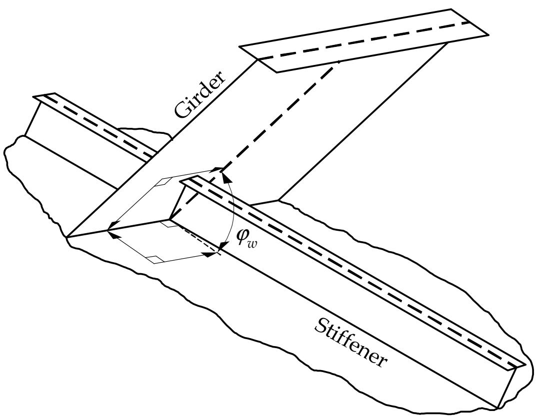
P_{im} bow impact pressure as given in *Section 7/4.4* and calculated at the load calculation point defined in *Section 3/5.3*.2 or at the intersection of the side shell with the deck/bulkhead, in kN/m²

b_{slm} breadth of impact load area supported by the primary support member, to be taken as spacing between primary support members as defined in *Section 4/2.2.2*, but not to be taken as greater than l_{slm}, in m

φ_w angle, in degrees, between the primary support member web and the shell plate, see *Figure 8.6.7*

σ_{crb} critical buckling stress in compression of the web of the primary support member or deck/bulkhead panel in way of the applied load given by *Section 10/3.2.1*, in N/mm²

Figure 8.6.7
Angle between Shell Primary Member and Shell Plate



6.4.8 Connection of stiffeners to primary support members

6.4.8.1 Stiffeners are, in general, to be continuous. Where this not practicable end brackets complying with *Section 4/3.2.3* are to be provided.

6.4.8.2 The scantlings of the end connection of each stiffener are to comply with *Section 4/3.4*.

7 APPLICATION OF SCANTLING REQUIREMENTS TO OTHER STRUCTURE

7.1 General

7.1.1 Application

7.1.1.1 The requirements of this Sub-Section apply to plating, local and primary support members where the basic structural configurations or strength models assumed in *Section 8/2* to *8/5* are not appropriate. These are general purpose strength requirements to cover various load assumptions and end support conditions. These requirements are not to be used as an alternative to the requirements of *Section 8/2* to *8/5* where those sections can be applied.

7.1.1.2 The net scantlings described in *7.2* are related to gross scantlings as follows:

(a) for plating and local support members, the gross thickness and gross cross-sectional properties are obtained from the requirements of *7.2.2* by adding the full corrosion additions specified in *Section 6/3*.

(b) for primary support members, the gross shear area, gross section modulus and other gross cross-sectional properties are obtained from the requirements of *7.2.3* by adding one half of the relevant full corrosion additions specified in *Section 6/3*.

7.1.1.3 These requirements are to be applied in conjunction with all other appropriate requirements in *Sections 8, 9* and *10* for the particular structural member under consideration, including longitudinal strength, minimum thickness, proportions and structural stability, strength assessment (FEM), fatigue and hull girder ultimate strength.

7.1.1.4 The requirements for local and primary support members are to be specially considered when the member is:

(a) part of a grillage structure

(b) subject to large relative deflection between end supports

(c) where the load model or end support condition is not given in *Table 8.7.1.*

7.1.1.5 The application of alternative or more advanced calculation methods will be specially considered.

7.2 Scantling Requirements

7.2.1 General

7.2.1.1 The design load sets to be applied to the structural requirements for the local and primary support members are given in *Table 8.7.2*, as applicable for the particular structure under consideration. The static and dynamic load components are to be combined in accordance with *Table 7.6.1* and the requirements given in *Section 7/6.3*.

7.2.2 Plating and local support members

7.2.2.1 For plating subjected to lateral pressure the net thickness, t_{net}, is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2,* and given by:

$$t_{net} = 0.0158\, a_p s \sqrt{\frac{|P|}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$$= 1.2 - \frac{s}{2100\, l_p}$$

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.1.2*, in kN/m²

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_p length of plate panel, to be taken as the spacing of primary support members, S, unless carlings are fitted, in m

C_a permissible bending stress coefficient for the design load set being considered, as given in *Tables 8.2.4*, *8.3.2* or *8.4.2*, as applicable for the individual member being considered

σ_{yd} specified minimum yield stress of the material, in N/mm²

7.2.2.2 For stiffeners subjected to lateral pressure, point loads, or some combination thereof, the net section modulus requirement, Z_{net}, is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$Z_{net} = \frac{|P|\, s\, l_{bdg}^2}{f_{bdg} C_s\, \sigma_{yd}} \quad \text{cm}^3\text{, for lateral pressure loads}$$

$$Z_{net} = \frac{1000\ |F|\, l_{bdg}}{f_{bdg}\, C_s\, \sigma_{yd}} \quad \text{cm}^3\text{, for point loads}$$

$$Z_{net} = \frac{\left| \sum \frac{P_i\, s\, l_{bdg}^2}{f_{bdg-i}} + \sum \frac{1000 F_j\, l_{bdg}}{f_{bdg-j}} \right|}{C_s\, \sigma_{yd}} \quad \text{cm}^3\text{, for a combination of loads}$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_{bdg} effective bending span, as defined in *Section 4/2.1.1*

f_{bdg} bending moment factor

for continuous stiffeners and where end connections are fitted consistent with idealization of the stiffener as having fixed ends:

= 12 for horizontal stiffeners

= 10 for vertical stiffeners

for other configurations the bending moment factor may be taken as in *Table 8.7.1*

C_s permissible bending stress coefficient for the design load set being considered as given in *Tables 8.2.5*, *8.3.3* or *8.4.3*, as applicable for the individual member being considered

σ_{yd} specified minimum yield stress of the material, in N/mm²

F point load for the design load set being considered, in kN

i indices for load component i

j indices for load component j

7.2.2.3 For stiffeners subjected to lateral pressure, point loads, or some combination thereof, the net web thickness, t_{w-net}, based on shear area requirements is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$t_{w-net} = \frac{f_{shr}\,|P|\,s\,l_{shr}}{d_{shr}\,C_t\,\tau_{yd}}$$ mm, for lateral pressure loads

$$t_{w-net} = \frac{1000 f_{shr}\,|F|}{d_{shr}\,C_t\tau_{yd}}$$ mm, for point loads

$$t_{w-net} = \frac{\left|\sum f_{shr-i}\,P_i\,s\,l_{shr} + \sum 1000 f_{shr-j}\,F_j\right|}{d_{shr}\,C_t\tau_{yd}}$$ mm, for a combination of loads

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

f_{shr} shear force factor

for continuous stiffeners and where end connections are fitted consistent with idealization of the stiffener as having fixed ends:

= 0.5 for horizontal stiffeners

= 0.7 for vertical stiffeners

for other configurations the shear force factor may be taken as in *Table 8.7.1.*

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_{shr} effective shear span, as defined in *Section 4/2.1.2*

d_{shr} as defined in *Section 4/2.4.2.2*

C_t permissible shear stress coefficient for the design load set being considered as given in *Tables 8.2.6* or *8.3.4*, as applicable for the individual member being considered

τ_{yd} $= \dfrac{\sigma_{yd}}{\sqrt{3}}$ N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

F point load for the design load set being considered, in kN

i indices for load component i

j indices for load component j

7.2.3 Primary support members

7.2.3.1 The requirements in *7.2.3* are applicable where the primary support member is idealised as a simple beam. More advanced calculation methods may be required to ensure that nominal stress level for all primary support members are less than the permissible stresses and stress coefficients given in *7.2.3.4* and *7.2.3.5* when subjected to the applicable design load sets. See also *7.1.1.4*.

7.2.3.2 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support member are to be applied as required in the notes of *Table 8.7.1*.

7.2.3.3 For primary support members intersecting with or in way of curved hull sections, the effectiveness of end brackets is to include an allowance for the curvature of the hull.

7.2.3.4 For primary support members the net section modulus requirement, Z_{net50}, is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$Z_{net50} = \frac{1000\,|P|\,S\,l_{bdg}^2}{f_{bdg}\,C_s\,\sigma_{yd}} \quad \text{cm}^3\text{, for lateral pressure loads}$$

$$Z_{net50} = \frac{1000\,|F|\,l_{bdg}}{f_{bdg}\,C_s\,\sigma_{yd}} \quad \text{cm}^3\text{, for point loads}$$

$$Z_{net50} = \frac{\left|\sum \frac{1000 P_i\,S\,l_{bdg}^2}{f_{bdg-i}} + \sum \frac{1000 F_j\,l_{bdg}}{f_{bdg-j}}\right|}{C_s\,\sigma_{yd}} \quad \text{cm}^3\text{, for a combination of loads}$$

Where:

P	design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.3.3*, in kN/m²
S	primary support member spacing, in m, as defined in *Section 4/2.2.2*
l_{bdg}	effective bending span, as defined in *Section 4/2.1.4*
f_{bdg}	bending moment factor, as given in *Table 8.7.1.*
C_s	permissible bending stress coefficient for the design load set being considered as given in *Tables 8.2.10* or *8.3.6*, as applicable for the individual member being considered
σ_{yd}	specified minimum yield stress of the material, in N/mm²
F	point load for the design load set being considered, in kN
i	indices for load component i
j	indices for load component j

7.2.3.5 For primary support members the net shear area of the web, $A_{shr-net50}$, is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2,* and given by:

$$A_{shr-net50} = \frac{10 f_{shr} |P| S l_{shr}}{C_t \tau_{yd}} \quad \text{cm}^2\text{, for lateral pressure loads}$$

$$A_{shr-net50} = \frac{10 f_{shr} |F|}{C_t \tau_{yd}} \quad \text{cm}^2\text{, for point loads}$$

$$A_{shr-net50} = \frac{\left| \sum 10 f_{shr-i} P_i l_{shr} + \sum 10 f_{shr-j} F_j \right|}{C_t \tau_{yd}} \quad \text{cm}^2\text{, for a combination of}$$

loads

Where:

P	design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.3.2*, in kN/m^2
S	primary support member spacing, in m, as defined in *Section 4/2.2.2*
l_{shr}	effective shear span, as defined in *Section 4/2.1.5*
f_{shr}	shear force factor, as given in *Table 8.7.1*
C_t	permissible shear stress coefficient for the design load set being considered as given in *Tables 8.2.10* or *8.3.7*, as applicable for the individual member being considered
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm^2
σ_{yd}	specified minimum yield stress of the material, in N/mm^2
F	point load for the design load set being considered, in kN

Table 8.7.1 (Continued)
Values of f_{bdg} and f_{shr}

Load and boundary conditions				Bending moment and shear force factor (based on load at mid span where load varies)			Application
Load model	Position (1)			1	2	3	
	1 Support	2 Field	3 Support	f_{bdg1} f_{shr1}	f_{bdg2} -	f_{bdg3} f_{shr3}	
I				- 0.5	4 -	- 0.5	Simply supported. Single point load in the centre of the span
J				- $\frac{a}{l}$	$\frac{l^2}{a(l-a)}$ -	- $\frac{l-a}{l}$	Simply supported. Single point load, load anywhere along the span

<u>Note</u>

1. The bending moment factor f_{bdg} for the support positions are applicable for a distance of $0.2l_{bdg}$ from the end of the effective bending span for both local and primary support members.
2. The shear force factor f_{shr} for the support positions are applicable for a distance of $0.2l_{shr}$ from the end of the effective shear span for both local and primary support members.
3. Application of f_{bdg} and f_{shr} for local support members:
   (a) the section modulus requirement of local support members is to be determined using the lowest value of f_{bdg1} , f_{bdg2} and f_{bdg3}
   (b) the shear area requirement of local support members is to be determined using the greatest value of f_{shr1} and f_{shr3}.
4. Application of f_{bdg} and f_{shr} for primary support members:
   (a) the section modulus requirement within $0.2l_{bdg}$ from the end of the effective span is generally to be determined using the applicable f_{bdg1} and f_{bdg3}, however f_{bdg} is not to be taken greater than 12
   (b) the section modulus of mid span area is to be determined using f_{bdg} =24, or f_{bdg2} from the table if lesser
   (c) the shear area requirement of end connections within $0.2l_{shr}$ from the end of the effective span is to be determined using f_{shr} = 0.5 or the applicable f_{shr1} or f_{shr3}, whichever is greater
   (d) for models A through F the value of f_{shr} may be gradually reduced outside of $0.2l_{shr}$ towards $0.5f_{shr}$ at mid span where f_{shr} is the greater value of f_{shr1} and f_{shr3}.

Where:

l effective span, l_{bdg} and l_{shr} as applicable

l_{bdg} as defined in *Section 4/2.1.1* for local support members and *Section 4/2.1.4* for primary support members

l_{shr} as defined in *Section 4/2.1.2* for local support members and *Section 4/2.1.5* for primary support members

Table 8.7.2
Design Load Sets for Plating, Local Support Members and Primary Support Members

Type of Local Support and Primary Support Member	Design Load Set (1)	Load Component	External Draught	Comment	Diagrammatic Representation
Shell Envelope	1	P_{ex}	T_{sc}	Sea pressure only		2	P_{ex}	T_{sc}		
	5	P_{in}	T_{bal}	Tank pressure only. Sea pressure to be ignored		6	P_{in}	$0.25T_{sc}$		
External Decks	1	P_{ex}	T_{sc}	Green sea pressure only	Cargo Tank Boundaries	3	P_{in}	$0.6T_{sc}$	Pressure from one side only Full tank with adjacent tank empty		4	P_{in}	-		
	11	$P_{in\text{-}flood}$	-		
Other Tank Boundaries or Watertight Boundaries	5	P_{in}	T_{bal}	Pressure from one side only Full tank with adjacent tank empty		6	P_{in}	$0.25T_{sc}$		
	11	$P_{in\text{-}flood}$	-		
Internal and External Decks or Flats	9	P_{dk}	T_{bal}	Distributed or concentrated loads only. Adjacent tanks empty. Green sea pressure may be ignored		10	P_{dk}	T_{bal}		

Where:

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

T_{bal} minimum design ballast draught, in m, as defined in *Section 4/1.1.5.2*

Notes

1. The specification of design load combinations, and other load parameters for the design load sets are given in *Table 8.2.8*
2. When the ship's configuration cannot be described by the above, then the applicable Design Load Sets to determine the scantling requirements of structural boundaries are to be selected so as to specify a full tank on one side with the adjacent tank or space empty. The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. See Note 4 on *Table 8.2.7* and *Table 8.2.8.*
3. The boundaries of void and dry space not forming part of the hull envelope are to be evaluated using Design Load Set 11. See Note 2.

SECTION 9

DESIGN VERIFICATION

1 HULL GIRDER ULTIMATE STRENGTH

1.1 General

1.1.1 Application

1.1.1.1 The hull girder ultimate bending capacity in sagging is to be evaluated and checked to ensure it satisfies the following criteria. The criteria are applicable to intact ship structures, in extreme at sea conditions. They do not cover hogging, harbour or damaged conditions.

1.1.1.2 The scantling requirements in this Sub-Section are to be applied to any cross section along the entire vessel's length and are in addition to all other requirements within the rules.

RCN 1 to July 2010 version (effective from 1 July 2012)

1.1.1.3 Outside the $0.4L$ region of amidships the plate and stiffeners may be gradually reduced towards the local requirements at the ends.

1.2 Rule Criteria

1.2.1 Vertical hull girder ultimate bending capacity

1.2.1.1 The vertical hull girder ultimate bending capacity is to satisfy the following criteria:

$$\gamma_S M_{sw} + \gamma_W M_{wv-sag} \leq \frac{M_U}{\gamma_R}$$

Where:

M_{sw} sagging still water bending moment, in kNm, to be taken as specified in *Table 9.1.1*.

$M_{wv\text{-}sag}$ sagging vertical wave bending moment, in kNm, to be taken as the midship sagging value defined in *Section 7/3.4.1.1*

M_U sagging vertical hull girder ultimate bending capacity, in kNm, as defined in *Appendix A/1.1.1*

γ_S, γ_W, γ_R are the partial safety factors for the design load combinations given in *1.4*

1.3 Hull Girder Bending Moment Capacity

1.3.1 Calculation of capacity

1.3.1.1 The hull girder ultimate bending capacity, M_U, in sagging is to be calculated according to *Appendix A/1.1.1*.

1.3.1.2 The effective area for the hull girder ultimate strength capacity assessment is specified in *Section 8/1.2.1*.

1.3.1.3 The capacity is to be based on net scantlings using a corrosion addition, $0.5t_{corr}$, see *Section 6/3.2*

1.4 Partial Safety Factors

1.4.1 General

1.4.1.1 The partial safety factors given in *Table 9.1.1* apply when M_U is calculated according to the single step method in *Appendix A/2.1* or the incremental method in *A/2.2*. The partial safety factors are given for two different design load combinations and both combinations are to be satisfied. Note that the definition of M_{sw} is different for each combination.

Table 9.1.1
Partial Safety Factors

Design load combination	Definition of Still Water Bending Moment, M_{sw}	γ_S	γ_W	γ_R
a)	Permissible sagging still water bending moment, $M_{sw-perm-sea}$, in kNm, see *Section 7/2.1.1*	1.0	1.2	1.1
b)	Maximum sagging still water bending moment for operational seagoing homogeneous full load condition, $M_{sw-full}$, in kNm, see note 1	1.0	1.3	1.1

Where:

γ_S partial safety factor for the sagging still water bending moment

γ_W partial safety factor for the sagging vertical wave bending moment covering environmental and wave load prediction uncertainties

γ_R partial safety factor for the sagging vertical hull girder bending capacity covering material, geometric and strength prediction uncertainties

Notes

1 The maximum sagging still water bending moment is to be taken from the departure condition with the ship homogeneously loaded at maximum draught and corresponding arrival and any mid-voyage conditions.

2 STRENGTH ASSESSMENT (FEM)

2.1 General

2.1.1 Application

2.1.1.1 A strength assessment of the hull structure using finite element analysis is mandatory.

2.1.1.2 The finite element analysis consists of two parts:

(a) cargo tank analysis to assess the strength of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads.

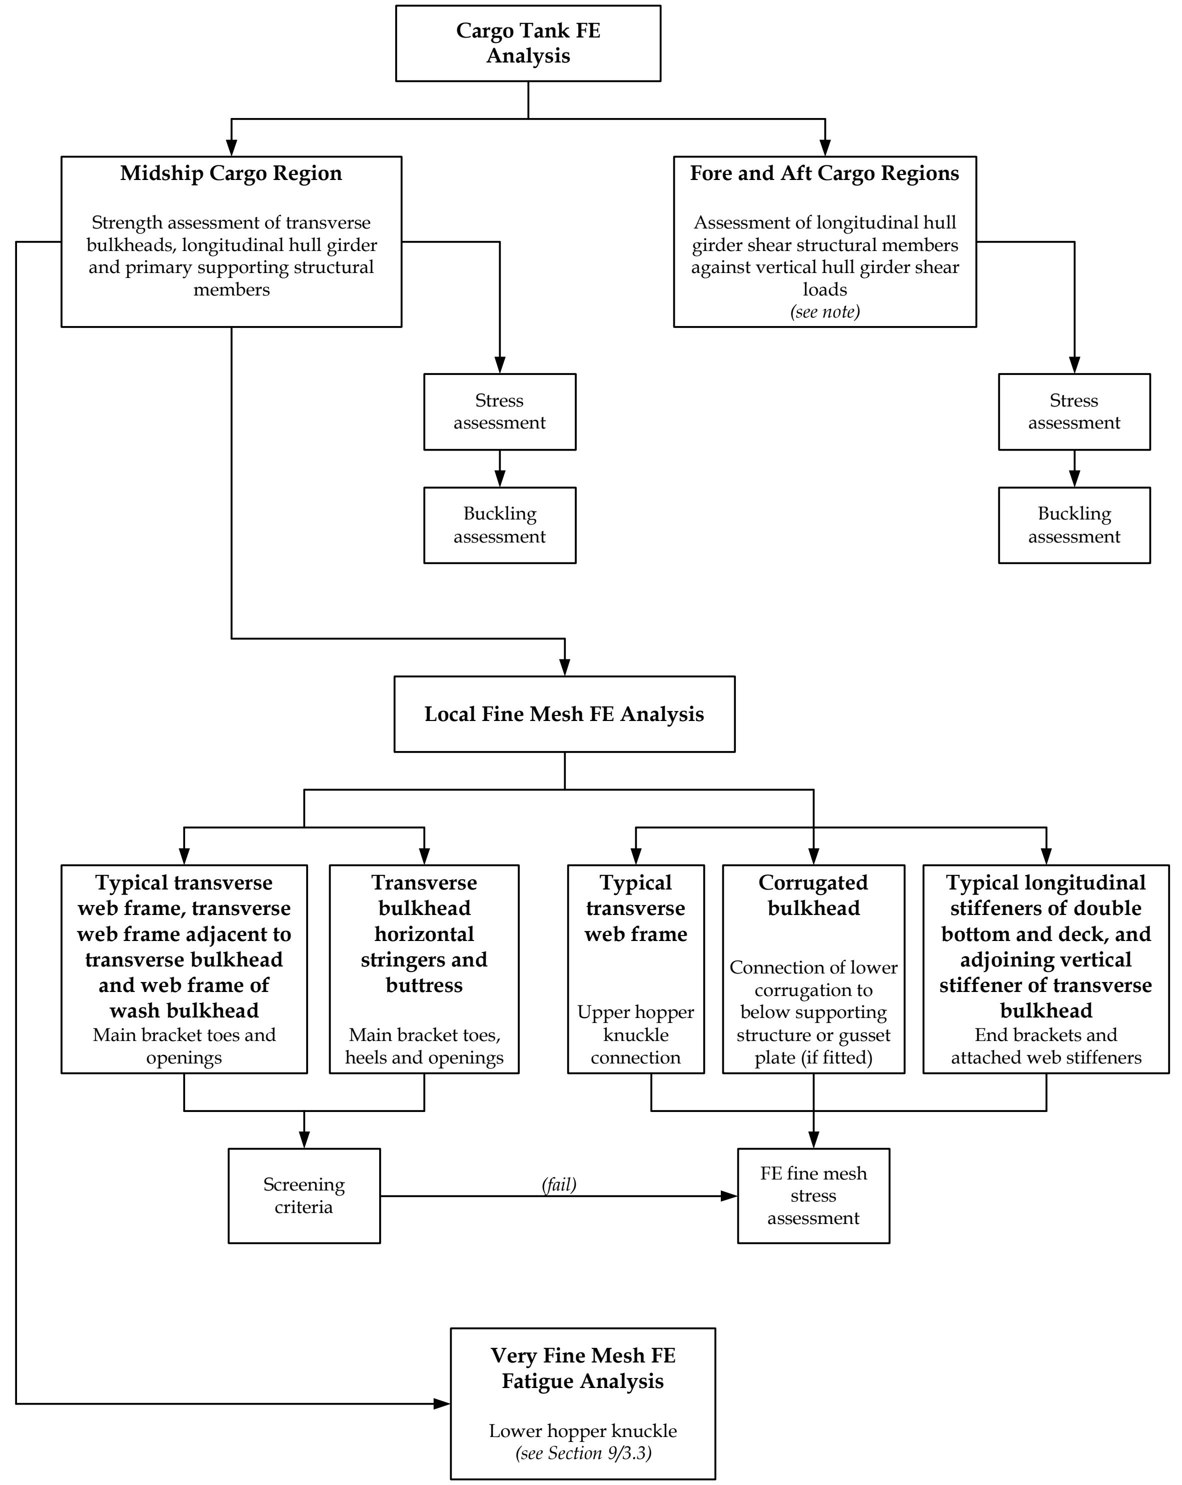
(b) fine mesh analysis to assess detailed stress levels in local structural details.

2.1.1.3 A flow diagram showing the minimum requirement of finite element analysis is shown in *Figure 9.2.1*.

2.1.1.4 The structural assessment is to be carried out in accordance with the requirements given in *Appendix B*. The structural assessment is to verify that the acceptance criteria specified in *2.2.5* and *2.3.5* are complied with.

2.1.1.5 The application of the scantlings verified by the structural assessment within the cargo tank region is to be in accordance with *2.4*.

Figure 9.2.1
Rule Minimum Requirement on Finite Element Analysis



Note

1. The strength assessment of longitudinal hull girder shear structural members, as defined in *2.2.1.1* and *Section 4/Table 4.1.1*, against hull girder vertical shear loads in way of transverse bulkheads may be based on the midship cargo tank finite element model with modification of plate and stiffener properties where appropriate, see *Appendix B/1.1.1* and *Appendix B/2.2.1*.

2.1.2 Submission of results

2.1.2.1 A detailed report of the structural analysis is to be submitted to demonstrate compliance with the specified structural design criteria. This report shall include the following information:

(a) list of plans used including dates and versions
(b) detailed description of structural modelling including all modelling assumptions and any deviations in geometry and arrangement of structure compared with plans
(c) plots to demonstrate correct structural modelling and assigned properties
(d) details of material properties, plate thickness, beam properties used in the model
(e) details of boundary conditions
(f) details of all loading conditions reviewed with calculated hull girder shear force and bending moment distributions
(g) details of applied loads and confirmation that individual and total applied loads are correct
(h) plots and results that demonstrate the correct behaviour of the structural model under the applied loads
(i) summaries and plots of global and local deflections
(j) summaries and sufficient plots of stresses to demonstrate that the design criteria are not exceeded in any member
(k) plate and stiffened panel buckling analysis and results
(l) tabulated results showing compliance, or otherwise, with the design criteria
(m) proposed amendments to structure where necessary, including revised assessment of stresses, buckling and fatigue properties showing compliance with design criteria.

2.1.3 Computer programs

2.1.3.1 In general, any finite element computation program recognised by the Classification Society may be employed to determine the stress and deflection of the hull structure, provided that the combined effects of bending, shear, axial and torsional deformations are considered.

2.1.3.2 The computer program used for the assessment of panel buckling capability is to take account of the combined interaction of bi-axial compressive stresses, shear stress and lateral pressure loads, as required by *Section 10/4*.

2.1.3.3 A computer program that has been demonstrated to produce reliable results to the satisfaction of the Classification Society is regarded as a recognised program. Where the computer programs employed are not supplied or recognised by the Classification Society, full particulars of the computer program, including calculation output, are to be submitted for approval. It is recommended that the designers consult the Classification Society on the suitability of the computer programs intended to be used prior to the commencement of any analysis work.

2.2 Cargo Tank Structural Strength Analysis

2.2.1 Objective and scope

2.2.1.1 The analysis is to cover at least the assessment of:

(a) longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads in the midship cargo tank region, and

(b) longitudinal hull girder shear structural members in way of transverse bulkheads against hull girder vertical shear loads within the cargo area. These structural members include side shell, inner hull longitudinal bulkheads including upper sloped plate where fitted, hopper, longitudinal bulkheads and double bottom girders as defined in *Section 4/Table 4.1.1.* The required strengthening in way of transverse bulkheads for hull girder shear loads in the forward, midship or aft cargo region may be based on the maximum hull girder shear force within the region considered. Alternatively assessment may be carried out to determine the strengthening requirement in way of individual transverse bulkhead position. The details are given in *Appendix B/1.1.1*.

2.2.1.2 The required strengthening in way of transverse bulkheads for hull girder shear loads in the forward, midship or aft cargo region may be based on the maximum hull girder shear force within the region considered. Alternatively assessment may be carried out to determine the strengthening requirement in way of individual transverse bulkhead position. The details are given in *Appendix B/1.1.1*

2.2.1.3 The analysis is to verify that the following are within the acceptance criteria under the applied static and dynamic loads:

(a) stress level in the plating of longitudinal hull girder structural members, primary support structural members and transverse bulkheads, face plate of primary support members modelled by plate or rod elements.

(b) buckling capability of plates and stiffened panels.

2.2.2 Structural modelling

2.2.2.1 The modelling scantlings of the cargo tank finite element model are to be based on net scantlings as described in *Section 6/3.3.6.1* and *Appendix B/2.2.1.5*.

2.2.2.2 The length of the cargo tank finite element model is to cover three cargo tank lengths. Where the tanks in the midship cargo region are of different lengths, the middle tank of the finite element model is to represent the cargo tank of the greatest length. All main longitudinal and transverse structural elements are to be represented in the finite element model. These include inner and outer shell, double bottom floor and girder system, transverse and vertical web frames, stringers, transverse and longitudinal bulkhead structures. All plating and stiffeners, including web stiffeners, on these structural elements are to be modelled.

2.2.2.3 The mesh of the finite element model is to follow the stiffening system of the structure as far as practical, and is to represent the actual plate panels between stiffeners.

2.2.2.4 The structure modelling is to be in accordance with the requirements given in *Appendix B/2.2*.

2.2.3 Loads and loading conditions

2.2.3.1 The combinations of the ship static and dynamic loads which are likely to impose the most onerous load regimes on the hull structure are to be investigated in the structural analysis.

2.2.3.2 The standard load cases to be used in the structural analysis are given in *Appendix B/2.3.1*. These load cases cover seagoing conditions (design load combination S + D) and harbour/tank testing conditions (design load combination S).

2.2.3.3 Where the loading conditions specified by the designer are not covered by the standard load cases then these additional loading conditions are to be examined, see also *Appendix B/2.3.1*.

2.2.4 Load applications and boundary conditions

2.2.4.1 All simultaneously acting hull girder and local loads are to be applied to the model. The application of local and hull girder loads to the finite element model is to be in accordance with the requirement given in *Appendix B/2.4* and *B/2.5*.

2.2.4.2 The boundary conditions to be applied are given in *Appendix B/2.6*.

2.2.5 Acceptance criteria

2.2.5.1 Verification of results against the acceptance criteria is to be carried out in accordance with *Appendix B/2.7*.

2.2.5.2 Verification of results against the acceptance criteria is to be carried out for all structural members within the longitudinal extent of the middle tanks of the three tank FE model, and the regions forward and aft of the middle tanks up to the extent of the transverse bulkhead stringer and buttress structure. For the assessment of shear strength in way of transverse bulkheads against hull girder shear loads, stress level and buckling capability of inner hull longitudinal bulkheads including upper sloped plate where fitted, side shell, longitudinal bulkheads, hopper and bottom longitudinal girders are to be verified against the acceptance criteria. See also *Appendix B/2.7.1*.

2.2.5.3 The structural analysis is to demonstrate that the permissible von Mises stress criteria and utilisation factor against buckling for plate and stiffened panels specified in *Tables 9.2.1* and *9.2.2* are not exceeded.

2.2.5.4 Capacity models used for the assessment of local buckling capability of plate and stiffened panels are to be based on deduction of full corrosion addition thickness from the plate and stiffeners, as described in *Section 6/3.3.6.2* and *Appendix B/2.7.3*.

2.2.5.5 Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible stresses and buckling utilisation factors given in *Tables 9.2.1* and *9.2.2* are to be reduced by 10% for the corrugation and below supporting structure within the extent defined as follows:

(a) Full height of the corrugation

(b) Supporting structure for a transverse corrugated bulkhead - longitudinally within half a web frame space forward and aft of the bulkhead

(c) Supporting structure for a longitudinal corrugated bulkhead – transversely within three longitudinal stiffener spacings from each side of the bulkhead.

Table 9.2.1
Maximum Permissible Stresses

Structural component	Yield utilisation factor
Internal structure in tanks	
Plating of all non-tight structural members including transverse web frame structure, wash bulkheads, internal web, horizontal stringers, floors and girders. Face plate of primary support members modelled using plate or rod elements	$\lambda_y \le 1.0$ (load combination S + D) $\lambda_y \le 0.8$ (load combination S)
Structure on tank boundaries	
Plating of deck, sides, inner sides, hopper plate, bilge plate, plane and corrugated cargo tank longitudinal bulkheads. Tight floors, girders and webs	$\lambda_y \le 0.9$ (load combination S + D) $\lambda_y \le 0.72$ (load combination S)
Plating of inner bottom, bottom, plane transverse bulkheads and corrugated bulkheads.	$\lambda_y \le 0.8$ (load combination S + D) $\lambda_y \le 0.64$ (load combination S)

Where:

λ_y yield utilisation factor

$= \dfrac{\sigma_{vm}}{\sigma_{yd}}$ for plate elements in general

$= \dfrac{\sigma_{rod}}{\sigma_{yd}}$ for rod elements in general

σ_{vm} von Mises stress calculated based on membrane stresses at element's centroid, in N/mm^2

σ_{rod} axial stress in rod element, in N/mm^2

σ_{yd} specified minimum yield stress of the material, in N/mm^2, but not to be taken as greater than 315 N/mm^2 for load combination S + D in areas of stress concentration (2)

Note

1. Structural items given in the table are for guidance only. Stresses for all parts of the FE model specified in *2.2.5.2* are to be verified against the permissible stress criteria. See also *Appendix B/2.7.1*
2. Areas of stress concentration are corners of openings, knuckle joints, toes and heels of primary supporting structural members and stiffeners
3. Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible stresses are to be reduced by 10% in accordance with *2.2.5.5*.
4. The yield utilisation factor for plane and corrugated longitudinal bulkheads between cargo tanks may be taken as for non-tight structural members for FE load cases where either both sides of the bulkhead are empty or both sides are loaded. The water-tight bottom girder under the longitudinal bulkhead is to be treated as a tight structural member.

(RCN 1, effective from 1 April 2007)

RCN 2 to July 2008 version (effective from 1 July 2010)

Table 9.2.2
Maximum Permissible Utilisation Factor Against Buckling

Structural component	Buckling utilisation factor
Plate and stiffened panels [(3)]	$\eta \le 1.0$ (load combination S + D) $\eta \le 0.8$ (load combination S)
Web plate in way of openings	$\eta \le 1.0$ (load combination S + D) $\eta \le 0.8$ (load combination S)
Pillar buckling of cross tie structure	$\eta \le 0.75$ (load combination S + D) $\eta \le 0.65$ (load combination S)
Corrugated bulkheads - flange buckling - column buckling	$\eta \le 0.9$ (load combination S + D) $\eta \le 0.72$ (load combination S)

Where:

η utilisation factor against buckling calculated in accordance with *Appendix D/5* and *Appendix B/2.7.3*. Also see *Section 10/3.4.1* for web plate in way of openings and *Section 10/3.5.1* for cross tie structure

Note

1. Buckling capability of curved panels (e.g. bilge plate), face plate and tripping bracket of primary supporting members are not assessed based on finite element stress result
2. Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible buckling utilisation factors are to be reduced by 10% in accordance with *2.2.5.5*
3. Permissible buckling utilisation factors specified in this table are applicable for the reference advanced buckling method given in *Appendix D/1.1.2*. If alternative buckling procedures are used the permissible utilisation factors are to be assessed and if required adjusted to meet acceptance criteria for equivalence specified in *Appendix D/1.1.2*.

RCN 1 to July 2008 version (effective from 1 February 2010)

2.3 Local Fine Mesh Structural Strength Analysis

2.3.1 Objective and scope

2.3.1.1 For tankers of conventional arrangements, as a minimum requirement, the following areas in the midship cargo region are to be investigated:

(a) main bracket toes and openings at critical locations and upper hopper knuckle joint of a typical transverse web frame located in the midship tank. Where a wash bulkhead is fitted, main bracket toes and openings at critical locations of transverse and vertical webs

(b) main bracket toes and openings at critical locations on a typical transverse web frame adjacent to a transverse bulkhead in way of the transverse bulkhead horizontal stringers

(c) main bracket toes, heels and openings at critical locations of horizontal stringers, connection of transverse bulkhead to double bottom girder or buttress of a typical transverse bulkhead

(d) connections of transverse and longitudinal corrugated bulkheads to bottom stool or inner bottom and double bottom supporting structure if a lower stool is

not fitted. If a gusset plate is fitted the connection between the corrugation and the upper corners of the gusset are to be assessed

(e) end brackets and attached web stiffeners of typical longitudinal stiffeners of double bottom and deck, and adjoining vertical stiffener of transverse bulkhead. If longitudinal stiffeners are fitted above the deck then the connection in way of the transverse bulkhead are to be assessed.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.1.2 The selection of critical locations on the structural members described in *2.3.1.1* to perform fine mesh analysis is to be in accordance with *Appendix B/3.1.*

2.3.1.3 Where the stress level in areas of stress concentration on structural members not specified in *2.3.1.1* exceeds the acceptance criteria of the cargo tank analysis, a fine mesh analysis is to be carried out to demonstrate satisfactory scantlings.

2.3.1.4 Where the geometry can not be adequately represented in the cargo tank finite element model, a fine mesh analysis may be used to demonstrate satisfactory scantlings. In such cases the average stress within an area equivalent to that specified in the cargo tank analysis (typically s by s) is to comply with the requirement given in *Table 9.2.1*. See also Note 1 of *Table 9.2.3*.

2.3.2 Structural modelling

2.3.2.1 The fine mesh structural models are to be in accordance with the requirements given in *Appendix B/3.2*.

2.3.2.2 The fine mesh analysis may be carried out by means of a separate local finite element model with fine mesh zones, in conjunction with the boundary conditions obtained from the cargo tank model, or by incorporating fine mesh zones into the cargo tank model.

2.3.2.3 The extent of the local finite element models is to be such that the calculated stresses at the areas of interest are not significantly affected by the imposed boundary conditions and application of loads. Detailed requirements on the extension of local finite element models are given in *Appendix B/3.2.*

2.3.2.4 The fine mesh zone is to represent the localised area of high stress. The finite element mesh size within the fine mesh zones is to be not greater than 50mm x 50mm. The extent of the fine mesh zone is to be in accordance with *Appendix B/3.2.*

2.3.2.5 The fine mesh models are to be based on the net scantlings in accordance with *Section 6/3.3.6.3* and *Appendix B/3.2*.

2.3.3 Loads and loading conditions

2.3.3.1 Fine mesh detailed stress analysis is to be carried out for the standard load cases, and any other specifically specified load cases, required by *2.2.3*.

2.3.4 Load applications and boundary conditions

2.3.4.1 The application of loads and boundary conditions to the finite element model is to be in accordance with the requirements given in *Appendix B/3.4*.

2.3.5 Acceptance criteria

2.3.5.1 Verification of stress results against the acceptance criteria is to be carried out in accordance with *Appendix B/3.5*.

2.3.5.2 The structural assessment is to demonstrate that the von Mises stresses obtained from the fine mesh finite element analysis do not exceed the maximum permissible stress criteria specified in *Table 9.2.3*.

Table 9.2.3
Maximum Permissible Membrane Stresses for Fine Mesh Analysis

Element stress	Yield utilisation factor
Element not adjacent to weld	$\lambda_y \le 1.7$ (load combination S + D) $\lambda_y \le 1.36$ (load combination S)
Element adjacent to weld	$\lambda_y \le 1.5$ (load combination S + D) $\lambda_y \le 1.2$ (load combination S)

Where:

λ_y yield utilisation factor

$= \dfrac{k\ \sigma_{vm}}{235}$ for plate element

$= \dfrac{k\ \sigma_{rod}}{235}$ for rod or beam element

σ_{vm} von Mises stress calculated based on membrane stress at element's centroid, in N/mm^2

σ_{rod} axial stress in rod element, in N/mm^2

k higher strength steel factor, as defined in *Section 6/1.1.4* but not to be taken as less than 0.78 for load combination S + D

Note

1. Where the von Mises stress of the elements in the cargo tank FE model in way of the area under investigation by fine mesh exceeds its permissible value specified in *Table 9.2.1*, average von Mises stress, obtained from the fine mesh analysis, calculated over an area equivalent to the mesh size of the cargo tank finite element model is to be less than the permissible value specified in *Table 9.2.1*
2. The maximum permissible stresses are based on the mesh size of 50mm x 50mm. Where a smaller mesh size is used, an average von Mises stress calculated in accordance with *Appendix B/3.5.1* over an area equal to the specified mesh size may be used to compare with the permissible stresses.
3. Average von Mises stress is to be calculated based on weighted average against element areas:

$$\sigma_{vm-av} = \frac{\sum_1^n A_i \sigma_{vm-i}}{\sum_1^n A_i}$$

where

σ_{vm-av} is the average von Mises stress

σ_{vm-i} is the von Mises stress of the ith plate element within the area considered

A_i is the area of the ith plate element within the area considered

n is the number of elements within the area considered

4. Stress averaging is not to be carried across structural discontinuities and abutting structure
5. Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible stresses are to be reduced by 10% for the areas under investigation by fine mesh analysis.

2.4 Application of Scantlings in Cargo Tank Region

2.4.1 General

2.4.1.1 The application of the scantlings that comply with the requirements of the finite element strength assessment, to the structure within the cargo tank region, is to be in accordance with the requirements given in this sub-section.

2.4.1.2 The application given in this sub-section assumes that the same material yield strength of the structure is maintained throughout the cargo tank region. Where steel having a different yield strength is applied, the required scantlings are to be assessed.

2.4.1.3 The scaling procedure given in this sub-section is based on scantlings that satisfied the requirements given in *Section 9/2* and *Appendix B*.

2.4.1.4 The net thickness and sectional properties for plating and local support members described in this sub-section are to be based on deduction of full corrosion addition, as specified in *Section 6/Table 6.3.2*, from the gross scantlings. The gross thickness of plating, web and face plate of local support members are to be obtained by adding the full corrosion addition to the net thickness.

2.4.2 Application of scantlings to deck

2.4.2.1 The scantlings of deck plating and deck longitudinal stiffeners are to be maintained longitudinally within 0.4*L* amidships. The scantlings of deck plating and deck longitudinal stiffeners at a given transverse location within 0.4*L* amidships are not to be taken as less than the maximum of that required for the corresponding transverse location along the length of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5.*

2.4.2.2 Outside 0.4*L* amidships, the scantlings of the deck plating and deck longitudinal stiffeners may be tapered to that required by *Section 8* at the ends of the cargo tank region.

2.4.3 Application of scantlings to inner bottom

2.4.3.1 The thickness of inner bottom plating may vary along the length and breadth of a tank.

2.4.3.2 The scantlings of the inner bottom plating and longitudinal stiffeners of midship cargo tanks are not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks.

2.4.3.3 For the fore-most and aft-most cargo tanks, the scantlings of the inner bottom longitudinal stiffeners are not to be less than the scantling requirements for the midship cargo tanks provided that the spacing of primary support members are not reduced in the forward and/or aft cargo tank. The minimum net thickness of the inner bottom plate, t_{ib-net}, is given by:

$$t_{ib-net} = t_{ib-net-mid}\left(\frac{l_{bdg}}{l_{bdg-mid}}\right)^{0.25}\frac{s_{ib}}{s_{ib-mid}} \quad \text{mm}$$

where:

$t_{ib\text{-}net\text{-}mid}$ required net thickness of the inner bottom plating for the corresponding location in the midship tank, in mm

l_{bdg} effective bending span, of floor at location under consideration, in accordance with *Figure 4.2.7*, in m

$l_{bdg\text{-}mid}$ effective bending span, of floor at corresponding location in midship tank, defined in accordance with *Figure 4.2.7*, in m

s_{ib} spacing between longitudinal stiffeners at location under consideration, in mm

$s_{ib\text{-}mid}$ spacing between longitudinal stiffeners at corresponding location in midship tank, in mm

2.4.4 Application of scantlings to bottom

2.4.4.1 The scantlings of bottom longitudinal stiffeners are to be maintained longitudinally within 0.4*L* amidships. The scantlings of the bottom longitudinal stiffener at a given transverse location within 0.4*L* amidships are not to be less than the maximum of that required for the corresponding transverse location along the length of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5.*

2.4.4.2 Outside 0.4*L* amidships, the scantlings of the bottom longitudinal stiffeners may be tapered to that required by *Section 8* at the ends of the cargo region.

2.4.4.3 The thickness of the bottom plating may vary along the length and breadth of a tank. The bottom plate thicknesses of midship tanks are not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These thicknesses are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks.

2.4.4.4 For the fore-most and aft-most cargo tanks, the required minimum net thickness of the bottom plating, $t_{btm\text{-}net}$, is to be obtained as follows:

$$t_{btm-net} = t_{btm-net-mid}\left(\frac{l_{bdg}}{l_{bdg-mid}}\right)^{0.25}\frac{s_{btm}}{s_{btm-mid}} \quad \text{mm}$$

where:

$t_{btm\text{-}net\text{-}mid}$ required net thickness of the bottom plating for the corresponding location in the midship tank, in mm

l_{bdg} effective bending span, of floor at location under consideration, in accordance with *Figure 4.2.7*, in m

$l_{bdg\text{-}mid}$ effective bending span, of floor at corresponding location in midship tank, defined in accordance with *Figure 4.2.7*, in m

s_{btm} spacing between longitudinal stiffeners at location under consideration, in mm

$s_{btm\text{-}mid}$ spacing between longitudinal stiffeners at corresponding location in midship tank, in mm

2.4.5 Application of scantlings to side shell, longitudinal bulkheads and inner hull longitudinal bulkheads

2.4.5.1 The scantlings of plating and longitudinal stiffeners of side shell, longitudinal bulkheads and inner longitudinal bulkheads within 0.15*D* from the deck are to be maintained longitudinally within 0.4*L* amidships. The scantlings of plating and longitudinal stiffener at a given height are not to be less than the maximum of that required for the corresponding vertical location along the length of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5.* Outside 0.4*L* amidships, the scantlings of the plating and stiffeners within 0.15*D* from the deck may be tapered to that required by *Section 8* at the ends of the cargo tank region.

2.4.5.2 The plate thickness of side shell, longitudinal bulkheads and inner hull longitudinal bulkheads, including hopper plating, outside 0.15*D* from the deck may vary along the length and height of a tank. The plate thickness away from the transverse bulkheads is not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks. For the fore-most and aft-most cargo tanks, the minimum net thickness of the side shell, longitudinal bulkheads or inner hull longitudinal bulkheads (including hopper plating) plating outside 0.15*D* from the deck is given by:

$$t_{net} = t_{net-mid} \frac{s}{s_{mid}} \quad \text{mm}$$

Where:

$t_{net-mid}$ required net thickness for corresponding location in the midship tank, in mm

s spacing between longitudinal stiffeners at location under consideration, in mm

s_{mid} spacing between longitudinal stiffeners at corresponding location in midship tank, in mm

2.4.5.3 The plate thickness of side shell, longitudinal bulkheads and inner hull longitudinal bulkheads, including hopper plating, in way of transverse bulkheads required for strengthening against hull girder shear loads is not to be less than that required by *Appendix B/1.1.1.6, B/1.1.1.7* and *B/1.1.1.8*. Within 0.15*D* from the deck, the plate thicknesses in way of transverse bulkheads are not to be taken as less than that required by *2.4.5.1*. Outside 0.15*D* from the deck, the plate thicknesses in way of transverse bulkheads are not to be taken as less than that required by *2.4.5.2*.

2.4.5.4 The scantlings of longitudinal stiffeners of side shell, longitudinal bulkheads, inner longitudinal bulkheads and hopper plate at a given height, outside 0.15*D* from the deck, are not to be less than that required for the corresponding vertical location of the middle tanks of the cargo tank finite element model as required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region.

2.4.5.5 The plate thickness required for strengthening against hull girder shear loads of the side shell, longitudinal bulkheads and inner hull longitudinal bulkheads in way of a transverse bulkhead is to be taken as the greater from the corresponding vertical location of the forward and aft transverse bulkhead of the middle tanks of the cargo tank finite element model as required by Appendix B/1.1.1.5. All relevant requirements in other sections of the Rules are also to be complied with.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.4.6 Application of scantlings to transverse bulkheads

2.4.6.1 The scantlings of transverse bulkhead plating, stiffeners and horizontal stringers may vary along the height and breadth of the bulkhead. The scantlings at a given location are not to be less than the maximum required at the corresponding location of both middle tank end transverse bulkheads of the cargo tank finite element model as required by *Appendix B/1.1.1.5*.

2.4.7 Application of scantlings to primary structural support members

2.4.7.1 The web thickness of primary structural support members may vary along the length, breadth and height of a tank. The scantlings of the primary structural support members are not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks.

2.4.7.2 Scantling requirements for primary support members in the fore-most and aft-most cargo tanks are to be determined by scaling the scantlings of the corresponding structural members in the midship tanks in accordance with *Section 8/2.6.9*.

2.4.8 Structural details and openings

2.4.8.1 Arrangement and scantlings of openings and structural details of primary structural members, complying with the requirements of *Appendix B/3,* are to be applied to the corresponding structural members in all tanks within the cargo tank region.

3 FATIGUE STRENGTH

3.1 Fatigue Evaluation

3.1.1 General

3.1.1.1 This Sub-Section, together with *Appendix C*, gives the minimum Rule requirements for design against fatigue failure for the structural details stipulated in these Rules. Structural details at other locations that are considered to be critical may require assessment using a procedure consistent with that contained in these Rules.

3.1.1.2 The fatigue criteria, applicable to a broad range of structural details and arrangements, are to be used for the assessment of fatigue strength utilising numerical techniques.

3.1.1.3 The fatigue analysis is to be carried out using either a '*nominal stress approach*' or a '*hot spot stress approach*' depending on the structural details, as specified in *3.4*. The procedure is illustrated in *Figure 9.3.1*.

3.1.1.4 In a *nominal stress approach*, stresses in a structural component are calculated by using either analytical methods (e.g. a beam model) or using numerical methods (e.g. a coarse finite element mesh), based on the applied loads and the structural properties of the component.

3.1.1.5 In a *hot spot stress approach*, local stresses at a critical location (hot spot) where fatigue cracks may initiate are evaluated by numerical methods (e.g. a fine mesh finite element analysis). The analysis takes into account the influence of structural discontinuities due to the geometry of the connection but excludes the effects of welds.

3.2 Fatigue Criteria

3.2.1 Corrosion model

3.2.1.1 Net thicknesses in accordance with *Section 6/3.3.7* are to be used in the fatigue assessment.

3.2.2 Loads

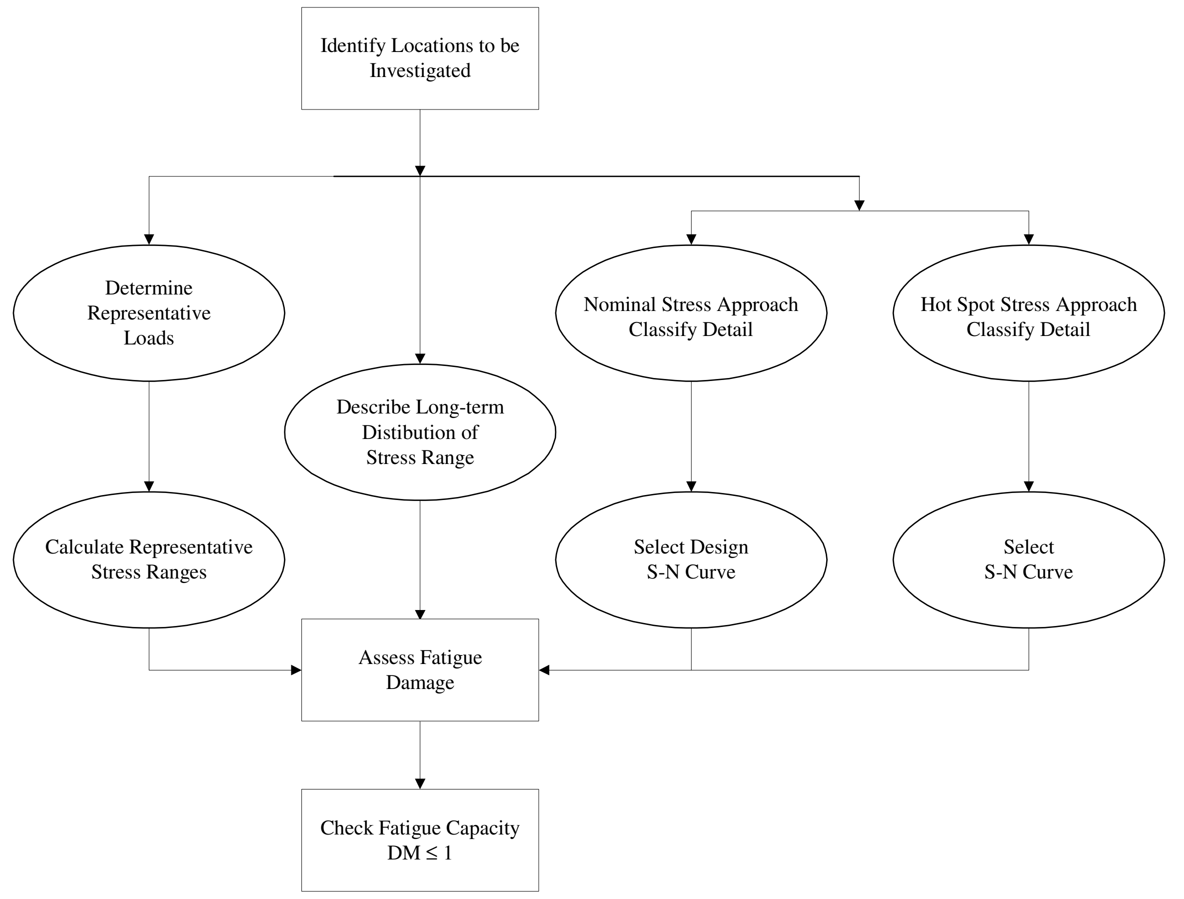
3.2.2.1 The loads specified in *Section 7/3*, which are based on the North Atlantic wave environment, are to be used for the fatigue assessment. Other secondary cyclic loading, such as slamming, low cycle, or vibration induced fatigue, which may result in significant levels of stress range over the expected lifetime of the vessel, although not within the scope of these Rules, may need to be specially considered.

3.2.2.2 These Rules assume a 10^{-4} probability level of exceedance for the purposes of load application and fatigue strength assessment.

3.2.3 Acceptance criteria

3.2.3.1 The criteria stated in this sub-section and *Appendix C* are presented as a comparison of fatigue strength of the structure (capacity), and fatigue inducing loads (demands), in the form of a fatigue damage parameter, *DM*, see *Appendix C/1.4.1.1*. The calculated fatigue damage, *DM*, is to be less than or equal to 1 for the design life of the ship, which is not to be taken as less than 25 years.

Figure 9.3.1
Schematic of Fatigue Assessment Process
(For Each Location or Structural Detail)



3.3 Locations to Apply

3.3.1 Longitudinal structure

3.3.1.1 A fatigue strength assessment is to be carried out and submitted for the end connections of longitudinal stiffeners to transverse bulkheads, including wash bulkheads and web frames within the cargo tank region, located on the bottom shell, inner bottom, side shell, inner hull longitudinal bulkheads, longitudinal bulkheads and strength deck.

3.3.1.2 A fatigue strength assessment is to be carried out for scallops in way of block joints on the strength deck within the cargo tank region.

3.3.2 Transverse structure

3.3.2.1 A fatigue strength assessment is to be carried out and submitted for the knuckle between inner bottom and hopper plate for at least one transverse frame close to amidships. The total stress range for fatigue assessment is to be determined from a fine mesh finite element analysis.

3.4 Fatigue Assessment Methods

3.4.1 Nominal stress approach

3.4.1.1 The nominal stress approach, as described in *Appendix C/1*, is to be used for the fatigue evaluation of the following items:

(a) longitudinal stiffener end connections to the transverse bulkheads, including wash bulkheads, and web frames on the bottom, inner bottom, side shell, inner hull longitudinal bulkheads, longitudinal bulkheads and strength deck.

(b) scallops in way of block joints on the strength deck as described in *Appendix C/1.6*.

3.4.2 Hot spot stress approach

3.4.2.1 The hot spot stress approach, as described in *Appendix C/2*, is to be used for the fatigue evaluation of the following items:

(a) knuckle between inner bottom and hopper plate.

3.4.3 Alternative direct calculation approach

3.4.3.1 Where it is considered necessary to carry out a fatigue assessment using an alternative direct calculation approach, not applying the loads specified in *Section 7/3*, it is to be based on the individual Classification Society's procedures. However, in no case are the scantlings to be lower than those which would be required by *3.4.1* and *3.4.2*.

SECTION 10

BUCKLING AND ULTIMATE STRENGTH

1 GENERAL

1.1 Strength Criteria

1.1.1 Scope

1.1.1.1 This Section contains the strength criteria for buckling and ultimate strength of local support members, primary support members and other structure such as pillars, corrugated bulkheads and brackets. These criteria are to be applied as specified in *Section 8* for determining the initial structural scantlings and also *Section 9* for the design verification.

1.1.1.2 All structural elements are to comply with the stiffness and proportions requirements specified in *Sub-Section 2*.

1.1.1.3 For each structural member the characteristic buckling strength is to be taken as the most unfavourable/critical buckling mode.

1.1.1.4 The strength criteria are to be based on the following assumptions and limitations in respect to buckling and ultimate strength control in design:

(a) the buckling strength of stiffeners is to be greater than the plate panels they support

(b) the primary support members supporting stiffeners are to have sufficient inertia to prevent out of plane buckling of the primary member, see *2.3.2.3*

(c) all stiffeners with their associated effective plate are to have moments of inertia to provide adequate lateral stability, see *2.2.2*

(d) the proportions of local support members and primary support members are to be such that local instability is prevented

(e) tripping of primary support members (e.g. torsional instability) is to be prevented by fitment of tripping brackets or equivalents, see in *2.3.3*

(f) the web plate of primary support members is to be such that elastic buckling of the plate between web stiffeners is prevented

(g) for plates with openings, the buckling strength of the areas surrounding the opening or cut out and any edge reinforcements are adequate, see *3.4.1* and *2.4.3*.

RCN 1 to July 2010 version (effective from 1 July 2012)

2 STIFFNESS AND PROPORTIONS

2.1 Structural Elements

2.1.1 General

2.1.1.1 All structural elements are to comply with the applicable slenderness or proportional ratio requirements in *2.2* to *2.3*.

2.1.1.2 The following requirements are based on net scantlings, see also *Section 6/3*.

2.1.1.3 For structural idealisation and definitions see *Section 4/2*.

2.2 Plates and Local Support Members

2.2.1 Proportions of plate panels and local support members

2.2.1.1 The net thickness of plate panels and stiffeners is to satisfy the following criteria:

(a) plate panels

$$t_{net} \geq \frac{s}{C}\sqrt{\frac{\sigma_{yd}}{235}}$$

(b) stiffener web plate

$$t_{w-net} \geq \frac{d_w}{C_w}\sqrt{\frac{\sigma_{yd}}{235}}$$

(c) flange/face plate

$$t_{f-net} \geq \frac{b_{f-out}}{C_f}\sqrt{\frac{\sigma_{yd}}{235}}$$

Where:

s	plate breadth, in mm, taken as the spacing between the stiffeners, as defined in *Section 4/2.2.1*
t_{net}	net thickness of plate, in mm
d_w	depth of stiffener web, in mm, as given in *Table 10.2.1*
t_{w-net}	net web thickness, in mm
b_{f-out}	breadth of flange outstands, in mm, as given in *Table 10.2.1*
t_{f-net}	net flange thickness, in mm
C, C_w, C_f	slenderness coefficients, as given in *Table 10.2.1*
σ_{yd}	specified minimum yield stress of the material, in N/mm^2

Table 10.2.1
Slenderness Coefficients

Item		Coefficient
plate panel, C	hull envelope and tank boundaries	100
	other structure	125
stiffener web plate, C_w	angle and T profiles	75
	bulb profiles	41
	flat bars	22
flange/face plate[(1)], C_f	angle and T profiles	12

Note

1. The total flange breadth, b_f, for angle and T profiles is not to be less than: $b_f = 0.25d_w$
2. Measurements of breadth and depth are based on gross scantlings

Where:

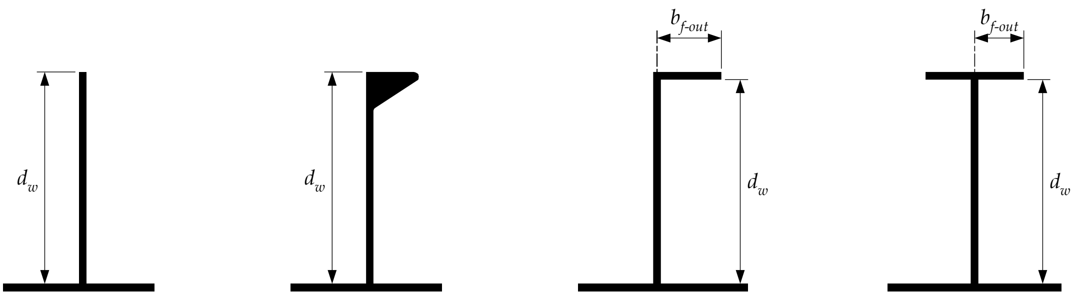
t_{net} net thickness of plate, in mm

d_w depth of web plate, in mm

$t_{w\text{-}net}$ net web thickness, in mm

$b_{f\text{-}out}$ breadth of flange outstands, in mm

$t_{f\text{-}net}$ net flange thickness, in mm



Flat bars Bulb flats Angles T bars

(RCN 1, effective from 1 April 2007)

2.2.2 Stiffness of stiffeners

2.2.2.1 The minimum net moment of inertia about the neutral axis parallel to the attached plate, I_{net}, of each stiffener with effective breadth of plate equal to 80% of the stiffener spacing s, is given by:

$$I_{net} = Cl_{stf}^2 A_{net} \frac{\sigma_{yd}}{235} \quad \text{cm}^4$$

Where:

l_{stf} length of stiffener between effective supports, in m

A_{net} net sectional area of stiffener including attached plate assuming effective breadth of 80% of stiffener spacing s, in cm²

s stiffener spacing, in mm, as defined in *Section 4/2.2.1*

σ_{yd} specified minimum yield stress of the material of the attached

plate, in N/mm²

C slenderness coefficient:
= 1.43 for longitudinals subject to hull girder stresses
= 0.72 for other stiffeners

2.3 Primary Support Members

2.3.1 Proportions of web plate and flange/face plate

2.3.1.1 The net thicknesses of the web plates and face plates of primary support members are to satisfy the following criteria:

(a) web plate

$$t_{w-net} \geq \frac{s_w}{C_w}\sqrt{\frac{\sigma_{yd}}{235}}$$

(b) flange/face plate

$$t_{f-net} \geq \frac{b_{f-out}}{C_f}\sqrt{\frac{\sigma_{yd}}{235}}$$

Where:

s_w plate breadth, in mm, taken as the spacing between the web stiffeners. For web plates with stiffening parallel to the attached plate the spacing may be corrected in accordance with *Appendix D/Fig. 5.6*.

t_{w-net} net web thickness, in mm

b_{f-out} breadth of flange outstand, in mm

t_{f-net} net flange thickness, in mm

C_w slenderness coefficient for the web plate
= 100

C_f slenderness coefficient for the flange/face plate
= 12

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.3.2 Stiffness requirements

2.3.2.1 The web and flange net thicknesses of web stiffeners are not to be less than specified in *2.2.1*.

2.3.2.2 The net moment of inertia of each web stiffener, I_{net}, with effective breadth of plate equal to 80% of stiffener spacing s, is not to be less than as defined in *Table 10.2.2*.

Table 10.2.2
Stiffness Criteria for Web Stiffening

Mode	Inertia requirements, cm^4
(a) web stiffeners parallel to the flanges of the primary support member 	$$I_{net} = Cl^2 A_{net} \frac{\sigma_{yd}}{235}$$
(b) web stiffeners normal to flanges of the primary support member 	$$I_{net} = 1.14\text{x}10^{-5} l\ s^2 t_{w-net} \left(2.5 \frac{1000l}{s} - 2 \frac{s}{1000l} \right) \frac{\sigma_{yd}}{235}$$

Where:

C	= 1.43 for longitudinal stiffeners in cargo tank region = 0.72 for other stiffeners
l	length of web stiffener, in m. For web stiffeners welded to local support members (LSM), the length is to be measured between the flanges of the local support members. For sniped web stiffeners the length is to be measured between the lateral supports e.g. the total distance between the flanges of the primary support member as shown for Mode (b).
A_{net}	net section area of web stiffener including attached plate assuming effective breadth of 80% of stiffener spacing s, in cm^2
s	spacing of stiffeners, in mm, as defined in *Section 4/2.2.1*
t_{w-net}	net web thickness of the primary support member, in mm
σ_{yd}	specified minimum yield stress of the material of the web plate of the primary support member, in N/mm^2

2.3.2.3 The net moment of inertia for primary support members, $I_{prm-net50}$, supporting stiffeners subject to axial compressive stresses, including effective plate width at mid span, is not to be less than:

$$I_{psm-net50} = 300 \frac{l_{bdg}^4}{S^3 s} I_{net} \quad cm^4$$

Where:

l_{bdg} bending span of primary support member, in m

S distance between primary support members, in m

s spacing of stiffeners, in mm, as defined in *Section 4/2.2.1*

I_{net} maximum required moment of inertia, as given in *2.2.2.1*, for stiffeners within the central half of the bending span, in cm^4

2.3.3 Spacing between flange supports or tripping brackets

2.3.3.1 The torsional buckling mode of primary support members is to be controlled by flange supports or tripping brackets. The unsupported length of the flange of the primary support member, i.e. the distance between tripping brackets, s_{bkt}, is not to be greater than:

$$s_{bkt} = b_f C \sqrt{\frac{A_{f-net50}}{\left(A_{f-net50} + \frac{A_{w-net50}}{3}\right)} \left(\frac{235}{\sigma_{yd}}\right)}$$ m, but need not be less than $s_{bkt-min}$

Where:

b_f breadth of flange, in mm

C slenderness coefficient:

= 0.022 for symmetrical flanges

= 0.033 for one sided flanges

$A_{f-net50}$ net cross-sectional area of flange, in cm^2

$A_{w-net50}$ net cross-sectional area of the web plate, in cm^2

σ_{yd} specified minimum yield stress of the material, in N/mm^2

$s_{bkt-min}$ = 3.0m for primary support members in the cargo tank region, on tank boundaries or on the hull envelope including external decks

= 4.0m for primary support members in other areas

2.4 Other Structure

2.4.1 Proportions of pillars

2.4.1.1 For I-sections the thickness of the web plate and the flange thickness is to comply with *2.2.1.1*.

2.4.1.2 The thickness of thin walled box sections is to comply with *2.2.1.1(b)*. The radius of circular tube sections is to be less than 50 times the net thickness of the pillar.

2.4.2 Proportions of brackets

2.4.2.1 The net thickness of end brackets, $t_{bkt-net}$, is except as specified in *2.4.2.2* not to be less than:

$$t_{bkt-net} = \frac{d_{bkt}}{C} \sqrt{\frac{\sigma_{yd}}{235}} \quad \text{mm}$$

Where:

d_{bkt} depth of brackets, in mm. See *Table 10.2.3*

C slenderness coefficient as defined in *Table 10.2.3*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

2.4.2.2 Where it can be demonstrated that the bracket is only subjected to tensile stresses, e.g. in way of internal brackets in a tank surrounded by void space, the requirement in *2.4.2.1* need not be complied with.

Table 10.2.3
Buckling Coefficient, *C*, for Proportions of Brackets

Mode	C
(a) Brackets without edge stiffener 	$C = 20\left(\frac{d_{bkt}}{l_{bkt}}\right) + 16$ Where: $0.25 \le \frac{d_{bkt}}{l_{bkt}} \le 1.0$
(b) Brackets with edge stiffener 	$C = 70$

Where:

l_{bkt} effective length of edge of bracket, in mm

2.4.2.3 Tripping brackets on primary support members are to be stiffened by a flange or edge stiffener if the effective length of the edge, l_{bkt}, is greater than:

$$l_{bkt} = 75 t_{bkt-net} \quad \text{mm}$$

Where:

$t_{bkt-net}$ bracket thickness, in mm

2.4.3 Requirements to edge reinforcements in way of openings and bracket edges

2.4.3.1 The depth of stiffener web, d_w, of edge stiffeners in way of openings and bracket edges is not to be less than:

$$d_w = Cl\sqrt{\frac{\sigma_{yd}}{235}} \quad \text{mm, or 50 mm, whichever is greater}$$

Where:

l length of edge stiffener, in m

σ_{yd} specified minimum yield stress of the material, in N/mm^2

C slenderness coefficient

75 for end brackets

50 for tripping brackets

50 for edge reinforcements in way of openings

2.4.3.2 The net thickness of the web plate and flange of the edge stiffener is not to be less than that required in *2.2.1*.

3 PRESCRIPTIVE BUCKLING REQUIREMENTS

3.1 General

3.1.1 Scope

3.1.1.1 This Sub-Section contains the methods for determination of the buckling capacity, definitions of buckling utilisation factors and other measures necessary to control buckling of plate panels, stiffeners and primary support members.

3.1.1.2 The buckling utilisation factor, η, is to satisfy the following criteria:

$$\eta \leq \eta_{allow}$$

Where:

η_{allow} allowable buckling utilisation factor as defined in *Section 8* and *Section 9*

η buckling utilisation factor, as defined in *3.2.1.1*, *3.3.2.2*, *3.3.3.1*, *3.4.1.1* and *3.5.1.1*

3.1.1.3 For structural idealisation and definitions see also *Section 4/2*. The thickness and section properties of plates and stiffeners are to be taken as specified by the appropriate rule requirements.

3.2 Buckling of Plates

3.2.1 Uni-axial buckling of plates

3.2.1.1 The buckling utilisation factor, η, for uni-axial stress is to be taken as:

$$\eta = \frac{\sigma_x}{\sigma_{xcr}}$$ for compressive stresses in x-direction

$$\eta = \frac{\sigma_y}{\sigma_{ycr}}$$ for compressive stresses in y-direction

$$\eta = \frac{\tau}{\tau_{cr}}$$ for shear stress

Where:

σ_x, σ_y actual compressive stresses, in N/mm^2

τ actual shear stress, in N/mm^2

$\sigma_{xcr}, \sigma_{ycr}$ critical compressive stress, in N/mm^2, as defined in *3.2.1.3*

τ_{cr} critical shear stress, in N/mm^2, as defined in *3.2.1.3*

3.2.1.2 Reference degree of slenderness, to be taken as:

$$\lambda = \sqrt{\frac{\sigma_{yd}}{K \sigma_E}}$$

Where:

K buckling factor, see *Table 10.3.1*

σ_E reference stress, in N/mm²

$$= 0.9\,E\left(\frac{t_{net}}{l_a}\right)^2$$

E modulus of elasticity, 206 000 N/mm²

t_{net} net thickness of plate panel, in mm

l_a length of the side of the plate panel as defined in *Table 10.3.1*, in mm

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.2.1.3 The critical stresses, σ_{xcr}, σ_{ycr} or τ_{cr}, of plate panels subject to compression or shear, respectively, is to be taken as:

$$\sigma_{xcr} = C_x\,\sigma_{yd}$$

$$\sigma_{ycr} = C_y\,\sigma_{yd}$$

$$\tau_{cr} = C_\tau\,\frac{\sigma_{yd}}{\sqrt{3}}$$

Where:

C_x, C_y, C_τ reduction factors, as given in *Table 10.3.1*

Table 10.3.1
Buckling Factor and Reduction Factor for Plane Plate Panels

Case	Stress ratio ψ	Aspect ratio α	Buckling factor K	Reduction factor C
1 	$1 \geq \psi \geq 0$	$\alpha > 1$	$K = \dfrac{8.4}{\psi + 1.1}$	$C_x = 1$ for $\lambda \leq \lambda_c$ $C_x = c\left(\dfrac{1}{\lambda} - \dfrac{0.22}{\lambda^2}\right)$ for $\lambda > \lambda_c$ Where: $c = (1.25 - 0.12\psi) \leq 1.25$ $\lambda_c = \dfrac{c}{2}\left(1 + \sqrt{1 - \dfrac{0.88}{c}}\right)$
	$0 > \psi > -1$		$K = 7.63 - \psi\,(6.26 - 10\,\psi)$	
	$\psi \leq -1$		$K = 5.975\,(1 - \psi)^2$	
2 	$1 \geq \psi \geq 0$	$\alpha \geq 1$	$K = \left(1 + \dfrac{1}{\alpha^2}\right)^2 \dfrac{2.1}{(\psi + 1.1)}$	$C_y = c\left(\dfrac{1}{\lambda} - \dfrac{R + F^2(H - R)}{\lambda^2}\right)$ Where: $c = (1.25 - 0.12\psi) \leq 1.25$ $R = \lambda(1 - \lambda / c)$ for $\lambda < \lambda_c$ $R = 0.22$ for $\lambda \geq \lambda_c$ $\lambda_c = 0.5\,c\left(1 + \sqrt{1 - 0.88 / c}\right)$ $F = \left(1 - \left(\dfrac{K}{0.91} - 1\right) / \lambda_p^2\right) c_1 \geq 0$ $\lambda_p^2 = \lambda^2 - 0.5$ and $1 \leq \lambda_p^2 \leq 3$ $c_1 = 1$ for σ_y due to direct loads (3) $c_1 = (1 - 1 / a) \geq 0$ for σ_y due to bending (in general) (2) $c_1 = 0$ for σ_y due to bending in extreme load cases (e.g. w/t. bhds.) $H = \lambda - \dfrac{2\lambda}{c(T + \sqrt{T^2 - 4})} \geq R$ $T = \lambda + \dfrac{14}{15\lambda} + \dfrac{1}{3}$
	$0 > \psi > -1$	$1 \leq \alpha \leq 1.5$	$K = \left[1 + \dfrac{1}{\alpha^2}\right]^2 \dfrac{2.1\,(1 + \psi)}{1.1} - \dfrac{\psi}{\alpha^2}(13.9 - 10\,\psi)$	
		$\alpha > 1.5$	$K = \left[1 + \dfrac{1}{\alpha^2}\right]^2 \dfrac{2.1\,(1 + \psi)}{1.1} - \dfrac{\psi}{\alpha^2}\left(5.87 + 1.87\,\alpha^2 + \dfrac{8.6}{\alpha^2} - 10\psi\right)$	
	$\psi \leq -1$	$1 \leq \alpha \leq \dfrac{3\,(1 - \psi)}{4}$	$K = \left(\dfrac{1 - \psi}{\alpha}\right)^2 5.975$	
		$\alpha > \dfrac{3\,(1 - \psi)}{4}$	$K = \left(\dfrac{1 - \psi}{\alpha}\right)^2 3.9675 + 0.5375\left(\dfrac{1 - \psi}{\alpha}\right)^4 + 1.87$	

Table 10.3.1 (Continued)
Buckling Factor and Reduction Factor for Plane Plate Panels

Case	Stress ratio ψ	Aspect ratio a	Buckling factor K	Reduction factor C
3 	$1 \geq \psi \geq 0$	$\alpha > 0$	$K = \dfrac{4(0.425 + 1/\alpha^2)}{3\psi + 1}$	$C_x = 1$ for $\lambda \leq 0.7$ $C_x = \dfrac{1}{\lambda^2 + 0.51}$ for $\lambda > 0.7$
	$0 > \psi \geq -1$		$K = 4\,(0.425 + 1/\alpha^2)\,(1 + \psi)$ $- 5\,\psi\,(1 - 3.42\,\psi)$	
4 	$1 \geq \psi \geq -1$	$\alpha > 0$	$K = \left(0.425 + \dfrac{1}{\alpha^2}\right)\dfrac{3 - \psi}{2}$	
5 	-		$K = K_\tau \sqrt{3}$	$C_\tau = 1$ for $\lambda \leq 0.84$ $C_\tau = \dfrac{0.84}{\lambda}$ for $\lambda > 0.84$
		$\alpha \geq 1$	$K_\tau = \left[5.34 + \dfrac{4}{\alpha^2}\right]$	
		$0 < \alpha < 1$	$K_\tau = \left[4 + \dfrac{5.34}{\alpha^2}\right]$	
6 	-		$K = K' r$ K' = K according to Case 5 r = opening red. factor $r = \left(1 - \dfrac{d_a}{\alpha l_a}\right)\left(1 - \dfrac{d_b}{l_a}\right)$ $\dfrac{d_a}{\alpha l_a} \leq 0.7$ and $\dfrac{d_b}{l_a} \leq 0.7$	

Table 10.3.1 (Continued)
Buckling Factor and Reduction Factor for Plane Plate Panels

Where:

ψ	the ratio between smallest and largest compressive stress as shown for Case 1-4
l_a	length in mm, of the shorter side of the plate panel for Cases 1 and 2
l_a	length in mm, of the side of the plate panel as defined for Cases 3, 4, 5 and 6
α	aspect ratio of the plate panel

Edge boundary conditions:

- - - - - - - - -	plate edge free
————————	plate edge simply supported

Notes

(1) Cases listed are general cases. Each stress component (σ_x, σ_y) is to be understood in local coordinates.

(2) c_1 due to bending (in general) corresponds to straight edges (uniform displacement) of a plate panel integrated in a large structure. This value is to be applied for hull girder buckling and buckling of web plate of primary support members in way of openings.

(3) c_1 for direct loads corresponds to a plate panel with edges not restrained from pull-in which may result in non-straight edges

3.3 Buckling of Stiffeners

3.3.1 Critical compressive stress

3.3.1.1 The buckling utilisation factor of stiffeners is to be taken as the maximum of the column and torsional buckling mode as given in *3.3.2* and *3.3.3*.

3.3.2 Column buckling mode

3.3.2.1 Stiffeners are to be verified against the column buckling mode as given in *3.3.2.2* with the allowable buckling utilisation factor, η_{allow}, see *3.1.1.2*. Stiffeners not subjected to lateral pressure and that have a net moment of inertia, I_{net}, complying with *3.3.2.4* have acceptable column buckling strength and need not be verified against *3.3.2.2*.

3.3.2.2 The buckling utilisation factor for column buckling of stiffeners is to be taken as:

$$\eta = \frac{\sigma_x + \sigma_b}{\sigma_{yd}}$$

Where:

σ_x compressive axial stress in the stiffener, in N/mm², in way of the midspan of the stiffener. See *Section 3/5.2.3.1*

σ_b bending stress at the midspan of the stiffener according to *3.3.2.3*, in N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.3.2.3 The bending stress, σ_b, in N/mm², in the stiffener is equal to:

$$\sigma_b = \frac{M_o + M_1}{1000\ Z_{net}}$$

Where:

Z_{net} net section modulus of stiffener, in cm³, including effective breadth of plating according to *3.3.4.1*

a) if lateral pressure is applied to the stiffener:

Z_{net} is the section modulus calculated at flange if the lateral pressure is applied on the same side as the stiffener.

Z_{net} is the section modulus calculated at attached plate if the lateral pressure is applied on the side opposite to the stiffener.

b) if no lateral pressure is applied on the stiffener:

Z_{net} is the minimum section modulus among those calculated at flange and attached plate.

M_1 bending moment, in Nmm, due to the lateral load P

$$= \frac{P s l_{stf}^{\ 2}}{24} 10^3$$

P lateral load, in kN/m²

s stiffener spacing as defined in *Section 4/2.2.1*, in mm

l_{stf} span of stiffener, in m, equal to spacing between primary support members

M_0 bending moment, in Nmm, due to the lateral deformation w of stiffener

$$= F_E \left(\frac{P_z\, w}{c_f - P_z} \right) \qquad \text{where } (c_f - P_z) > 0$$

F_E ideal elastic buckling force of the stiffener, in N

$$= \left(\frac{\pi^2}{l_{stf}^{\,2}} \right) E\, I_{net}\, 10^{-2}$$

E modulus of elasticity, 206 000 N/mm²

I_{net} moment of inertia, in cm⁴, of the stiffener including effective width of attached plating according to *3.3.4.1*. I_{net} is to comply with the following requirement:

$$I_{net} \geq \frac{s\, t_{net}^{\,3}}{12} 10^{-4}$$

t_{net} net thickness of plate flange, to be taken as the mean thickness of the two attached plate panels, in mm

P_z nominal lateral load, in N/mm², acting on the stiffener due to membrane stresses, σ_x, σ_y and τ_1, in the attached plate in way of the stiffener midspan:

$$= \frac{t_{net}}{s} \left(\sigma_{xl} \left(\frac{\pi\, s}{1000\, l_{stf}} \right)^2 + 2\, c_y\, \sigma_y + \sqrt{2}\, \tau_1 \right)$$

σ_{xl}

$$= \sigma_x \left(1 + \frac{A_{net}}{s\, t_{net}} \right) \quad \text{N/mm}^2$$

τ_1

$$= \left[\tau - t_{net} \sqrt{\sigma_{yd}\, E \left(\frac{m_1}{(1000\, l_{stf})^2} + \frac{m_2}{s^2} \right)} \right] \geq 0$$

with m_1 and m_2 taken equal to

$$m_1 = 1.47 \quad m_2 = 0.49 \ \text{for} \ \frac{1000\, l_{stf}}{s} \geq 2.0$$

$$m_1 = 1.96 \quad m_2 = 0.37 \ \text{for} \ \frac{1000\, l_{stf}}{s} < 2.0$$

σ_x compressive axial stress in the stiffener, in N/mm², in way of the midspan of the stiffener. See *Section 3/5.2.3.1*

A_{net} net sectional area of the stiffener without attached plating, in mm²

c_y factor taking into account the membrane stresses in the attached plating acting perpendicular to the stiffener's axis

$$= 0.5\,(1 + \psi) \ \text{for} \ 0 \leq \psi \leq 1$$

$$= \frac{0.5}{1 - \psi} \ \text{for} \ \psi < 0$$

ψ edge stress ratio for Case 2 according to *Table 10.3.1*

σ_y membrane compressive stress in the attached plating acting perpendicular to the stiffener's axis, in N/m²

τ shear membrane stress in the attached plating, in N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

w deformation of stiffener, in mm

$= w_0 + w_1$

w_0 assumed imperfection, in mm.

$$= \min\left[\frac{1000\, l_{stf}}{250},\ \frac{s}{250},\ 10\right]$$

For stiffeners sniped at both ends w_0 is not to be taken less than the distance from the midpoint of attached plating to the neutral axis of the stiffener calculated with the effective width of the attached plating according to *3.3.4.1*

w_1 deformation of stiffener at midpoint of stiffener span due to lateral load P, in mm. In case of uniformly distributed load the w_1 is to be taken as:

$$= \frac{P\, s\, l_{stf}^{\ 4}}{384 \cdot E\, I_{net}} 10^5$$

c_f elastic support provided by the stiffener, in N/mm²

$$= F_E\, \frac{\pi^2}{l_{stf}^{\ 2}} (1 + c_p) 10^{-6}$$

c_p

$$= \frac{1}{1 + \frac{0.91}{c_a}\left(\frac{12\, I_{net}\, 10^4}{s\, t_{net}^{\ 3}} - 1\right)}$$

$$c_a = \left[\frac{1000\, l_{stf}}{2s} + \frac{2s}{1000\, l_{stf}}\right]^2 \quad \text{for} \quad l_{stf} \geq \frac{2s}{1000}$$

$$c_a = \left[1 + \left(\frac{1000\ l_{stf}}{2s}\right)^2\right]^2 \quad \text{for} \quad l_{stf} < \frac{2s}{1000}$$

3.3.2.4 Stiffeners not subjected to lateral pressure are considered as complying with the requirements of *3.3.2.2* if their net moments of inertia, in cm⁴, satisfy the following requirement:

$$I_{net} \geq 100 \frac{P_z\, l_{stf}^{\ 2}}{\pi^2} \left[\frac{w_o\left(e_f - 0.5 t_{f-net}\right)}{\eta_{allow}\sigma_{yd} - \sigma_x} + \frac{l_{stf}^{\ 2}}{E \pi^2} 10^6\right]$$

Where:

e_f distance from connection to plate (C as shown in *Figure 10.3.1*) to centre of flange, in mm

$= (d_w - 0.5 t_{f-net})$ for bulb flats

$= (d_w + 0.5 t_{f-net})$ for angles and T bars

d_w depth of web plate, in mm, as shown in *Figure 10.3.1*

$t_{f\text{-}net}$ net flange thickness, in mm

η_{allow} allowable buckling utilisation factor as defined in *Section 8* and *Section 9*

Note

Other parameters are as defined in *3.3.2.3*

3.3.3 Torsional buckling mode

3.3.3.1 The torsional buckling mode is to be verified against the allowable buckling utilisation factor, η_{allow}, see *3.1.1.2*. The buckling utilisation factor for torsional buckling of stiffeners is to be taken as:

$$\eta = \frac{\sigma_x}{C_T\,\sigma_{yd}}$$

Where:

σ_x compressive axial stress in the stiffener, in N/mm², in way of the midspan of the stiffener. See *Section 3/5.2.3.1*

C_T torsional buckling coefficient

$= 1.0$ for $\lambda_T \le 0.2$

$$= \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_T^2}} \quad \text{for } \lambda_T > 0.2$$

$$\Phi = 0.5(1 + 0.21(\lambda_T - 0.2) + \lambda_T^2)$$

λ_T reference degree of slenderness for torsional buckling

$$= \sqrt{\frac{\sigma_{yd}}{\sigma_{ET}}}$$

σ_{ET} reference stress for torsional buckling, in N/mm²

$$= \frac{E}{I_{p-net}}\left(\frac{\varepsilon \pi^2 I_{\omega-net} 10^{-4}}{l_t^2} + 0.385 I_{T-net}\right)$$

RCN 1 to July 2008 version (effective from 1 February 2010)

σ_{yd} specified minimum yield stress of the material, in N/mm²

E modulus of elasticity, 206 000 N/mm²

I_{P-net} net polar moment of inertia of the stiffener about point C, in cm⁴, as shown in *Figure 10.3.1* and Table 10.3.2

RCN 1 to July 2008 version (effective from 1 February 2010)

I_{T-net} net St. Venant's moment of inertia of the stiffener, in cm⁴, as shown in *Table 10.3.2*

RCN 1 to July 2008 version (effective from 1 February 2010)

$I_{\omega-net}$ net sectorial moment of inertia of the stiffener about point C, in cm⁶ as shown in *Figure 10.3.1* and Table 10.3.2

RCN 1 to July 2008 version (effective from 1 February 2010)

ε degree of fixation

$$1 + 1000\sqrt{\frac{l_t^4}{\frac{3}{4}\pi^4 I_{\omega-net}\left(\frac{s}{t_{net}^3} + \frac{4\left(e_f - 0.5t_{f-net}\right)}{3t_{w-net}^3}\right)}}$$

RCN 1 to July 2008 version (effective from 1 February 2010)

l_t torsional buckling length to be taken equal the distance between tripping supports, in m

d_w depth of web plate, in mm

t_{w-net} net web thickness, in mm

b_f flange breadth, in mm

t_{f-net} net flange thickness, in mm

e_f distance from connection to plate (C in *Figure 10.3.1*) to centre of flange, in mm

$= (d_w - 0.5t_{f-net})$ for bulb flats

$= (d_w + 0.5t_{f-net})$ for angles and T bars

A_{w-net} net web area, in mm²

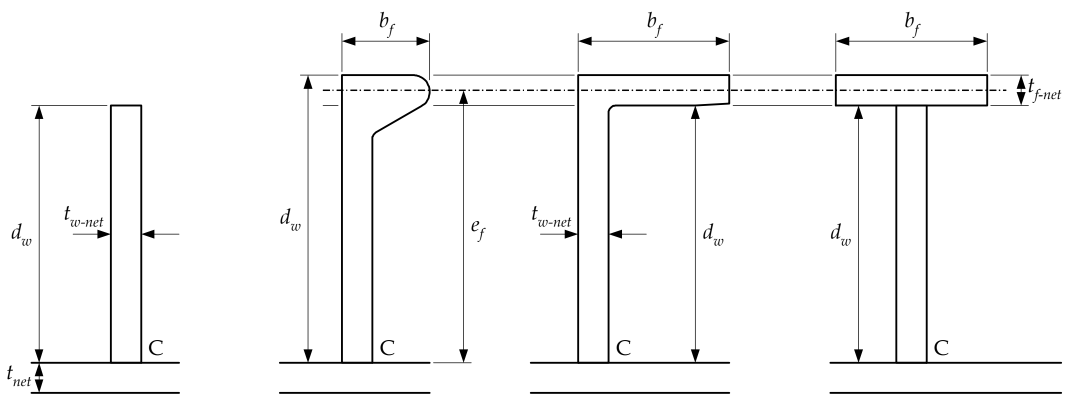
$= (e_f - 0.5t_{f-net})t_{w-net}$

A_{f-net} net flange area, in mm²

$= b_f\, t_{f-net}$

s stiffener spacing as defined in *Section 4/2.2.1*, in mm

Figure 10.3.1
Stiffener cross sections



Note:
1. Measurements of breadth and depth are based on gross scantlings as described in *Section 4/2.4.1.2*.
2. Characteristic flange data for bulb profiles are given in *Appendix C/Table C.1.2*

Table 10.3.2 Moments of Inertia		
Section property	**Flat bars**	**Bulb flats, angles and T bars**
I_{P-net}	$\dfrac{d_w^3\, t_{w-net}}{3x10^4}$	$\left(\dfrac{A_{w-net}(e_f - 0.5t_{f-net})^2}{3} + A_{f-net}\, e_f^2\right)10^{-4}$
I_{T-net}	$\dfrac{d_w\, t_{w-net}^3}{3x10^4}\left(1-0.63\dfrac{t_{w-net}}{d_w}\right)$	$\dfrac{(e_f - 0.5t_{f-net})t_{w-net}^3}{3x10^4}\left(1-0.63\dfrac{t_{w-net}}{e_f - 0.5t_{f-net}}\right)$ $+$ $\dfrac{b_f\, t_{f-net}^3}{3x10^4}\left(1-0.63\dfrac{t_{f-net}}{b_f}\right)$
$I_{\omega-net}$	$\dfrac{d_w^3\, t_{w-net}^3}{36x10^6}$	for bulb flats and angles: $\dfrac{A_{f-net}\, e_f^2\, b_f^2}{12x10^6}\left(\dfrac{A_{f-net}+2.6A_{w-net}}{A_{f-net}+A_{w-net}}\right)$ for T bars: $\dfrac{b_f^3\, t_{f-net}\, e_f^2}{12x10^6}$

3.3.4 Effective breadth of attached plating

3.3.4.1 The effective breadth of attached plating of ordinary stiffeners is to be taken as:

$$b_{eff} = \min(C_x s,\ \chi_s s)$$

Where:

$$\chi_s = 0.0035\left(\frac{1000\, l_{eff}}{s}\right)^3 - 0.0673\left(\frac{1000\, l_{eff}}{s}\right)^2 + 0.4422\left(\frac{1000\, l_{eff}}{s}\right) - 0.0056 \le 1.0$$

s	stiffener spacing as defined in *Section 4/2.2.1*, in mm
C_x	average reduction factor for buckling of the two attached plate panels, according to Case 1 in *Table 10.3.1*
l_{stf}	span of stiffener, in m, equal to spacing between primary support members
l_{eff}	effective span of stiffeners in m $l_{eff} = l_{stf}$ if simply supported at both ends $l_{eff} = 0.6 l_{stf}$ if fixed at both ends

(RCN 2, effective from 1 July 2008)

3.4 Primary Support Members

3.4.1 Buckling of web plate of primary support members in way of openings

3.4.1.1 The web plate of primary support members with openings is to be assessed for buckling based on the combined axial compressive and shear stresses. The web plate adjacent to the opening on both sides is to be considered as individual unstiffened plate panels as shown in *Table 10.3.3*. The buckling utilisation factor, η, is to be taken as:

$$\eta = \left(\frac{|\sigma_{av}|}{C\,\sigma_{yd}}\right)^{e} + \left(\frac{|\tau_{av}|\sqrt{3}}{C_\tau\,\sigma_{yd}}\right)^{e_\tau}$$

Where:

σ_{av}	average compressive stress in the area of web plate being considered according to case: 1, 2 or 3 in *Table 10.3.1*, in N/mm^2
τ_{av}	average shear stress in the area of web plate being considered according to case 5 or 6 in *Table 10.3.1*, in N/mm^2
σ_{yd}	specified minimum yield stress of the material, in N/mm^2
$e = 1 + C^4$	exponent for compressive stress
$e_\tau = 1 + C\,C_\tau^2$	exponent for shear stress
$C = C_x$	reduction factor according to Case 1 or 3, *Table 10.3.1*
$C = C_y$	reduction factor according to Case 2, *Table 10.3.1*
C_τ	reduction factor according to Case 5 or 6, *Table 10.3.1*

3.4.1.2 The reduction factors, C_x or C_y in combination with C_τ, of the plate panel(s) of the web adjacent to the opening is to be taken as shown in *Table 10.3.3.*

Table 10.3.3
Reduction Factors

Mode	C_x, C_y	C_τ
(a) without edge reinforcements 	Separate reduction factors are to be applied to areas P1 and P2 using Case 3, *Table 10.3.1*, with edge stress ratio: $\psi = 1.0$	A common reduction factor is to be applied to areas P1 and P2 using Case 6, *Table 10.3.1* for area marked:

Table 10.3.3 (Continued)
Reduction Factors

Mode	C_x, C_y	C_τ
(b) with edge reinforcements 	Separate reduction factors are to be applied for areas P1 and P2 using: C_x for Case 1 or C_y, for Case 2, see *Table 10.3.1* with stress ratio $\psi = 1.0$	Separate reduction factors are to be applied for areas P1 and P2 using Case 5, *Table 10.3.1*
(c) example of hole in web 	Panels P1 and P2 are to be evaluated in accordance with (a). Panel P3 is to be evaluated in accordance with (b)	

Note

1. Web panels to be considered for buckling in way of openings are shown shaded and numbered P1, P2, etc.

3.5 Other Structures

3.5.1 Struts, pillars and cross ties

3.5.1.1 The critical buckling stress for axially compressed struts, pillars and cross ties is to be taken as the lesser of the column and torsional critical buckling stresses. The buckling utilisation factor, η, is to be taken as:

$$\eta = \frac{\sigma_{av}}{\sigma_{cr}}$$

Where:

σ_{av} average axial compressive stress in the member, in N/mm²

σ_{cr} minimum critical buckling stress according to *3.5.1.2*, in N/mm²

3.5.1.2 The critical buckling stress in compression, σ_{cr}, for each mode is to be taken as:

$$\sigma_{cr} = \sigma_E \text{ for } \sigma_E \le 0.5\sigma_{yd}$$

$$\sigma_{cr} = \left(1 - \frac{\sigma_{yd}}{4\sigma_E}\right)\sigma_{yd} \text{ for } \sigma_E > 0.5\sigma_{yd}$$

Where:

σ_E elastic compressive buckling stress, in N/mm², given for each buckling mode, see *3.5.1.3* to *3.5.1.5*

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.5.1.3 The elastic compressive column buckling stress, σ_E, of pillars subject to axial compression is to be taken as:

$$\sigma_E = 0.001 E f_{end} \frac{I_{net50}}{A_{pill-net50} l_{pill}^2} \quad \text{N/mm}^2$$

Where:

I_{net50} net moment of inertia about the weakest axis of the cross-section, in cm⁴

$A_{pill-net50}$ net cross-sectional area of the pillar, in cm²

f_{end} end constraint factor:

1.0 where both ends are pinned

2.0 where one end is pinned and the other end is fixed

4.0 where both ends are fixed

A pillar end may be considered fixed when effective brackets are fitted. These brackets are to be supported by structural members with greater bending stiffness than the pillar.

Column buckling capacity for cross tie shall be calculated using f_{end} equal to 2.0 and span as defined in *8/2.6.8.1*

RCN 1 to July 2008 version (effective from 1 February 2010)

E modulus of elasticity, 206 000, in N/mm²

l_{pill} unsupported length of the pillar, in m

3.5.1.4 The elastic torsional buckling stress, σ_{ET}, with respect to axial compression of pillars is to be taken as:

$$\sigma_{ET} = \frac{G I_{sv-net50}}{I_{pol-net50}} + \frac{0.001 f_{end} E c_{warp}}{I_{pol-net50} l_{pill}^2} \quad \text{N/mm}^2$$

Where:

G shear modulus

$$= \frac{E}{2(1+\upsilon)}$$

E modulus of elasticity, 206 000, in N/mm²

υ Poisson's ratio, 0.3

$I_{sv-net50}$ net St. Venants moment of inertia, in cm⁴, see *Table 10.3.4*

$I_{pol-net50}$ net polar moment of inertia about the shear centre of cross section, in cm⁴

$$= I_{y-net50} + I_{z-net50} + A_{net50}\left(y_0^2 + z_0^2\right)$$

f_{end} end constraint factor:

1.0 where both ends are pinned

2.0 where one end is pinned and the other end is fixed

4.0 where both ends are fixed

Elastic torsional buckling capacity for cross tie shall be calculated using f_{end} equal to 2.0 and span as defined in *8/2.6.8.1*

RCN 1 to July 2008 version (effective from 1 February 2010)

c_{warp} warping constant, in cm^6, see *Table 10.3.4*

l_{pill} unsupported length of the pillar, in m

y_0 position of shear centre relative to the cross-sectional centroid, in cm, see *Table 10.3.4*

z_0 position of shear centre relative to the cross-sectional centroid, in cm, see *Table 10.3.4*

A_{net50} net cross-sectional area, in cm^2

$I_{y-net50}$ net moment of inertia about y-axis, in cm^4

$I_{z-net50}$ net moment of inertia about z-axis, in cm^4

3.5.1.5 For cross-sections where the centroid and the shear centre do not coincide, the interaction between the torsional and column buckling mode is to be examined. The elastic torsional/column buckling stress, σ_{ETF}, with respect to axial compression is to be taken as:

$$\sigma_{ETF} = \frac{1}{2\zeta}\left[(\sigma_E + \sigma_{ET}) - \sqrt{(\sigma_E + \sigma_{ET})^2 - 4\zeta\sigma_E\sigma_{ET}}\right]$$

Where:

ζ $= 1 - \dfrac{\left(y_0{}^2 + z_0{}^2\right)A_{net50}}{I_{pol-net50}}$

y_o Position of shear centre relative to the cross-sectional centroid, in cm, see *Table 10.3.4*

z_0 position of shear centre relative to the cross-sectional centroid, in cm, see *Table 10.3.4*

A_{net50} net cross-sectional area, in cm^2

$I_{pol-net50}$ net polar moment of inertia about the shear centre of cross section, as defined in *3.5.1.4*

σ_{ET} elastic torsional buckling stress, as defined in *3.5.1.4*

σ_E elastic column compressive buckling stress, as defined in *3.5.1.3*

3.5.2 Corrugated bulkheads

3.5.2.1 Local buckling of a unit flange of corrugated bulkheads is to be controlled according to *3.2.1.1*, for Case 1, as shown in *Table 10.3.1*, applying stress ratio $\psi = 1.0$.

3.5.2.2 The overall buckling failure mode of corrugated bulkheads subjected to axial compression is to be checked for column buckling according to *3.5.1* (e.g. horizontally corrugated longitudinal bulkheads, vertically corrugated bulkheads subject to localised vertical forces). End constraint factor corresponding to pinned ends is to be applied except for fixed end support to be used in way of stool with width exceeding 2 times the depth of the corrugation.

4 ADVANCED BUCKLING ANALYSES

4.1 General

4.1.1 Assessment

4.1.1.1 For the assessment of buckling of plates and stiffened panels subjected to combined stress fields, the advanced buckling assessment method is to be followed.

4.1.1.2 The advanced buckling assessment method is to consider the following effects in deriving the buckling capacity:

(a) non linear geometrical behaviour
(b) inelastic material behaviour
(c) initial imperfections (geometrical out-of flatness of plate and stiffeners)
(d) welding residual stresses
(e) interactions between structural elements; plates, stiffeners, girders etc.
(f) simultaneous acting loads; bi-axial compression/tension, shear and lateral pressure
(g) boundary conditions

4.1.1.3 All effects are to be modelled to represent a lower bound of structural strength. The modelling shape and amplitude of geometrical imperfections is to be such that they trigger the most critical failure modes.

4.1.1.4 The buckling strength is to be derived in accordance with the method described in *Appendix D*.

4.1.1.5 Alternative advanced buckling analysis tools may be used provided they give comparable results with the bench mark results obtained from implementing the advanced buckling methodology described in *Appendix D*.

4.1.1.6 Theoretical background, assumptions, models, verifications, calibrations, etc., for alternative advanced buckling analysis are to be submitted for review and acceptance.

SECTION 11

GENERAL REQUIREMENTS

1 HULL OPENINGS AND CLOSING ARRANGEMENTS

1.1 Shell and Deck Openings

1.1.1 General

1.1.1.1 For closing appliances for openings in superstructures, deck house sides and ends see *1.4*. For overflows and vents, and for discharges and inlets, see *1.5*.

1.1.1.2 For testing requirements, see *Sub-Section 5*.

1.1.2 Cargo tank hatches - materials

1.1.2.1 Covers for access hatches, tank cleaning and other openings for cargo tanks and adjacent spaces are to be manufactured from the following material:

(a) normal strength steel in accordance with *Section 6/1*

(b) non-ferrous material such as bronze or brass may be considered; however, aluminium alloy is not to be used for covers of any opening to cargo tanks and spaces adjacent thereto

(c) synthetic materials may also be considered, taking into account their fire resistance and physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover, and the method of manufacture are to be submitted for approval.

1.1.2.2 The hatch cover packing material is to be compatible with the cargoes that are intended to be carried and is to be effectively held in place.

1.1.3 Cargo tank access coamings

1.1.3.1 The height of the hatch coaming above the upper surface of the freeboard deck is not to be less than 600mm. Lower heights may be permitted by the Flag Administration. The top of the hatch coaming is also not to be lower than the highest point of the tank over which it is fitted and is to be of sufficient height for the purpose of damage stability.

1.1.3.2 The gross thickness of the coaming plate is not to be less than 10mm. Where the coaming height, as fitted, exceeds 600mm, the thickness may be required to be increased or edge stiffening fitted. The scantlings of coaming plates of tank access coamings that enclose an area of 1.2m^2 or more, and/or those that are not configured with a well rounded shape, may be subject to additional requirements.

1.1.4 Cargo tank access hatch covers

1.1.4.1 The gross thickness of unstiffened plate covers with an area less than 1.2m^2 is not to be less than 12.5mm. The gross thickness of covers of a larger area will need to be increased or the cover will require stiffening.

1.1.4.2 Flat and unstiffened covers on circular hatchways are to be secured by fastenings with a spacing of not more than 600mm.

1.1.4.3 On rectangular hatchways, the spacing of fastenings is generally not to be greater then 450mm and the distance between hatch corners, and adjacent fastenings, is not to be greater than 230mm.

1.1.4.4 The requirements of *1.1.4.1* to *1.1.4.3* do not apply to dished covers or covers of other specially approved design.

1.1.4.5 Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be considered securing devices for the cover and should be designed so as to prevent the gasket from being over tightened.

1.1.5 Machinery access openings - protection

1.1.5.1 Machinery casings are generally to be protected by an enclosed poop or bridge; or by a deck house structure complying with the strength requirements of *1.4*.

1.1.5.2 Where a vessel is intended to operate at the freeboard allowed by the *International Convention on Load Lines* for Type-A freeboard vessels, the height of such structure is not to be less than 2.3m. The bulkheads at the forward ends of these structures are to have scantlings at least equivalent to those required for bridge-front bulkheads, see *1.4.9* and *1.4.13*.

1.1.6 Small hatches on the exposed fore deck

1.1.6.1 Openings to forward spaces as defined in *1.1.6.2* are to comply with the requirements of *1.1.6.3* to *1.1.6.14*.

1.1.6.2 These requirements apply to small hatches (generally openings 2.5m^2 or less) on the exposed deck within 0.25*L* from the F.P. and at a height less than 0.1*L* or 22m, whichever is less, from the summer load water line at the location of the hatch.

1.1.6.3 Hatches designed for emergency escape need not comply with *1.1.6.9(a), 1.1.6.9(b), 1.1.6.13* and *1 1.6.14*.

1.1.6.4 For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with *Table 11.1.1* and *Figure 11.1.1*.

1.1.6.5 Stiffeners, where fitted, are to be aligned with the metal to metal contact points required by *1.1.6.10* and *1.1.6.11*. See also *Figure 11.1.1*. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener. See *Figure 11.1.2*.

1.1.6.6 The upper edge of the hatchway coaming is to be suitably reinforced by a horizontal member, normally not more than 190mm from the upper edge of the coaming.

1.1.6.7 For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to provide strength and stiffness equivalent to the requirements for small rectangular hatches.

1.1.6.8 For small hatch covers constructed of materials other than normal strength steel, the required scantlings are to provide equivalent strength and stiffness.

1.1.6.9 The primary securing devices are to be such that the hatch cover can be secured in place and be made weathertight by means of a closing mechanism employing any one of the following methods:

(a) butterfly nuts tightening onto forks (clamps)

(b) quick acting cleats, or

(c) a central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

1.1.6.10 The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged.

1.1.6.11 The metal to metal contacts are to be arranged close to each securing device as shown in *Figure 11.1.1*, and are to be of sufficient capacity to withstand the bearing force.

1.1.6.12 The primary securing method is to be designed and manufactured such that the designed compression pressure can be achieved by one person without the need for any tools.

1.1.6.13 For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use, by means of curving the forks upward and raising the surface on the free end, or a similar method. The gross plate thickness of unstiffened steel forks is not to be less than 16mm. An example arrangement is shown in *Figure 11.1.2*.

1.1.6.14 Small hatches on the exposed fore deck are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device becomes loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

1.1.6.15 For small hatch covers located on the exposed deck within the forward 0.25L from the F.P., the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

1.1.7 Manholes and flush deck scuttles

1.1.7.1 Manholes and flush deck scuttles in Position 1 or Position 2, as defined in *Section 4/1.2*, or within superstructures, other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight.

1.1.7.2 The strength of watertight manholes is to be equivalent to that of the deck.

1.1.7.3 Unless secured by closely spaced bolts, the covers are to be permanently attached.

1.1.8 Other openings

1.1.8.1 Openings in freeboard decks other than hatchways, machinery space openings, manholes and flush scuttles are to be protected by an enclosed superstructure, or by a deck house or companionway of equivalent strength and weathertightness. Any such opening in an exposed superstructure deck, or in the top of a deck house on the freeboard deck, which gives access to a space below the freeboard deck or a space within an enclosed superstructure, is to be protected by an efficient deck house or companionway, as defined in *1.4*.

1.1.9 Escape openings

1.1.9.1 The closing appliances of escape openings are to be readily operable from each side.

1.1.10 Rope hatches

1.1.10.1 Rope hatches may be accepted with reduced coaming height, but generally not less than 380mm, provided that they are well secured and can be opened only at the Master's discretion. The gross thickness of the coaming is to be not less than the Rule minimum gross thickness for hull envelope plating for that position, or 11mm, whichever is the lesser.

1.1.11 Portable plates

1.1.11.1 Where portable plates are required in casings or decks, for unshipping machinery or other similar reasons, they may be accepted provided that they are of equivalent strength to the un-pierced bulkhead or deck. Portable plates may be fitted with flush covers and they are to be secured by gaskets and closely spaced bolts at a distance not greater than five bolt diameters.

1.1.11.2 The sill heights of access openings and the coaming heights of deck openings, closed by covers which are kept permanently closed at sea will be specially considered.

1.1.12 Tank cleaning and ullage openings

1.1.12.1 Tank cleaning and ullage openings are to be fitted with watertight covers or an equivalent. Flush covers may be accepted for tank cleaning and ullage openings where they comply with the applicable requirements of *1.1.11*.

Table 11.1.2
900mm High Ventilator Thickness and Bracket Standards

Nominal pipe Size	Minimum fitted gross thickness, in mm	Maximum projected area of head, in cm²	Height of brackets, in mm

500A	8.5	4000	-

1.2 Ventilators

1.2.1 General

1.2.1.1 Ventilators are to comply with the requirements of *1.2.2* through *1.2.6* and are also to be in accordance with any relevant requirements for machinery of the individual Classification Societies.

1.2.2 Details, arrangements and scantlings for ventilators

1.2.2.1 For standard ventilators of 900mm in height, closed by heads of not more than the tabulated projected area, the minimum pipe thickness and bracket heights are to be as specified in *Table 11.1.2*.

1.2.2.2 For ventilators of height greater than 900mm, brackets or alternative means of support are to be provided. Brackets, where fitted, are to be of suitable thickness and length according to their height.

1.2.2.3 Ventilators are to have coamings constructed of steel or other equivalent material and are to meet the requirements indicated in *Table 11.1.3*.

1.2.2.4 All component parts and connections of ventilators are to be capable of withstanding the loads defined in *1.2.3*.

1.2.2.5 Rotating type mushroom ventilator heads are not to be used for application in the areas specified in *1.2.3.1*.

1.2.2.6 Ventilators passing through superstructures, other than enclosed superstructures, are to have substantially constructed coamings of steel or other equivalent material at the freeboard deck. Ventilators of deep tanks or tunnels passing through tween decks are to be watertight with scantlings to withstand the expected pressure.

Table 11.1.3
Coamings for Ventilators

Feature	Requirement	
Height(4)	h_{coam} = 900 at Position 1 h_{coam} = 760 at Position 2(1)

	$165 < d_{coam} < 320$	$t_{coam\text{-}grs} = 8.5$
	$d_{coam} \geq 470$	$t_{coam\text{-}grs} = 10.0$
	Intermediate values are to be obtained by linear interpolations	
Support(3)	Where h_{coam} exceeds 900 the coaming is to be specially supported	

Where:
h_{coam} height of coaming, in mm
d_{coam} external diameter of coaming, in mm
$t_{coam\text{-}grs}$ gross thickness of coaming, in mm

Note
1. The coaming height may need to be increased to satisfy any applicable subdivision and damage stability requirements.
2. Where the height of the ventilator exceeds that given, the gross thickness given above may be gradually reduced, above that height, to a minimum of 6.5mm.
3. See also *1.2.3* and for *1.2.4* ventilators in the forward part of the ship.
4. Heights are measured above sheathing, if fitted.

1.2.3 Applied loading on ventilators

1.2.3.1 Ventilators on an exposed deck within the forward 0.25*L*, and where the height of the exposed deck at the ventilator is less than 0.1*L* or 22m, whichever is less, from the summer load waterline are to comply with the requirements of *1.2.3.2* through *1.2.3.3* and *1.2.4.1.*

1.2.3.2 The pressures acting on ventilators, P_{vent}, and their closing devices are given by:

$$P_{vent} = 0.5 \rho_{sw} v_{sea}^2 C_1 C_2 C_3 \quad \text{kN/m}^2$$

Where:

ρ_{sw} density of sea water, 1.025 tonnes/m³

v_{sea} velocity of water over the fore deck, 13.5 m/sec

C_1 shape coefficient:

- 0.5 for pipes
- 1.3 for pipe or ventilator heads in general
- 0.8 for pipe or ventilator heads of cylindrical form with its axis in the vertical direction

C_2 slamming coefficient, 3.2

C_3 protection coefficient:

- 0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle
- 1.0 elsewhere, including immediately behind a bulwark

1.2.3.3 Forces acting in the horizontal direction on the ventilator and its closing device may be calculated from the above pressure, using the largest projected area of each component.

1.2.4 Strength requirements for ventilators and their closing devices

1.2.4.1 Bending moments and stresses in ventilators are to be calculated at critical positions:

(a) at penetration pieces

(b) at weld or flange connections

(c) at toes of supporting brackets.

Bending stresses in the net section are not to exceed $0.8\sigma_{yd}$, where σ_{yd} is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2mm is then to be applied.

1.2.5 Closing appliances

1.2.5.1 Except as indicated otherwise in this paragraph, ventilator openings are to be provided with efficient, permanently attached, closing appliances. Ventilators in Position 1, the coamings of which extend to more than 4.5m above the deck, and in Position 2, the coamings of which extend to more than 2.3m above the deck, need not be fitted with closing arrangements unless unusual features of the design make it necessary. Position 1 and Position 2 are defined in *Section 4/1.2*.

1.2.6 Fire dampers

1.2.6.1 Where a fire damper is located within a ventilation coaming, an inspection port or opening at least 150mm in diameter is to be provided in the coaming to facilitate survey of the damper without disassembling the coaming or the ventilator. The closure provided for the inspection port or opening is to maintain the weathertight integrity of the coaming and, if appropriate, the fire integrity of the coaming.

1.3 Air Pipes

(RCN 2, effective from 1 July 2008)

1.3.1 General

1.3.1.1 Air pipes are to comply with the requirements of *1.3.2* through *1.3.6* and are also to be in accordance with any relevant requirements for machinery of the individual Classification Societies.

(RCN 2, effective from 1 July 2008)

1.3.2 Height

1.3.2.1 The minimum height for air pipes on decks exposed to weather is given as:

(a) 760mm for those on the freeboard deck; and

(b) 450mm for those on the superstructure deck.

The height is to be measured from the top of the sheathing, if fitted, to the point where water may have access below.

1.3.2.2 Where these heights may interfere with the working of the vessel, a lower height may be accepted subject to the fitting of an approved closing appliance at the open end of the vent.

1.3.2.3 The height may need to be increased to satisfy any applicable subdivision and damage stability requirements.

1.3.2.4 Where air pipes are led through the side of superstructures, the height of their opening is to be at least 2.3m above the summer load waterline. Automatic vent heads of approved design are to be provided.

1.3.3 Details, arrangement and scantlings for air pipes

(RCN 2, effective from 1 July 2008)

1.3.3.1 The wall thicknesses of air pipes, where exposed to weather, are not to be taken less than that given in *Table 11.1.4*.

(RCN 2, effective from 1 July 2008)

Table 11.1.4
Minimum wall Thickness for Air Pipes

External diameter, in mm	Gross minimum wall thickness, in mm
$d_{air} \leq 80$	6.0
$d_{air} \geq 165$	8.5

Where:

d_{air} external diameter of pipe, in mm

Note

1. Intermediate values are to be obtained by linear interpolations.
2. See also *1.3.4* and *1.3.5* for ventilators in forward part of the ship.

(RCN 2, effective from 1 July 2008)

1.3.3.2 For standard air pipes of 760mm in height, closed by heads of not more than the tabulated projected area, the minimum pipe thickness and bracket heights are to be as specified in *Table 11.1.5*. Where brackets are required, three or more radial brackets are to be fitted. In addition, the relevant requirements of *1.3.4* are to be applied.

1.3.3.3 Brackets are to have a gross thickness of 8mm or more, minimum length of 100mm, and height according to *Table 11.1.5*, but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported. In addition, loads according to *1.3.4* are to be applied. Brackets, where fitted, are to be of suitable thickness and length according to their height.

1.3.3.4 Gross pipe thickness is to be in accordance with the relevant requirements for machinery of the individual Classification Societies.

1.3.4 Applied loading on air pipes

(RCN 2, effective from 1 July 2008)

1.3.4.1 Air pipes on an exposed deck within the forward 0.25*L*, where the height of the exposed deck at the air pipe or sounding pipe is less than 0.1*L* or 22m, whichever is less, from the summer load waterline are to comply with the requirements of *1.3.4.2* through *1.3.4.3* and *1.3.5.1*.

(RCN 2, effective from 1 July 2008)

Table 11.1.5
Thickness and Bracket Standards for 760mm High Air Pipes

Nominal pipe size	Minimum fitted gross thickness, in mm	Maximum projected area of head, in cm^2	Height (1) of brackets, in mm
65A	6.0	-	480
80A	6.3	-	460
100A	7.0	-	380
125A	7.8	-	300
150A	8.5	-	300
175A	8.5	-	300
200A	8.5(2)	1900	300 (2)
250A	8.5(2)	2500	300 (2)
300A	8.5(2)	3200	300 (2)
350A	8.5(2)	3800	300 (2)
400A	8.5(2)	4500	300 (2)

Note
1. Brackets (see *1.3.3.2*) need not extend over the joint flange for the head.
2. Brackets are required where the gross thickness of the pipe section is less than 10.5mm, or where the tabulated projected head area is exceeded.

RCN 2 to July 2008 version (effective from 1 July 2010)

1.3.4.2 The pressures acting on air pipes and their closing devices, P_{pipe}, are given by:

$$P_{pipe} = 0.5\rho_{sw} v_{sea}^2 C_1 C_2 C_3 \quad \text{kN/m}^2$$

Where:

ρ_{sw} density of sea water, 1.025 tonnes/m^3

v_{sea} velocity of water over the fore deck, 13.5 m/sec

C_1 shape coefficient:

0.5 for pipes

1.3 for pipe or ventilator heads in general

0.8 for pipe or ventilator heads of cylindrical form with its axis in the vertical direction

C_2 slamming coefficient, 3.2

C_3 protection coefficient:

0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle

1.0 elsewhere, including immediately behind a bulwark

(RCN 2, effective from 1 July 2008)

1.3.4.3 Forces acting in the horizontal direction on the pipe and its closing device may be calculated from the above pressure, using the largest projected area of each component.

1.3.5 Strength requirements for air pipes and their closing devices

(RCN 2, effective from 1 July 2008)

1.3.5.1 Bending moments and stresses in air pipes are to be calculated at critical positions:

(a) at penetration pieces

(b) at weld or flange connections

(c) at toes of supporting brackets.

Bending stresses in the net section are not to exceed $0.8\sigma_{yd}$, where σ_{yd} is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2mm is then to be applied.

(RCN 2, effective from 1 July 2008)

1.3.6 Closing appliances for air pipes

1.3.6.1 All air pipes terminating on the weather deck are to be fitted with return bends (gooseneck), or other equivalent arrangement to prevent water from passing inboard.

1.3.6.2 A weathertight permanent means of closure is to be provided for the outlet. The closing device is to be of an automatic type, i.e. close automatically upon submergence (e.g. ball float or equivalent) for any one of the following cases:

(a) the outlet is submerged, with the ship at its summer load water line at an angle of 40 degrees, or the angle of down flooding if this is less than 40 degrees

(b) to comply with damage stability requirements.

1.3.6.3 Air pipes are not to be fitted with valves that may impair the venting function.

1.4 Deck Houses and Companionways

1.4.1 Applicability

1.4.1.1 The requirements of this section are applicable to steel deck houses and companionways, as defined in *1.4.3.1* and *1.4.3.2*.

1.4.1.2 Scantling requirements depend on the vertical location of the item relative to the waterline. This location is categorized in terms of “tiers”.

1.4.2 Materials

1.4.2.1 The scantlings in *1.4* apply to structures constructed of hull structural steel, in accordance with the requirements of *Section 6/1*. Scantlings of aluminium alloy deck houses will be considered by the individual Society, supported by the submission of a specification of the proposed alloys.

1.4.3 Definitions

1.4.3.1 A deck house is defined as a decked structure, above the strength deck, with the side plating being inboard of the shell plating by more than 4% of the ship's breadth, B.

1.4.3.2 A companionway is defined as a weathertight deck structure; protecting an access opening leading below the freeboard deck, or into a space within an enclosed superstructure.

1.4.3.3 A tier is defined as a measure of the extent of a deck house. A deck house tier consists of a deck and external bulkheads. In general, the first tier is the tier situated on the freeboard deck.

1.4.4 Structural continuity

1.4.4.1 In deck houses aft, the front bulkhead is to be in line with a transverse bulkhead in the hull below or is to be supported by a combination of partial transverse bulkheads, girders and pillars.

1.4.4.2 The aft end bulkhead is to be effectively supported.

1.4.4.3 At the corners of the deck house attachment at the strength deck, attention is to be given to the connection of the deck house to the deck and the arrangements to transmit load into the under-deck supporting structure.

1.4.4.4 As far as practicable, exposed sides and main longitudinal and transverse bulkheads are to be located above bulkheads and/or deep girder frames in the hull structure, and are to be in line in the various tiers of accommodation. Where such structural arrangement in line is not possible, there is to be other effective support.

1.4.4.5 Arrangements are to be made to minimize the effect of discontinuities in erections. All openings cut in the sides are to be substantially framed and have well-rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings.

1.4.5 Deck plating

1.4.5.1 The gross thickness of the plating, $t_{dk\text{-}grs}$, is not to be less than:

$$t_{dk\text{-}grs} = 7.5\sqrt{\frac{k\,s}{s_{std}}}$$ mm, on first tier deck houses

$$t_{dk\text{-}grs} = 7.0\sqrt{\frac{k\,s}{s_{std}}}$$ mm, on second tier deck houses

$$t_{dk\text{-}grs} = 6.5\sqrt{\frac{k\,s}{s_{std}}}$$ mm, on third tier and above deck house

Where:

s spacing of stiffeners, in m

k	higher strength steel factor, as defined in *Section 6/1.1.4*
σ_{yd}	specified minimum yield stress of the material, in N/mm^2
s_{std}	standard reference spacing of longitudinals or beams, in m: $= 0.470 + 0.00167L_1$
L_1	rule length, as defined in *Section 4/1.1.1.1*, but is not to be taken greater than 250m

1.4.5.2 The plating thickness inside deck houses may be reduced by 10 percent provided that the reduced gross thickness, $t_{dh\text{-}grs}$, is not less than:

$$t_{dh\text{-}grs} = (5.8s + 1)\sqrt{k} \quad \text{mm, but is not to be less than 5.5mm}$$

Where:

s	spacing of stiffeners, in m
k	higher strength steel factor, as defined in *Section 6/1.1.4*
σ_{yd}	specified minimum yield stress of the material, in N/mm^2

1.4.6 Deck longitudinals and beams

1.4.6.1 For each longitudinal or beam, in association with the plating to which it is attached, the gross section modulus, $Z_{lng\text{-}grs}$, is not to be less than:

$$Z_{lng\text{-}grs} = 4.563s\,l_{bdg}^{\;2}h_{tier}k \quad \text{cm}^3$$

Where:

s	spacing of stiffeners, in m
l_{bdg}	effective bending span, as defined in *Section 4/2.1.1*, in m
B	as defined in *Section 4/1.1.3.1*
h_{tier}	load head in relation to the deck house tier, in m: 1.68 for poop and first tier above freeboard deck 1.30 for second tier above freeboard deck 0.91 for third and higher tiers above freeboard deck For decks with position second tier or higher above the freeboard deck, generally used only as weather covering, the value of h_{tier} may be reduced, but in no case is it to be less than 0.46
k	higher strength steel factor, as defined in *Section 6/1.1.4*
σ_{yd}	specified minimum yield stress of the material, in N/mm^2

1.4.7 Deck girders and transverses

1.4.7.1 Deck girders and transverses are to be arranged to support beams or deck longitudinals. Where arrangements of deck girders and transverses are such that these members act as a grillage structure, additional analysis may be carried out to consider grillage effects and justify that scantlings are equivalent to those required by *1.4.7.2* and *1.4.7.3*. In this analysis gross scantlings are to be used, basic geometry parameters are to be as indicated in *1.4.7.2*, the load is to be taken as the head required by *1.4.7.2* with a unit density of 0.715tonnes/m^3 and the permissible bending stress is to be taken as $0.67\sigma_{yd}$. For the determination of equivalent

scantlings to those required by *1.4.7.3*, equivalency is to be based on the deflection at girder/transverse intersection points and at midspan of the members, and the permissible deflection is to be taken as the deflections calculated for a simple beam meeting the requirements of *1.4.7.2* and with depth d_{grd} as required by *1.4.7.3*.

1.4.7.2 For each deck girder or transverse web, the gross section modulus, $Z_{t\text{-}grs}$, is not to be less than:

$$Z_{t\text{-}grs} = 4.74 b_{dk} l_{bdg}{}^2 h_{tier} k \quad \text{cm}^3$$

Where:

b_{dk}	mean breadth of the area of deck supported, in m
l_{bdg}	effective bending span, to be taken as the distance between centres of supporting pillars, or between pillars, tranverse members, girders and/or bulkheads supporting them, in m. Where an effective bracket is fitted at the bulkhead, the length l_{bdg} may be modified, see *Section 4/2.1.4*
h_{tier}	load head in relation to the deck house tier, in m: 1.68 for poop and first tier above freeboard deck 1.30 for second tier above freeboard deck 0.91 for third and higher tiers above freeboard deck For decks with position second tier or higher above the freeboard deck, generally used only as weather covering, the value of h_{tier} may be reduced, but in no case is it to be less than 0.46
k	higher strength steel factor, as defined in *Section 6/1.1.4*
σ_{yd}	specified minimum yield stress of the material, in N/mm^2

1.4.7.3 The depth of girders and transverse webs, d_{grd}, is not to be less than:

$$d_{grd} = 0.0583 l_{bdg} \quad \text{m}$$

Where:

l_{bdg}	effective bending span, to be taken as the distance between centres of supporting pillars, or between pillars, transverse members, girders and/or bulkheads supporting them, in m. Where an effective bracket is fitted at the bulkhead, the length l_{bdg} may be modified, see *Section 4/2.1.4*

Where girders and transverse webs intersect, consideration may be given to accept a lesser depth for the longer member, where the shorter member provides full support to the longer member.

1.4.7.4 The gross thickness of girders or transverse webs is not to be taken as less than 1mm per 100mm of depth, plus an additional 4mm. Where web shear strength and buckling capacity are demonstrated to be satisfactory, lesser thicknesses may be accepted. For shear strength analysis gross scantlings are to be used, basic geometry parameters are to be as indicated in *1.4.7.2*, the load is to be taken as the head required by *1.4.7.2* with a unit density of 0.715 tonnes/m^3 and the permissible shear stress is to be taken as $0.39\sigma_{yd}$. Bucking capacity is demonstrated as satisfactory when the depth to gross thickness ratio of the web is less than 75.

1.4.8 Pillars

1.4.8.1 The gross scantlings of pillars are to be such that the permissible load, determined in accordance with *1.4.8.2,* is greater than the design load, determined in accordance with *1.4.8.3*, considering the requirement of *1.4.8.4*.

1.4.8.2 The permissible loading on a pillar, W_{perm}, is given by:

$$W_{perm} = (f_{s1} - h_{pill}\, f_{s2}/r_{gyr\text{-}grs})A_{pill\text{-}grs} \quad \text{kN}$$

Where:

f_{s1} steel factor:

12.09	normal strength steel
13.59	HT27 strength steel
16.11	HT32 strength steel
17.12	HT34 strength steel
18.12	HT36 strength steel
20.14	HT40 strength steel

h_{pill} distance between the top of the pillar supporting deck or other structure to the underside of the supported beam or girder, in m

f_{s2} steel factor:

4.44	normal strength steel
5.57	HT27 strength steel
7.47	HT32 strength steel
8.24	HT34 strength steel
9.00	HT36 strength steel
10.52	HT40 strength steel

$r_{gyr\text{-}grs}$ radius of gyration for gross pillar section, in cm

$A_{pill\text{-}grs}$ gross cross sectional area of pillar, in cm^2

1.4.8.3 The design load for a specific pillar, W_{des}, is given by:

$$W_{des} = 7.04\, b_{dk}\, h_{tier}\, l_{dk} \quad \text{kN}$$

Where:

b_{dk} mean breadth of the area of deck supported, in m

h_{tier} load head in relation to the deck house tier, in m:

1.68	for poop and first tier above freeboard deck
1.30	for second tier above freeboard deck
0.91	for third and higher tiers above freeboard deck

For decks with position second tier or higher above the freeboard deck, generally used only as weather covering, the value of h_{tier} may be reduced, but in no case is it to be less than 0.46

l_{dk} mean length of the area of deck supported, in m

1.4.8.4 Where pillars are arranged in a vertical line, the design load on the pillar at each level is to be calculated by summing the design load for the deck directly above the pillar and one-half of the design load for each pillar above.

1.4.9 Exposed bulkheads

1.4.9.1 The scantlings of the exposed bulkheads of deck houses and companionways are to be in accordance with *1.4.10* to *1.4.13*. Increased scantlings may be required where the structure supports loads from deck equipment, fittings, etc.

1.4.9.2 Special consideration may be given to the bulkhead scantlings of deck houses which do not protect openings in the freeboard deck, superstructure deck or in the top of a lowest tier deck house. Special consideration may also be given to the bulkhead scantlings of deck houses which do not protect machinery casings, provided they do not contain accommodation or do not protect equipment essential to the operation of the vessel.

1.4.9.3 Long deck houses may need additional support in order to provide resistance to racking, see *1.4.13*.

1.4.10 Exposed bulkhead plating

1.4.10.1 The gross thickness of plating, $t_{blk\text{-}grs}$, is not to be less than that calculated from *1.4.10.2* and that given by:

$$t_{blk\text{-}grs} = 3s\sqrt{k\,h_{des}} \quad \text{mm}$$

Where:

s spacing of stiffeners, in m

k higher strength steel factor, as defined in *Section 6/1.1.4*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

h_{des} design head, in m:

$C_4[(C_5 f) - z]c$

but is not to be taken less than given below for the specified location:

$2.5 + L_1/100$ unprotected front bulkheads on the lowest tier

$1.25 + L_2/200$ elsewhere

L_1 rule length, L, as defined in *Section 4/1.1.1.1*, but is not to be taken greater than 250m

L_2 rule length, L, as defined in *Section 4/1.1.1.1*, but is not to be taken greater than 300m

C_4 coefficient as given in *Table 11.1.6*

C_5 coefficient:

$$1.0 + \left[\frac{(x/L) - 0.45}{C_{b1} + 0.2}\right]^2 \qquad \text{where } x/L \le 0.45$$

$$1.0 + 1.5\left[\frac{(x/L) - 0.45}{C_{b1} + 0.2}\right]^2 \qquad \text{where } x/L > 0.45$$

C_{b1} block coefficient as defined in *Section 4/1.1.9.1*, but is not to be taken as less than 0.60 or greater than 0.80. For aft end

	bulkheads forward of amidships, C_{b1} may be taken as 0.80
x	distance between the A.P. and the bulkhead being considered, in m. Deck house side bulkheads are to be divided into equal parts not exceeding 0.15*L* in length, and x is to be measured from the A.P. to the centre of each part considered
L	rule length, as defined in *Section 4/1.1.1.1*
f	as defined in *Table 11.1.7*
z	vertical distance from the summer load waterline measured to the middle of the plate, in m
c	$0.3 + 0.7 b_{dh} / B_1$ but is not to be taken as less than 1.0 for exposed machinery casing bulkheads and in no case is b_{dh}/B_1 to be taken as less than 0.25
b_{dh}	breadth of deck house at the position being considered, in m
B_1	actual breadth of the vessel at the freeboard deck at the position being considered, in m

Table 11.1.6
Values of 'C_4'

Bulkhead location	Value of 'C_4'
Unprotected front, lowest tier	$2.0 + L_2/120$
Unprotected front, 2nd tier	$1.0 + L_2/120$
Unprotected front, 3rd tier and above	$0.5 + L_2/150$
Protected front, all tiers	$0.5 + L_2/150$
Sides, all tiers	$0.5 + L_2/150$
Aft ends, aft of amidships, all tiers	$0.7 + (L_2/1000) - 0.8x/L$
Aft ends, forward of amidships, all tiers	$0.5 + (L_2/1000) - 0.4x/L$

RCN 1 to July 2010 version (effective from 1 July 2012)

Table 11.1.7
Values of 'f'

L, in m	f, in m
90	6.00
100	6.61
120	7.68
140	8.65
160	9.39
180	9.88
200	10.27
220	10.57
240	10.78
260	10.93
280	11.01
≥ 300	11.03

Note
1. This Table is based on the equations given in *Table 11.1.8*

Table 11.1.8
Origin of '*f*' Values

L, in m	*f*, in m
$L \leq 150$	$(L/10)(e^{-L/300}) - [1-(L/150)^2]$
$150 < L < 300$	$(L/10)(e^{-L/300})$
$L \geq 300$	11.03

1.4.10.2 The gross thickness for the lowest tier bulkheads, $t_{blk\text{-}tier\text{-}grs}$, is not to be less than:

$$t_{blk-tier-grs} = 5.0 + L_1/100 \quad \text{mm}$$

For other tiers, the gross thickness of bulkheads is not to be less than:

$$t_{blk\text{-}tier\text{-}grs} = 4.0 + L_1/100 \quad \text{mm, or 5.0mm, whichever is greater}$$

Where:

L_1 rule length, L, as defined in *Section 4/1.1.1.1*, but is not to be taken greater than 250m

1.4.11 Exposed bulkhead stiffeners

1.4.11.1 Each stiffener, in association with the plating to which it is attached, is to have a gross section modulus, $Z_{blk\text{-}grs}$, not less than:

$$Z_{blk\text{-}grs} = 3.5\, s\, h_{tween}{}^2 h_{des}\, k \quad \text{cm}^3$$

Where:

s spacing of stiffeners, in m

h_{tween} 'tween deck height, in m

h_{des} design head, as defined in *1.4.10.1*, with z taken as the vertical distance from the summer load waterline to midpoint of the stiffener span, in m

k higher strength steel factor, as defined in *Section 6/1.1.4*

σ_{yd} specified minimum yield stress of the material, in N/mm²

1.4.12 Stiffener end attachments for stiffeners on exposed bulkheads

1.4.12.1 Both ends of the webs of lowest tier bulkhead stiffeners are to be effectively attached. The scantlings of stiffeners having other types of end connection will be specially considered.

1.4.13 Web arrangements for webs on exposed bulkheads

1.4.13.1 In long deck houses with multiple tiers, web frames or partial bulkheads are to be fitted within the first tier, spaced a maximum of approximately 9m apart and arranged, where practicable, in line with watertight bulkheads below.

1.4.13.2 Webs are also to be arranged in way of large openings, boats davits and other points of high loading.

1.4.14 Closing arrangements for openings in deck houses and companionways

1.4.14.1 All openings in the bulkheads of deck houses and companionways, which give direct access to enclosed superstructures or to spaces below the freeboard, are to be

provided with efficient means of closing so that in any sea condition, water will not penetrate the vessel.

1.4.14.2 Doors of such openings are to be of steel or other equivalent material, permanently and strongly attached to the bulkhead. The doors are to be provided with gaskets and clamping devices, or other equivalent arrangements, which are to be permanently attached to the bulkhead or to the doors themselves. The doors are to be so arranged that they can be operated from both sides of the bulkhead. Doors complying with a recognized national or international standard will generally be accepted.

1.4.14.3 Access openings are to be framed and stiffened so that the whole structure is equivalent to the un-pierced bulkhead when closed.

1.4.14.4 Except as permitted by *1.4.14.5*, access doors, air inlets and openings to accommodation spaces, control stations and machinery spaces, are not to face the cargo tank region. They are to be located on the transverse bulkhead or on the side of the deck house at a distance of at least 0.04*L* and not less than 3m from the end of the deck house facing the cargo tank region. This distance need not exceed 5m.

1.4.14.5 Access doors in boundary bulkheads facing the cargo tank region, or within the 5m limits specified in *1.4.14.4*, leading to the main cargo control stations and to such service spaces used as provision rooms, store rooms and lockers, may be permitted, provided they do not give access directly or indirectly to any other space containing or providing for accommodation, control stations or service spaces such as galley, pantries or work shops, or similar spaces containing source of vapour ignition. The boundary of such a space is to be insulated to "A-60" class standard, with the exception of the boundary facing the cargo tank region.

1.4.15 Sills of access openings

1.4.15.1 The height of the sills of access openings, in the bulkheads of deck houses and companionways, which give direct access to enclosed superstructures or to spaces below the freeboard deck, is to be a minimum of 600mm in Position 1 and 380mm in Position 2, as defined in *Section 4/1.2*.

1.4.16 Access openings in machinery casings on Type 'A' freeboard tankers

1.4.16.1 In general, there are to be no openings giving direct access from the freeboard deck to the machinery space in exposed machinery casings.

1.4.16.2 A door complying with the requirements of *1.4.14.1* to *1.4.14.3* may be permitted in the exposed machinery casing provided that it leads to a space or passageway which is as strongly constructed as the casing, and is separated from the engine room by a second door complying with the requirements of *1.4.14.1* to *1.4.14.3*. The sill of the exterior door is not to be taken less than 600mm and the sill of the second door is not to be taken less than 230mm.

1.4.17 Windows and side scuttles

1.4.17.1 Side scuttles, in the external bulkheads of deck houses and weathertight doors, are to be of substantial construction in accordance with a recognised national or international standard.

1.4.17.2 Windows and side scuttles, fitted in the boundaries of deck houses protecting direct access into superstructures, or to spaces below the freeboard deck, are to be fitted with efficient hinged inside deadlights.

1.4.17.3 Windows and portlights facing the cargo tank region, and on the side of the superstructures or deck houses within the limits specified in *1.4.14.4* and *1.4.14.5*, shall be of a fixed (non-opening) type. Such windows and portlights, except wheelhouse windows, shall be constructed to "A-60" class standard.

1.5 Scuppers, Inlets and Discharges

1.5.1 Drains – enclosed spaces

1.5.1.1 Scuppers and discharges which drain spaces below the freeboard deck, or spaces within intact superstructures or deck houses on the freeboard deck, fitted with doors complying with the requirements of the *International Convention on Load Lines, Regulation 12*, may be led to the bilges in the case of scuppers, or to suitable sanitary tanks in the case of sanitary discharges. Alternatively, they may be led overboard, provided that:

(a) the freeboard is such that the deck edge is not immersed when the ship heels to five degrees either way, and

(b) each drain is fitted with means of preventing water from passing inboard, in accordance with *1.5.3*.

1.5.2 Drains – open spaces

1.5.2.1 Drains leading from superstructures or deck houses not fitted with doors complying with the requirements of *International Convention on Load Lines, Regulation 12* are to be led overboard.

1.5.3 Prevention of water passing inboard

1.5.3.1 Drains either from spaces below the freeboard deck or from within superstructures and deck houses on the freeboard deck, where permitted to be led overboard, see *1.5.1.1(a)*, are to be fitted with efficient and accessible means for preventing water from passing inboard, in accordance with *1.5.3.2* to *1.5.3.7*.

1.5.3.2 For drains which remain open during normal operation of the ship, such as sanitary discharges, means for preventing water passing inboard are to be in accordance with those given below for the area described. h_{disc} is the height from the summer load line to the inboard end of the discharge, in m:

(a) $h_{disc} \le 0.01L_L$:

- one automatic non-return valve with a positive means of closing it from a position above the freeboard deck
- alternatively, one automatic non-return valve and one positive closing valve controlled from above the freeboard deck may be accepted.

(b) $0.01L_L < h_{disc} \le 0.02L_L$:

- two automatic non-return valves, without positive means of closing, provided that the inboard valve is always accessible for examination under service conditions
- the inboard valve is to be located above the deepest salt water load line
- if this is not practicable, additional locally controlled positive closing may be provided outboard, or the outboard non-return valve may be provided with a

locally controlled positive closing feature, in which case the inboard valve need not be located above the deepest salt water load line.

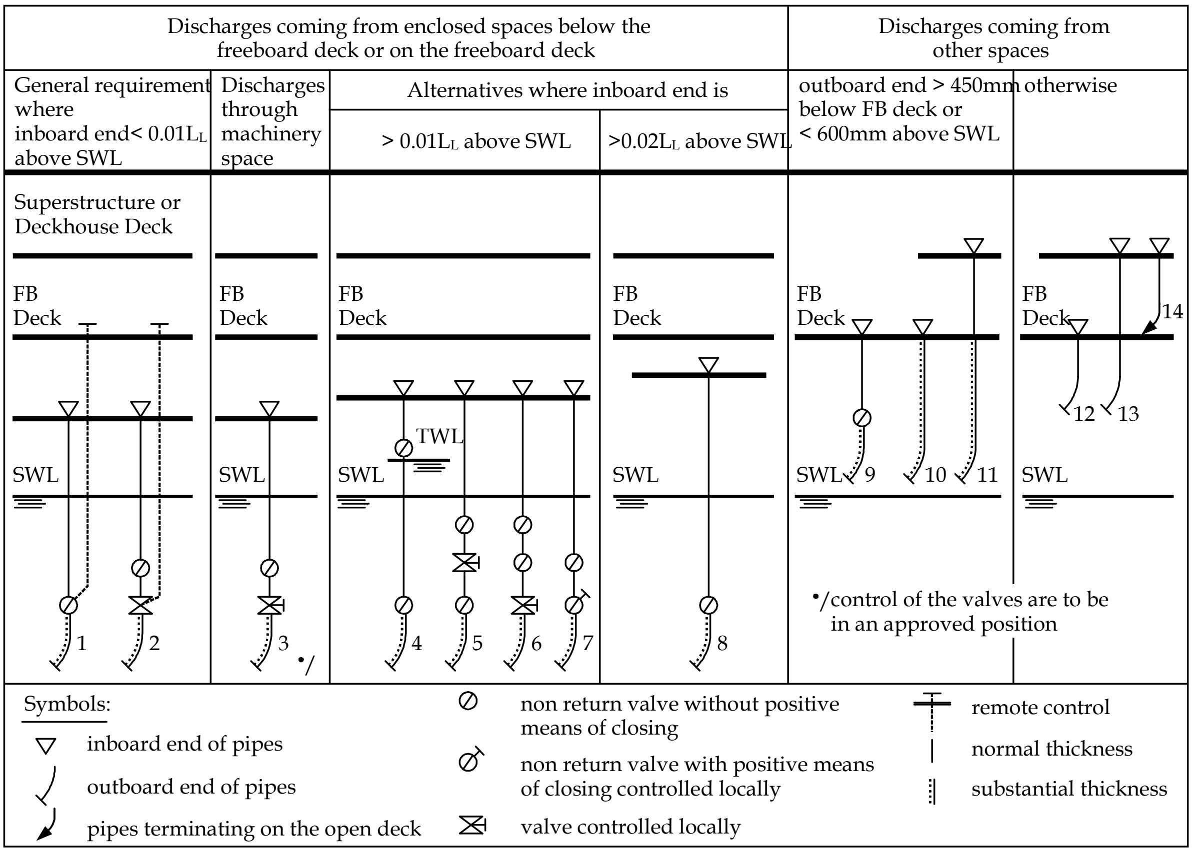
(c) $h_{disc} > 0.02L_L$:

- one single automatic non-return valve without positive means of closing.

1.5.3.3 For overboard discharges in way of machinery spaces, a locally operated positive closing valve at shell together with a non-return valve inboard, may be accepted in lieu of those required by *1.5.3.2*.

1.5.3.4 For acceptable arrangements for discharges and scuppers, see *Figure 11.1.3*.

Figure 11.1.3
Diagrammatic Arrangement of Discharge and Scupper Systems



RCN 1 to July 2010 version (effective from 1 July 2012)

1.5.3.5 For drains which are closed at sea, such as gravity drains from topside ballast tanks, a single screw down valve operated from the deck may be accepted.

1.5.3.6 The means for operating the positive closing valve are to be readily accessible and provided with an indicator showing whether the valve is open or closed.

1.5.3.7 Drain pipes originating at any level and penetrating the shell either more than 450mm below the freeboard deck or less than 600mm above the summer load waterline are to be provided with a non-return valve at the shell. This valve, unless required by *1.5.3.2* through *1.5.3.4*, may be omitted if the pipe is of substantial thickness, in accordance with *1.5.7.3*.

1.5.4 Sea inlets

1.5.4.1 In manned machinery spaces, main and auxiliary sea inlets and discharges in connection with the operation of machinery may be controlled locally. The control is

to be readily accessible and provided with indicators showing whether the valves are open or closed.

1.5.5 Shell valves and fittings

1.5.5.1 For installation; the shell valves are to be mounted on the shell (or sea chest). However, where it is impracticable to do so, a distance piece, of substantial thickness in accordance with *1.5.7.3*, may be fitted. Shell outlets are to be so located as to prevent any discharge falling onto a lowered survival craft.

1.5.5.2 For material; all required shell valves and fittings are to be of steel, bronze or other approved ductile material. Valves of ordinary cast iron or similar material are not acceptable.

1.5.5.3 Material readily rendered ineffective by heat is not to be used for shell connection where the failure of the material in case of fire would give rise to danger of flooding.

1.5.6 Unattended machinery space

1.5.6.1 For unattended machinery space; the control of any valve serving a sea inlet, a discharge below the waterline, or a bilge injection system, is to be so sited as to allow adequate time to reach and operate the control, in case of ingress of water to the space with the ship in the fully loaded condition.

1.5.6.2 For application of *1.5.6.1* in an unattended machinery space; where it can be demonstrated by calculation that the damaged water line will not be above the tank top floor level after 10 minutes from the initiation of the uppermost bilge level alarm, the valve control may be from the tank top floor.

Guidance Note:

Various Flag Administrations have interpretations of this requirement. Where the ship is flagged by an Administration having an interpretation of this requirement, the interpretation of the Flag Administration shall take precedence or the requirements of *1.5.6.2*.

1.5.7 Pipes

1.5.7.1 All pipes from shell to the first valve are to be of steel or other equivalent material.

1.5.7.2 The gross wall thickness of steel piping inboard of the valve is not to be less than that given in *Table 11.1.9*, unless substantial thickness is required.

Table 11.1.9
Thickness of Normal Steel Piping

External diameter, in mm	Gross wall thickness, in mm
≤ 155	4.5
≥ 230	6.0

Note
1. Intermediate values are to be obtained by linear interpolation.

1.5.7.3 The gross wall thickness of steel piping, where required to be of substantial thickness, see *1.5.3.7* and *1.5.5.1*, is not to be less than given in *Table 11.1.10*.

Table 11.1.10
Thickness of Substantial Steel Piping

External diameter, in mm	Gross wall thickness, in mm
≤ 80	7.0
180	10.0
≥ 220	12.5

Note
1. Intermediate values are to be obtained by linear interpolation.

1.5.8 Rubbish chutes, offal and similar discharges

1.5.8.1 Rubbish chutes, offal, and similar discharges are to be constructed of mild steel piping or plating equal to the shell thickness. Other materials will be specially considered.

1.5.8.2 Openings are to be kept clear of the sheer strake and areas of high stress concentration.

1.5.8.3 Rubbish chute hoppers are to be provided that comprise a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time.

1.5.8.4 The hopper cover is to be secured closed when not in use, and a suitable notice is to be displayed at the control position.

1.5.8.5 Where the inboard end of the hopper is less than $0.01L_L$, a positive closing valve is to be provided in addition to the cover and flap, in an easily accessible position above the deepest salt water load line.

1.5.8.6 The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a notice to that effect is to be displayed at the valve operating position.

2 CREW PROTECTION

2.1 Bulwarks and Guardrails

2.1.1 General

2.1.1.1 Bulwarks or guard rails are to be provided at the boundaries of exposed freeboard and superstructure decks, at the boundary of first tier deck houses and at the ends of superstructures.

2.1.1.2 Bulwarks, or guard rails, are to be a minimum of 1.0m in height, measured above sheathing, and are to be constructed as required in *2.1.2*. Where this height would interfere with the normal operation of the vessel, a lesser height may be approved. Where approval of a lower height is requested, justifying information is to be submitted.

2.1.1.3 Within 0.6L amidships, bulwarks are to be arranged to ensure that they are free from hull girder stresses.

2.1.1.4 Satisfactory means in the form of guard rails, life lines, gangways, under deck passages or an equivalent are to be provided for the protection of crew during passage from their quarters, the machinery space, and all other locations necessary for the crewing of the ship, see *2.3.1.1*.

2.1.2 Construction of bulwarks

2.1.2.1 The gross thickness of bulwark plating, at the boundaries of exposed freeboard and superstructure decks, is not to be less than that given in *Table 11.2.1*.

Table 11.2.1
Thickness of Bulwark Plates

Height of Bulwark	Gross Thickness
1.8m or more	As required for superstructure in the same position
1.0m	6.5mm
Intermediate height	To be determined by linear interpolation

2.1.2.2 Plate bulwarks are to be stiffened by a top rail. Plate bulwarks on the freeboard deck and forecastle deck are to be supported by stays having a spacing generally not greater than 2.0m.

2.1.2.3 The free edge of the stay is to be stiffened.

2.1.2.4 The gross section modulus of stays, $Z_{stay-grs}$, is not to be less than that given below. In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck. Where, at the ends of the ship, the bulwark plating is connected to the sheer strake, a width of attached plating, not exceeding 600mm, may also be included.

$$Z_{stay-grs} = 77 h_{blwk}{}^2 s_{stay} \quad \text{cm}^3$$

Where:

h_{blwk} height of bulwark from the top of the deck plating to the top of the rail, in m

s_{stay} spacing of the stays, in m

2.1.2.5 Where mooring fittings subject the bulwark to large forces, the strength of the stays is to be suitably upgraded.

2.1.2.6 Bulwark stays are to be supported by, or are to be in line with, suitable under deck stiffening. The stiffening is to be connected by double continuous fillet welds in way of bulwark stay connections.

2.1.2.7 Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of openings.

2.1.2.8 Bulwarks are to be adequately strengthened and increased in thickness in way of mooring pipes.

2.1.2.9 Cuts in bulwarks for gangways or other openings are to be kept clear of breaks of superstructures.

2.1.2.10 Where bulwarks are fitted, freeing ports are to be provided as required in *2.1.5*. The freeing ports are to comply with the requirements of the individual Classification Society.

2.1.3 Construction of guard rails

2.1.3.1 Stanchions of guard rails required by *2.1.1.1* are to comply with the following requirements:

(a) fixed, removable or hinged stanchions are to be fitted approximately 1.5m apart

(b) at least every third stanchion is to be supported by a bracket or stay

(c) removable or hinged stanchions are to be capable of being locked in the upright position

(d) in the case of ships with rounded gunwales, the stanchions are to be placed on the flat of the deck

(e) in the case of ships with sheer strake, the stanchions are not to be attached to the sheer strake, upstand or a continuous gutter bar.

2.1.3.2 The size of openings, below the lowest course of rails and the deck or upstand, is to be a maximum of 230mm. The distance between other courses is not to be greater than 380mm.

2.1.3.3 Wire ropes may be accepted, in lieu of guard rails, only in special circumstances and then only in limited lengths. In such cases, they are to be made taut by means of turnbuckles.

2.1.3.4 Chains may be accepted, in lieu of guard rails, only where they are fitted between two fixed stanchions and/or bulwarks.

2.1.4 Additional requirements for bulwarks and guard rails related to spill containment

2.1.4.1 Generally, open guard rails are to be fitted on the upper deck. Plate bulwarks, with a 230mm high continuous opening, at the lower edge, may be accepted provided the arrangement allows for the acceptable handling of spillage on deck and minimises the possibility for accumulation of volatile gas.

2.1.4.2 Deck spills are to be prevented from spreading to the accommodation and service areas and from discharge into the sea by a permanent continuous coaming with a minimum height of 100mm surrounding the cargo deck. Along the sides at the aft end of the cargo deck, the coaming is to have a minimum height of 200mm extending a minimum of 4.5m forward from each corner. At the aft end of the cargo

deck, the coaming is to have a minimum height of 300mm and is to extend from ship-side to ship-side.

2.1.4.3 Where a continuous gutter bar deck coaming is fitted, it is to be constructed of the same material strength and grade as the deck plating to which it is attached.

2.1.4.4 Scupper plugs of mechanical type are to be provided. Means of draining or removing oil or oily water within the coaming are also to be provided.

2.1.5 Additional requirements for deeper loading

2.1.5.1 Ships with Type A or B-100 Freeboard (i.e. a freeboard less than that based on Type B-60) are to have open rails fitted for a minimum of half the length of the exposed parts of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33% of the total area of the bulwark. The freeing area is to be located in the lower part of the bulwark.

2.1.5.2 Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

2.1.5.3 Ships with Type B-60 Freeboard (i.e. a freeboard less than that based on Type B but not less than Type B-60) are to have a minimum freeing area of at least 25% of the total area of the bulwark. The freeing area is to be located in the lower part of the bulwark.

2.2 Tank Access

2.2.1 Access to tanks in the cargo tank region

2.2.1.1 Access to tanks in the cargo tank region is to be in accordance with *Section 5/5*.

2.3 Bow Access

2.3.1 General

2.3.1.1 The ship is to be provided with means to enable the crew to gain safe access to the bow even in severe weather conditions, see *Table 11.2.2*.

Table 11.2.2

Where:

h_{ss} the standard height of a superstructure as defined in *ICLL Regulation 33*

h_{FB} freeboard from the summer load waterline amidships, in m, calculated as a Type A ship, regardless of the type of freeboard actually assigned

a a well lit and ventilated under deck passageway with a clear opening with a minimum width of 0.8m, and a minimum height of 2.0m, providing access to the locations under consideration and located as close as practicable to the freeboard deck

b a permanently constructed gangway fitted at or above the level of the superstructure deck, on or as near as practicable to the centreline of the vessel, providing a continuous platform of a non-slip surface at least 0.6m in width, with a foot-stop and guard rails extending on each side along its length. Guard rails are to be as required in *2.1.3*, except that stanchions are to be fitted with a maximum spacing of 1.5m

c a permanent walkway with a minimum width of 0.6m, fitted at the freeboard deck level, consisting of two rows of guard rails, the stanchions of which, are to have a maximum spacing of 3m. The number of courses of rails and their spacing are to be as given in *2.1.3*. On Type B freeboard ships, hatchway coamings with a height equal to or greater than 0.6m may be regarded as forming one side of the walkway provided that two rows of guard rails are fitted between the hatchways

Table 11.2.2 (Continued)
Acceptable Arrangements for Access

d	a rope lifeline with a minimum diameter of 10mm, supported by stanchions approximately 10m apart, or a single hand rail or wire rope attached to the hatch coamings, continued and adequately supported between hatchways
e	a permanently constructed gangway fitted at or above the level of the superstructure deck on, or as near as practicable, to the centreline of the vessel: • located so as not to hinder easy access across the working areas of the deck • providing a continuous platform with a minimum width of 1.0m • constructed of fire resistant and non-slip material • fitted with guard rails extending on each side throughout its length. Guard rails are to be as required in *2.1.3*, except that stanchions are to be fitted with a maximum spacing of 1.5m • provided with a foot stop on each side • having openings, with ladders to and from the deck, where appropriate. Openings are to be spaced a maximum of 40m apart • having shelters of substantial construction set in way of the gangway at intervals not exceeding 45m, if the length of the exposed deck to be traversed is greater than 70m. Every such shelter is to be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward, port and starboard sides
f	a permanent and efficiently constructed walkway fitted at the freeboard deck level on, or as near as practicable, to the centreline of the vessel, having the same specifications as those defined for a permanent gangway in 'e' above, except for foot-stops. On Type B freeboard ships the hatch coamings may be accepted as forming one side of the walkway, provided that the combined height of the hatch coaming and hatch cover, in the closed condition, is not less than 1m, and that two rows of guard rails are fitted between the hatchways

Note

1. At or near the centreline of the vessel, or fitted on hatchways at or near the centreline of the vessel
2. Fitted on each side of the vessel
3. Fitted on one side of the vessel, provision being made for fitting on either side
4. Fitted on one side only
5. Fitted on each side of the hatchways as near to the centreline as far as practicable
6. In all cases where wire ropes are fitted, adequate devices are to be provided to enable the maintaining of their tautness
7. A means of passage over obstructions, if any, such as pipes or other fittings of a permanent nature is to be provided
8. Generally, the width of the gangway or walkway is not to exceed 1.5m.

Guidance Note

Deviations from some or all of these requirements may be allowed, subject to agreement on a case-by-case basis with the relevant Flag Administration.

3 SUPPORT STRUCTURE AND STRUCTURAL APPENDAGES

3.1 Support Structure for Deck Equipment

3.1.1 General

3.1.1.1 Information pertaining to the support structure of deck equipment and fittings, as listed in *3.1.2* to *3.1.7*, is to be submitted for approval.

3.1.1.2 This sub-section includes scantling requirements for the support structure and foundations of the following pieces of equipment and fittings:

(a) anchor windlasses

(b) anchoring chain stoppers

(c) mooring winches

(d) deck cranes, derricks and lifting masts

(e) emergency towing arrangements

(f) bollards and bitts, fairleads, stand rollers, chocks and capstans

(g) other deck equipment and fittings which are subject to specific approval

(h) miscellaneous deck fittings which are not subject to specific approval.

3.1.1.3 Where deck equipment is subject to multiple load cases, such as an operational load and a green seas load, the operational load and green seas load are be applied independently for the evaluation of strength of foundations and support structure.

3.1.2 Supporting structures for anchoring windlass and chain stopper

3.1.2.1 The windlass is to be efficiently bedded and secured to the deck. The deck thickness in way of the windlass and chain stopper is to be compatible with the deck attachment design.

3.1.2.2 In addition to complying with the requirements of *3.1.2.6*, the shipbuilder and the windlass manufacturer are to satisfy themselves that the foundation is suitable for the safe operation and maintenance of the windlass equipment.

3.1.2.3 The Breaking Strength is defined as the minimum breaking strength of the chain.

3.1.2.4 The following plans and information are to be submitted for approval:

(a) details of the supporting structure for the anchor windlass

(b) details of the windlass foundation design, including material specifications for holding down bolts and the connection of the foundation to the deck

(c) details of the chain stopper foundation design, including material specification and the connection of the foundation to the deck.

3.1.2.5 The following supporting information is also to be submitted:

(a) general arrangement drawing of anchoring equipment.

(b) design loads as specified in *3.1.2.8* and *3.1.2.9* and associated reaction forces applied to the foundation and supporting structure.

3.1.2.6 The scantlings of the support structure are to be dimensioned to ensure that for each of the load scenarios specified in *3.1.2.8* and *3.1.2.9*, the calculated stresses in the support structure does not exceed the permissible stress levels given in *3.1.2.15* to *3.1.2.18*.

3.1.2.7 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using gross scantlings.

3.1.2.8 The following load cases are to be examined for the anchoring operation, as appropriate:

(a) windlass where chain stopper is provided: 45% of Breaking Strength

(b) windlass where chain stopper is not provided: 80% of Breaking Strength

(c) chain stopper: 80% of Breaking Strength

Breaking Strength is defined in 3*.1.2.3*.

3.1.2.9 The following forces are to be applied separately in the load cases that are to be examined for the design loads due to green seas in the forward 0.25*L*, see *Figure 11.3.1*:

$P_x = 200 A_x$ kN, acting normal to the shaft axis

$P_y = 150 A_y f$ kN, acting parallel to the shaft axis (inboard and outboard directions to be examined separately)

Where:

A_x projected frontal area, in m^2

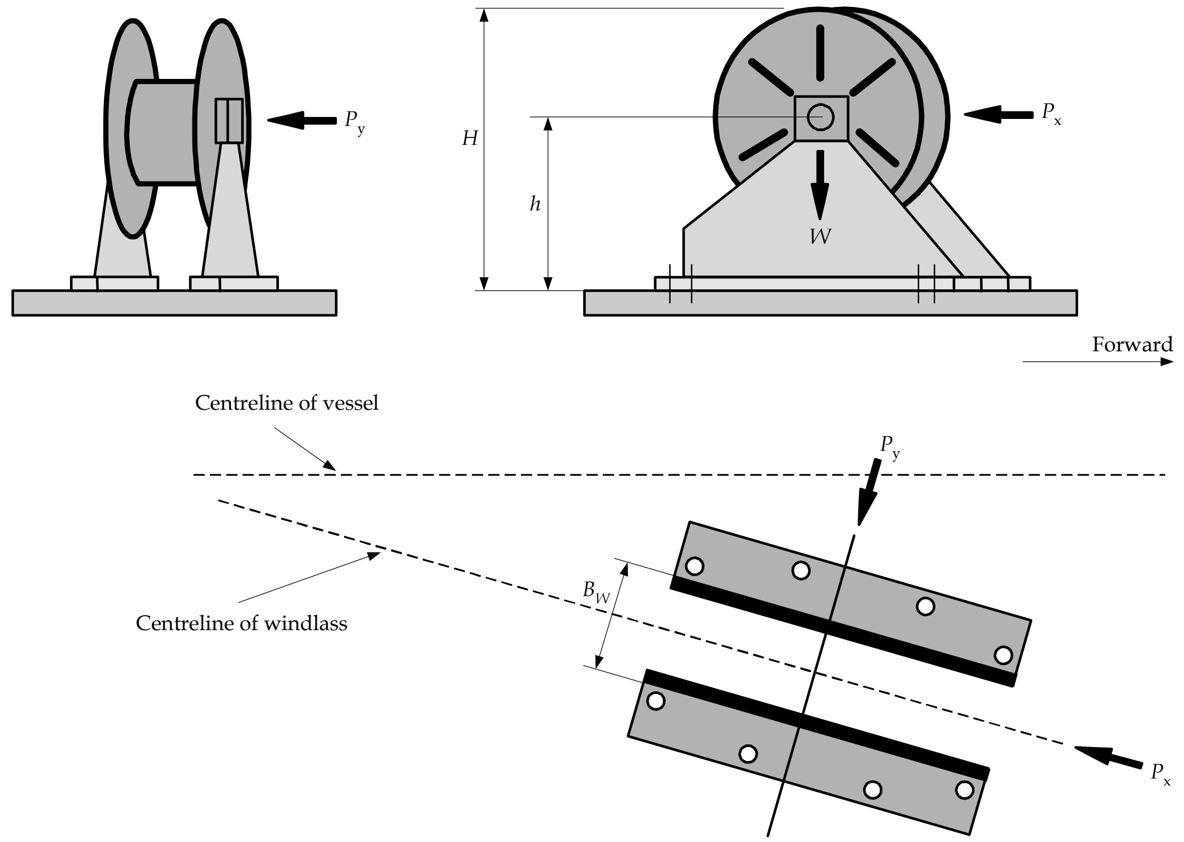
A_y projected side area, in m^2

f $= 1 + B_W/H$, but not to be taken greater than 2.5

B_W breadth of windlass measured parallel to the shaft axis, in m. See *Figure 11.3.1*

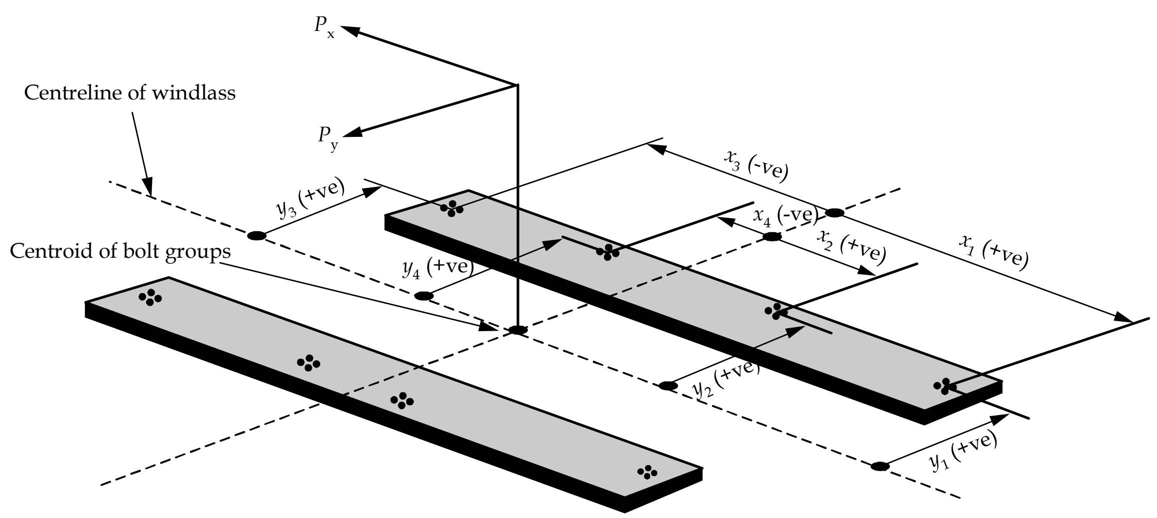
H overall height of windlass, in m, see *Figure 11.3.1*

Figure 11.3.1
Direction of Forces and Weight



3.1.2.10 Forces resulting from green sea design loads in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by a number of bolt groups, N, each containing one or more bolts. See *Figure 11.3.2*.

Figure 11.3.2
Bolting Arrangements and Sign Conventions



3.1.2.11 The axial forces, R_{xi} and R_{yi}, in bolt group (or bolt) i, positive in tension, are given by:

$$R_{xi} = P_x h x_i A_i / I_x$$

$$R_{yi} = P_y h y_i A_i / I_y$$

$$R_i = R_{xi} + R_{yi} - R_{si}$$

Where:

P_x	force acting normal to the shaft axis, in kN
P_y	force acting parallel to the shaft axis, either inboard or outboard, whichever gives the greater force in bolt group *i*, in kN
h	shaft centre height above the windlass mounting, in cm, see *Figure 11.3.1*
x_i, y_i	x and y coordinates of bolt group *i* from the centroid of all *N* bolt groups, in cm. Positive in the direction opposite to that of the applied force
A_i	cross sectional area of all bolts in group *i*, in cm^2
I_x	$= \Sigma A_i\, x_i^2$ for *N* bolt groups, in cm^4
I_y	$= \Sigma A_i\, y_i^2$ for *N* bolt groups, in cm^4
R_{si}	static reaction at bolt group *i*, due to the weight of windlass, in kN

3.1.2.12 The shear forces, F_{xi} and F_{yi}, applied to the bolt group *i*, and the resultant combined force F_i, are given by:

$$F_{xi} = (P_x - C_1 gm)/N$$

$$F_{yi} = (P_y - C_1 gm)/N$$

$$F_i = \sqrt{F_{xi}^{\,2} + F_{yi}^{\,2}}$$

Where:

C_1	coefficient of friction, 0.5
m	mass of windlass, in tonnes
g	acceleration due to gravity, 9.81m/s2
N	number of bolt groups

3.1.2.13 The resultant forces from the application of the loads specified in *3.1.2.8* and *3.1.2.9* are to be considered in the design of the supporting structure.

3.1.2.14 Where a separate foundation is provided for the windlass brake, the distribution of resultant forces is to be calculated on the assumption that the brake is applied for load cases *(a)* and *(b)* defined in *3.1.2.8*.

3.1.2.15 The stresses resulting from anchoring design loads induced in the supporting structure are not to be greater than the permissible values given below, based on the gross thickness of the structure:

Normal stress 1.00 σ_{yd}

Shear stress 0.58 σ_{yd}

Where:

σ_{yd}	specified minimum yield stress of the material, in N/mm^2

Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.2.16 The tensile axial stresses resulting from green sea design loads in the individual bolts in each bolt group *i* are not to exceed 50% of the bolt proof strength under the above forces. The load is to be applied in the direction of the chain. Where fitted bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses are not to exceed 50% of the bolt proof strength.

3.1.2.17 The horizontal forces resulting from the green sea design loads F_{xi} and F_{yi} may be reacted by shear chocks. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculation.

3.1.2.18 The stresses resulting from green sea design loads induced in the supporting structure are not to be greater than the permissible values given below, based on the gross thickness of the structure:

Normal stress 1.00 σ_{yd}

Shear stress 0.58 σ_{yd}

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.3 Supporting structure for mooring winches

3.1.3.1 Mooring winches are to be efficiently bedded and secured to the deck. The deck thickness in way of mooring winches is to be compatible with the deck attachment design.

3.1.3.2 In addition to complying with the requirements of *3.1.3.6*, the shipbuilder and mooring winch manufacturer are to satisfy themselves that the foundation is suitable for the safe operation and maintenance of the mooring winch equipment.

3.1.3.3 The Rated Pull is defined as the maximum load which the mooring winch is designed to exert during operation and is to be stated on the mooring winch foundation/support plan.

3.1.3.4 The Holding Load is defined as the maximum load which the mooring winch is designed to resist during operation and is to be taken as the design brake holding load or equivalent and is to be stated on the mooring winch foundation/support plan.

3.1.3.5 The following plans and information are to be submitted for approval:

(a) details of the supporting structure for mooring winches

(b) details of the mooring winch foundation design, including material specifications for hold down bolts and the connection of the foundation to the deck

(c) design loads as specified in *3.1.3.8* and *3.1.3.9* and associated reaction forces applied to the foundation and supporting structure.

3.1.3.6 The scantlings of the support structure are to be dimensioned to ensure that, for each of the load cases specified in *3.1.3.8* and *3.1.3.9*, the calculated stresses in the

support structure do not exceed the permissible stress levels specified in *3.1.3.13* and *3.1.3.14*, respectively.

3.1.3.7 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using net scantlings.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.3.8 Each of the following load cases are to be examined for design loads due to mooring operation:

(a) mooring winch at maximum pull:	100% of the rated pull
(b) mooring winch with brake effective:	100% of the holding load
(c) line strength:	125% of the breaking strength of the mooring line (hawser) required by *Table 11.4.2* for the ship's corresponding equipment number

Rated pull and holding load are defined in *3.1.3.3* and *3.1.3.4*. The design load is to be applied through the mooring line according to the arrangement shown on the mooring arrangement plan.

3.1.3.9 For mooring winches situated within the forward 0.25*L*, the load cases for green seas are to be applied as indicated in *3.1.2.9*.

3.1.3.10 For mooring winches situated within the forward 0.25*L*, the resultant forces in the bolts obtained from green sea design loads are to be calculated in accordance with *3.1.2.10* to *3.1.2.12*.

3.1.3.11 The resultant forces from the application of the loads specified in *3.1.3.8* and *3.1.3.9* are to be considered in the design of the supporting structure.

3.1.3.12 Where a separate foundation is provided for the mooring winch brake, the distribution of resultant forces is to take account of the different load path. The brake is only to be considered in relation to the forces in *3.1.3.8*, load case *(b)*.

3.1.3.13 The stresses resulting from mooring operation design loads, induced in the supporting structure, are not to exceed those given in *3.1.2.15*.

3.1.3.14 For mooring winches situated within the forward 0.25*L*, the stresses resulting from green sea design loads, induced in the bolts and supporting structure, are not to exceed values indicated in *3.1.2.16* through *3.1.2.18*.

3.1.4 Supporting structure for cranes, derricks and lifting masts

3.1.4.1 Support structures of cranes, derricks and lifting masts with a Safe Working Load greater than 30kN, or a maximum overturning moment to the supporting structure greater than 100kNm, are to comply with the following requirements.

3.1.4.2 These requirements apply to the connection to the deck and the supporting structure of cranes, derricks and lifting masts. Where the crane, derrick or lifting mast is to be certified by the Classification Society, additional requirements may be applied by the individual Society.

3.1.4.3 These requirements do not cover the following items:

(a) supports of lifting appliances for personnel or passengers, see *3.1.7.5*

(b) the structure of the lifting appliance pedestals or post above the area of the deck connection

(c) holding down bolts and their arrangement, which are considered part of the lifting appliance.

3.1.4.4 The term, Lifting Appliance, is defined as a crane, derrick or lifting mast.

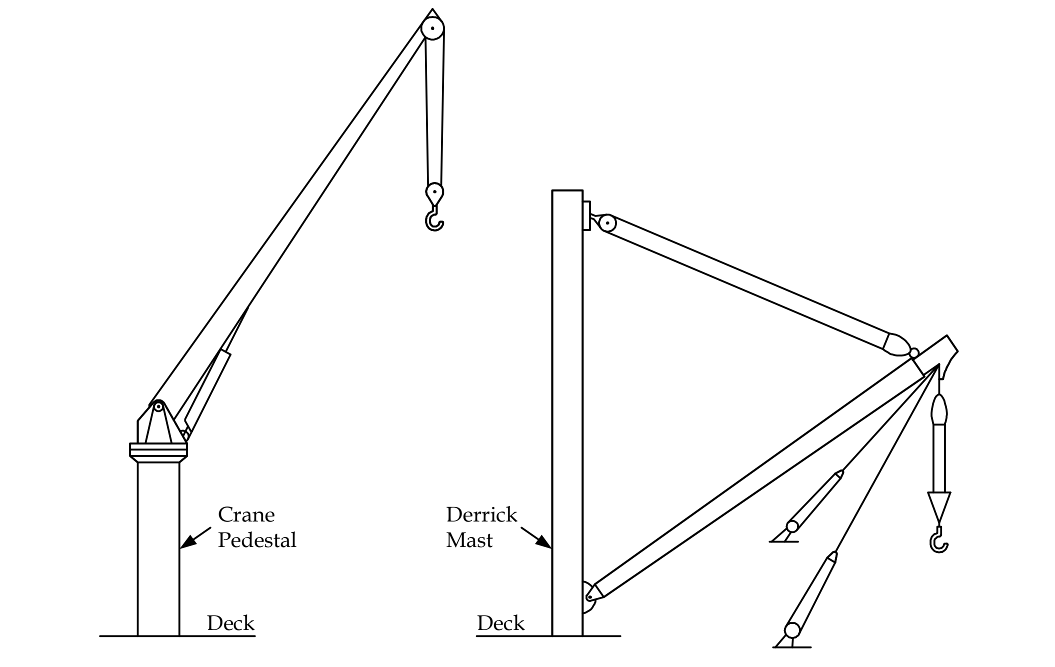
3.1.4.5 The Safe Working Load is defined as the maximum load which the lifting appliance is certified to lift at any specified outreach.

3.1.4.6 The Self Weight is the calculated gross self weight of the lifting appliance, including the weight of any lifting gear.

3.1.4.7 The Overturning Moment is the maximum bending moment, calculated at the connection of the lifting appliance to the ship structure, due to the lifting appliance operating at Safe Working Load, taking into account outreach and self weight.

3.1.4.8 The Crane Pedestal and Derrick Mast are as defined in *Figure 11.3.3*.

Figure 11.3.3
Crane Pedestal and Derrick Mast



3.1.4.9 The following plans and information are to be submitted for approval:

(a) details of the supporting structure of the lifting appliance, including its connection of the deck

(b) details of the Safe Working Load, self weight, vertical reaction forces and the maximum overturning moment in the supporting structure of the lifting appliance

(c) for offshore operation, the maximum sea state in which the lifting appliance is to be used.

3.1.4.10 The following supporting information is also to be submitted:

(a) a general arrangement drawing of the crane/derrick/lifting mast.

3.1.4.11 Deck plating and under deck structure is to provide adequate support for derrick masts against the calculated vertical loads and maximum overturning moment. Where the deck is penetrated, the deck plating is to be suitably strengthened.

3.1.4.12 Deck plating and under deck structure is to provide adequate support for crane pedestals against the calculated vertical loads and maximum overturning moment.

3.1.4.13 In general, structural continuity of the deck structure is to be maintained and deep under-deck members are to be provided to support the crane pedestal.

3.1.4.14 Depending on the arrangement of the deck connection in way of crane pedestals, the following additional requirements are to be complied with:

(a) where the pedestal is directly connected to the deck, without above deck brackets, adequate under deck structure directly in line with the crane pedestal is to be provided. Where the crane pedestal is attached to the deck without bracketing or where the crane pedestal is not continuous through the deck, welding to the deck of the crane pedestal and its under deck support structure is to be made by suitable full penetration welding. This could include a deep penetration welding procedure with a maximum root face of 3mm provided this results in full penetration and consequently enable ultrasonic lamination testing after welding has been completed. The design of the weld connection is to be adequate for the calculated stress in the welded connection, in accordance with *3.1.4.21*.

(b) where the pedestal is directly connected to the deck with brackets, under deck support structure is to be fitted to ensure a satisfactory transmission of the load, and to avoid structural hard spots. Above deck brackets may be fitted inside or outside of the pedestal and are to be aligned with deck girders and webs. The design is to avoid stress concentrations caused by an abrupt change of section. Brackets and other direct load carrying structure and under deck support structure are to be welded to the deck by suitable full penetration welding. This could include a deep penetration welding procedure with a maximum root face of 3mm provided this results in full penetration and consequently enables ultrasonic lamination testing after welding has been completed. The design of the connection is to be adequate for the calculated stress, in accordance with *3.1.4.21*.

(RCN 1, effective from 1 April 2007)

3.1.4.15 Deck plates are to be of a thickness and material strength compatible with the crane pedestal. Where necessary, a thicker insert plate is to be fitted. In no case are doublers to be used where structures are subject to tension.

3.1.4.16 The scantlings of the support structure are to be dimensioned to ensure that for the load cases specified in *3.1.4.18* and *3.1.4.19*, the calculated stresses in the support structure do not exceed those given in *3.1.4.21*.

3.1.4.17 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or beam element finite-element analysis using gross scantlings.

3.1.4.18 For lifting appliances which are limited to use in harbour, the following load scenario is to be examined:

(a) 130% of the Safe Working Load added to the lifting appliances self weight.

3.1.4.19 For lifting appliances which may be used for offshore operations the following is to be submitted for approval purposes:

(a) the maximum sea state in which the lifting appliance is to be used

(b) the worst case vertical and horizontal accelerations

(c) the worst case wind loadings for the specified design sea state and wind environment.

The load scenario to be examined is to account for these environmental loads. As a minimum, the following load scenario is to be examined:

(a) 150% of the Safe Working Load added to the lifting appliances self weight.

When a crane cab is fitted above the slewing ring, the load scenario is to be specially considered.

3.1.4.20 The vertical reaction force and maximum overturning moment, corresponding to the design loads specified in *3.1.4.18* and *3.1.4.19*, are to be calculated and used in the assessment of the structure.

3.1.4.21 The stresses induced in the supporting structure are not to exceed the permissible values given below, based on the gross thickness of the structure:

Normal stress 0.67 σ_{yd}

Shear stress 0.39 σ_{yd}

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.4.22 The capability of the supporting structure to resist buckling failure is also to be assured.

3.1.5 Supporting structures for components used in emergency towing arrangements on tankers

3.1.5.1 Tankers having a deadweight of greater than or equal to 20 000tonnes are to be fitted with an emergency towing arrangement at both ends, complying with *Maritime Safety Committee Resolution MSC 35(63)*.

3.1.5.2 The Safe Working Load of emergency towing arrangements is as specified in *IMO Resolution MSC 35(63)*, as follows:

(a) 1000kN for vessels having a deadweight greater than or equal to 20000tonnes, but less than 50 000tonnes

(b) 2000kN for vessels having a deadweight greater than or equal to 50000tonnes.

3.1.5.3 The following plans are to be submitted for approval:

(a) details of the supporting structure for the emergency towing arrangement, including the connection to the deck.

3.1.5.4 The following supporting information is also to be submitted:

(a) details of the emergency towing arrangement showing sufficient detail to enable the position and direction of load actions to be ascertained.

3.1.5.5 The deck in way of strong-points and fairleads is to have a minimum gross thickness of 15mm.

3.1.5.6 The structural arrangement is to provide continuity of strength.

3.1.5.7 The structural arrangement of the ship's structure in way of the emergency towing equipment is to be such that, abrupt changes of shape or section are to be avoided in

order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in high stress areas.

3.1.5.8 The scantlings of the support structure are to be dimensioned to ensure that for the load cases specified in *3.1.5.10* and *3.1.5.11*, the calculated stresses in the support structure do not exceed the permissible stress levels specified in *3.1.5.12*.

3.1.5.9 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using gross scantlings.

3.1.5.10 The design load for the connection of the strong-point and fittings to the deck and its supporting structure is to be taken as twice the Safe Working Load.

3.1.5.11 The assessment of the structure is to consider lines of action of the applied design load, taking into account the particular arrangements proposed. See *IMO MSC 35(63)*.

3.1.5.12 For the design load specified in *3.1.5.10* and *3.1.5.11* the stresses induced in the supporting structure and welds, in way of strong-points and fairleads, are not to exceed the permissible values given below based on the gross thickness of the structure:

Normal stress 1.00 σ_{yd}

Shear stress 0.58 σ_{yd}

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.5.13 The capability of the structure to resist buckling failure is also to be assured.

3.1.6 Supporting structure for bollards and bitts, fairleads, stand rollers, chocks and capstans

3.1.6.1 In general, shipboard fittings (bollards and bitts, fairleads, stand rollers and chocks) and capstans used for mooring, and towing (other than as specified in *3.1.5*) of the vessel are to be fitted to the deck or bulwark structures using a purpose designed base or attachment.

3.1.6.2 The attachment of shipboard fittings to sheer strakes or sheer strake upstands is to be avoided, as required by *Sections 8/2.2.5.2* and *Section 8/2.2.5.3*.

3.1.6.3 Where fairleads are fitted in bulwarks and the imposed loads from mooring or towing lines are high, the thickness of bulwarks may need to be increased. See also *2.1.2*.

3.1.6.4 The following plans are to be submitted for approval:

(a) details of the supporting structure for the shipboard fitting and capstan arrangements, including the connection of shipboard fittings and their seats to the deck.

3.1.6.5 The following supporting information is also to be submitted:

(a) details of the shipboard fittings and capstans including the Safe Working Load of shipboard fittings and arrangements showing sufficient detail to enable the position and direction of load actions to be ascertained.

3.1.6.6 The structural arrangement is to provide continuity of strength.

3.1.6.7 The structural arrangement of the ship's structure in way of the shipboard fittings and their seats and in way of capstans is to be such that, abrupt changes of shape or section are to be avoided in order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in high stress areas.

3.1.6.8 The scantlings of the support structure are to be dimensioned to ensure that for the loads specified in *3.1.6.10, 3.1.6.11* and *3.1.6.12*, the calculated stresses in the support structure do not exceed the permissible stress levels specified in *3.1.6.13*.

3.1.6.9 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using net scantlings. The required gross thickness is obtained by adding the relevant full corrosion addition specified in *Section 6/3* to the required net thickness.

3.1.6.10 The design load for the connection of shipboard fittings and their seats to the deck and its supporting structure is to be based on the line load as the greater of the following requirements, as applicable for the particular fitting and its intended use:

(a) in the case of normal towing in harbour or manoeuvring operations, 125% of the maximum towline load as indicated on the towing and mooring arrangement plan, or

(b) in the case of towing service other than that experienced in harbour or manoeuvring operations, such as escort service, the nominal breaking strength of towline according to *Table 11.4.2* for the ship's corresponding equipment number, or

(c) in the case of mooring operations 125% of the nominal breaking strength of the mooring line (hawser) or towline according to *Table 11.4.2* for the ship's corresponding equipment number.

3.1.6.11 The design load for the supporting structure for capstans is to be based the following:

(a) 125% of the maximum hauling in force.

3.1.6.12 The assessment of the structure is to consider lines of action of the applied design load, taking into account the particular arrangements proposed, however, the total load applied for towing and mooring scenarios described in *3.1.6.10* need not be more than twice the design load on the mooring line or towline. The acting point for the force on the shipboard fittings is to be taken as the attachment point of the mooring line or towline, or at a change in its direction.

3.1.6.13 For the design load specified in *3.1.6.10, 3.1.6.11* and *3.1.6.12* the stresses induced in the supporting structure and welds are not to exceed the permissible values given below based on the net thickness of the structure. The required gross thickness is obtained by adding the relevant full corrosion addition specified in *Section 6/3* to the required net thickness.

Normal stress $1.00\ \sigma_{yd}$

Shear stress $0.60\ \sigma_{yd}$

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

RCN 2 to July 2008 version (effective from 1 July 2010)

3.1.6.14 The capability of the structure to resist buckling failure is also to be assured.

3.1.6.15 The following requirements on Safe Working Load apply for a single post basis (no more than one turn of one cable).

(a) The Safe Working Load used for normal towing operations (e.g., harbour/manoeuvring is not to exceed 80% of the design load per *3.1.6.10(a)* and the Safe Working Load used for other towing operations (e.g., escort) is not to exceed the design load per *3.1.6.10(b)*. For deck fittings used for both normal and other towing operations, the greater of the design loads of *3.1.6.10(a)* and *3.1.6.10(b)* is to be used.

(b) The Safe Working Load for mooring operations is not to exceed 80% of the design load per *3.1.6.10(c)*.

(c) The Safe Working Load of each deck fitting is to be marked (by weld bead or equivalent) on the deck fittings used for towing and/or mooring.

(d) The towing and mooring arrangements plan mentioned in 3.1.6.16 is to define the method of use of towing lines and/or mooring lines.

3.1.6.16 The Safe Working Load for the intended use for each deck fitting is to be noted in the towing and mooring arrangements plan available on board for the guidance of the Master. Information provided on the plan is to include in respect of each deck fitting:

(a) Location on the ship;

(b) Fitting type;

(c) SWL;

(d) Purpose (mooring/harbour towing/escort towing); and

(e) Manner of applying towing or mooring line load including limiting fleet angles.

This information is to be incorporated into the pilot card in order to provide the pilot proper information on harbour/escorting operations.

3.1.7 Supporting structures for other deck equipment or fittings which are subject to specific approval

3.1.7.1 The following requirements relate to other items of deck equipment which are not covered by *3.1.2* to *3.1.6*. The scantlings and arrangements of support structure for such items are to be in accordance with the following requirements and the additional requirements of the individual Classification Society.

3.1.7.2 The support structure of items not mentioned in this sub-section will be independently considered by the individual Classification Society.

3.1.7.3 The following details are to be submitted for approval. They may be indicated separately or may be included on the main structural drawings:

(a) plans showing the supporting structure for deck equipment/fittings

(b) details of the loads imposed on the structure by the deck equipment/fittings.

3.1.7.4 The support structure is to be arranged in order to resist both in-plane and out-of-plane loads acting on the deck structure.

3.1.7.5 Support for lifting appliances for personnel is to be provided as follows:

(a) in general, lifesaving appliances (lifeboats, life-rafts and rescue boats) are to be stowed on a purpose built cradle, seat or deployment appliance. The design load imposed on the ship structure is to be established by the supplier of the lifesaving appliance

(b) the support structure is to be adequate for the design loads. Local stiffening and a local increase in plating thickness is to be provided. Deep supporting members may be required. Additional National and International Regulations are to be applied, where applicable

(c) support structure for crew lifts is to be provided in way of the anchor points of lift operating equipment

(d) support structure for boarding (accommodation) ladders is to be provided in way of the anchor points of accommodation ladders.

3.1.7.6 Support for mast structures fitted with navigation aids is to be provided as follows:

(a) adequate primary support members for the mast are to be arranged in the form of bulkheads, deep beams or girders. Such members are to be arranged below or close to the mast structure

(b) in order to transmit the loads from the mast structure to the primary support members, under-deck stiffening members are to be arranged below the mast structure forming the attachment of the mast to the deck

(c) the deck thickness may be required to be increased to provide an adequate thickness for the weld attachments.

3.1.7.7 Supporting structure for breakwaters is to be designed to withstand the same design load as the breakwater itself. It is to be suitable for transmitting the loads from the breakwater into the primary supporting members of the ship. Efficient under-deck stiffening is to be provided in way of the breakwater structure that forms the deck connection.

3.1.8 Support and attachment of miscellaneous deck fittings which are not subject to specific approval

3.1.8.1 The following general requirements are to be considered in the design of the support and attachment of miscellaneous fittings which impose relatively small loads on the ship's structure and are not subject to specific approval. The arrangements of such details do not require the approval of plans by the Classification Society.

3.1.8.2 Support positions are to be arranged so that the attachment to the ship structure is clear of deck openings and stress concentrations, such as the toes of end brackets. Design of supports is to be such that the attachment to the deck minimises the creation of hard points.

3.1.8.3 A cargo manifold support is a self-contained, fabricated assembly designed to support the main pipework used for loading and unloading the ship. The design of the cargo manifold support is to be such as to distribute the loads imposed on the pipework during loading and unloading into the ship structure. To achieve this, the connection of the cargo manifold support to the deck is normally to be arranged to align with stiffening members of the main hull structure. Where this is impracticable, additional stiffening is to be fitted in order to avoid the creation of hard points. Attention is to be paid to the detail design of the structure forming the deck attachment in order to minimise the effects of change of section.

3.2 Docking

3.2.1 Docking arrangements

3.2.1.1 The drydocking arrangement itself is not covered explicitly in these Rules.

3.2.1.2 The structure of bottom girders is to be sufficiently stiffened to withstand the forces imposed by drydocking the ship.

3.2.1.3 For ships of unusual form, or where the Owner of the vessel has specific requirements for docking strength, the builder may need to carry out additional calculations. Such calculations are outside of the scope of Classification, but may be reviewed upon request.

3.2.2 Docking plan

3.2.2.1 It is recommended that consideration be given to providing a docking plan for a vessel. The docking plan is to indicate any and all assumptions made during the design, including but not limited to, the arrangement of docking blocks, the maximum permissible loading during docking and the corresponding load at each block.

3.2.2.2 The docking plan does not require approval by the Society as a condition of Classification.

Guidance Note:

1. It is recommended that bottom plugs are not fitted in way of the keel plate.

3.3 Bilge Keels

3.3.1 Construction and materials

3.3.1.1 The bilge keel is to be of the same material tensile properties as the bilge strake to which it is attached.

3.3.1.2 Bilge keels of a different design, from that shown in *Figure 11.3.4*, will be specially considered.

3.3.1.3 A plan of all bilge keels is to be submitted for the approval of the material strength and grades, welded connections and detail design.

3.3.1.4 The design of single web bilge keels is to ensure that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of the bilge keel does not exceed that of the ground bar.

3.3.2 Ground bars

3.3.2.1 Bilge keels, where fitted, are to be attached to the shell by a ground bar, or doubler, as shown in *Figures 11.3.4* and *11.3.5*. In general, the ground bar is to be continuous.

3.3.2.2 The gross thickness of the ground bar is not to be less than the gross thickness of the bilge strake or 14mm, whichever is the lesser.

3.3.2.3 The ground bar is to be of the same material strength as the bilge strake to which it is attached and constructed of the steel grade given in *Section 6/1.2, Tables 6.1.2* and *6.1.3* for bilge strakes.

3.3.3 End details

3.3.3.1 The ends of the bilge keel are to be suitably tapered and are to terminate on an internal stiffening member. Typical arrangements complying with the requirements of this subsection are shown in *Figure 11.3.5*. Alternative end arrangements will be accepted, provided that they are considered equivalent.

3.3.3.2 The ground bar and bilge keel ends are to be tapered or rounded. Where the ends are tapered, the tapers are to be gradual with a minimum ratio of 3:1. See *Figures*

11.3.5(a), *11.3.5(b)*, *11.3.5(d)* and *11.3.5(e)*. Where the ends are rounded, details are to be as shown in *Figure 11.3.5(c)*. Cut outs on the bilge keel web, within zone 'A', see *Figures 11.3.5(b)* and *11.3.5(e)*, are not permitted.

3.3.3.3 The end of the bilge keel web is to be not less than 50mm and not greater than 100mm from the end of the ground bar. See *Figures 11.3.5(a)* and *11.3.5(d)*.

3.3.3.4 An internal transverse support member is to be positioned between the end of the bilge keel web and the halfway point between the end of the bilge keel web and the end of the ground bar. See *Figures 11.3.5(a), 11.3.5(b)* and *11.3.5(c)*.

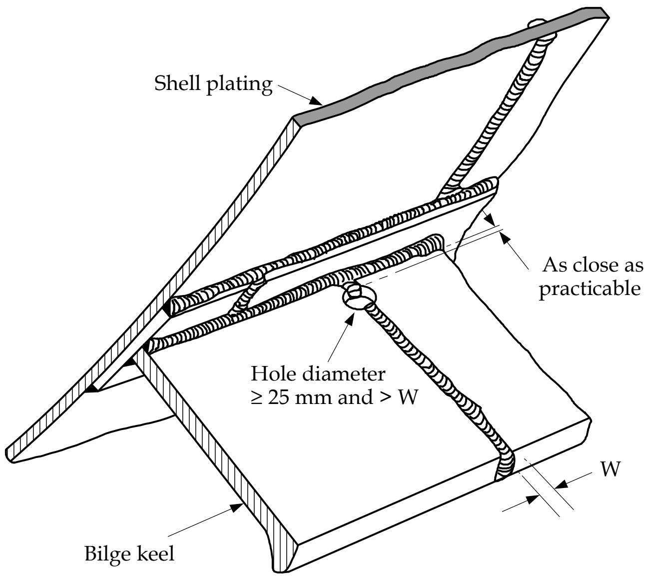
3.3.3.5 Where an internal longitudinal stiffener is fitted in line with the bilge keel web, the longitudinal stiffener is to extend to at least the nearest transverse member forward and aft of zone 'A'. See *Figures 11.3.5(b)* and *11.3.5(e)*. In this case, the requirement in *3.3.3.4* relating to the internal transverse support does not apply.

3.3.4 Welding

3.3.4.1 The ground bar is to be connected to the shell with a continuous fillet weld, and the bilge keel to the ground bar with a light continuous fillet weld, in accordance with *Table 11.3.1*.

3.3.4.2 Butt welds, in the bilge keel and ground bar, are to be well clear of each other and of butts in the shell plating. In general, shell butts are to be flush in way of the ground bar and ground bar butts are to be flush in way of the bilge keel. Direct connection between ground bar butt welds and shell plating, and between bilge keel butt welds and ground bar is to be avoided.

Figure 11.3.4
Bilge Keel Construction



3.3.4.3 In general, scallops and cut-outs are not to be used. Crack arresting holes are to be drilled in the bilge keel butt welds as close as practicable to the ground bar. The diameter of hole is to be greater than the width of the butt weld and is to be a minimum of 25mm in diameter, as illustrated in *Figure 11.3.4*. Where the butt weld has been subject to non-destructive examination, the crack arresting hole may be omitted.

3.3.4.4 Welds at the end of the ground bar and shell plating, and at the end of the bilge keel web and ground bar connection, within Zone 'B', see *Figures 11.3.5(a)* and *11.3.5(d)* are to have a throat thickness as given in *Table 11.3.1* for "At ends". The toes of these welds are to be ground to blend them smoothly with the base materials.

Bilge Keel End Design

Table 11.3.1
Welding Requirements for End Connections of Bilge Keels

Structural items being joined	Throat thickness, in mm	
	At ends	Elsewhere
Ground bar to shell	0.44 t_{grs}	0.34 t_{grs}
Bilge keel web to ground bar	0.34 t_{grs}	0.21 t_{grs}
Where: t_{grs} gross thickness of the item being attached, in mm		

4 EQUIPMENT

4.1 Equipment Number Calculation

4.1.1 Requirements

4.1.1.1 Anchors and chains are to be in accordance with *Table 11.4.1* and the quantity, mass and sizes of these are to be determined by the equipment number (EN), given by:

$$EN = \Delta^{2/3} + 2Bh_{dk} + 0.1A$$

Where:

Δ	moulded displacement, in tonnes, as defined in *Section 4/1.1.7.1*
B	moulded breadth, in m, as defined in *Section 4/1.1.3.1*
h_{dk}	$h_{FB} + h_1 + h_2 + h_3 + \ldots$, as shown in *Figure 11.4.1*. In the calculation of h, sheer, camber and trim may be neglected
h_{FB}	freeboard from the summer load waterline amidships, in m
$h_1, h_2, h_3 \ldots h_n$	height on the centreline of each tier of houses having a breadth greater than $B/4$, in m
A	profile area of the hull, superstructure and houses above the summer load waterline which are within the length L, in m^2. Superstructures or deck houses having a breadth equal to or less than $B/4$ at any point may be excluded. With regard to determining A, when a screen or bulwark is more than 1.5m high, the area shown in *Figure 11.4.2* as A_2 is to be included in A
L	rule length, as defined in *Section 4/1.1.1.1*

Notes

(a) Screens or bulwarks 1.5 m or more in height are to be regarded as parts of houses when determining h and A.

(b) If a house having a breadth greater than B/4 is above a house with a breadth of B/4 or less then the wide house is to be included but the narrow house ignored.

RCN 1 to July 2010 version (effective from 1 July 2012)

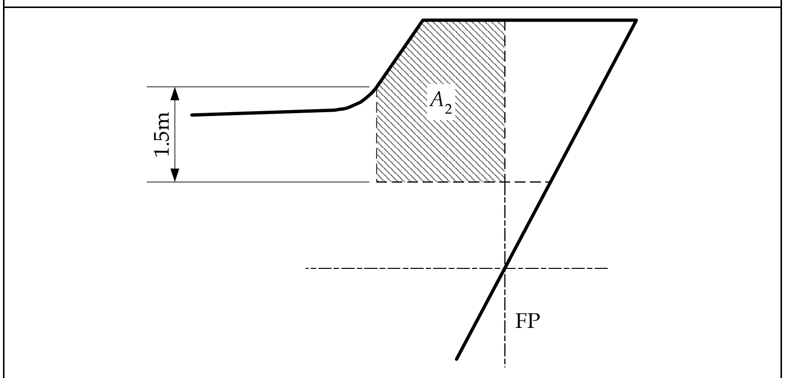
Profile Areas of Screens and Bulwarks



4.2 Anchors and Mooring Equipment

4.2.1 General

4.2.1.1 The following anchoring equipment specification is intended for temporary mooring of a vessel within a harbour or sheltered area when the vessel is awaiting berth, tide, etc.

4.2.2 Limitations

4.2.2.1 The equipment specified is not intended to be adequate to hold a ship off fully exposed coasts in rough weather or to stop a ship that is moving or drifting. In such a condition, the loads on the anchoring equipment increase to such a degree that its components may be damaged or lost.

4.2.2.2 The anchoring equipment specified is intended to hold a ship in good holding ground in conditions such as to avoid dragging of the anchor. In poor holding ground, the ability of the anchors to hold the ship will be significantly reduced.

4.2.3 Assumptions

4.2.3.1 The Equipment Number (*EN*) formula for the required anchoring equipment is based on an assumed current speed of 2.5m/s, wind speed of 25m/s and a scope of chain cable between 6 and 10. The scope of chain cable is defined as the ratio between the length of chain paid out and the waters depth.

4.2.3.2 It is assumed that under normal circumstances a ship will use only one bow anchor and chain cable at a time.

4.2.4 Documentation

4.2.4.1 The following plans and particulars are to be submitted for approval:

(a) equipment number calculations

(b) list of equipment including type of anchor, grade of anchor chain, type and breaking load of steel and fibre ropes

(c) anchor design, if different from standard or previously approved anchor types, including material specification

(d) windlass design; including material specifications for cable lifters, shafts, couplings and brakes

(e) chain stopper design and material specification

(f) emergency towing, towing and mooring arrangement plans and applicable Safe Working Load data, and other information related to emergency towing and mooring arrangements that will be available onboard the ship for the guidance of the Master.

4.2.5 Anchors

4.2.5.1 Two bower anchors are to be connected to chain cable and stowed in position ready for use.

4.2.5.2 A third anchor is recommended to be provided as a spare bower anchor and is listed for guidance only; it is not required as a condition of classification.

4.2.5.3 Anchors are to be of an approved design. The design of anchor heads is to be such as to minimize stress concentrations. In particular, the radii, on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.

4.2.5.4 The mass per anchor of bower anchors given in *Table 11.4.1* is for anchors of equal mass. The mass of individual anchors may vary 7% above or below the tabulated value, provided that the combined mass of all anchors is not less than that required for anchors of equal mass.

4.2.6 Ordinary anchors

4.2.6.1 Anchors are to be of the stockless type. The mass of the head of a stockless anchor, including pins and fittings, is not to be less than 60% of the total mass of the anchor.

4.2.7 High holding power anchors

4.2.7.1 Where agreed by the Owner, consideration will be given to the use of special types of anchors. Where these are of a proven increased holding ability, consideration may also be given to some reduction in the basic requirement of anchor mass, up to a maximum of 25 percent from the mass specified in *Table 11.4.1*.

4.2.7.2 An anchor for which approval is sought as a high holding power (HHP) anchor is to be tested at sea to show that it has a holding power of twice that approved for a standard stockless anchor of the same mass.

4.2.7.3 If approval is sought for a range of sizes then at least two are to be tested. The smaller of the two anchors is to have a mass not less than one-tenth of that of the larger anchor. The larger of the two anchors tested is to have a mass not less than one-tenth of that of the largest anchor for which approval is sought.

4.2.7.4 Each test is to comprise a comparison between at least two anchors, one ordinary stockless bower anchor and one HHP anchor. The masses of the anchors are to be approximately equal.

4.2.7.5 The tests are to be conducted on at least three different types of bottom, which may be soft mud or silt, sand or gravel, and hard clay or similarly compacted material.

4.2.7.6 The tests are generally to be carried out by means of a tug. The pull is to be measured by a dynamometer or determined from recently verified data of the tug's bollard pull as a function of propeller rpm.

4.2.7.7 The diameter of the chain cables connected to the anchors is to be as required for the relevant Equipment Number. During the test, the length of the chain cable on each anchor is to be sufficient to obtain an approximately horizontal pull on the anchor. Generally, a horizontal distance between anchor and tug equal to 10 times the water depth will be sufficient.

4.2.7.8 High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by *4.2.7.2*, irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. A demonstration of these abilities may be required.

4.2.7.9 The design approval of high holding power anchors may be given as a general/type approval, and listed in a published document by the Society.

4.2.8 Chain cables

4.2.8.1 The total length of chain required to be carried onboard, as given in *Table 11.4.1*, is to be divided approximately equally between the two bower anchors.

4.2.8.2 Where the Owner requires equipment for anchoring at depths greater than 82.5m, it is the Owner's responsibility to specify the appropriate total length of the chain cable required. In such a case, consideration can be given to dividing the chain cable into two unequal lengths.

4.2.8.3 Chain cables which are intended to form part of the equipment are not to be used as check chains when the vessel is launched.

4.2.9 Chain lockers

4.2.9.1 The chain locker is to have adequate capacity and be of a suitable form to provide for the proper stowage of the chain cable, allowing an easy direct lead for the cable into the chain pipes when the cable is fully stowed. Port and starboard cables are to have separate spaces.

4.2.9.2 The chain locker boundaries and access openings are to be watertight. Provisions are to be made to minimize the probability of the chain locker being flooded in bad weather. Adequate drainage facilities for the chain locker are to be provided.

4.2.9.3 Chain or spurling pipes are to be of suitable size and provided with chafing lips.

4.2.9.4 Chain lockers fitted aft the collision bulkhead are to be watertight and the space is to be efficiently drained.

4.2.10 Securing and emergency release of chain cable

4.2.10.1 Provisions are to be made for securing the inboard ends of the chain to the structure. This attachment is to be able to withstand a force of not less than 15% or more than 30% of the minimum breaking strength of the as fitted chain cable. The structure to which it is attached is to be adequate for this load.

4.2.10.2 The fastening of the chain to the ship is to be arranged in such a way that in case of an emergency, when the anchor and chain have to be sacrificed, the chain can be readily released from an accessible position outside the chain locker. The proposed arrangement for slipping the chain cable must be made as watertight as possible.

4.2.11 Chain stoppers

4.2.11.1 Means are to be provided to secure each chain cable once it is paid out. This is normally achieved by means of chain stoppers.

4.2.11.2 Securing arrangements of chain stoppers are to be capable of withstanding a load equal to 80% of the breaking load of the chain cable as required by *4.2.8*, without undergoing permanent deformation.

4.2.12 Tests

4.2.12.1 All anchors and chain cables are to be tested at establishments and on machines recognised by the Society, under the supervision of Surveyors or other Representatives of the Society and in accordance with the relevant requirements for materials of the individual Classification Society.

4.2.12.2 Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads applied are to be available. These certificates are to be examined by the Surveyor when the anchors and cables are placed onboard the ship.

4.2.12.3 Steel wire and fibre ropes are to be tested in accordance with the relevant requirements for materials of the individual Classification Society.

4.2.13 Mooring lines and towlines

4.2.13.1 Except as indicated in *4.3*, mooring lines and towlines are not required as a condition of Classification. The hawsers and towlines listed in *Table 11.4.2* are intended as a guide. Where the tabular breaking strength is greater than 490kN, the breaking strength and the number of individual hawsers given in the Table may be modified, provided that their product is not less than that of the breaking strength and the number of hawsers given in the Table.

4.2.14 Increased number or strength of mooring lines

4.2.14.1 On a ship regularly using exposed berths, it is recommended that the total strength of mooring lines is twice that indicated in *4.2.13.1*.

4.2.14.2 Attention is also drawn to the Oil Companies International Marine Forum document, *Mooring Equipment Guidelines*, for guidance on mooring of tankers at exposed locations.

4.2.15 Alternative mooring arrangement

4.2.15.1 For ease of handling, fibre ropes should not to be less than 20mm in diameter.

4.2.15.2 All ropes having breaking strengths greater than 736kN and used in normal mooring operations should be handled by, and stored on, suitably designed winches. Alternative methods of storing are to give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490kN. In such cases, the breaking strength and the number of individual hawsers given in *Table 11.4.2* may be modified, but their product is not to be less than that of the breaking strength and the number of hawsers given in the Table. However, the number of mooring lines is not be less than six, and no line should have a breaking strength less than 490kN.

4.2.16 Securing mooring lines

4.2.16.1 Means should be provided to enable mooring lines to be adequately secured onboard ship. It is recommended that the total number of suitably placed bollards on either side of the ship and/or the total brake holding power of mooring winches is to be capable of holding not less than 1.5 times the sum of the maximum breaking strengths of the mooring lines.

4.2.17 Bollards and bitts, fairleads, stand rollers and chocks

4.2.17.1 The strength of shipboard fittings used for normal and/or emergency operations at bow, sides and stern are to comply with the requirements of *4.2.17.2* and *4.2.17.3*. The requirements for the support structure of these shipboard fittings are specified in *3.1.6*.

4.2.17.2 Shipboard fittings are to be designed and constructed in accordance with recognized standards (e.g. ISO3913 Shipbuilding Welded Steel Bollards). The design load used to assess shipboard fittings and their attachments to the hull are to be in accordance with *3.1.6*.

4.2.17.3 The following requirements on Safe Working Load (SWL) apply to shipboard fittings used for mooring and/or emergency towing:

(a) the SWL is not to exceed 80% of the design load specified in *3.1.6.10(a)* and *3.1.6.10(c)* or 100% of the design load specified in *3.1.6.10(b)*, as applicable

(b) the SWL of each fitting is to be marked by weld bead or equivalent

(c) the SWL with its intended use, i.e., mooring, towing or emergency towing operations or some combination thereof, for each fitting is to be indicated in the towing/emergency towing and mooring arrangement plans available onboard the ship for the guidance of the Master. The arrangement plans or information is to include information on each fitting detailing location on the ship, fitting type, Safe Working Load, purpose, method of applying load and limiting fleet angle, and it is to explicitly prohibit the use of mooring and/or towing lines outside of their intended function and/or different characteristics

(d) the requirements of this paragraph apply for a single post basis (no more than one turn of one cable).

4.2.18 Mooring winches

4.2.18.1 Mooring winch design and capacity are not subject to approval by the Society as a condition of Classification. Mooring winch plans and information are to be submitted for approval of the supporting structure in way of the winch and for the connection of the mooring winch to its foundation and the connection of the foundation to the deck, as required by *3.1.3*.

Guidance Note:
Mooring winches should be fitted with drum brakes, the strength of which is to be sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 percent of that for a rope with breaking strength equal to the greater of the maximum breaking strength of the rope specified on the mooring arrangement plan or that according to *Table 11.4.2* for the ship's corresponding equipment number, as fitted on the first layer on the winch drum.

4.2.19 Windlass

4.2.19.1 A windlass of sufficient power and suitable for the size of chain is to be fitted to the ship in accordance with the requirements of the Classification Society. Where an Owner requires equipment significantly in excess of Rule requirements, it is the Owner's responsibility to specify increased windlass power.

4.2.19.2 The windlass is to be capable of heaving in either cable.

4.2.19.3 The design of the windlass is to be such that access to the chain pipe is adequate to permit the fitting of a cover or seal of sufficient strength over the sperling pipe.

Special consideration will be given to the acceptance of equivalent arrangements that minimize the probability of the chain locker or forecastle being flooded in bad weather.

4.2.20 Anchor windlass trial

4.2.20.1 Each windlass is to be tested under working conditions after installation onboard to demonstrate satisfactory operation. Each unit is to be independently tested for the following:

(a) braking

(b) clutch functioning

(c) lowering and hoisting of chain cable and anchor

(d) proper riding of the chain over the chain lifter

(e) proper transit of the chain through the hawse pipe and the chain pipe

(f) effecting proper stowage of the chain and the anchor.

4.2.20.2 During trials onboard ship, the windlass is to be shown to:

(a) for all specified design anchorage depths, raise the anchor from a depth of 82.5m to a depth of 27.5m at a mean speed of 9m/min

(b) for specified design anchorage depths greater than 82.5m, in addition to (a), raise the anchor from the specified design anchorage depth to a depth of 82.5m at a mean speed of 3m/min.

Where the depth of the water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative.

4.2.21 Stowage and deployment arrangements for anchors

4.2.21.1 Arrangements are to be provided to ensure the simple deployment, recovery and stowage of anchors. Such arrangements generally consist of a hawse pipe and anchor housing which may be in the form of a fabricated anchor box or pocket.

4.2.21.2 Where hawse pipes are not fitted, alternative arrangements will be specially considered.

4.2.22 Dimensions and scantlings of hawse pipes and anchor pockets

4.2.22.1 Hawse pipes are to be of a suitable size and configuration to ensure adequate clearance and an easy lead of the chain cable from the chain stopper through the ship's side.

4.2.22.2 Hawse pipes are to be of sufficient strength.

4.2.22.3 Anchor pockets are to be of substantial thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor, caused by wave action.

4.2.22.4 Hawse pipes and anchor pockets are to have full-rounded flanges or rubbing bars in order to minimize the nip on the cables and to minimize the probability of cable links being subjected to high bending stresses. The radius of curvature is to be such that at least three links of chain will bear simultaneously on the rounded parts of the upper and lower ends of the hawse pipes in those areas where the chain cable is supported during paying out and hoisting and when the vessel is at anchor.

4.2.23 Hull reinforcement

4.2.23.1 Hawse pipes are to be securely attached to thick, doubling or insert plates, by continuous welds.

4.2.23.2 Framing in way of hawse pipes or anchor pockets is to be reinforced as necessary to ensure a rigid fastening to the hull.

4.2.23.3 On ships provided with a bulbous bow, where it is not possible to obtain a suitable clearance between shell plating and the anchors during anchor handling, local reinforcements of the bulbous bow are to be provided in the form of increased shell plate thickness.

4.2.24 Testing

4.2.24.1 The anchors are to be shipped and unshipped so that the Surveyor is satisfied that there is no risk of the anchor jamming in the hawse pipe.

4.2.24.2 During the windlass trials at sea, the Surveyor is to be satisfied that upon release of the brake, the anchor immediately starts falling by its own weight.

4.2.24.3 When in position, hawse pipes and anchor pockets are to be thoroughly tested for watertightness by means of a hose in which the water pressure is in accordance with the requirements given in *Sub-section 5*.

4.3 Emergency Towing

4.3.1 General requirements

4.3.1.1 Emergency towing arrangements are to be fitted at both the bow and stern of every tanker with a deadweight of 20000 tonnes or more, as required by the *International Convention for the Safety of Life at Sea, 1974, as amended (Regulation II-1/3-4)*.

4.3.1.2 The design and construction of the towing arrangements is to be approved by the applicable Flag Administration, based on *IMO MSC.35(63), Guidelines for Emergency Towing Arrangements on Tankers*. See also *3.1.5* for requirements relating to the support structure of emergency towing equipment.

5 TESTING PROCEDURES

5.1 Tank Testing

5.1.1 Application

5.1.1.1 The following tanks and boundaries are to be tested in accordance with the requirements given in *5.1.3* to *5.1.9*, as follows:

(a) gravity tanks, excluding independent tanks of less than 5m^3 in capacity, for their structural adequacy and tightness

(b) watertight boundaries, other than tank boundaries, for watertightness

(c) weathertight boundaries for weathertightness.

5.1.2 Definitions

5.1.2.1 Watertight means capable of preventing the passage of water through the structure under a head of water for which the surrounding structure is designed.

5.1.2.2 Weathertight means that in any sea conditions water will not penetrate into the ship.

5.1.2.3 Structural Testing is a hydrostatic test carried out in order to demonstrate structural adequacy of the design. Where severe practical limitations prevail and hydrostatic testing is not feasible, hydropneumatic testing may be carried out instead.

5.1.2.4 Leak Testing is an air or other medium test, carried out in order to demonstrate the tightness of the structure.

5.1.2.5 Hose Testing is carried out by a jet of water in order to demonstrate the tightness of the structure items which are not subjected to hydrostatic or leak testing, and to other components which contribute to the watertight or weathertight integrity of the hull.

5.1.2.6 Hydropneumatic Testing is a combination of hydrostatic and air testing, undertaken by filling the tank with water and applying an additional air pressure. It is carried out in order to demonstrate the tightness of the tanks and the structural adequacy of the design as an alternative to a hydrostatic test.

5.1.2.7 Hydrostatic Testing is a test to verify the structural adequacy of the design and the tightness of the tank's structure by means of water pressure, produced by filling water to the level given in *Table 11.5.1*. Hydrostatic testing is the normal means for structural testing, with exception, where severe practical limitations prevent it or where air testing is permitted.

5.1.2.8 Shop Primer is a thin coating applied after surface preparation and prior to fabrication as a protection against corrosion during fabrication.

5.1.2.9 Protective Coating is the coating system applied to protect the structure from corrosion. This excludes the shop primer.

5.1.3 Test procedures

5.1.3.1 Tests are to be carried out in the presence of, and to the satisfaction of the Surveyor. The construction is to be at a stage sufficiently close to completion, after all attachments, outfittings or penetrations, which may affect the strength or tightness of the structure, have been completed, such that the strength and tightness are not subsequently impaired, and before any ceiling and cement work is applied over joints.

5.1.3.2 Specific test requirements are given in *Table 11.5.1*.

5.1.3.3 For the timing of the application of coating in relation to testing, see *5.1.8*.

5.1.4 Structural testing

5.1.4.1 Where structural testing is specified by *Table 11.5.1*, hydrostatic testing will be acceptable, except where practical limitations prevent it or where leak testing is permitted by *Note 1* to *Table 11.5.1*. Hydropneumatic testing may be approved in lieu of hydrostatic testing.

5.1.4.2 Hydrostatic testing is to consist of a head of water to the level specified in *Table 11.5.1*.

5.1.4.3 Hydropneumatic testing, where approved, is to simulate the actual loading as far as practicable in relation to the combined water level and air pressure. The requirements and recommendations in *5.1.5* relative to air pressure will also apply.

5.1.4.4 Structural testing may be carried out afloat where testing using water is undesirable in dry dock or on the building berth. When structural testing is carried out afloat it is to be performed by filling each tank and cofferdam separately to the test head given in *Table 11.5.1*.

5.1.4.5 With about half the number of tanks full, the bottom and lower side shell in the empty tanks is to be examined and the remainder of the lower side shell is to be examined when the water has been transferred to the remaining tanks.

5.1.4.6 Tank boundaries are to be tested from at least from one side. Tanks to be tested for structural adequacy (see *Note 1* to *Table 11.5.1*) are to be selected so that all representative structural members are tested for the expected tension and compression.

5.1.5 Leak testing

5.1.5.1 All boundary welds, erection joints, and penetrations including pipe connections, except welds made by automatic processes are to be examined in accordance with the approved procedure and under a pressure of at least 0.15bar with a leak indicating solution (e.g. soapy water solution). Pressures greater than 0.20bar are not recommended.

RCN 1 to July 2010 version (effective from 1 July 2012)

5.1.5.2 It is recommended that the air pressure in the tank be raised to and maintained at 0.20bar for approximately one hour, with a minimum number of personnel around the tank, before being lowered to the test pressure.

5.1.5.3 A U-tube filled with water up to a height corresponding to the required test pressure is to be fitted for verification and to avoid over pressure. The cross sectional area of the U-tube is to be not less than that of the pipe supplying the air. In addition to the U-tube, a master gauge or other approved means is to be provided to verify the pressure.

5.1.5.4 Other effective methods of leak testing, including compressed air fillet weld testing or vacuum testing may be considered upon submission of full particulars.

5.1.6 Hose testing

5.1.6.1 Hose testing is applied to structures not subjected to structural or air testing but that are required to be watertight or weathertight as specified in *Table 11.5.1*.

5.1.6.2 Hose testing is to be carried out with a pressure in the hose of at least 2.0 bar for the duration of the test. The nozzle is to have minimum inside diameter of 12mm and is to be directed at the joint being tested from a distance not exceeding 1.5m.

5.1.6.3 Leak testing or structural testing may be accepted in lieu of hose testing.

5.1.7 Other methods of testing

5.1.7.1 Other methods of testing may be considered upon submission of the full particulars.

5.1.8 Application of coating – protective coating

5.1.8.1 Final coating may be applied prior to the hydrostatic testing provided that leak testing is carried out before the application of the final coating.

5.1.8.2 The cause of any discolouration or disturbance of the coating is to be ascertained, and any deficiencies repaired.

5.1.8.3 For all manual or semi-automatic erection welds, and all fillet weld tank boundary connections, including penetrations, final coating is to be applied after leak testing has taken place. For other welds, the final coating may be applied prior to leak testing, provided the Surveyor, after careful examination prior to the application of coating, is satisfied with the weld. The Surveyor may require leak testing to be carried out prior to final coating of automatic erection welds and manual or automatic pre-erection welds, taking account of the quality control procedure of the shipyard.

5.1.8.4 Final coating is to be applied after all required hose testing is completed.

5.1.9 Temporary coating

5.1.9.1 Temporary coatings which may conceal defects or leaks are to be applied as specified for protective coating, see *5.1.8*. This requirement does not apply to shop primer applied before fabrication.

5.1.9.2 Silicate based shop primer may be applied to welds before leak testing. The layer of the primer is to be applied with a maximum thickness of 50 microns. Other primers of uncertain chemical composition are to be applied with a maximum thickness of 30 microns.

Table 11.5.1
Testing Requirements for Tanks and Boundaries

	Structures to be tested	Type of testing	Hydrostatic testing head or pressure	Remarks
1	Double Bottom Tanks	Structural(1)	The greater of - to the top of overflow, or - to the bulkhead deck	Tank boundaries tested from at least one side
2	Double Side Tanks	Structural(1)	The greater of - to the top of overflow, or - to 2.4m above top of tank(2)	Tank boundaries tested from at least one side
3	Cargo Tanks Fuel Oil Bunkers	Structural(1) Structural(1)	The greatest of - to the top of overflow, - to 2.4m above top of tank(2), or - to the top of tank(2) plus setting of any pressure relief valve	Tank boundaries tested from at least one side
4	Cofferdams	Structural(3)	The greater of - to the top of overflow, or - to 2.4m above top of cofferdam	
5a	Peak Tanks	Structural	The greater of - to the top of overflow, or - to 2.4m above top of tank(2)	Aft peak tank test to be carried out after installation of stern tube.
5b	Fore Peak not used as a tank	Refer to *SOLAS II.1 Reg.14*		
5c	Aft Peak not used as a tank	Leak		
6	Watertight Bulkheads in way of dry space	Hose(4)		Including steps and recesses
7	Watertight Doors below freeboard or bulkhead deck	Hose		For testing before installation(5)
8	(void)			
9	Watertight hatch covers of tanks on combination carriers	Structural testing	The greater of: - to 2.4m above the top of hatch cover, or - setting pressure of the pressure relief valve	At least every second hatch cover is to be tested
10	Weathertight Hatch Covers, Doors and other Closing Appliances	Hose(4)		
11	Shell plating in way of pump room	Visual examination		To be carefully examined with the vessel afloat

RCN 2 to July 2008 version (effective from 1 July 2010)
RCN 1 to July 2010 version (effective from 1 July 2012)

Table 11.5.1 (Continued)
Testing Requirements for Tanks and Boundaries

	Structures to be tested	Type of testing	Hydrostatic testing head or pressure	Remarks
12	Chain Locker (aft Collision Bulkhead)	Structural	To the top of chain locker spurling pipe	
13	Independent Tanks	Structural	The greater of - to the top of overflow, or - to 0.9 m above top of tank	
14	Ballast Ducts	Structural	Ballast pump maximum pressure or setting of any relief valve for the ballast duct if that is less	
15	Hawse Pipes	Hose		

Note

1. Leak or hydropneumatic testing may be accepted under the conditions specified in *5.1.5*, provided that at least one tank for each type is structurally tested, and selected in connection with the approval of the design. In general, the structural testing need not be repeated for subsequent vessels of a series of identical new buildings unless the Surveyor deems the repetition necessary. The structural testing of cargo space boundaries and tanks for segregated cargoes or pollutants on subsequent vessels of a series of identical new buildings are to be in accordance with the requirements of the individual Classification Society.
2. Top of tank is defined as the deck forming the top of the tank excluding hatchways.
3. Leak testing in accordance with *5.1.5* may be accepted, except that hydropneumatic testing may be required in consideration of the construction techniques and welding procedures employed.
4. Where hose testing is impractical due to the stage of outfitting (machinery, cables, switchboard, insulation etc.), it may be replaced at the individual Society's discretion, by a careful visual examination of all the crossings and welded joints. A dye penetrant test, leak test or ultrasonic leak test may be required.
5. Before installation (i.e. normally at manufacture) the watertight access doors or hatches are to be hydrostatically tested with a head of water equivalent to the bulkhead deck at centre, from the side which is most prone to leakage. The acceptance criteria are as follows:
    - no leakage for doors or hatches with gaskets
    - a maximum water leakage of one litre per minute for doors or hatches with metallic sealing.
6. If leak or hydropneumatic testing is carried out, arrangements are to be made to ensure that no pressure in excess of 0.30 bar is applied.

SECTION 12

SHIP IN OPERATION RENEWAL CRITERIA

1 ALLOWABLE THICKNESS DIMINUTION FOR HULL STRUCTURE

1.1 General

1.1.1 Applicability

1.1.1.1 The purpose of this Section is to provide criteria for the allowable thickness diminution of the ships' hull structure.

1.1.1.2 The criteria apply only to ships in operation that are designed and built in accordance with these Rules.

1.1.1.3 Thickness measurements are to be used to assess the ships' structure against the specified renewal criteria.

1.1.2 Wastage allowance concept

1.1.2.1 Wastage allowance is comprised of two aspects; local wastage allowance and overall hull girder wastage allowance. Local wastage allowance is defined in *1.4* and the overall hull girder wastage allowance is defined in *1.5*.

1.1.2.2 Assessment against both local and overall hull girder wastage criteria is required during the operational life of the vessel.

1.1.2.3 Steel renewal is required if either the local or overall hull girder wastage allowance is exceeded.

1.1.2.4 The newbuilding requirements within these Rules incorporate corrosion additions, see *Section 6/3*, and consider all relevant loads and failure modes (e.g. yielding, buckling, and fatigue). No further assessment of the scantlings against the requirements within these Rules is required during the operational life of the ship provided that the thickness of any structural member remains greater than the renewal thickness specified herein.

1.1.3 Requirements for documentation

1.1.3.1 The plans to be supplied onboard the ship, see *Section 3/2.2.3*, are to include both the as-built and renewal thickness as defined in *1.4.2*. Any owner's extra thickness is also to be clearly indicated on the drawings.

1.1.3.2 The "as-built" Midship Section plan provided by the builder and carried on board the ship is to include a table showing the minimum allowable hull girder sectional properties, as defined in *1.5*, for the mid-tank transverse section in all cargo tanks.

1.2 Assessment of Thickness Measurements

1.2.1 General

1.2.1.1 The minimum survey requirements for the maintenance of class of double hull oil tankers are defined in *IACS Unified Requirement Z10.4*.

1.2.1.2 Thickness measurements are to be conducted in accordance with the requirements of the individual Classification Society and *IACS Unified Requirement Z10.4*.

1.2.2 Assessment of local wastage

1.2.2.1 Thickness measurements are to be taken to confirm that the measured thickness is not less than the renewal thickness for general corrosion and local pitting/edge corrosion as defined in *1.4.2* and *1.6* respectively. See also *1.3*.

1.2.2.2 When a survey identifies that steel renewal is required or structural defects are present which, in the opinion of the Surveyor, will impair the ships' fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.2.2.3 Re-examination and additional thickness measurements at Annual and Intermediate Surveys are required where the measured thickness, t_m, is less than the allowable thickness at annual survey, t_{annual}, defined as:

$$t_{annual} = t_{as-built} - t_{own} - t_{was} \quad \text{mm}$$

Where:

$t_{as\text{-}.built}$ as built thickness, in mm

t_{was} wastage allowance, as defined in *1.4.2.2*

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

1.2.2.4 Where re-examination and additional thickness measurements are required by *1.2.2.3* then additional measurements are to be carried out in accordance with *Table 12.1.1* to determine the full extent of the corrosion pattern.

Table 12.1.1
Additional Thickness Measurement in way of Structure Identified with $t_m < t_{annual}$

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect areas and adjacent plates	5 point pattern over 1m^2
Stiffeners	Suspect areas	3 measurements in line across web 3 measurements in line across flange

1.2.2.5 At each Special Survey, thickness measurements are to be taken in way of critical areas, as considered necessary by the Surveyor. Critical areas are to include locations throughout the ship with corrosion levels that are likely to contravene *1.2.2.3* and/or are considered prone to rapid wastage.

1.2.3 Assessment of overall hull girder wastage

1.2.3.1 The hull girder sectional properties of the ship are to be calculated for the cross-sections as specified in *IACS Unified Requirement Z10.4*, based on the thicknesses given by the thickness measurements, to confirm that the resulting hull girder sectional properties are not less than the minimum allowable defined in *1.5.2*. The actual sectional properties calculated based on measured thicknesses and in accordance with *IACS Unified Requirement Z10.4*, are to be submitted to the Classification Society.

1.3 Categories of Corrosion

1.3.1 General corrosion

1.3.1.1 General corrosion is defined as areas where general uniform reduction of material thickness is found over an extensive area.

1.3.1.2 Renewal criteria for general corrosion are given in *1.4*.

1.3.2 Pitting corrosion

1.3.2.1 Pitting corrosion is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area.

1.3.2.2 The pitting intensity is defined in *Figure 12.1.1*.

1.3.2.3 Renewal criteria for pitting corrosion are given in *1.6.2*.

1.3.3 Edge corrosion

1.3.3.1 Edge corrosion is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion is shown in *Figure 12.1.2*.

1.3.3.2 Renewal criteria for edge corrosion are given in *1.6.3*.

1.3.4 Groove corrosion

1.3.4.1 Groove corrosion is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion is shown in *Figure 12.1.3*.

1.3.4.2 Renewal criteria for groove corrosion are given in *1.6.4*.

Figure 12.1.1
Pitting Intensity Diagrams

5% Scattered	10% Scattered	20% Scattered	30% Scattered	50% Scattered	
Figure 12.1.2
Edge Corrosion

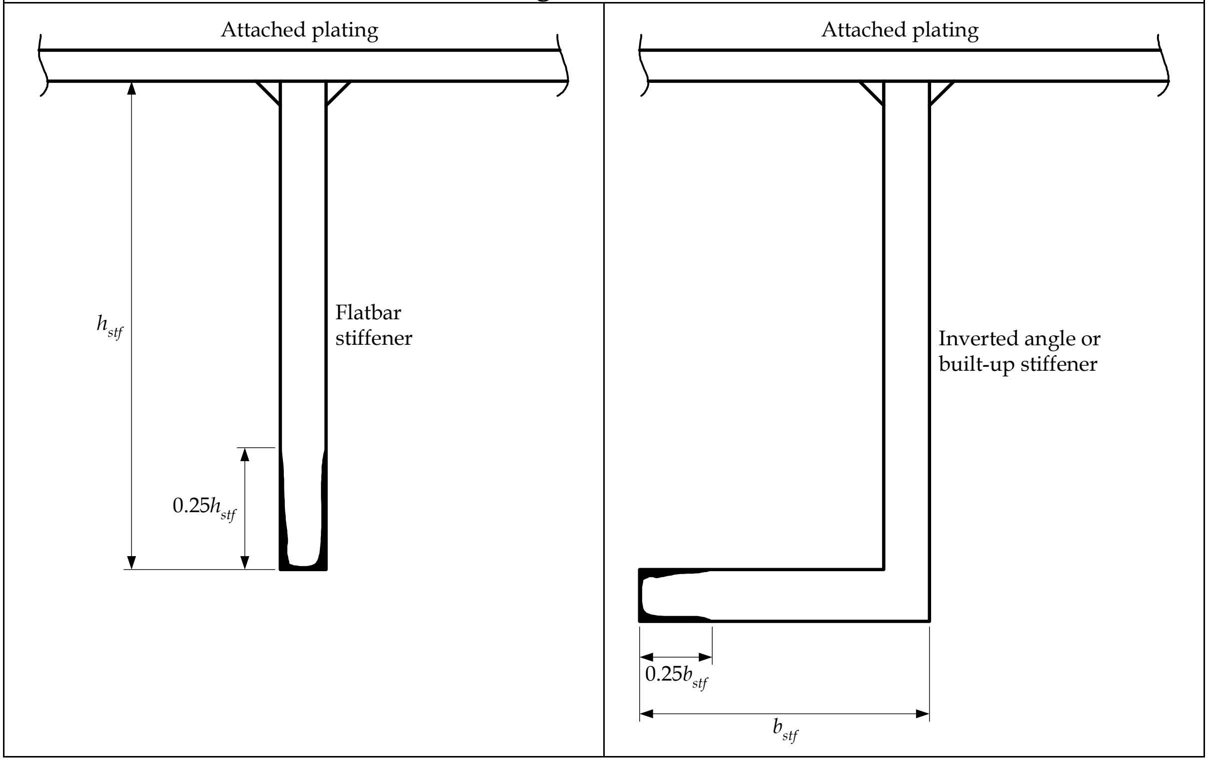

Figure 12.1.3
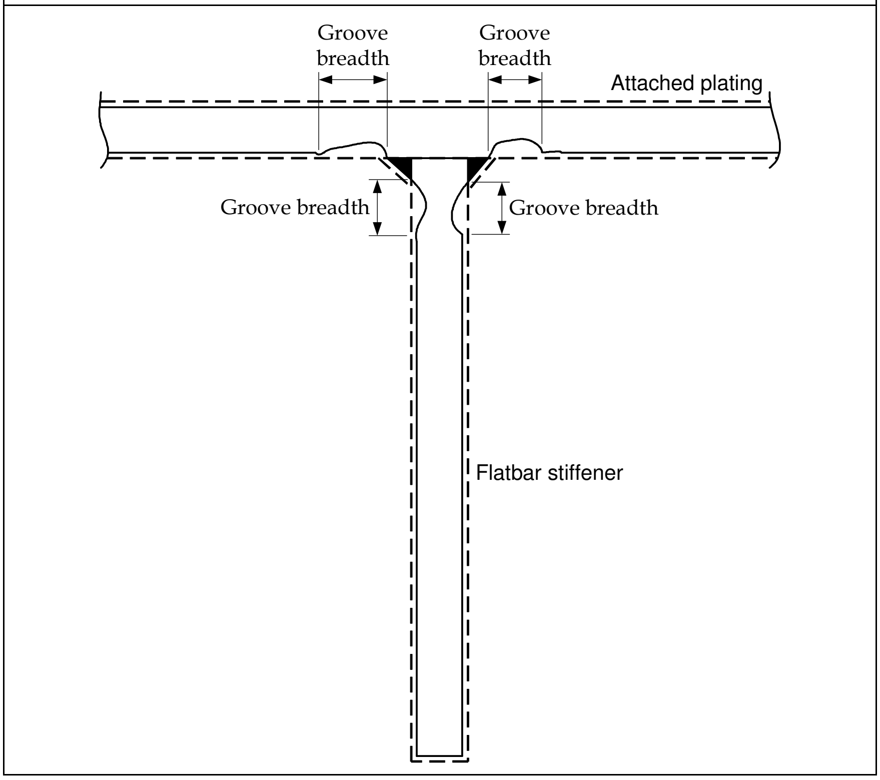
Groove Corrosion



1.4 Renewal Criteria of Local Structure for General Corrosion

1.4.1 Application

1.4.1.1 The renewal criteria in *1.4.2* generally apply to areas of structural members with general corrosion.

1.4.2 Renewal criteria

1.4.2.1 Steel renewal is required if the measured thickness, t_{tm}, is less than the renewal thickness, t_{ren}, defined as:

$$t_{ren} = t_{as-built} - t_{was} - t_{own} - t_{corr-2.5} \quad \text{mm}$$

Where:

$t_{as-.built}$ as built thickness, in mm

t_{was} wastage allowance, as defined in *1.4.2.2*

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

$t_{corr-2.5}$ 0.5mm, wastage allowance in reserve for corrosion occurring in the two and a half years between Intermediate and Special surveys

1.4.2.2 The wastage allowance, t_{was}, is given by:

$$t_{was} = t_{was-1} + t_{was-2} \quad \text{mm} \quad \text{and rounded up to the nearest 0.5mm}$$

Where:

t_{was} total wastage allowance of the considered structural member, in mm

t_{was-1} wastage allowance for side one of the structural member considering the contents of the compartment to which it is exposed, in mm, as given *Table 12.1.2*

t_{was-2} wastage allowance for side two of the structural member considering the contents of the compartment to which it is exposed, in mm, as given *Table 12.1.2*

1.4.2.3 In no case is the wastage allowance, t_{was}, to be less than 1.5mm, except in way of internals of dry spaces and pump room where 1.0mm is applicable.

1.4.2.4 Wastage allowances for compartments not listed in *Table 12.1.2* will be subject to special consideration.

1.4.2.5 Areas which need to be renewed based on the renewal criteria in *1.4.2.1* are, in general, to be repaired with inserted material which is to have the same or greater grade/strength as the original and to have a thickness, t_{repair}, not less than:

$$t_{repair} = t_{as-built} - t_{own} \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

Table 12.1.2
Local Wastage Allowance for One Side of Structural Elements

Compartment Type	Structural Member		Ship in Operation Component Wastage Allowance, t_{was-1} or t_{was-2} (mm)
Ballast water tank and chain locker	Face plate of PSM	Within 3m below top of tank (1)	2.0
		Elsewhere	1.5
	Other members(3)	Within 3m below top of tank (1)	1.7
		Elsewhere	1.2
Cargo oil tank	Face plate of PSM	Within 3m below top of tank (1)	1.7
		Elsewhere	1.4
	Inner-bottom plating/bottom of tank		2.1
	Other members	Within 3m below top of tank (1)	1.7
		Elsewhere	1.0
Exposed to atmosphere	Weather deck plating		1.7
	Other members		1.0
Exposed to sea water	Shell plating(2)		1.0
Fuel and lube oil tank (4)	Top of tank and attached internal stiffeners		1.0
	Elsewhere		0.7
Fresh water tank	Top of tank and attached internal stiffeners		1.0
	Elsewhere		0.7
Void spaces	Spaces not normally accessed, e.g. access only via bolted manhole openings, pipe tunnels, etc.		0.7
Dry spaces	Internals of deckhouses, machinery spaces, pump room, store rooms, steering gear space, etc.		0.5

Notes
1. Only applicable to cargo and ballast tanks with weather deck as the tank top.
2. 0.5mm to be added for side plating in the quay contact region as defined in *Section 8/Figure 8.2.2.*
3. 0.5mm to be added to the plate surface exposed to ballast for plate boundary between water ballast and heated cargo oil tanks. 0.3mm to be added to each surfaces of the web and face plate of a stiffener in a ballast tank and attached to the boundary between water ballast and heated cargo oil tanks. Heated cargo oil tanks are defined as tank arranged with any form of heating capability (most common type is heating coils).
4. 0.7mm to be added for plate boundary between water ballast and heated fuel oil tanks

(RCN 1, effective from 1 April 2007)

1.5 Renewal Criteria of Hull Girder Sectional Properties for General Corrosion

1.5.1 General

1.5.1.1 The following actual hull girder sectional properties are required to be verified, see *1.5.2-3*:

(a) vertical hull girder moment of inertia, about the horizontal axis, I_v

(b) hull girder section modulus about the horizontal axis - at deck-at-side, Z_{v-dk}

(c) hull girder section modulus about the horizontal axis - at keel, Z_{v-kl}

(d) hull girder section modulus about the vertical axis - at side, Z_{h-side}

(e) hull girder vertical shear area, A_{v-shr}

1.5.2 Renewal criteria

1.5.2.1 Steel renewal is required if the actual hull girder sectional properties, $I_{v\text{-}tm}$, $Z_{v\text{-}tm\text{-}dk}$, $Z_{v\text{-}tm\text{-}kl}$, $Z_{h\text{-}tm\text{-}side}$, $A_{v\text{-}tm\text{-}shr}$, calculated using the actual thickness measurements are less than the minimum allowable hull girder sectional properties defined in accordance with *1.5.3*.

1.5.2.2 The actual hull girder sectional properties listed in *1.5.2.1* are to be calculated in accordance with *Section 4/2.6*, using the measured thicknesses.

1.5.2.3 If steel renewal is required due to reduced hull girder sectional properties this is to be done by replacing local corroded structural elements. Any combination of structural elements may be replaced provided that the resulting hull girder sectional properties satisfy *1.5.2.1*. Local structural elements being renewed are to be replaced in accordance with the requirements of *1.4.2.3*.

1.5.3 Calculation of the minimum allowable hull girder sectional properties

1.5.3.1 The minimum allowable hull girder sectional properties listed in *1.5.1.1* are to be calculated in accordance with *Section 4/2.6*, using the thicknesses defined in *1.5.3.2*.

1.5.3.2 The minimum allowable hull girder sectional properties in the corroded condition are calculated using the same corrosion thickness reductions that are used during the newbuilding stage, thus linking the newbuilding and ship in operation criteria. Therefore the calculation of the minimum allowable hull girder sectional properties is to be based on a member thickness, t, given by:

$$t = t_{as-built} - 0.5t_{corr} - t_{own} \quad \text{mm}$$

Where:

$t_{as\text{-}built}$ as built thickness, in mm

t_{corr} corrosion addition, as defined in *Section 6/3.2*

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

1.6 Allowable Material Diminution for Pitting, Grooving and Edge Corrosion

1.6.1 General

1.6.1.1 Steel renewal for pitting, grooving and edge corrosion is required if the measured thickness is less than the criteria defined in *1.6.2*, *1.6.3* and *1.6.4* respectively.

1.6.2 Pitting

1.6.2.1 For plates with pitting intensity less than 20%, see *Figure 12.1.1*, the measured thickness, t_{tm}, of any individual measurement is to meet the lesser of the following criteria:

$$t_{tm} \geq 0.7\left(t_{as-built} - t_{own}\right) \quad \text{mm}$$

$$t_{tm} \geq t_{ren} - 1 \quad \text{mm}$$

Where:

$t_{as\text{-}built}$ as built thickness of the member, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

t_{ren} renewal criteria for general corrosion as defined in *1.4.2.1*

1.6.2.2 The average thickness across any cross section in the plating is not to be less than the renewal criteria for general corrosion given in *1.4.2.1*.

1.6.3 Edge corrosion

1.6.3.1 Provided that the overall corroded height of the edge corrosion of the flange, or web in the case of flat bar stiffeners, is less than 25%, see *Figure 12.1.2*, of the stiffener flange breadth or web height, as applicable, the measured thickness, t_{tm}, is to meet the lesser of the following criteria:

$$t_{tm} \geq 0.7(t_{as-built} - t_{own}) \quad \text{mm}$$

$$t_{tm} \geq t_{ren} - 1 \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness of the member, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

t_{ren} renewal criteria for general corrosion as defined in *1.4.2.1*

1.6.3.2 The average measured thickness across the breadth or height of the stiffener is not to be less than that defined in *1.4.2*.

1.6.3.3 Plate edges at openings for manholes, lightening holes etc. may be below the minimum thickness given in *1.4.2* provided that:

(a) the maximum extent of the reduced plate thickness, below the minimum given in *1.4.2*, from the opening edge is not more than 20% of the smallest dimension of the opening and does not exceed 100mm

(b) rough or uneven edges may be cropped-back provided that the maximum dimension of the opening is not increased by more than 10%.

1.6.4 Grooving

1.6.4.1 Where the groove breadth is a maximum of 15% of the web height, but not more than 30mm, see *Figure 12.1.3*, the measured thickness, t_{tm}, in the grooved area is to meet the lesser of the following criteria:

$$t_{tm} \geq 0.75(t_{as-built} - t_{own}) \quad \text{mm}$$

$$t_{tm} \geq t_{ren} - 0.5 \quad \text{mm}$$

but is not to be less than

$$t_{tm} = 6 \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness of the member, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

t_{ren} renewal criteria for general corrosion as defined in *1.4.2.1*

1.6.4.2 Members with areas of grooving greater than those in *1.6.4.1* are to be assessed based on the criteria for general corrosion as defined in *1.4.2* using the average measured thickness across the plating/stiffener.

APPENDIX A

HULL GIRDER ULTIMATE STRENGTH

1 GENERAL

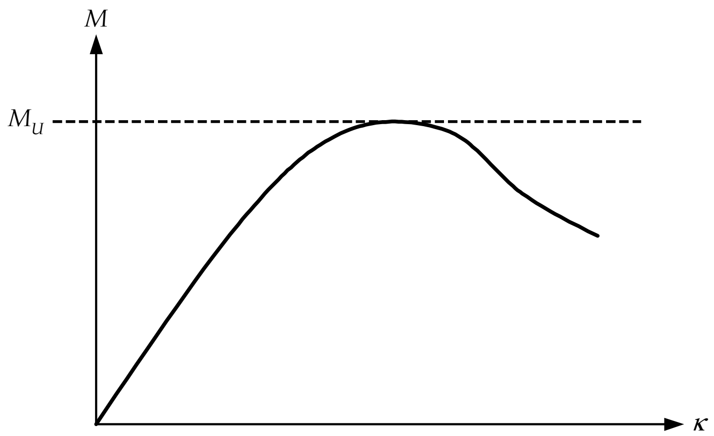
1.1 Definitions

1.1.1 Hull girder bending moment capacity

1.1.1.1 The hull girder ultimate bending moment capacity, M_U, is defined as the maximum bending capacity of the hull girder beyond which the hull will collapse. Hull girder failure is controlled by buckling, ultimate strength and yielding of longitudinal structural elements.

1.1.1.2 The sagging hull girder ultimate capacity of a hull girder section, is defined as the maximum value on the static non-linear bending moment-curvature relationship M-κ, see *Figure A.1.1*. The curve represents the progressive collapse behaviour of hull girder under vertical bending.

Figure A.1.1
Bending Moment - Curvature Curve M-κ



1.1.1.3 The curvature of the critical inter-frame section, κ, is defined as:

$$\kappa = \frac{\theta}{l}$$

Where:

θ the relative angle rotation of the two neighbouring cross-sections at transverse frame positions

l the transverse frame spacing, i.e. span of longitudinals

1.2 Application

1.2.1 General

1.2.1.1 The sagging hull girder ultimate bending capacity is to be assessed by the single step method in *2.1* or the incremental-iterative method in *2.2*. This is only applicable to longitudinally framed double hull tankers in the sagging bending condition.

1.2.1.2 The magnitudes of the partial safety factors in *Section 9/1.4* have been calibrated for this single step method in *2.1* and are also appropriate for the incremental iterative method in *2.2*.

1.3 Assumptions

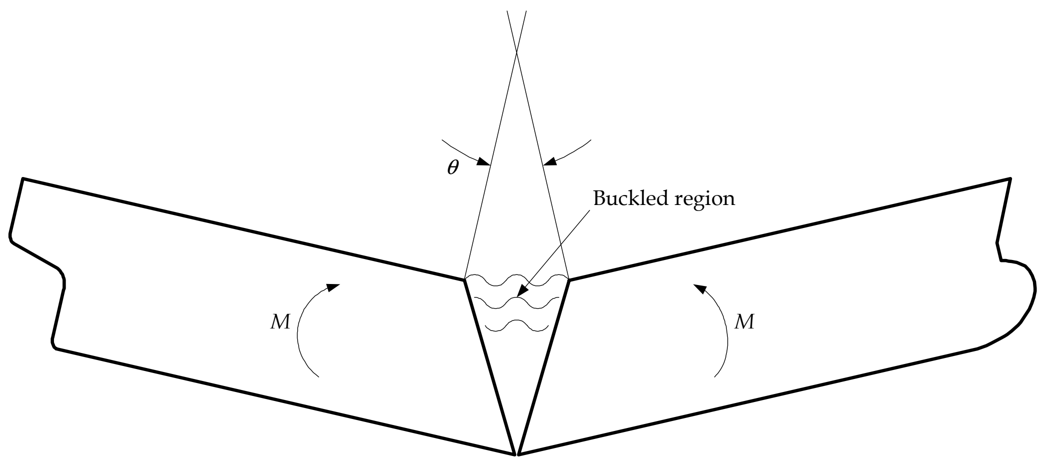
1.3.1 General

1.3.1.1 The method for calculating the ultimate hull girder capacity is to identify the critical failure modes of all main longitudinal structural elements. For tankers, in sagging, the critical mode is generally inter-frame buckling of deck structures, as shown in *Figure A.1.2*.

1.3.1.2 Structures compressed beyond their buckling limit have reduced load carrying capacity. All relevant failure modes for individual structural elements, such as: plate buckling, torsional stiffener buckling, stiffener web buckling, lateral or global stiffener buckling; and their interactions, are to be considered in order to identify the weakest inter-frame failure mode.

1.3.1.3 For tankers in the sagging condition, only vertical bending is considered. The effects of shear force, torsional loading, horizontal bending moment and lateral pressure are neglected.

Figure A.1.2
Ship in Extreme Sagging Inter-Frame Buckling Failure



1.4 Alternative Methods

1.4.1 General

1.4.1.1 Principles for alternative methods for the calculation of the hull girder ultimate bending capacity; e.g. incremental-iterative procedure that may differ from the one defined in *2.2*, and non-linear finite element analysis, are given in *Sub-Section 3*.

1.4.1.2 Application of alternative methods is to be agreed with the individual Classification Society prior to commencement. Documentation of the analysis methodology and detailed comparison of its results with those of the individual Classification Societies' procedures are to be submitted for review and acceptance. The use of such methods may require the partial safety factors in *Section 9/1.4* to be re-calibrated.

2 CALCULATION OF HULL GIRDER ULTIMATE CAPACITY

2.1 Single Step Ultimate Capacity Method

2.1.1 Procedure

2.1.1.1 The single step procedure for calculation of the sagging hull girder ultimate bending capacity is a simplified method based on a reduced hull girder bending stiffness accounting for buckling of the deck, see *Figure A.2.1*. The hull girder ultimate bending moment capacity, M_U, is to be taken as:

$$M_U = Z_{red}\sigma_{yd} \cdot 10^3 \quad \text{kNm}$$

Where:

Z_{red} reduced section modulus of deck (to the mean deck height)

$$= \frac{I_{red}}{z_{dk-mean} - z_{NA-red}} \quad \text{m}^3$$

I_{red} reduced hull girder moment of inertia, in m^4. The inertia is to be calculated in accordance with *Section 4/2.6.1.1*, using:

- a hull girder net thickness of t_{net50} for all longitudinally effective members
- the effective net area after buckling of each stiffened panel of the deck, A_{eff}

A_{eff} effective net area after buckling of the stiffened deck panel. The effective area is the proportion of stiffened deck panel that is effectively able to be stressed to yield:

$$= \frac{\sigma_U}{\sigma_{yd}} A_{net50} \quad \text{m}^2$$

Note

The effective area of deck girders is to be taken as the net area of the girders using a thickness of t_{net50}.

A_{net50} net area of the stiffened deck panel, in m^2

σ_U buckling capacity of stiffened deck panel, in N/mm^2. To be calculated for each stiffened panel using:

- the advanced buckling analysis method, see *Section 10/4* and *Appendix D*
- the net thickness t_{net50}

σ_{yd} specified minimum yield stress of the material, in N/mm^2, that is used to determine the hull girder section modulus. In the case of the stiffener and plate having different specified minimum yield stress, σ_{yd}, is to be taken as the lesser of the two.
RCN 2 to July 2008 version (effective from 1 July 2010)

$z_{dk-mean}$ vertical distance to the mean deck height, taken as the mean of the deck at side and the deck at centre line, measured from the baseline, in m

z_{NA-red} vertical distance to the neutral axis of the reduced section measured from the baseline, in m

2.1.1.2 It is to be shown that the ultimate bending moment capacity, M_U, does not give stresses exceeding the specified minimum yield stress of the material, σ_{yd}, in the bottom shell plating. Therefore the ultimate hull girder bending moment capacity, M_U, is not to be greater than:

$$M_U = \sigma_{yd} \frac{I_{red}}{z_{NA-red}} \cdot 10^3 \quad \text{kNm}$$

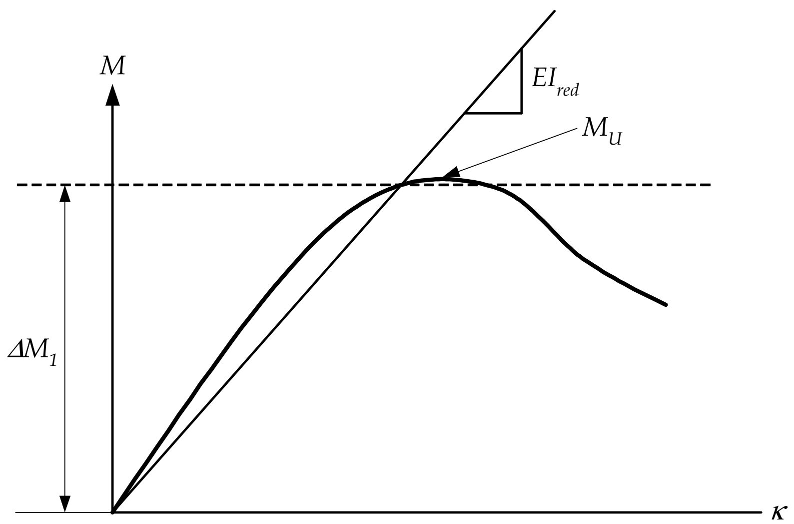
Where:

σ_{yd} specified yield stress of material, in N/mm²

I_{red} reduced hull girder moment of inertia, as defined in *2.1.1.1*

z_{NA-red} vertical distance to the neutral axis of the reduced section measured from the baseline, in m

Figure A.2.1
Moment – Curvature of Hull Girder Single Step Procedure



2.1.2 Assumption

2.1.2.1 The assumption behind this procedure is that the ultimate sagging capacity of tankers is the point at which the ultimate capacity of the stiffened deck panels is reached. If the structural configuration is such that this assumption is not valid, then an alternative method to derive the ultimate capacity is to be used.

2.2 Simplified Method Based on an Incremental-iterative Approach

2.2.1 Procedure

2.2.1.1 In this approach, the ultimate hull girder bending moment capacity M_U is defined as the peak value of the curve with vertical bending moment M versus the curvature κ of the ship cross section as shown in *Figure A.1.1*.

2.2.1.2 The curve M-κ is obtained by means of an incremental-iterative approach; the steps involved in the procedure are given in *2.2.1.7* and illustrated in the flow chart in *Figure A.2.2*.

2.2.1.3 The bending moment M_i which acts on the hull girder transverse section due to the imposed curvature κ_i is calculated for each step of the incremental procedure. This imposed curvature corresponds to an angle of rotation of the hull girder transverse section about its effective horizontal neutral axis, which induces an axial strain ε in each hull structural element. In the sagging condition, the structural elements below the neutral axis are lengthened, whilst elements above the neutral axis are shortened.

2.2.1.4 The stress σ induced in each structural element by the strain ε is obtained from the stress-strain curve σ-ε of the element, which takes into account the behaviour of the structural element in the non-linear elasto-plastic domain.

2.2.1.5 The force in each structural element is obtained from its area times the stress and these force are summated to derive the total axial force on the transverse section. Note the element area is taken as the total net area of the structural element. This total force may not be zero as the effective neutral axis may have moved due to the non linear response. Hence it is necessary to adjust the neutral axis position, recalculate the element strains, forces and total sectional force and iterate until the total force is zero.

2.2.1.6 Once the position of the new neutral axis is known, then the correct stress distribution in the structural elements is obtained. The bending moment M_i about the new neutral axis due to the imposed curvature κ_i is then obtained by summating the moment contribution given by the force in each structural element.

2.2.1.7 The main steps of the incremental-iterative approach are summarised as follows (see also *Figure A.2.2*):

Step 1 Divide the hull girder transverse section into structural elements, ie longitudinal stiffened panels (one stiffener per element), hard corners and transversely stiffened panels, see *2.2.2.2*.

Step 2 Derive the stress-strain curves (or so called load-end shortening curves) for all structural elements, see *2.3*.

Step 3 Derive the expected maximum required curvature κ_F, see *2.2.1.8*. The curvature step size $\Delta\kappa$ is to be taken as $\kappa_F/300$. The curvature for the first step, κ_1 is to be taken as $\Delta\kappa$.

Derive the neutral axis z_{NA-i} for the first incremental step (i=1) with the value of the elastic hull girder section modulus, $z_{v-net50}$, see *Section 4/2.6.1*

Step 4 For each element (index j), calculate the strain $\varepsilon_{ij} = \kappa_i \ (z_j - z_{NA-i})$ corresponding to κ_i, the corresponding stress σ_j, see *2.2.1.9*, and hence the force in the element $\sigma_j A_j$.

Step 5 Determine the new neutral axis position z_{NA-i} by checking the longitudinal force equilibrium over the whole transverse section. Hence adjust z_{NA_i} until

$F_i = 0.1\Sigma A_j \sigma_j$ kN = 0

Note σ_j is positive for elements under compression and negative for elements under tension. Repeat from step 4 until equilibrium is satisfied. Equilibrium is satisfied when the change in neutral axis position is less than 0.0001m.

Step 6 Calculate the corresponding moment by summating the force contributions of all elements as follows:

$$M_i = 0.1\sum \left|\sigma_j A_j \left(z_j - z_{NA-i}\right)\right| \quad \text{kNm}$$

Step 7 Increase the curvature by $\Delta\kappa$, use the current neutral axis position as the initial value for the next curvature increment and repeat from step 4 until the maximum required curvature is reached. The ultimate capacity is the peak value M_u from the M-κ curve. If the peak does not occur in the curve, then κ_F is to be increased until the peak is reached

2.2.1.8 The expected maximum required curvature, κ_F, in m^{-1}, for the sagging condition is to be taken as:

$$\kappa_F = 3\frac{M_{yd}}{EI_{v-net50}}10^{-3} \text{ m}^{-1}$$

Where:

M_{yd} vertical bending moment given by a linear elastic bending stress of yield in the deck or keel. To be taken as the greater of :

$Z_{v-net50-dk}\ \sigma_{yd}\ 10^3$ kNm

$Z_{v-net50-kl}\ \sigma_{yd}\ 10^3$ kNm

$Z_{v-net50-dk}$
$Z_{v-net50-kl}$ section modulus at deck or bottom, in m^3, see *Section 8/1.2.2.3* and *1.2.2.4*,

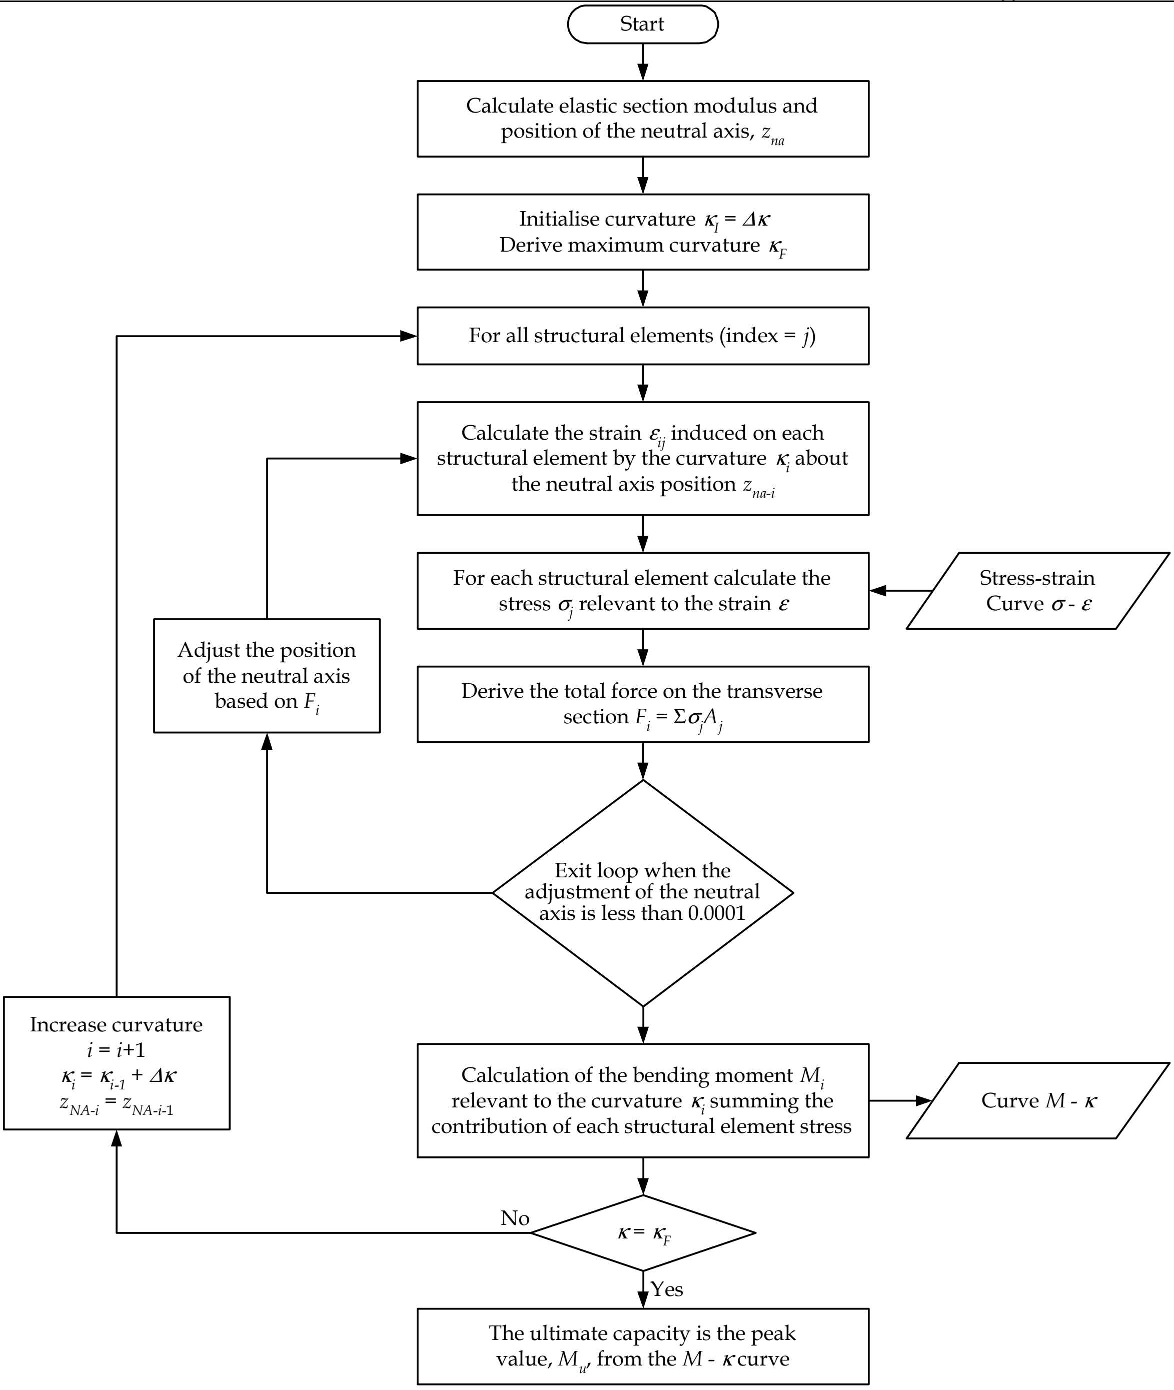
E modulus of elasticity, 2.06×10^5 N/mm^2

σ_{yd} specified minimum yield stress of the material, in N/mm^2

$I_{v-net50}$ hull girder moment of inertia, in m^4, see *Section 8/1.2.1.1*

2.2.1.9 For each structural element, the stress σ_j corresponding to the element strain ε_{ij} is to be taken as the minimum stress value from all applicable stress-strain curves σ-ε for that element.

Figure A.2.2
Flow Chart of the Procedure for the Evaluation of the Curve M-χ



2.2.2 Assumptions and modelling of the hull girder cross-section

2.2.2.1 In applying the procedure described in *2.2.1*, the following assumptions are to be made:

(a) The ultimate strength is calculated at a hull girder transverse section between two adjacent transverse webs.

(b) The hull girder transverse section remains plane during each curvature increment.

(c) The material properties of steel are assumed to be elastic, perfectly plastic.

(d) The hull girder transverse section can be divided into a set of elements which act independently of each other.

2.2.2.2 The elements making up the hull girder transverse section are:

(a) longitudinal stiffeners with attached plating, the structural behaviour is given in *2.3.1*

(b) transversely stiffened plate panels, the structural behaviour is given in *2.3.1*

(c) hard corners, as defined in *2.2.2.3*, the structural behaviour is given in *2.3.2*

2.2.2.3 The following structural areas are to be defined as hard corners:

(a) the plating area adjacent to intersecting plates

(b) the plating area adjacent to knuckles in the plating with an angle greater than 30 degrees.

(c) plating comprising rounded gunwales

An illustration of hard corner definition for girders on longitudinal bulkheads is given in *Figure A.2.3*. The hard corner size is defined in *2.2.2.4*.

2.2.2.4 The size and modelling of hard corner elements is to be as follows:

(a) it is to be assumed that the hard corner extends up to $s/2$ from the plate intersection for longitudinally stiffened plate, where s is the stiffener spacing

(b) it is to be assumed that the hard corner extends up to $20t_{grs}$ from the plate intersection for transversely stiffened plates, where t_{grs} is the gross plate thickness.

Note

(a) For transversely stiffened plate, the effective breadth of plate for the load shortening portion of the stress-strain curve is to be taken as the full plate breadth, i.e. to the intersection of other plates – not from the end of the hard corner if any. The area on which the value of σ_{CR5} defined in 2.3.8.1 applies is to be taken as the breadth between the hard corners, i.e. excluding the end of the hard corner if any.

(b) For longitudinally stiffened plate, the effective breadth of attached plate is equal to the mean spacing of the ordinary stiffener when the panels on both sides of the stiffener are longitudinally stiffened, or equal to the breadth of the longitudinally stiffened panel when the panel on one side of the stiffener is longitudinally stiffened and the other panel is of the transversely stiffened.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.2.2.5 Where the plate members are stiffened by non-continuous longitudinal stiffeners, the non-continuous stiffeners are considered only as dividing a plate into various elementary plate panels.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.2.2.6 Openings are to be considered in accordance with Section 4/2.6.3.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.2.2.7 Where attached plating is made of steels having different thicknesses and/or yield stresses, an average thickness and/or average yield stress obtained by the following formula are to be used for the calculation:

(a) $$t = \frac{t_1 s_1 + t_2 s_2}{s}$$

(b) $$\sigma_{ydp} = \frac{\sigma_{ydp1} t_1 s_1 + \sigma_{ydp2} t_2 s_2}{ts}$$

Where: t_1, s_1, t_2, s_2, σ_{ydp1}, σ_{ydp2}, s, see Figure A.2.4.

RCN 1 to July 2010 version (effective from 1 July 2012)

Figure A.2.3
Example of Defining Structural Elements

b) Example showing girder on longitudinal bulkhead

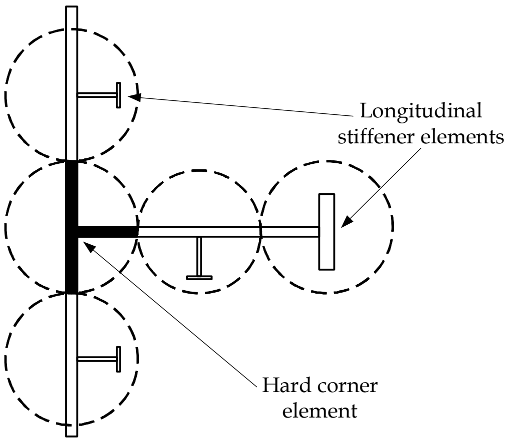

Figure A.2.4
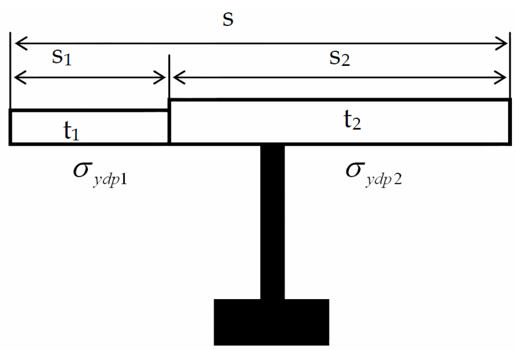
Definitions



RCN 1 to July 2010 version (effective from 1 July 2012)

2.3 Stress-strain Curves σ-ε (or Load-end Shortening Curves)

2.3.1 Plate panels and stiffeners

2.3.1.1 Plate panels and stiffeners are assumed to fail according to one of the modes of failure specified in *Table A.2.1*. The relevant stress-strain curve σ-ε is to be obtained for lengthening and shortening strains according to *Table A.2.1*.

2.3.1.2 Where the plate members are stiffened by non-continuous longitudinal stiffeners, the stress of the element is to be obtained in accordance with 2.3.3 to 2.3.7, taking into account the non-continuous longitudinal stiffener. In calculating the total forces for checking the hull girder ultimate strength, the area of non-continuous longitudinal stiffener is to be assumed as zero.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.1.3 Where openings are provided in the plate panel, the considered area of the element is to be obtained by deducting the opening area from the plating in calculating the total force for checking the hull girder ultimate strength. Openings are to be considered in accordance with Section 4/2.6.3.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.2 Hard corners

2.3.2.1 Hard corners are sturdier elements which are assumed to buckle and fail in an elastic, perfectly plastic manner. The relevant stress strain curve σ-ε is to be obtained for lengthened and shortened hard corners according to *2.3.3*.

Table A.2.1
Modes of Failure of Plate Panels and Stiffeners

Element	Mode of failure	Stress-strain curve σ-ε defined in
Lengthened transversely framed plate panels or stiffeners	Elastic, perfectly plastic failure	See *2.3.3*
Shortened stiffeners	Beam column buckling Torsional buckling Web local buckling of flanged profiles Web local buckling of flat bars	See *2.3.4* See *2.3.5* See *2.3.6* See *2.3.7*
Shortened transversely framed plate panels	Plate buckling	See *2.3.8*

2.3.3 Elasto-plastic failure of structural elements

2.3.3.1 The equation describing the stress-strain curve σ-ε or the elasto-plastic failure of structural elements is to be obtained from the following formula, valid for both positive (compression or shortening) of hard corners and negative (tension or lengthening) strains of all elements (see *Figure A.2.5*):

$$\sigma = \Phi \sigma_{ydA}$$

Where:

Φ edge function:

$\Phi = -1$ for $\varepsilon < -1$

$\Phi = \varepsilon$ for $-1 < \varepsilon < 1$

$\Phi = 1$ for $\varepsilon > 1$

ε relative strain:

$$\varepsilon = \frac{\varepsilon_E}{\varepsilon_{yd}}$$

ε_E element strain

ε_{yd} strain corresponding to yield stress in the element:

$$\varepsilon_{yd} = \frac{\sigma_{ydA}}{E}$$

σ_{ydA} equivalent minimum yield stress of the considered element, in N/mm^2

$$\sigma_{ydA} = \frac{\sigma_{ydp} A_{p-net50} + \sigma_{yds} A_{s-net50}}{A_{p-net50} + A_{s-net50}}$$

σ_{ydp} specified minimum yield stress of the material of the plate, in N/mm^2

σ_{yds} specified minimum yield stress of the material of the stiffener, in N/mm^2

$A_{p-net50}$ net sectional area of attached plating, in cm^2

$A_{s-net50}$ net sectional area of the stiffener without attached plating, in cm^2

Note

The signs of the stresses and strains in this Appendix are opposite to those in the rest of the Rules

RCN 1 to July 2010 version (effective from 1 July 2012)

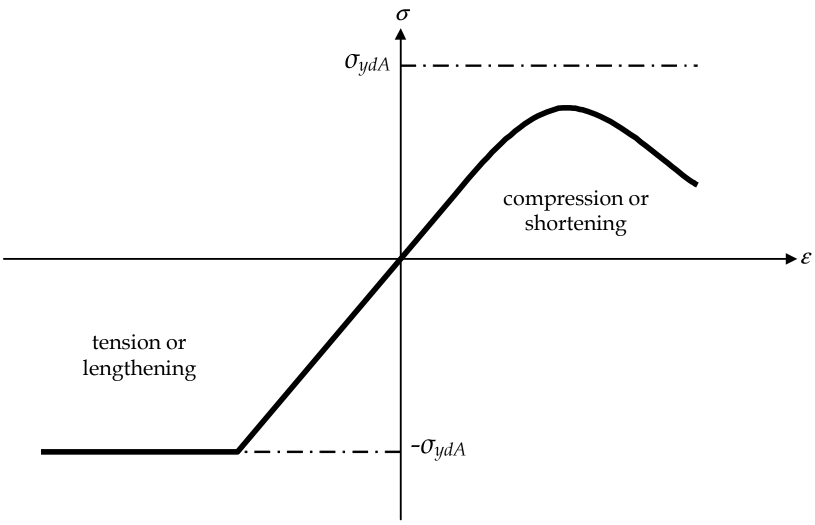
b) Typical stress strain curve σ-ε for elasto-plastic failure of a stiffener



RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.4 Beam column buckling

2.3.4.1 The equation describing the shortening portion of the stress strain curve σ_{CR1}-ε for the beam column buckling of stiffeners is to be obtained from the following formula:

$$\sigma_{CR1} = \Phi \sigma_{C1} \left(\frac{A_{s-net50} + 10^{-2} b_{eff-p} t_{net50}}{A_{s-net50} + 10^{-2} s t_{net50}} \right) \quad \text{N/mm}^2$$

Where:

Φ edge function defined in *2.3.3.1*

$A_{s-net50}$ net area of the stiffener, in cm², without attached plating

σ_{C1} critical stress, in N/mm²:

$$\sigma_{C1} = \frac{\sigma_{E1}}{\varepsilon} \quad for \quad \sigma_{E1} \le \frac{\sigma_{ydB}}{2}\varepsilon$$

$$\sigma_{C1} = \sigma_{ydB}\left(1 - \frac{\sigma_{ydB}\varepsilon}{4\sigma_{E1}}\right) \quad for \quad \sigma_{E1} > \frac{\sigma_{ydB}}{2}\varepsilon$$

ε relative strain defined in *2.3.3.1*

σ_{E1} Euler column buckling stress, in N/mm²:

$$\sigma_{E1} = \pi^2 E \frac{I_{E-net50}}{A_{E-net50} l_{stf}^2} 10^{-4}$$

E modulus of elasticity, 2.06 x 10⁵ N/mm²

$I_{E-net50}$ net moment of inertia of stiffeners, in cm⁴, with attached plating of width b_{eff-s}

b_{eff-s} effective width, in mm, of the attached plating for the stiffener:

$$b_{eff-s} = \frac{s}{\beta_p} \quad \text{for} \quad \beta_p > 1.0$$

$$b_{eff-s} = s \quad \text{for} \quad \beta_p \le 1.0$$

β_p $= \frac{s}{t_{net50}}\sqrt{\frac{\varepsilon\sigma_{ydp}}{E}}$

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in *Section 4/2.2.1*

t_{net50} net thickness of attached plating, in mm

$A_{E-net50}$ net area, in cm², of stiffeners with attached plating of width b_{eff-p}

l_{stf} span of stiffener, in m, equal to spacing between primary support members

b_{eff-p} effective width, in mm, of the plating:

$$b_{eff-p} = \left(\frac{2.25}{\beta_p} - \frac{1.25}{\beta_p^2}\right)s \quad \text{for} \quad \beta_p > 1.25$$

$$b_{eff-p} = s \quad \text{for} \quad \beta_p \le 1.25$$

σ_{ydB} equivalent minimum yield stress of the considered element, in N/mm²

$$\sigma_{ydB} = \frac{\sigma_{ydp} A_{pE-net50} l_{pE} + \sigma_{yds} A_{s-net50} l_{sE}}{A_{pE-net50} l_{pE} + A_{s-net50} l_{sE}}$$

$A_{pE-net50}$ effective area, in cm²

$$A_{pE-net50} = 10^{-2} b_{eff-s} t_{net50}$$

σ_{ydp} specified minimum yield stress of the material of the plate, in N/mm²

σ_{yds} specified minimum yield stress of the material of the stiffener, in N/mm²

l_{pE} distance, in mm, measured from the neutral axis of the stiffener with attached plate of width, b_{eff-s}, to the bottom of the attached

plate

l_{sE} distance, in mm, measured from the neutral axis of the stiffener with attached plate of width, b_{eff-s}, to the top of the stiffener

(RCN 2, effective from 1 July 2008)

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.5 Torsional buckling of stiffeners

2.3.5.1 The equation describing the shortening portion of the stress-strain curve σ_{CR2}-ε for the lateral-flexural buckling of stiffeners is to be obtained according to the following formula:

$$\sigma_{CR2} = \Phi \frac{A_{s-net50}\sigma_{C2} + 10^{-2} st_{net50}\sigma_{CP}}{A_{s-net50} + 10^{-2} st_{net50}} \quad \text{N/mm}^2$$

Where:

Φ edge function defined in *2.3.3.1*

$A_{s-net50}$ net area of the stiffener, in cm², without attached plating

σ_{C2} critical stress, in N/mm²:

$$\sigma_{C2} = \frac{\sigma_{E2}}{\varepsilon} \qquad for \quad \sigma_{E2} \le \frac{\sigma_{yds}}{2}\varepsilon$$

$$\sigma_{C2} = \sigma_{yds}\left(1 - \frac{\sigma_{yds}\varepsilon}{4\sigma_{E2}}\right) \qquad for \quad \sigma_{E2} > \frac{\sigma_{yds}}{2}\varepsilon$$

σ_{E2} Euler torsional buckling stress, in N/mm²

$\sigma_{E2} = \sigma_{ET}$

σ_{ET} reference stress for torsional buckling, in N/mm², defined in *Section 10/3.3.3.1*, calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$.

ε relative strain defined in *2.3.3.1*

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in *Section 4/2.2.1*

t_{net50} net thickness of attached plating, in mm

σ_{CP} ultimate strength of the attached plating for the stiffener, in N/mm²:

$$\sigma_{CP} = \left(\frac{2.25}{\beta_p} - \frac{1.25}{\beta_p^2}\right)\sigma_{ydp} \qquad \text{for} \quad \beta_p > 1.25$$

$$\sigma_{CP} = \sigma_{ydp} \qquad \text{for} \quad \beta_p \le 1.25$$

β_p coefficient defined in *2.3.4*

σ_{ydp} specified minimum yield stress of the material of the plate, in N/mm²

σ_{yds} specified minimum yield stress of the material of the stiffener, in N/mm²

(RCN 2, effective from 1 July 2008)

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.6 Web local buckling of stiffeners with flanged profiles

2.3.6.1 The equation describing the shortening portion of the stress strain curve σ_{CR3}-ε for the web local buckling of flanged stiffeners is to be obtained from the following formula:

$$\sigma_{CR3} = \Phi \frac{b_{eff-p} t_{net50} \sigma_{ydp} + \left(d_{w-eff} t_{w-net50} + b_f t_{f-net50}\right) \sigma_{yds}}{s t_{net50} + d_w t_{w-net50} + b_f t_{f-net50}} \quad \text{N/mm}^2$$

Where:

Φ edge function defined in *2.3.3.1*

b_{eff-p} effective width, in mm, of the plating, defined in *2.3.4*

t_{net50} net thickness of plate, in mm

d_w depth of the web, in mm

$t_{w-net50}$ net thickness of web, in mm

b_f breadth of the flange, in mm

$t_{f-net50}$ net thickness of flange, in mm

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in *Section 4/2.2.1*

d_{w-eff} effective depth of the web, in mm:

$$d_{w-eff} = \left(\frac{2.25}{\beta_w} - \frac{1.25}{\beta_w^2}\right) d_w \quad \text{for} \quad \beta_w > 1.25$$

$$d_{w-eff} = d_w \quad \text{for} \quad \beta_w \le 1.25$$

β_w $\dfrac{d_w}{t_{w-net50}} \sqrt{\dfrac{\varepsilon \sigma_{yds}}{E}}$

ε relative strain defined in *2.3.3.1*

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.7 Web local buckling of flat bar stiffeners

2.3.7.1 The equation describing the shortening portion of the stress-strain curve σ_{CR4}-ε for the web local buckling of flat bar stiffeners is to be obtained from the following formula:

$$\sigma_{CR4} = \Phi\left(\frac{s t_{net50} \sigma_{CP} + 10^{-2} A_{s-net50} \sigma_{C4}}{s t_{net50} + 10^{-2} A_{s-net50}}\right)$$

Where:

Φ edge function defined in *2.3.3.1*

σ_{CP} ultimate strength of the attached plating, in N/mm², defined in *2.3.5*

σ_{C4} critical stress, in N/mm²:

$$\sigma_{C4} = \frac{\sigma_{E4}}{\varepsilon} \qquad for \quad \sigma_{E4} \le \frac{\sigma_{yds}}{2}\varepsilon$$

$$\sigma_{C4} = \sigma_{yds}\left(1 - \frac{\sigma_{yds}\varepsilon}{4\sigma_{E4}}\right) \qquad for \quad \sigma_{E4} > \frac{\sigma_{yds}}{2}\varepsilon$$

σ_{E4} Euler buckling stress, in N/mm²:

$$\sigma_{E4} = 160000\left(\frac{t_{w-net50}}{d_w}\right)^2$$

ε relative strain defined in *2.3.3.1*.

$A_{s\text{-}net50}$ net area of stiffener, in cm², *see* 2.3.5.1

$t_{w\text{-}net50}$ net thickness of web, in mm

d_w depth of the web, in mm

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in *Section 4/2.2.1*

t_{net50} net thickness of attached plating, in mm

σ_{yds} specified minimum yield stress of the material of the stiffener, in N/mm²

(RCN 2, effective from 1 July 2008)

RCN 1 to July 2010 version (effective from 1 July 2012)

2.3.8 Buckling of transversely stiffened plate panels

2.3.8.1 The equation describing the shortening portion of the stress-strain curve σ_{CR5}-ε for the buckling of transversely stiffened panels is to be obtained from the following formula:

$$\sigma_{CR5} = \min\begin{cases} \Phi\sigma_{ydp}\left[\dfrac{s}{1000l_{stf}}\left(\dfrac{2.25}{\beta_p} - \dfrac{1.25}{\beta_p^2}\right) + 0.1\left(1 - \dfrac{s}{1000l_{stf}}\right)\left(1 + \dfrac{1}{\beta_p^2}\right)^2\right] \\ \sigma_{ydp}\Phi \end{cases} \quad \text{N/mm}^2$$

Where:

β_p coefficient defined in *2.3.4.1*

Φ edge function defined in *2.3.3.1*

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in *Section 4/2.2.1*

l_{stf} stiffener span, in m, equal to spacing between primary support members

σ_{ydp} specified minimum yield stress of the material of the plate, in N/mm²

(RCN 2, effective from 1 July 2008)

RCN 1 to July 2010 version (effective from 1 July 2012)

3 ALTERNATIVE METHODS

3.1 General

3.1.1 Considerations for alternative models

3.1.1.1 The bending moment-curvature relationship, M-κ, may be established by alternative methods. Such models are to consider all the relevant effects important to the non-linear response with due considerations of:

(a) non-linear geometrical behaviour

(b) inelastic material behaviour

(c) geometrical imperfections and residual stresses (geometrical out-of flatness of plate and stiffeners)

(d) simultaneously acting loads:

- bi-axial compression
- bi-axial tension
- shear and lateral pressure

(e) boundary conditions

(f) interactions between buckling modes

(g) interactions between structural elements such as plates, stiffeners, girders etc.

(h) post-buckling capacity.

3.2 Methods

3.2.1 Incremental-iterative procedure

3.2.1.1 The most generally used method to assess the hull girder ultimate moment capacity is to derive the non-linear moment-curvature relationship, M-κ, by incrementally increasing the bending curvature, κ, of the hull section between two adjacent transverse frames and then identifying the maximum moment along this curve as the ultimate bending capacity, M_U.

3.2.1.2 The M-κ curve is to be based on the axial non-linear P-ε (load/strain) load-shortening curves for individual structural component in the cross-section. The P-ε curves shall consider all relevant structural effects as listed in *3.1.1.1*.

3.2.2 Non-linear finite element analysis

3.2.2.1 Advanced non-linear finite element analyses models may be used for the assessment of the hull girder ultimate capacity. Such models are to consider the relevant effects important to the non-linear responses with due consideration of the items listed in *3.1.1.1*.

3.2.2.2 Particular attention is to be given to modelling the shape and size of geometrical imperfections. It is to be ensured that the shape and size of geometrical imperfections trigger the most critical failure modes.

APPENDIX B

STRUCTURAL STRENGTH ASSESSMENT

1 GENERAL

1.1 Application

1.1.1 General

1.1.1.1 In accordance with *Section 9/2.1*, a finite element (FE) assessment is to be carried out to verify the strength of the hull structure.

1.1.1.2 The structural assessment is to be carried out in accordance with the requirements given in this Appendix. The structural assessment is to verify that the acceptance criteria specified are complied with.

1.1.1.3 The requirements in this Appendix apply to the assessment of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads of the tanks in the midship cargo region and, in addition, the assessment of strengthening of longitudinal hull girder shear structural members, as defined in *Section 9/2.2.1.1* and *Section 4/Table 4.1.1*, in way of transverse bulkheads for hull girder vertical shear loads in the forward and aft cargo regions. The strength assessment of longitudinal hull girder shear structural members given in this Appendix is not applicable for forward transverse collision bulkhead, engine room transverse bulkhead and slop tank transverse bulkheads.

1.1.1.4 For the purpose of the FE structural assessment the cargo tank regions are as defined in *Figure B1.1*.

1.1.1.5 Cargo tank structural strength analysis, in accordance with *Appendix B/2*, for the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads in tanks within the midship cargo region, is mandatory. The assessment is to be based on the maximum permissible still water (load combination S) and combined permissible still water and wave hull girder vertical shear forces (load combination S+D) between and including the forward bulkhead of the aft most cargo tank and 0.65*L* from AP, but not including the engine room and slop tank transverse bulkheads, *see Figure B.1.1(a)*.

1.1.1.6 The assessment of longitudinal hull girder shear structural members in the forward cargo region, in accordance with *Appendix B/2*, is mandatory. The strengthening of these structural members in way of transverse bulkheads in the tanks of the forward cargo region may be based on the maximum permissible still water (load combination S) and combined permissible still water and wave hull girder vertical shear forces (load combination S+D) at the bulkhead positions forward of 0.65*L* from AP, but not including the forward collision bulkhead, *see Figure B.1.1(b).*

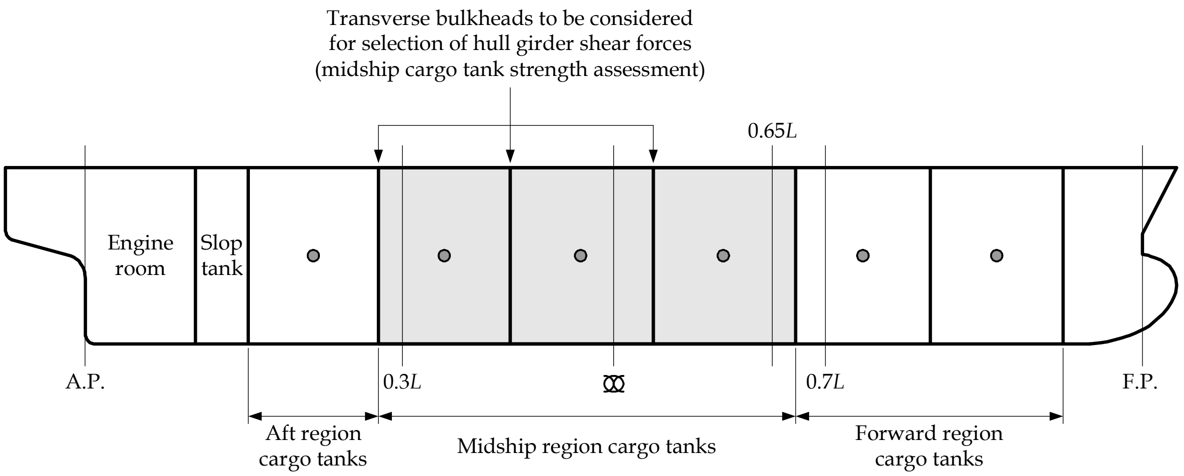
1.1.1.7 Strengthening of longitudinal hull girder shear structural members in way of transverse bulkheads of the tanks in the midship cargo region and the aft cargo region, in accordance with *Appendix B/2*, may be based on the scantling result obtained from the midship cargo tank analysis as described in *1.1.1.5*.

1.1.1.8 Alternatively, optional assessment may be carried out to determine the strengthening requirement of longitudinal hull girder shear structural members in way of individual transverse bulkheads based on the permissible still water (load combination S) and combined permissible still water and wave hull girder vertical shear forces (load combination S+D) at the transverse bulkhead position under consideration, *see Figure B.1.1(b).*

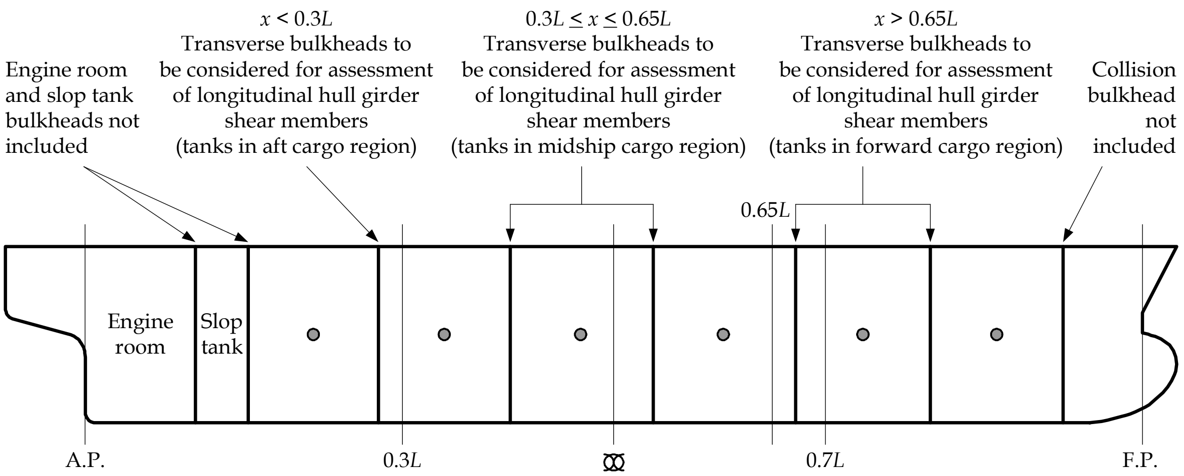
1.1.1.9 Fine mesh finite element analysis, in accordance with *Appendix B/3*, and the finite element based fatigue assessment of lower hopper knuckle joint, in accordance with *Appendix B/4*, are mandatory for the midship cargo region.

Figure B.1.1
Definition of Cargo Tank Regions for FE Structural Assessment

(a) Midship cargo tank strength assessment



(b) Assessment of longitudinal hull girder shear structural members



Note

1. Tanks in the forward cargo region are defined as tanks with their longitudinal centre of gravity position forward of $0.7L$ from A.P.
2. Tanks in the midship cargo region are defined as tanks with their longitudinal centre of gravity position at or forward of $0.3L$ from AP and at or aft of $0.7L$ from A.P.
3. Tanks in the aft cargo region are defined as tanks with their longitudinal centre of gravity position aft of $0.3L$ from A.P.

1.2 Symbols, Units and Definitions

1.2.1 General

1.2.1.1 The symbols and definitions, applicable to this section, are given in *Section 4/1*, *Section 7* and as follows:

a_v	vertical acceleration, taken at centre of gravity of tank
a_t	transverse acceleration, taken at centre of gravity of tank
a_{lng}	longitudinal acceleration, taken at centre of gravity of tank
E	Modulus of Elasticity of steel, $2.06\text{x}10^5$ N/mm^2
M_{wv}	vertical wave bending moment for a dynamic load case
M_{sw}	vertical still water bending moment for a finite element loading pattern
M_h	horizontal wave bending moment for a dynamic load case
Q_{wv}	vertical wave shear force for a dynamic load case
Q_{sw}	vertical still water shear force for a finite element loading pattern
T_{LC}	draught at the loading condition being considered
T_{sc}	scantling draught, as defined in *Section 4/1.1.5.5*
T_{bal-em}	emergency draught of ship
t_{grs}	proposed new building gross thickness excluding Owner's extras, see *Section 2/6.3.4*
t_{corr}	corrosion addition, as defined in *Section 6/3.2*
σ_{yd}	specified minimum yield stress of the material, N/mm^2
σ_{vm}	von Mises stress $= \sqrt{\sigma_x{}^2 + \sigma_y{}^2 - \sigma_x\sigma_y + 3\tau_{xy}{}^2}$
σ_x	axial stress in element x direction
σ_y	axial stress in element y direction
τ_{xy}	element shear stress in x-y plane
δ_x	displacement in x direction, in accordance with the coordinate system defined in *Section 4/1.4*
δ_y	displacement in y direction, in accordance with the coordinate system defined in *Section 4/1.4*
δ_z	displacement in z direction, in accordance with the coordinate system defined in *Section 4/1.4*
θ_x	rotation about x axis, in accordance with the coordinate system defined in *Section 4/1.4*
θ_y	rotation about y axis, in accordance with the coordinate system defined in *Section 4/1.4*
θ_z	rotation about z axis, in accordance with the coordinate system defined in *Section 4/1.4*

1.2.1.2 The nomenclature of structural components is defined in *Section 4/1.5*.

1.2.1.3 Consistent co-ordinate and unit systems are to be used throughout all parts of the structural analysis. However, in calculations using Rule Formulae, the units and co-ordinate system as specified are to be used. Where output values from Rule formulae are in a different unit and/or co-ordinate system as used in the structural analysis, the output values are to be converted to the appropriate unit and co-ordinate system.

1.2.2 Finite element types

1.2.2.1 The structural assessment is to be based on linear finite element analysis of three dimensional structural models. The general types of finite elements to be used in the finite element analysis are given in *Table B.1.1*.

1.2.2.2 Two node line elements and three or four node plate/shell elements are considered sufficient for the representation of the hull structure. The mesh requirements given in this Appendix are based on the assumption that these elements are used in the finite element models. However, higher order elements may also be used.

Table B.1.1
Types of Finite Element

Rod (or truss) element	Line element with axial stiffness only and constant cross-sectional area along the length of the element
Beam element	Line element with axial, torsional and bi-directional shear and bending stiffness and with constant properties along the length of the element
Membrane (or plane-stress) plate element	Plate element with bi-axial and in-plane plate element stiffness with constant thickness
Shell (or bending plate) element	Plate element with in-plane stiffness and out-of-plane bending stiffness with constant thickness

1.2.2.3 For the cargo tank and fine mesh strength analyses as specified in *Appendix B/2* and *B/3,* the assessment against stress acceptance criteria is to be based on membrane (or in-plane) stresses of plate elements. For the fatigue assessment as specified in *Appendix B/4*, the calculation of dynamic stress range for the determination of fatigue life is to be based on surface stresses of plate elements.

2 CARGO TANK STRUCTURAL STRENGTH ANALYSIS

2.1 Assessment

2.1.1 General

2.1.1.1 For tankers of conventional arrangements, the finite element strength assessment of the hull girder and primary supporting structural members is to be in accordance with the requirements in this section.

2.2 Structural Modelling

2.2.1 General

2.2.1.1 The longitudinal extent of the midship cargo tank finite element (FE) model is to cover three cargo tank lengths about midships. Where the tanks in the midship cargo region are of different lengths, the middle tank of the finite element model is to represent the cargo tank of the greatest length. The finite element model may be prismatic. The transverse bulkheads at the ends of the model are to be represented. Where corrugated transverse bulkheads are fitted, the model is to include the extent of the bulkhead stool structure forward and aft of the tanks at the model ends. The length of the model extending beyond the end transverse bulkheads is to be kept equal, at both ends. The web frames at the ends of the model are to be modelled. Typical finite element models representing the midship cargo tank region of different tanker configurations are shown in *Figure B.2.1*.

2.2.1.2 The assessment of longitudinal hull girder shear structural members, as defined in *Section 9/2.2.1.1* and *Section 4/Table 4.1.1*, against hull girder vertical shear loads in the forward and aft cargo regions may be based on the midship cargo tank finite element model with modification of plate and stiffener properties where appropriate. Where a separate cargo tank finite element model is used for the assessment of shear strength, the model is to cover three tank lengths.

2.2.1.3 Both port and starboard sides of the ship are to be modelled. The full depth of the ship is to be modelled.

2.2.1.4 All main longitudinal and transverse structural elements are to be modelled. These include inner and outer shell, double bottom floor and girder system, transverse and vertical web frames, stringers and transverse and longitudinal bulkhead structures. All plates and stiffeners on the structure, including web stiffeners, are to be modelled, see *2.2.1.11*.

2.2.1.5 The reduced thickness used in the FE model of the cargo tanks, applicable to all plating and stiffener's web and flanges is to be calculated as follows:

$$t_{FEM-net50} = t_{grs} - 0.5\, t_{corr}$$

Where:

t_{grs} gross thickness, as defined in *1.2*

t_{corr} corrosion addition, as defined in *Section 6/3.2*

Figure B.2.1

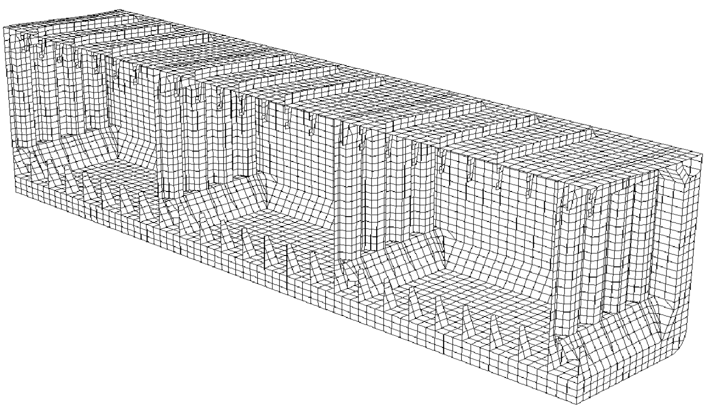
Typical Cargo Tank Model of a VLCC (shows only port side of the full breadth model)



Typical Cargo Tank Model of a Product Tanker (shows only port side of the full breadth model)

2.2.1.6 The plate element mesh is to follow the stiffening system as far as practicable, hence representing the actual plate panels between stiffeners. In general, the plate element mesh is to satisfy the following requirements:

(a) one element between every longitudinal stiffener, see *Figure B.2.2*.
Longitudinally, the element length is not to be greater than 2 longitudinal spaces

(b) one element between every vertical stiffener on transverse bulkheads, see *Figure B.2.3*

(c) one element between every web stiffener on transverse and vertical web frames, cross ties and stringers, see *Figure B.2.2* and *Figure B.2.4*

(d) at least three elements over the depth of double bottom girders and floors, transverse web frames, vertical web frames and horizontal stringers on transverse bulkheads. For cross ties, deck transverse and horizontal stringers on transverse wash bulkheads and longitudinal bulkheads with a smaller web depth, representation using two elements over the depth is acceptable provided that there is at least one element between every web stiffener. The mesh size of adjacent structure is to be adjusted to suit

(e) the mesh on the hopper tank web frame shall be fine enough to represent the shape of the web ring opening, see *Figure B.2.2*

(f) the curvature of the free edge on large brackets of primary support members is to be modelled accurately to avoid unrealistic high stress due to geometry discontinuities. In general, a mesh size equal to the stiffener spacing is acceptable. The bracket toe may be terminated at the nearest nodal point provided that the modelled length of the bracket arm does not exceed the actual bracket arm length. The bracket flange is not to be connected to the plating, see *Figure B.2.5*. The modelling of the tapering part of the flange is to be in accordance with *2.2.1.14*. An acceptable mesh is shown in *Figure B.2.5.* A finer mesh is to be used for the determination of detailed stress at the bracket toe, see *Appendix B/3*.

2.2.1.7 Corrugated bulkheads and bulkhead stools are to be modelled using shell plate elements, see *Figure B.2.6.* Diaphragms in the stools and internal longitudinal and vertical stiffeners on the stool plating are to be included in the model. Modelling is to be carried out as follows:

(a) the shell element mesh on the flange and web of the corrugation is in general to follow the stiffener spacing inside the bulkhead stool

(b) where difficulty occurs in matching the mesh on the corrugations directly with the mesh on the stool, it is acceptable to adjust the mesh on the stools in way of the corrugations in order that the corrugation bulkhead will retain its original geometrical shape. However, if the shape of the corrugation is adjusted in order to simplify the modelling procedure, this effect is to be taken into account in evaluation of stresses as described in *2.7.2.6.*

(c) for a corrugated bulkhead without an upper stool and/or lower stool, it may be necessary to adjust the geometry in order to simplify the modelling. The adjustment is to be made such that the shape and position of the corrugations and primary support members are retained. Hence, the adjustment is to be made on stiffeners and plate seams if necessary.

2.2.1.8 The aspect ratio of the plate elements is in general not to exceed three. The use of triangular plate elements is to be kept to a minimum. Where possible, the aspect ratio of plate elements in areas where there are likely to be high stresses or a high stress gradient is to be kept close to one and the use of triangular elements is to be avoided.

2.2.1.9 Typical mesh arrangements of the cargo tank structure are shown in *Figure B.2.7*.

2.2.1.10 Shell elements, in association with beam elements, are to be used to represent stiffened panels in areas under lateral pressure. Shell elements are to be used to represent unstiffened panels in areas under lateral pressure. Membrane and rod elements may be used to represent non-tight structure under no pressure loads.

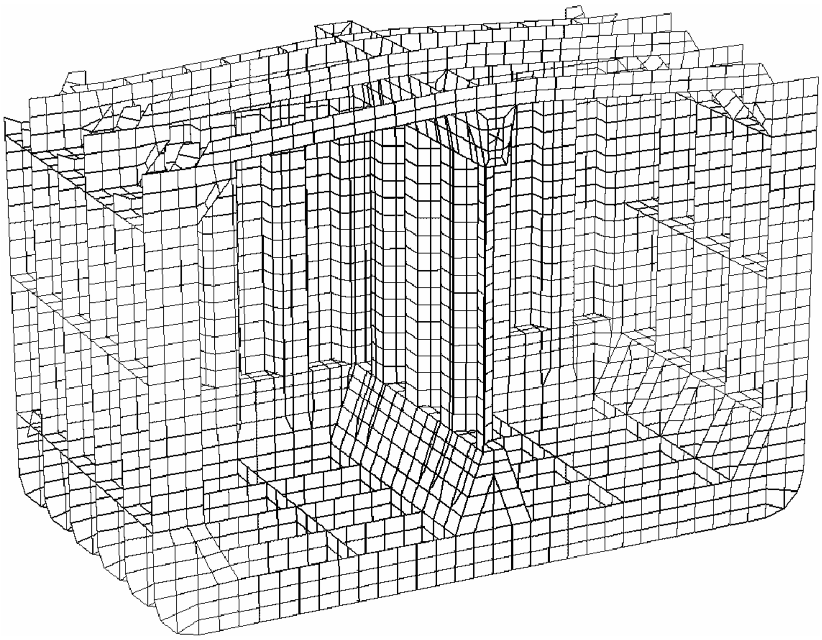
VLCC



Product tanker

2.2.1.11 All local stiffeners are to be modelled. These stiffeners may be modelled using line elements positioned in the plane of the plating. Beam elements are to be used in areas under the action of lateral loads whilst rod (truss) elements may be used to represent local stiffeners on internal structural members under no lateral loads. The line elements are to have the following properties:

(a) for beam elements, out of plane bending properties are to represent the inertia of the combined plating and stiffener. The width of the attached plate is to be

taken as ½ + ½ stiffener spacing on each side of the stiffener. The eccentricity of the neutral axis is not required to be modelled.

(b) for beam and rod elements, other sectional properties are to be based on a cross sectional area representing the stiffener area, excluding the area of the attached plating.

2.2.1.12 The effective cross sectional area of non-continuous stiffeners is to be calculated in accordance with *Table B.2.1*.

Table B.2.1
Effective Cross Sectional Area of Stiffener Line Elements

Structure represented by line element	Effective area A_e	
Stiffener within a distance $2d_w$ from a sniped (non-continuous) end	All sections	A_e=25%$A_{n\text{-}net50}$
Stiffener outside a distance $2d_w$ from a sniped (non-continuous) end	All sections	A_e=100%$A_{n\text{-}net50}$

Where:
$A_{n\text{-}net50}$ average cross sectional area over length of line element
d_w depth of stiffener web, excluding attached plate

2.2.1.13 Web stiffeners on primary support members are to be modelled. Where these stiffeners are not in line with the primary FE mesh, it is sufficient to place the line element along the nearby nodal points provided that the adjusted distance does not exceed 0.2 times the stiffener spacing under consideration. The stresses and buckling utilisation factors obtained need not be corrected for the adjustment. Buckling stiffeners on large brackets, deck transverses and stringers parallel to the flange are to be modelled. These stiffeners may be modelled using rod elements.

2.2.1.14 Face plates of primary support members and brackets may be modelled using rod elements. The effective cross sectional area at the curved part of the face plate is to be calculated in accordance with *Section 4/2.3.4*. The cross sectional area of a rod element representing the tapering part of the face plate is to be based on the average cross sectional area of the face plate in way of the element length.

2.2.1.15 Methods of representing openings in webs of primary support members are to be in accordance with *Table B.2.2*. Cut-outs for local stiffeners, scallops, drain and air holes need not be represented.

Table B.2.2
Representation of Openings in Primary Support Member Webs

$h_o/h < 0.35$ and $g_o < 1.2$	Openings do not need to be modelled
$0.5 > h_o/h \geq 0.35$ and $g_o < 1.2$	The plate modelled with mean thickness $t_{1\text{-}net50}$
$h_o/h < 0.5$ and $2 > g_o \geq 1.2$	The plate modelled with mean thickness $t_{2\text{-}net50}$
$h_o/h \geq 0.5$ or $g_o \geq 2.0$	The geometry of the opening is to be modelled

Where:

g_o $= 1 + \dfrac{l_o^2}{2.6(h - h_o)^2}$

$t_{1\text{-}net50}$ $= \dfrac{h - h_o}{h} t_{w-net50}$

$t_{2\text{-}net50}$ $= \dfrac{h - h_o}{h g_o} t_{w-net50}$

$t_{w\text{-}net50}$ net web thickness

l_o length of opening parallel to primary support member web direction, see *Figure B.2.8*

h_o height of opening parallel to depth of web, see *Figure B.2.8*

h height of web of primary support member in way of opening, see *Figure B.2.8*

t_{corr} corrosion addition, as defined in *Section 6/3.2*

Note

1. For sequential openings where the distance, d_o, between openings is less than $0.25h$, the length l_o is to be taken as the length across openings as shown in *Figure B.2.9*.
2. The same unit is to be used for l_o, h_o and h.

Figure B.2.8
Openings in Web

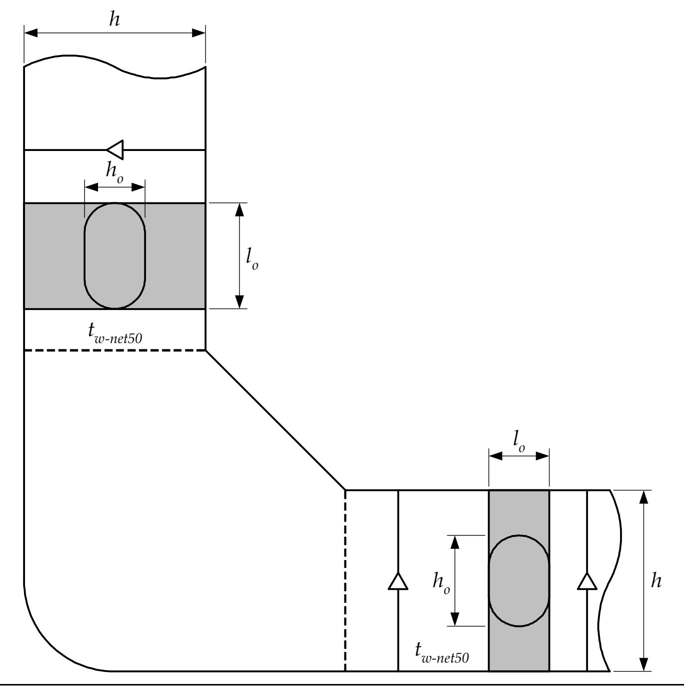


Figure B.2.9
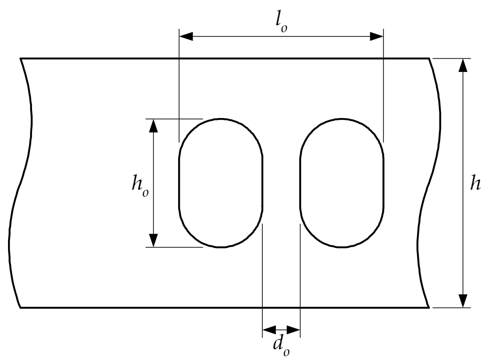
Length l_o for Sequential Openings with $d_o < h/4$



2.3 Loading Conditions

2.3.1 Finite element load cases

2.3.1.1 The standard design load combinations to be used in the structural analysis are given in *Tables B.2.3* and *B.2.4* for tankers with two oil-tight longitudinal bulkheads and one centreline oil-tight longitudinal bulkhead respectively.

2.3.1.2 For S+D design load combinations (seagoing load cases) the number of dynamic load cases required to be investigated for each loading pattern is indicated by the dynamic load case numbers specified for each loading pattern in *Tables B.2.3* and *B.2.4*. Each S+D design load combination consists of two parts:

(a) static loads, as described by the loading pattern, ship draught, hull girder still water bending moment and shear force specified, and

(b) dynamic loads defined in *Section 7/Table 7.6.2* for the dynamic load case number specified.

2.3.1.3 For tankers with two oil-tight longitudinal bulkheads and a cross tie arrangement in the centre cargo tanks, loading patterns A7 and A12 in *Table B.2.3* are to be examined for the possibility that unequal filling levels in transversely paired wing cargo tanks would result in a more onerous stress response. Loading pattern A7 is required to be analysed only if such a non-symmetric seagoing loading condition is included in the ship loading manual. Loading patterns A7 and A12 need not be examined for tankers without a cross tie arrangement in the centre cargo tanks.

2.3.1.4 For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A3 and harbour loading pattern A13, with all cargo tanks abreast empty, are to be analysed with a ship draught of $0.55T_{sc}$ and $0.65T_{sc}$ respectively. If conditions in the ship loading manual specify greater draughts for loading pattern A3 or A13, then the maximum specified draught in the ship's loading manual for the loading pattern is to be used.

2.3.1.5 For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A5 and harbour loading pattern A11, with all cargo tanks abreast fully loaded, are to be analysed with a ship draught of $0.8T_{sc}$ and $0.7T_{sc}$ respectively. If conditions in the ship loading manual specify lesser draughts for loading pattern A5 or A11, then the minimum specified draught in the ship's loading manual for the loading pattern is to be used.

2.3.1.6 For loading patterns A1, A2, B1, B2 and B3, with cargo tank(s) empty, a minimum ship draught of $0.9T_{sc}$ is to be used in the analysis. If conditions in the ship loading

manual specify greater draughts for loading patterns with empty cargo tank(s), then the maximum specified draught for the actual condition is to be used.

2.3.1.7 Where a ballast condition is specified in the ship loading manual with ballast water filled in one or more cargo tanks, loading patterns A8 and B7 in *Tables B.2.3* and *B.2.4* are to be examined. If this loading is un-symmetrical then additional strength assessment is to be carried out according to the requirements of the individual Classification Society.

RCN 2 to July 2008 version (effective from 1 July 2010)

Table B.2.3
FE Load Cases for Tankers with Two Oil-tight Longitudinal Bulkheads

Table B.2.3 (Continued)
FE Load Cases for Tankers with Two Oil-tight Longitudinal Bulkheads

Note

1.
   (a) For the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads within midship cargo region, *see 1.1.1.5*.
   (b) For the assessment of strengthening of longitudinal hull girder shear structural members in way of transverse bulkheads for hull girder vertical shear loads, see *1.1.1.6*, *1.1.1.7* and *1.1.1.8*.
2. The selection of permissible SWBM and SWSF for the assessment of different cargo regions of the ship is to be in accordance with *Table B.2.6*. The percentage of the permissible SWBM and SWSF to be applied are to be in accordance with this table.
3. The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.
4. The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used. Where this shear force exceeds the target SWSF (design load combination S) or target combined SWSF and VWSF, calculated in accordance with *2.4.5.2,* (design load combination S+D) as specified in the table, correction vertical loads are to be applied to adjust the shear force down to the required value.
5. Correction vertical loads are to be applied to adjust the shear force to the required value specified.
6. For loading pattern A3, with all cargo tanks abreast empty in sea-going condition, a draught of $0.55T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught greater than $0.55T_{sc}$, the maximum specified draught for those loading conditions is to be used in the FE analysis.
7. For loading pattern A5, with all cargo tanks abreast fully loaded in sea-going condition, a draught of $0.8T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught lesser than $0.8T_{sc}$, the minimum specified draught for those loading conditions is to be used in the FE analysis.
8. Loading pattern A7 is only required to be analysed for tankers with a cross tie arrangement in the centre cargo tanks if the ship's loading manual includes a non-symmetrical loading condition with only one of the wing tanks filled. The actual draught from the loading manual for the condition is to be used in the analysis, see *Table B.2.5*.
9. Ballast loading pattern A8 with ballast filled in one or more cargo tanks (i.e. gale ballast/emergency ballast conditions etc.) is only required to be analysed if the condition is specified in the ship's loading manual. The actual loading pattern and draught from the loading manual for the condition is to be used in the analysis, see *Table B.2.5*.
10. Loading patterns A12 is only required for tankers with a cross tie arrangement in the centre cargo tanks. The actual shear force and bending moment that results from the application of local loads to the FE model are to be used. Adjusting vertical loads and bending moments are not applied.
11. For loading pattern A13, with all cargo tanks abreast empty in harbour condition, a draught of $0.65T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught greater than $0.65T_{sc}$, the maximum specified draught for those loading conditions is to be used in the FE analysis.
12. For loading pattern A11, with all cargo tanks abreast fully loaded in harbour condition, a draught of $0.7T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught less than $0.7T_{sc}$, the minimum specified draught for those loading conditions is to be used in the FE analysis.
13. No dynamic loads are to be applied to Design Load Combination S (harbour and tank testing load cases).

Table B.2.4 (Continued)
Load Cases for Tankers with One Centreline Oil-tight Longitudinal Bulkhead

Loading Pattern	**Figure**	**Still Water Loads**			**Dynamic load cases**		
		Draught	Perm. SWBM(2)	Perm. SWSF(2)	Strength assessment (1a)	Strength assessment against hull girder shear loads (1b)	
					Midship region	Forward region	Midship and aft regions
B10 (6, 8)		$1/3T_{sc}$	100% (sag)	75% (+ve fwd) See note 4	Only applicable to strength assessment of midship region (see note 1(a))		
B11(8)		T_{sc}	100% (Hog)	100% (-ve fwd) See note 5	Applicable to strength assessment of midship region (see 1(a)) and strength assessment against hull girder shear loads (see 1(b))		

Note

1.
   (a) For the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads within midship region, see *1.1.1.5*.
   (b) For the assessment of strengthening of longitudinal hull girder shear structural members in way of transverse bulkheads for hull girder vertical shear loads, see *1.1.1.6*, *1.1.1.7* and *1.1.1.8*.
2. The selection of permissible SWBM and SWSF for the assessment of different cargo regions of the ship is to be in accordance with *Table B.2.6*. The percentage of the permissible SWBM and SWSF to be applied are to be accordance with this table.
3. The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.
4. The actual shear force that results from the application of static and dynamic local loads are to be used. Where this shear force exceeds the target SWSF (design load combination S) or target combined SWSF and VWSF, calculated in accordance with *2.4.5.2*, (design load combination S+D) as specified in the table, correction vertical loads are to be applied to adjust the shear force down to the required value.
5. Correction vertical loads are to be applied to adjust the shear force to the required value specified.
6. Load cases B2, B5 and B10 are only required if the structure is not symmetrical about the ship's centreline.
7. Ballast loading pattern B7 with ballast filled in cargo tanks (i.e. gale ballast/emergency ballast conditions etc.) is only required to be analysed if the condition is specified in the ship's loading manual. The actual loading pattern and draught from the loading manual for the condition is to be used in the analysis, see *Table B.2.5*. If the actual loading pattern is different from load case B7 then:
   (a) An operational restriction corresponding to the analysed condition is to be added in the Loading Manual.
   (b) 100% of the permissible SWBM is to be applied when analyzing loading pattern with ballast in cargo tanks.
8. No dynamic loads are to be applied to Design Load Combination S (harbour and tank testing load cases).

RCN 2 to July 2008 version (effective from 1 July 2010)

2.3.2 Dynamic load cases

2.3.2.1 The dynamic load cases to be used for the finite element analysis are specified in *Section 7/6.4.*

2.4 Application of Loads

2.4.1 General

2.4.1.1 The application of loads to the finite element model is to be in accordance with *Section 7/6* and the requirements specified in *B/2.4*.

2.4.1.2 The load parameters and locations to be used for the calculation of the applied loads and accelerations are to be in accordance with *Table B.2.5* and *Table B.2.6*.

2.4.1.3 Constant pressure load, evaluated at the element's centroid, may be applied to a finite plate element. Alternately, a linear pressure distribution between the element's nodal points can be applied.

Table B.2.5
Parameters for Calculation of Loads and Accelerations

Parameter	**Standard Conditions**			**Optional Conditions**	
	Draught T_{sc}	Draught $0.9T_{sc}$	Draught $0.6T_{sc}$	Loaded conditions: A3 (draught > $0.6T_{sc}$) and A7	Gale/emergency ballast conditions: A8 and B7
L	Rule Length			Rule Length	
C_b	block coefficient, as defined in *Section 4/1.1.1.1*			block coefficient, as defined in *Section 4/1.1.1.1*	
Ship speed	0.0			0.0	
Roll response					
GM	$0.12B$	$0.12B$	$0.24B$	Corrected GM in the ship's loading manual for the loaded or gale/emergency ballast pattern under consideration, see Note 1	
$r_{roll\text{-}gyr}$	$0.35B$	$0.35B$	$0.4B$	See Note 2	
Pitch response, longitudinal and transverse accelerations, horizontal wave bending moment and sea pressures					
Ship draught	T_{sc}	$0.9T_{sc}$	$0.6T_{sc}$	Maximum mean draught in the loading manual for the loading pattern under consideration	Minimum mean draught in the loading manual for the loading pattern under consideration

<u>Note</u>

1. Where GM for optional loaded or gale/emergency ballast conditions is not given in the ship's loading manual, GM is to be determined in accordance with *Section 7/3.1.3.2.*
2. Where $r_{roll\text{-}gyr}$ for optional loaded or gale/emergency ballast conditions is not given in the ship's loading manual, $r_{roll\text{-}gyr}$ is to be determined in accordance with *Section 7/3.1.3.3.*
3. A gale/emergency ballast condition is defined as a ballast condition with one or more cargo tanks filled with ballast.

Table B.2.6
Locations for the Determination of Loads and Accelerations

	Strength assessment (1a)	Strength assessment against hull girder shear loads (1b)		
	Midship cargo region	**Forward cargo region**	**Midship cargo region**	**Aft cargo region**
Design load combinations S + D (Sea-going load cases)				
Dynamic wave pressure and green sea load	Transverse section at 0.5*L* from AP	Transverse section at 0.75*L* from AP	Transverse section at 0.5*L* from AP	Transverse section at 0.25*L* from AP
Acceleration a_v, a_t, a_{lng}	at CG position of midship tanks (i.e. 0.5*L* from AP is within the tank boundary)	at CG position of forward tanks (i.e. 0.75*L* from AP is within the tank boundary)	at CG position of midship tanks (i.e. 0.5*L* from AP is within the tank boundary)	at CG position of aft tanks (i.e. 0.25*L* from AP is within the tank boundary)
VWBM and SWBM (SWBM is to be based on sea-going permissible values, as defined in *Section 7/2.1.1* and *2.1.2*)	at 0.5*L* from AP	at 0.75*L* from AP	at 0.5*L* from AP	at 0.25*L* from AP

Design load combination S (Harbour and tank testing load cases)				
SWBM (SWBM is to be based on harbour permissible values, as defined in *Section 7/2.1.1* and *2.1.2*)	at 0.5*L* from AP	at 0.75*L* from AP	at 0.5*L* from AP	at 0.25*L* from AP
SWSF (SWSF is to be based on harbour permissible values, as defined in *Section 7/2.1.3* and *2.1.4*)	maximum harbour permissible SWSF in the region (see *1.1.1.5*)	maximum harbour permissible SWSF in the region (see *1.1.1.6*) or at individual bulkhead position (see *1.1.1.8*)	based on midship cargo tank strength assessment (see *1.1.1.7*) or harbour permissible SWSF at individual transverse bulkhead position (see *1.1.1.8*)	

Note

1. The following assessments are to be carried out:
   (a) for the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads in tanks within midship cargo region, see *1.1.1.5*
   (b) for the assessment of strengthening of longitudinal hull girder shear structural members in way of individual transverse bulkheads for hull girder shear loads, see *1.1.1.6, 1.1.1.7* and *1.1.1.8*.
2. For each FE load case, accelerations are to be calculated at the centre of gravity position of the ballast and/or cargo in accordance with this table. The acceleration calculated for each reference tank is to be applied to the 3 corresponding cargo or ballast tanks along the length of the FE model.
3. Longitudinal distances used in the calculation of loads refer to distance measured forward from the A.P., as defined in *Section 4/1.1.12*
4. Dynamic wave pressure calculated at the specified section is to be applied to the full length of the FE model
5. Dynamic load combination factors applied to dynamic loads for design load combination S + D (sea-going load cases) as defined in *Section 7/6.4.*
6. The SWBM and SWSF to be applied are to be in accordance with *Tables B.2.3* and *B.2.4*.

2.4.2 Structural weight, cargo and ballast density

2.4.2.1 The design cargo density is to be taken as 1.025 tonnes/m³, see *2.4.7.2*.

2.4.2.2 The density of sea water is to be taken as 1.025 tonnes/m³.

2.4.2.3 The weight of the structure is to be included in the FE analysis. The density of steel is to be taken as 7.85 tonnes/m³.

2.4.3 Static sea pressure

2.4.3.1 The static sea pressure applied to a plate element due to draught immersion is to be calculated in accordance with *Section 7/2.2.2*.

2.4.3.2 The still water draught to be considered for each finite element load case is to be in accordance with *Tables B.2.3* and *B.2.4*. A constant draught is to be applied over the full length of the cargo tank FE model.

2.4.3.3 The static sea pressure due to immersed draught for the ship in an upright condition is to be applied for all finite element load cases. The static sea pressure change due to rolling of the ship is included in the dynamic wave pressure formulation.

2.4.4 Dynamic wave pressure

2.4.4.1 The dynamic wave pressure distribution is to be determined at a transverse section of the hull at the longitudinal position as defined in *TableB.2.6*. The dynamic wave pressure distribution is to be calculated in accordance with *Section 7/6.3.5*. This pressure distribution is to be applied over the full length of the FE model.

2.4.4.2 The pressure distribution due to green sea load on the weather deck is to be calculated in accordance with *Section 7/6.3.6* at the longitudinal position as defined in *Table B.2.6*. This pressure distribution is to be applied to the weather deck over the full length of the FE model.

2.4.5 Hull girder vertical bending moment and vertical shear force

2.4.5.1 The hull girder vertical bending moment is to reach the following required value, $M_{v\text{-}targ}$, at a section within the length of the middle tank of the three tanks FE model:

$$M_{v-targ} = M_{sw} + M_{wv}$$

Where:

M_{sw} is the still water bending moment to be applied to the FE load case, as specified in *Tables B.2.3* and *B.2.4*.

M_{wv} is the vertical wave bending moment for the dynamic load case under consideration, calculated in accordance with *Section 7/6.3.2*

2.4.5.2 Hull girder vertical shear force is to reach the following required Q_{targ} value at the forward transverse bulkhead position of the middle tank:

$$Q_{targ} = Q_{sw} + Q_{wv}$$

Where:

Q_{sw} is the vertical still water shear force to be applied to the FE load case, as specified *in Tables B.2.3* and *B.2.4.*

Q_{wv} is the vertical wave shear force for the dynamic load case under consideration, calculated in accordance with *Section 7/6.3.4.*

2.4.5.3 The required hull girder vertical bending moment and shear force are to be achieved in the same load case where required by *Tables B.2.3* and *B.2.4*. The procedure to apply the required shear force and bending moment distributions is described in *2.5*.

2.4.6 Hull girder horizontal wave bending moment

2.4.6.1 Hull girder horizontal wave bending moment at a section within the length of the middle tank of the three tanks FE model is to reach the value required by the dynamic load case under consideration, calculated in accordance with *Section 7/6.3.3*.

2.4.6.2 The procedure to adjust the required hull girder horizontal bending moment is described in *2.5*.

2.4.7 Pressure in cargo and ballast tanks

2.4.7.1 The total tank pressure, P_{in}, to be applied at the boundary of a cargo or ballast tank in the finite element analysis is to include the static and dynamic components specified in *Section* 7/*Table 7.6.1* and *Table B.2.6.*.

2.4.7.2 For the seagoing load cases (design combination S + D) the cargo tank pressure is to be taken as:

$$P_{in} = f_{density}(P_{in-tk} + P_{in-dyn}) \quad \text{kN/m}^2$$

where:

$f_{density}$ factor for joint probability of occurrence of cargo density and maximum sea state in 25 years design life

$= \rho_{max-LM} / \rho_{allowable}$

ρ_{max-LM} maximum cargo density associated with a full tank from any loading condition in the ship's loading manual. ρ_{max-LM} is not to be taken as less than 0.9 tonnes/m^3 for cargo loaded conditions and 1.025 tonnes/m^3 for the optional emergency ballast condition (i.e. A8 and B7 in *Tables B.2.3* and *B.2.4* respectively)

$\rho_{allowable}$ design cargo density associated with a full tank to be taken as 1.025 tonnes/m^3 unless a higher density is specified by the builder, see *Section 2/3.1.8.1*

P_{in-tk} static tank pressure as given in *Section 7/2.2.3.1*, in kN/m^2, and with density of fluid in tank equal to the design cargo density, $\rho_{allowable}$

P_{in-dyn} simultaneously acting dynamic pressure given in *Section 7/6.3.7.1* , in kN/m^2, with simplification given in *2.4.7.3* and with density of fluid in tank equal to the design cargo density, $\rho_{allowable}$

2.4.7.3 The envelope vertical acceleration, a_v, at the centre of gravity of tanks is calculated in accordance with *Section 7/3.3.3* with the following simplifications:

(a) for head sea conditions, a_{roll-z} is taken as 0

(b) for beam sea conditions, $a_{pitch-z}$ is taken as 0.

2.4.7.4 The vertical, transverse and longitudinal accelerations are to be calculated at the centre of gravity of the abreast tanks at the longitudinal position as specified in

Table B.2.6. These accelerations are to be applied to all corresponding tanks along the length of the three-tank FE model.

2.4.7.5 The dynamic tank pressure is to be calculated in accordance with *Section 7/6.3.7.1*, also see *Table B.2.6*.

2.4.7.6 For ballast tanks which utilise ballast water exchange by flow-through method, the following are to be considered when calculating tank pressure for seagoing load cases (design combination S + D) as required by *Section 7/Table 7.6.1*:

- Maximum vertical height of the air pipe or overflow pipe, i.e. h_{air} as defined in *Section 7/2.2.3.2* and *Figure 7.2.3*, of all ballast tanks in the cargo region is to be used in the calculation of the dynamic tank pressure due to vertical acceleration (see *Section 7/6.3.7.1*).
- Maximum value of h_{air} and P_{drop}, as defined in *Section 7/2.2.3.3*, of all ballast tanks in the cargo region are to be used to calculate the static tank pressure.

2.4.7.7 The following are to be considered when calculating the static tank pressure in cargo tanks for harbour/tank testing load cases (design combination S) as required by *Section 7/Table 7.6.1*:

- Maximum h_{air}, as defined in *Section 7/2.2.3.2* and *Figure 7.2.3*, of all cargo tanks in the cargo region are to be considered in the calculation of $P_{in\text{-}test}$, see *Section 7/2.2.3.5*.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.4.7.8 Where the length of the model is extended beyond the end transverse bulkheads, see *2.2.1.1*, tank pressure is only to be applied to the complete tanks within the model length.

2.4.7.9 Maximum setting of pressure relief valve, P_{valve}, as defined in Section 7/2.2.3.5 are to be considered in design combination S and S+D as required by Section 7/Table 7.6.1.
RCN 1 to July 2010 version (effective from 1 July 2012)

2.5 Procedure to Adjust Hull Girder Shear Forces and Bending Moments

2.5.1 General

2.5.1.1 The procedure described in this section is to be applied to adjust the hull girder horizontal bending moment, vertical shear force and vertical bending moment distributions on the three cargo tanks FE model to achieve the required values.

2.5.1.2 Vertical distributed loads are applied to each frame position, together with a vertical bending moment applied to the model ends to produce the required value of vertical shear force at both the forward and aft bulkhead of the middle tank of the FE model, and the required value of vertical bending moment at a section within the length of the middle tank of the FE model. The required values are specified in *2.4.5*.
RCN 1 to July 2010 version (effective from 1 July 2012)

2.5.1.3 A horizontal bending moment is applied to the ends of the model to produce the required target value of horizontal bending moment at a section within the length of the middle tank of the FE model. The required values are specified in *2.4.6*.

2.5.2 Shear force and bending moment due to local loads

2.5.2.1 The vertical shear forces generated by the local loads are to be calculated at the transverse bulkhead positions of the middle tank of the FE model. The maximum absolute shear force at the bulkhead position of the middle tank of the FE model is

to be used to obtain the required adjustment in shear forces at the transverse bulkhead, see 2.5.3. The vertical bending moment distribution generated by the local loads is to be calculated along the length of the middle tank of the three cargo tank FE model. The FE model can be used to calculate the shear forces and bending moments. Alternatively, a simple beam model representing the length of the 3-tank FE model with simply supported ends may be used to determine the shear force and bending moment values.

RCN 1 to July 2010 version (effective from 1 July 2012)

2.5.2.2 For beam and oblique sea conditions, the horizontal bending moment distribution due to dynamic sea pressure and dynamic tank pressure is to be calculated along the length of the middle tank of the FE model.

2.5.2.3 The following local loads are to be applied for the calculation of hull girder shear forces and bending moments:

(a) ship structural weight distribution over the length of the 3-tank model (static loads). Where a simple beam model is used, the weight of the structure of each tank can be distributed evenly over the length of the cargo tank. The structural weight is to be calculated based on a thickness deduction of $0.5t_{corr}$, as used in the construction of the cargo tank FE model, see *2.2.1.5.*

(b) weight of cargo and ballast (static loads)

(c) static sea pressure, dynamic wave pressure and, where applicable, green sea load. For the Design Load Combination S (harbour/tank testing load cases), only static sea pressure needs to be applied

(d) dynamic tank pressure load for Design Load Combination S+D (seagoing load cases).

2.5.3 Procedure to adjust vertical shear force distribution

2.5.3.1 The required adjustment in shear forces at the transverse bulkhead positions (ΔQ_{aft} and ΔQ_{fwd} as shown in *Figure B.2.10*) are to be generated by applying vertical load at the frame positions as shown in *Figure B.2.11*. It is to be noted that vertical correction loads are not to be applied to any transverse tight bulkheads, any frames forward of the forward tank and any frames aft of the aft tank of the FE model. The sum of the total vertical correction loads applied is equal to zero.

2.5.3.2 The required adjustment in shear forces at the aft and forward transverse bulkheads of the middle tank of the FE model in order to generate the required shear forces at the bulkheads are given by:

$$\Delta Q_{aft} = - Q_{targ} - Q_{aft}$$

$$\Delta Q_{fwd} = Q_{targ} - Q_{fwd}$$

Where:

ΔQ_{aft} required adjustment in shear force at aft bulkhead of middle tank based on the maximum absolute shear force at the bulkhead

ΔQ_{fwd} required adjustment in shear force at fore bulkhead of the middle tank based on the maximum absolute shear force at the bulkhead

Q_{targ} required shear force value to be achieved at forward bulkhead of middle tank, see *2.4.5.*

Q_{aft} shear force due to local loads at aft bulkhead of middle tank,

see *2.5.2*

Q_{fwd} shear force due to local loads at fore bulkhead of middle tank, see *2.5.2*

RCN 1 to July 2010 version (effective from 1 July 2012)

Figure B.2.10
Position of Target Shear Force and Required Shear Force Adjustment at Transverse Bulkhead Positions

Condition	Target			Aft Bkhd		Fore Bkhd

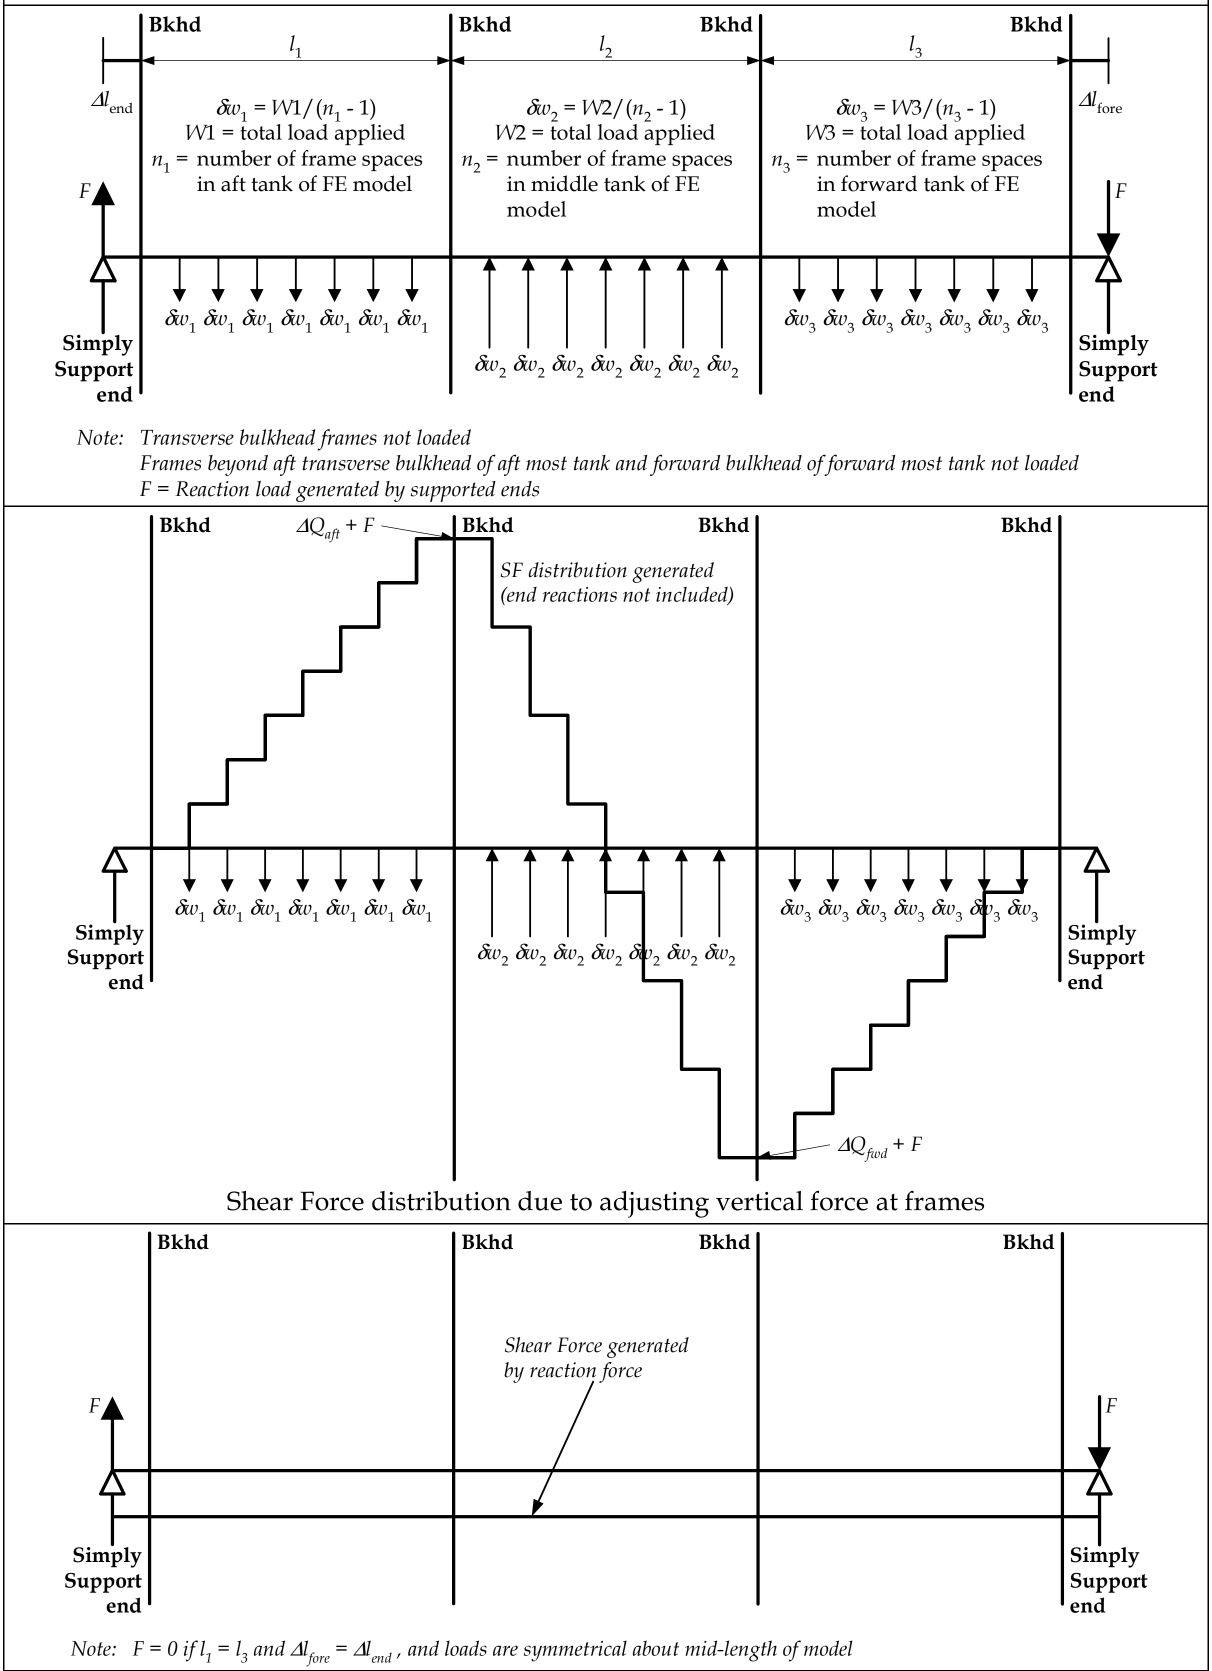
	Hog	-ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	Q_{targ} (-ve)	$Q_{targ} - Q_{fwd}$
	Hog	-ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	Q_{targ} (-ve)	$Q_{targ} - Q_{fwd}$
	Sag	+ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	Q_{targ} (+ve)	$Q_{targ} - Q_{fwd}$
	Sag	+ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	Q_{targ} (+ve)	$Q_{targ} - Q_{fwd}$

Note

For definition of symbols, see *2.5.3.2*.

Figure B.2.11

Distribution of Adjusting Vertical Force at Frames and Resulting Shear Force Distributions



Note

For definition of symbols, see *Table B.2.7*.

2.5.3.3 The value of the vertical loads to be applied to each frame to generate the increase in shear force at the bulkheads may be calculated using a simple beam model. For the case where an uniform frame spacing is used within each tank, the amount of vertical force to be distributed at each frame may be calculated in accordance with *Table B.2.7*. The length and frame spacing of individual cargo tanks may be different.

Table B.2.7
Formulae for Calculation of Vertical Loads for Adjusting Vertical Shear Forces

$$\delta w_1 = \frac{\Delta Q_{aft}(2l - l_2 - l_3) + \Delta Q_{fwd}(l_2 + l_3)}{(n_1 - 1)(2l - l_1 - 2l_2 - l_3)} \qquad F = 0.5\left(\frac{W1(l_2 + l_1) - W3(l_2 + l_3)}{l}\right)$$

$$\delta w_2 = \frac{(W1 + W3)}{(n_2 - 1)} = \frac{(\Delta Q_{aft} - \Delta Q_{fwd})}{(n_2 - 1)}$$

$$\delta w_3 = \frac{-\Delta Q_{fwd}(2l - l_1 - l_2) - \Delta Q_{aft}(l_1 + l_2)}{(n_3 - 1)(2l - l_1 - 2l_2 - l_3)}$$

Where:

l_1	length of aft cargo tank of model
l_2	length of middle cargo tank of model
l_3	length of forward cargo tank of model
ΔQ_{aft}	required adjustment in shear force at aft bulkhead of middle tank, see *Figure B.2.10*
ΔQ_{fwd}	required adjustment in shear force at fore bulkhead of middle tank, see *Figure B.2.10*
F	end reactions due to application of vertical loads to frames, see *2.5.3*
$W1$	total evenly distributed vertical load applied to aft tank of FE model, $(n_1 - 1)\,\delta w_1$
$W2$	total evenly distributed vertical load applied to middle tank of FE model, $(n_2 - 1)\,\delta w_2$
$W3$	total evenly distributed vertical load applied to forward tank of FE model, $(n_3 - 1)\,\delta w_3$
n_1	number of frame spaces in aft cargo tank of FE model
n_2	number of frame spaces in middle cargo tank of FE model
n_3	number of frame spaces in forward cargo tank of FE model
δw_1	distributed load at frame in aft cargo tank of FE model
δw_2	distributed load at frame in middle cargo tank of FE model
δw_3	distributed load at frame in forward cargo tank of FE model
Δl_{end}	distance between end bulkhead of aft cargo tank to aft end of FE model
Δl_{fore}	distance between fore bulkhead of forward cargo tank to forward end of FE model
l	total length of FE model (beam) including portions beyond end bulkheads: $= l_1 + l_2 + l_3 + \Delta l_{end} + \Delta l_{fore}$

Notes

1. Positive direction of loads, shear forces and adjusting vertical forces in the formulae is in accordance with *Figures B.2.10* and *B.2.11*.
2. $W1 + W3 = W2$
3. Note that the above formulae are only applicable if an uniform frame spacing is used within each tank, see *2.5.3.3*. The length and frame spacing of individual cargo tanks may be different.

2.5.3.4 The amount of adjusting load to be applied to the structural parts of each transverse frame section to generate the vertical load, δw_i, is to be in accordance with *Figure B.2.12*. This load is to be distributed at the finite element grid points of the structural parts. Where 4-node or 3-node finite plate elements are used, the load to be applied at each grid point of a plate element is given by:

$$F_{i-grid} = \frac{\sum_{1}^{n} 0.5\, A_{i-elem-net50}}{A_{s-net50}} F_s$$

Where:

F_{i-grid} load to be applied to the i^{th} FE grid point on the individual structural member under consideration, i.e. side shell, longitudinal bulkheads and bottom girders, inner hull longitudinal bulkheads, hopper plates, upper slope plates of inner hull and outboard girders as defined in *Figure B.2.12*

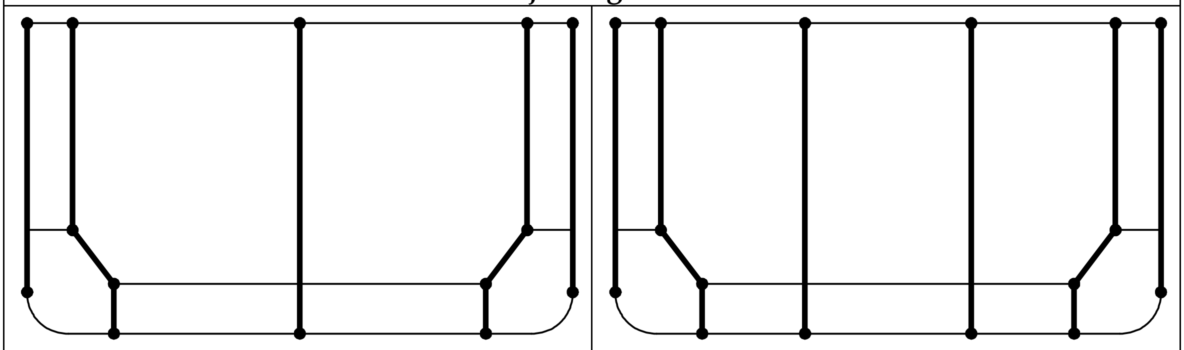
$A_{i-elem-net50}$ sectional area of each plate element in the individual structural member under consideration (see *Figure B.2.12)*, which is connected to the i^{th} grid point

n number of plate elements connected to the i^{th} grid point

F_s total load applied to individual structural member under consideration, as specified in *Figure B.2.12*

$A_{s-net50}$ plate sectional area of the individual structural member under consideration, i.e. side shell, longitudinal bulkheads, bottom girders, inner hull longitudinal bulkheads, hopper plates, upper slope plates of inner hull and outboard girders as defined in *Figure B.2.12*

Figure B.2.12
Distribution of Adjusting Load on a Transverse Section



Structural member	**Applied load F_s**
Side Shell	$f \cdot \delta w_i$
Longitudinal bulkhead including bottom girder beneath	$f \cdot \delta w_i$
Inner hull longitudinal bulkhead (vertical part)	$f \cdot \delta w_i \cdot \frac{A_{Ih-net50}}{A_{2-net50}}$
Hopper plate	$f \cdot \delta w_i \cdot \frac{A_{Hp-net50}}{A_{2-net50}}$
Upper slope plating of inner hull	$f \cdot \delta w_i \cdot \frac{A_{Usp-net50}}{A_{2-net50}}$
Outboard girder	$f \cdot \delta w_i \cdot \frac{A_{Og-net50}}{A_{2-net50}}$

Figure B.2.12 (Continued)
Distribution of Adjusting Load on a Transverse Section

Where

$\delta w_{i,}$	vertical load to be applied to each transverse frame section, see *2.5.3.3* and *Table B.2.7*
f	shear force distribution factor of structural part calculated at the mid-tank position in accordance with *Table B.2.8*
$A_{Ih\text{-}net50}$	plate sectional area of individual inner hull longitudinal bulkhead
$A_{Hp\text{-}net50}$	plate sectional area of individual hopper plate
$A_{Usp\text{-}net50}$	Plate sectional area of individual upper slope plate of inner hull
$A_{Og\text{-}net50}$	plate sectional area of individual outboard girder
$A_{2\text{-}net50}$	plate sectional area calculated in accordance with *Table B.2.8*

<u>Note</u>

1. Adjusting load is to be applied in plane to the hopper slope plate and upper slope plate of inner hull.
2. Adjusting load given is to be applied to individual structural member.

Table B.2.8
Shear Force Distribution Factors

	Side Shell	$f = 0.055 + 0.097\dfrac{A_{1-net50}}{A_{2-net50}} + 0.020\dfrac{A_{2-net50}}{A_{3-net50}}$
	Inner hull	$f = 0.193 - 0.059\dfrac{A_{1-net50}}{A_{2-net50}} + 0.058\dfrac{A_{2-net50}}{A_{3-net50}}$
	CL longitudinal bulkhead	$f = 0.504 - 0.076\dfrac{A_{1-net50}}{A_{2-net50}} - 0.156\dfrac{A_{2-net50}}{A_{3-net50}}$
	Side Shell	$f = 0.028 + 0.087\dfrac{A_{1-net50}}{A_{2-net50}} + 0.023\dfrac{A_{2-net50}}{A_{3-net50}}$
	Inner hull	$f = 0.119 - 0.038\dfrac{A_{1-net50}}{A_{2-net50}} + 0.072\dfrac{A_{2-net50}}{A_{3-net50}}$
	Longitudinal bulkhead	$f = 0.353 - 0.049\dfrac{A_{1-net50}}{A_{2-net50}} - 0.095\dfrac{A_{2-net50}}{A_{3-net50}}$

Where:

$A_{1\text{-}net50}$	plate sectional area of individual side shell (i.e. on one side), including bilge
$A_{2\text{-}net50}$	plate sectional area of individual inner hull longitudinal bulkhead (i.e. on one side), including hopper slope plate, double bottom side girder in way and, where fitted, upper slope plating of inner hull.
$A_{3\text{-}net50}$	plate sectional area of individual longitudinal bulkhead, including double bottom girder in way

<u>Note</u>

1. Where part of the structural member is not vertical, the area is to be calculated using the projected area in the vertical direction.
2. All plate areas are to be calculated based on the modelled thickness of the cargo tank FE model, see *2.2.1.5*.
3. For corrugated longitudinal bulkheads, the corrugation thickness for the calculation of shear force distribution factor, *f*, is to be corrected according to *Section 4/2.6.4*.

2.5.4 Procedure to adjust vertical and horizontal bending moments

2.5.4.1 An additional vertical bending moment is to be applied at both ends of the cargo tank finite element model to generate the required vertical bending moment in the middle tank of the model. This end vertical bending moment can be calculated as follows:

$$M_{v-end} = M_{v-targ} - M_{v-peak}$$

Where:

M_{v-end}	additional vertical bending moment to be applied at both ends of finite element model
M_{v-targ}	required hogging (positive) or sagging (negative) vertical bending moment, as specified in *2.4.5*
M_{v-peak}	maximum or minimum bending moment within the length of the middle tank due to the local loads described in *2.5.2.3* and the additional vertical loads applied to generate the required shear force, see *2.5.3*. M_{v-peak} is to be taken as the maximum bending moment if M_{v-targ} is hogging (positive) and as the minimum bending moment if M_{v-targ} is sagging (negative). M_{v-peak} can be obtained from FE analysis. Alternatively, M_{v-peak} may be calculated as follows based on a simply supported beam model: $M_{v-peak} = Max\{M_o + xF + M_{lineload}\}$
M_o	vertical bending moment at position x, due to the local loads described in *2.5.2.3*.
$M_{lineload}$	vertical bending moment at position x, due to application of vertical line loads at frames to generate required shear force, see *2.5.3*
F	reaction force at ends due to application of vertical loads to frames, see *2.5.3*
x	longitudinal position of frame in way of the middle tank of FE model from end, see *2.5.4.2*

2.5.4.2 For beam and oblique sea load cases, an additional horizontal bending moment is to be applied at the ends of the cargo tank FE model to generate the required horizontal bending moment at a section within the length of the middle tank of the model. The additional horizontal bending moment can be calculated as follows:

$$M_{h-end} = M_{h-targ} - M_{h-peak}$$

Where:

M_{h-end}	additional horizontal bending moment to be applied to ends of FE model
M_{h-targ}	required positive or negative horizontal bending moment, see *2.4.6*
M_{h-peak}	maximum or minimum horizontal bending moment within the length of the middle tank due to the local loads described in *2.5.2.3*. M_{h-peak} is to be taken as the maximum horizontal bending moment if M_{h-targ} is positive (starboard side in tension) and as the minimum horizontal bending moment if M_{h-targ} is negative (port side in tension).

2.5.4.3 The vertical and horizontal bending moments should be calculated over the length of the middle tank of the FE model to identify the position and value of each maximum/minimum bending moment as specified in *2.5.4.1* and *2.5.4.2*.

2.5.4.4 The additional vertical bending moment, $M_{v\text{-}end}$, and horizontal bending moment, $M_{h\text{-}end}$, are to be applied to both ends of the cargo tank model. The bending moments may be applied by either of the methods described in *2.5.4.5* and *2.5.4.6*.

2.5.4.5 The vertical and horizontal bending moments may be applied at the model ends by distributing axial nodal forces to all longitudinal elements according to the simple beam theory as follows:

$$(F_x)_i = \frac{M_{v-end}}{I_{y-net50}} \frac{A_{i-net50}}{n_i} z_i \qquad \text{for vertical bending moment}$$

$$(F_x)_i = \frac{M_{h-end}}{I_{z-net50}} \frac{A_{i-net50}}{n_i} y_i \qquad \text{for horizontal bending moment}$$

Where:

$M_{v\text{-}end}$	vertical bending moment to be applied to the ends of the model
$M_{h\text{-}end}$	horizontal bending moment to be applied to the ends of the model
$(F_x)_i$	axis force applied to a node of the ith element
$I_{y\text{-}net50}$	hull girder vertical moment of inertial of the end section about its horizontal neutral axis
$I_{z\text{-}net50}$	hull girder horizontal moment of inertial of the end section about its vertical neutral axis (normally centreline)
z_i	vertical distance from the neutral axis to the centre of the cross sectional area of the i^{th} element
y_i	horizontal distance from the neutral axis to the centre of the cross sectional area of the i^{th} element
$A_{i\text{-}net50}$	cross sectional area of the i^{th} element
n_i	number of nodal points of i^{th} element on the cross section, n_i = 2 for 4-node plate element

2.5.4.6 The vertical and horizontal bending moments may alternatively be applied to an independent grid point at the intersection of the vertical neutral axis (normally centreline) and the horizontal neutral axis, see *Figure B.2.13*. All nodal points of the longitudinal elements on the end section are to be rigidly linked to the independent point in θ_y (for vertical bending), θ_z (for horizontal bending) and δ_x. This independent point is not to be connected to the model except by the rigid link. The rigid links are to maintain the end plane of the model in keeping plane under the action of the applied bending moment, which is equivalent to imposing a prescribed displacement to the nodal points in accordance with the simple beam theory.

2.6 Boundary Conditions

2.6.1 General

2.6.1.1 All boundary conditions described in this section are in accordance with the global co-ordinate system defined in *Section 4/1.4.* The boundary conditions to be applied at the ends of the cargo tank FE model are given in *Table B.2.9*. The analysis may be carried out by applying all loads to the model as a complete load case or by combining the stress responses resulting from several separate sub-cases.

2.6.1.2 Ground spring elements, i.e. spring elements with one end constrained in all 6 degrees of freedom, with stiffness in global y degree of freedom are to be applied to the grid points along deck, inner bottom and bottom shell as shown in *Figure B.2.13.*

2.6.1.3 Ground spring elements with stiffness in global z degree of freedom are to be applied to the grid points along the vertical part of the side shells, inner hull longitudinal bulkheads and oil-tight longitudinal bulkheads as shown in *Figure B.2.13*.

Figure B.2.13
Spring Constraints at Model Ends

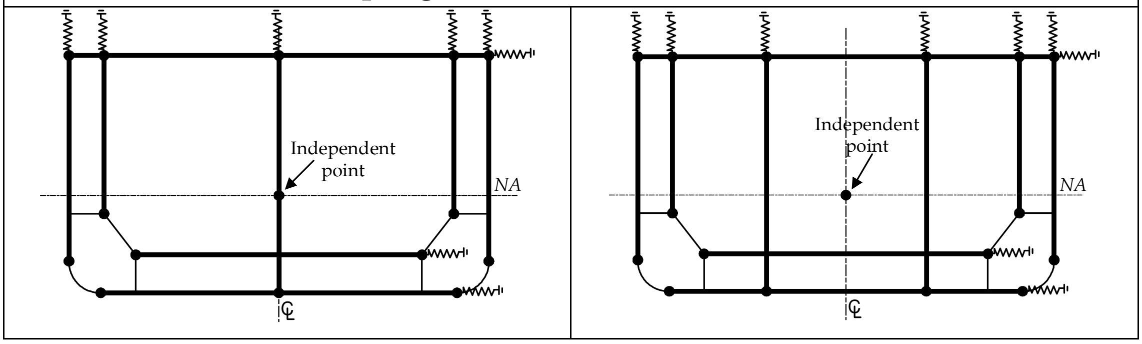


Table B.2.9
Boundary Constraints at Model Ends

Location	Translation			Rotation		
	δ_x	δ_y	δ_z	θ_x	θ_y	θ_z
Aft End						
Aft end (all longitudinal elements)	***RL***	-	-	-	***RL***	***RL***
Independent Point aft end, see *Figure B.2.13*	Fix	-	-	-	$M_{v\text{-}end}$	$M_{h\text{-}end}$
Deck, inner bottom and outer shell	-	Springs	-	-	-	-
Side, inner skin and longitudinal bulkheads	-	-	Springs	-	-	-
Fore End						
Fore end (all longitudinal elements)	***RL***	-	-	-	***RL***	***RL***
Independent point fore end, see *Figure B.2.13*	-	-	-	-	$M_{v\text{-}end}$	$M_{h\text{-}end}$
Deck, inner bottom and outer shell	-	Springs	-	-	-	-
Side, inner skin and longitudinal bulkheads	-	-	Springs	-	-	-

Where:

- no constraint applied (free)

RL nodal points of all longitudinal elements rigidly linked to independent point at neutral axis on centreline

Note

1. All translation and rotation displacements are in accordance with the global coordinate system defined in *Section 4/1.4*.
2. Where $M_{h\text{-}end}$ is not applied, the independent points at the fore and aft ends are to be free in θ_z.
3. Where $M_{v\text{-}end}$ is not applied, the independent points at the fore and aft ends are to be free in θ_y.
4. Where no bending moment is applied, the independent points at the fore and aft ends are to be free in θ_y and θ_z.
5. Where bending moment is applied as nodal forces, the independent points at the fore and aft ends are to be free in the corresponding degree of freedom of rotations (i.e. θ_y and/or θ_z).

2.6.2 Calculation of spring stiffness

2.6.2.1 The stiffness, *c*, of individual spring elements for each structural member, to be applied at each end of the cargo tank model, is given by:

$$c = \left(\frac{E}{1+\nu}\right)\frac{A_{s-net50}}{l_{tk}\ n} = 0.77\ \frac{A_{s-net50}E}{l_{tk}\ n} \quad \text{N/mm}$$

Where:

$A_{s\text{-}net50}$ shearing area of the individual structural member under consideration, i.e. plating of deck, inner bottom, bottom shell, side shell, inner hull longitudinal bulkheads or oil-tight longitudinal bulkhead. $A_{s\text{-}net50}$ is to be calculated based on the thickness of the cargo tank finite element model for areas indicated in *Table B.2.10* for the appropriate structural member under consideration, in mm^2

ν Poisson's ratio of the material

l_{tk} length of cargo tank, between bulkheads of the middle tank of the FE model, in mm^2

E Modulus of Elasticity, in N/mm^2

n number of nodal points to which the spring elements are applied to the structural member under consideration

Table B.2.10
Shear Areas to be Considered for the Calculation of Spring Stiffness

Vertical springs

	Side	Area of side shell plating, including bilge
	Inner hull longitudinal bulkheads	Area of inner skin plating, including hopper slope plate and double bottom side girder in way
	Longitudinal bulkheads	Area of longitudinal bulkhead plating, including double bottom girder in way
	<u>Note</u> Where part of the structural member is not vertical, the area is to be calculated using the projected area in the vertical direction.	

Table B.2.10 (Continued)
Shear Areas to be Considered for the Calculation of Spring Stiffness

Horizontal springs	
	Deck — Area of deck plating Inner bottom — Area of inner bottom plating, including hopper slope plate and horizontal stringer in way Bottom shell — Area of bottom shell plating, including bilge
	<u>Note</u> Where part of the structural member is not horizontal the area is to be calculated using the projected area in the horizontal direction.

2.6.2.2 For vertical corrugated longitudinal bulkheads, the corrugation thickness for the calculation of spring stiffness, c, shall be calculated according to *Section 4/2.6.4*.

2.6.2.3 Alternatively, rod elements may be used instead of spring elements, the equivalent cross section area of the rod is $(c{\cdot}l)/E$, where l is the length of the rod. One end of the rod is to be constrained in all 6 degrees of freedom.

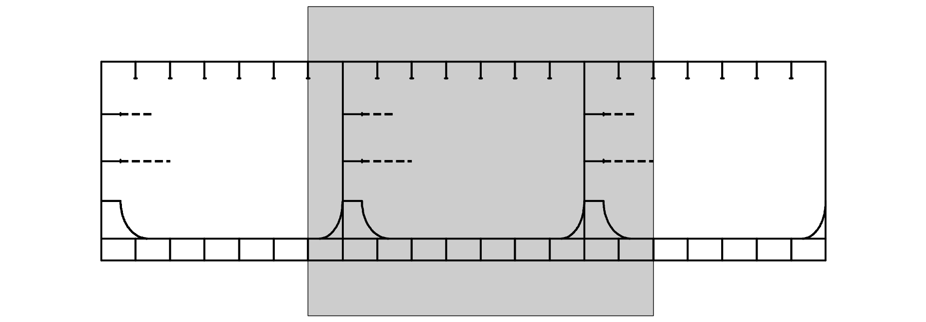
2.7 Result Evaluation

2.7.1 General

2.7.1.1 Verification of result against acceptance criteria is to be carried out for structural members within longitudinal extent shown in *Figure B.2.14*, which includes the middle tanks of the three cargo tanks FE model and the region forward and aft of the middle tanks up to the extent of the transverse bulkhead stringer and buttress structure. For the strength assessment of tanks in the midship cargo region, stress level and buckling capability of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads are to be verified. For the assessment of required strengthening in way of transverse bulkheads against hull girder shear load, stress level and buckling capability of inner hull longitudinal bulkheads including upper sloped plate where fitted, side shell, hopper, bottom girders and longitudinal bulkheads are to be verified.

2.7.1.2 Assessment of results is to be carried out for the standard load cases specified in *2.3.1*, and any other load cases specially considered as required by *Section 9/2.2.3*.

Figure B.2.14
Extent of FE Model for Verification against Acceptance Criteria



2.7.2 Stress assessment

2.7.2.1 Stresses are not to exceed the permissible values given in *Section 9/2.2.5*.

2.7.2.2 The maximum permissible stresses are based on the mesh sizes and element types described in *2.2*.

2.7.2.3 The von Mises stress, σ_{vm}, is to be calculated based on the membrane direct and shear stresses of the plate element. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element. Where plate elements are used, the stresses are to be evaluated at the element centroid.

2.7.2.4 Except as indicated in *2.7.2.5*, the element shear stress in way of openings in webs is to be corrected for loss in shear area in accordance with the following formula. The corrected element shear stress is to be used to calculate the von Mises stress of the element for verification against the acceptance criteria.

$$\tau_{cor} = \frac{h \; t_{mod-net50}}{A_{s-net50}} \tau_{elem}$$

Where:

τ_{cor} corrected element shear stress

h height of web of girder in way of opening, see *Figure B.2.8*. Where the geometry of the opening is modelled, h is to be taken as the net height with the height of the modelled opening deducted.

$t_{mod-net50}$ modelled web thickness in way of opening, see *Table B.2.2*.

$A_{s-net50}$ actual effective shear area of web, including area lost due to slots for stiffeners, calculated in accordance with *Section 4/2.5*. The thickness of the web is to be based on net thickness obtained by deducting $0.5t_{corr}$ from the gross thickness

τ_{elem} element shear stress before correction

2.7.2.5 Correction of element shear stress due to presence of openings is not required provided that:

(a) all slots for local support stiffeners are fitted with lugs or collar plates;

(b) the difference between the modelled shear area of the plate and the actual effective shear area, $A_{s-net50}$ calculated in accordance with *Section 4/2.5.1*, is less than 20% of the modelled shear area, and

(c) the yield utilisation factor is less than 80% of the permissible yield utilisation factor given in *Section 9/Table 9.2.1*.

2.7.2.6 Where the corrugation is not modelled with its exact geometric shape, the corrected axial stress in the flange of the corrugation, $\sigma_{fl\text{-}act}$, is to be taken as the greater of:

$$\sigma_{fl-act} = \sigma_{fl-FEM} \frac{Z_{corr-FEM-net50}}{Z_{corr-act-net50}} \frac{l_{corr-act}}{l_{corr-FEM}}$$

$$\sigma_{fl-act} = \sigma_{fl-FEM}$$

Where:

$\sigma_{fl\text{-}FEM}$ axial stress obtained from the finite element analysis, see *Figure B.2.15*

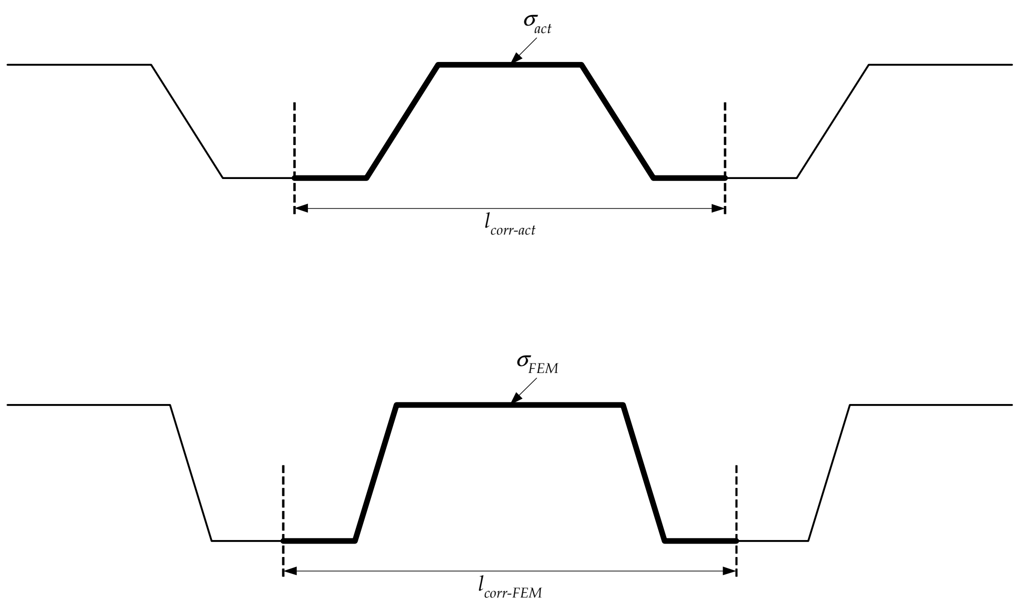
$Z_{corr\text{-}FEM\text{-}net50}$ is the section modulus of the modelled corrugation calculated in accordance with *Figure B.2.15*

$Z_{corr\text{-}act\text{-}net50}$ is the section modulus of the actual corrugation calculated in accordance with *Figure B.2.15*

$l_{corr\text{-}act}$ length of corrugation section, as given in *Figure B.2.15*

$l_{corr\text{-}FEM}$ length of corrugation section, as given in *Figure B.2.15*

Figure B.2.15
Axial Bending Stress in Flange Corrugation



<u>Note</u>
$l_{corr\text{-}act}$ = length of corrugation section, for the calculation of $Z_{corr\text{-}act\text{-}net50}$
$l_{corr\text{-}FEM}$ = length of corrugation section, for the calculation of $Z_{corr\text{-}FEM\text{-}net50}$

2.7.3 Buckling assessment

2.7.3.1 Buckling capability is to be assessed for the plating and stiffened panels of longitudinal hull girder structural members, primary support members and transverse bulkheads, including deck, double side, side, bottom, double bottom, hopper, transverse and vertical web frames, stringers, transverse and longitudinal bulkhead structures. Buckling capability of curved panels (e.g. bilge), face plate of

primary support members and tripping brackets is not assessed based on stress result obtained by the finite element analysis.

2.7.3.2 The utilisation factor against buckling for all plates and stiffened panels is not to exceed the permissible values given in *Section 9/2.2.5*. The method for carrying out buckling assessment of plates and stiffened panels is described in *Appendix D/5.*

2.7.3.3 The buckling assessment is to be based on the stresses obtained from the finite element analysis in conjunction with buckling capacity model based on net thickness obtained by deducting the full corrosion addition, t_{corr}, and any Owner's extras from the proposed thickness. This thickness deduction applies to all plating, stiffener webs and face plates.

2.7.3.4 The buckling assessment is to be based on membrane stress evaluated at the centroid of the plate elements. Where shell elements are used, stresses at the mid plane of the element are to be used for the buckling assessment.

2.7.3.5 The combined interaction of bi-axial compressive stresses, shear stress and lateral pressure loads are to be considered in the buckling calculation. Where a stress correction is to be applied to the finite element stresses as required by *2.7.2*, the buckling assessment is to be based on the corrected stresses.

2.7.3.6 For tankers with a cross tie arrangement, the pillar buckling capability of the cross tie structure is to be assessed based on the buckling formulae given in *Section 10/3.5.1*. The average axial compressive stress at the mid span of the cross tie in the ship's transverse direction, weighted by cross section area, is to be used for the buckling assessment.

2.7.3.7 In the absence of a suitable advanced buckling method described in *Appendix D/5* for the modelling of bulkhead corrugation, assessment of local buckling of unit corrugation flanges is to be in accordance with *Section 10/3.5.2* and criteria given in *Section 9/2.2.5*. The assessment is to be based only on uni-axial stress (membrane stress evaluated at element centroid) parallel to the corrugation knuckles. Averaged stress between elements is not to be used. For the part of the corrugated plate flange from the lower bulkhead stool top to a level of $s/2$ above, where s is the breadth of the flange, the stress used for the buckling assessment needs not be taken as greater than the value obtained at $s/2$ above the bulkhead stool top. The stress value at $s/2$ may be obtained by interpolation if the stress value cannot be obtained directly from a plate element.

2.7.3.8 In the absence of a suitable advanced buckling assessment method described in *Appendix D/5* for the modelling of panel with opening, local buckling of web plates of primary support members in way of openings is to be assessed in accordance with *Section 10/3.4* based on acceptance criteria on buckling utilisation factor given in *Section 9/2.2.5*. The assessment is to be based on FE membrane stress evaluated at the centroid of plate elements. Stresses in the area of the web required for buckling assessment are to be obtained as averaged stresses of the plate elements within the required area. Stress obtained from either the cargo tank analysis or local fine mesh analysis may be used for the assessment. Where the effect of opening is not taken into account in the cargo tank analysis, the stresses obtained from the finite element analysis are to be corrected in accordance with *2.7.2.4* and *2.7.2.5*.

3 LOCAL FINE MESH STRUCTURAL STRENGTH ANALYSIS

3.1 General

3.1.1 Application

3.1.1.1 For tankers of conventional arrangements, finite element fine mesh analysis of structural details is to be in accordance with the requirements given in this section.

3.1.1.2 Additional requirements of fine mesh analysis are to be in accordance with *Section 9/2.3.1.3* and *Section 9/2.3.1.4*.

3.1.2 Transverse web frame and wash bulkhead

3.1.2.1 Upper hopper knuckle connections as indicated in *Figure B.3.1* are to be evaluated by fine mesh analysis on a typical transverse web frame in the middle tank of the cargo tank model. Main bracket toes and openings as indicated in *Figure B.3.1* are to be evaluated by fine mesh analysis if the screening criteria given in *3.1.6* are not complied with.

3.1.2.2 Where a wash bulkhead is fitted, main bracket toes and openings of the transverse and vertical webs as indicated in *Figure B.3.1* are to be evaluated by fine mesh analysis if the screening criteria given in *3.1.6* are not complied with.

3.1.2.3 The web frame which indicates highest von Mises stresses in way of each structural detail from the cargo tank analysis is to be selected for the fine mesh analysis.

Figure B.3.1
Areas Requiring Consideration for Fine Mesh Analysis on a Typical Transverse Web Frame, Wash Bulkhead and Web Frame adjacent to Transverse Bulkhead

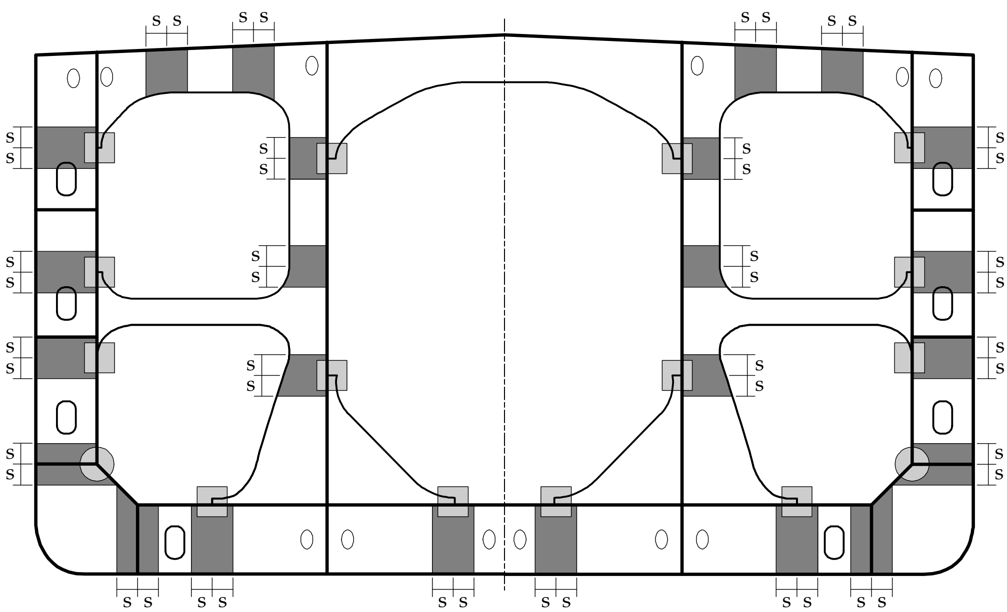


Figure B.3.1 (Continued)
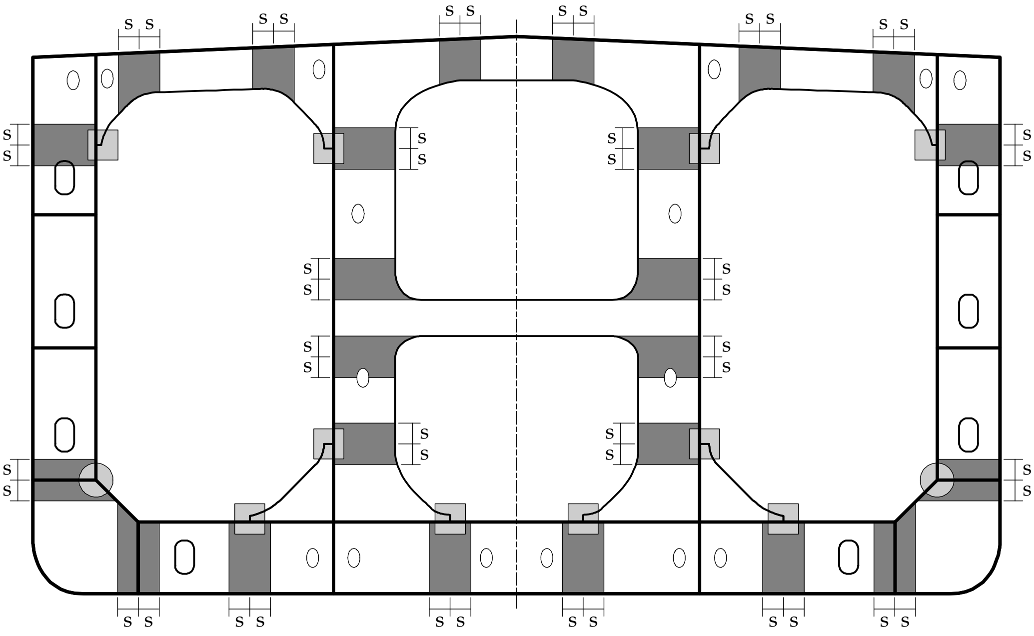
Areas Requiring Consideration for Fine Mesh Analysis on a Typical Transverse Web Frame, Wash Bulkhead and Web Frame adjacent to Transverse Bulkhead



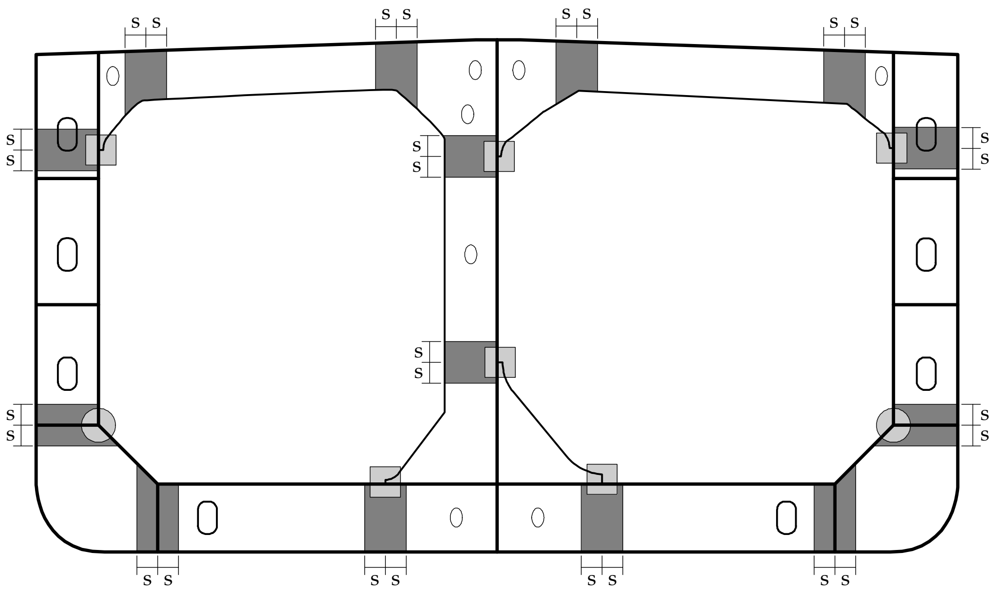


Figure B.3.1 (Continued)
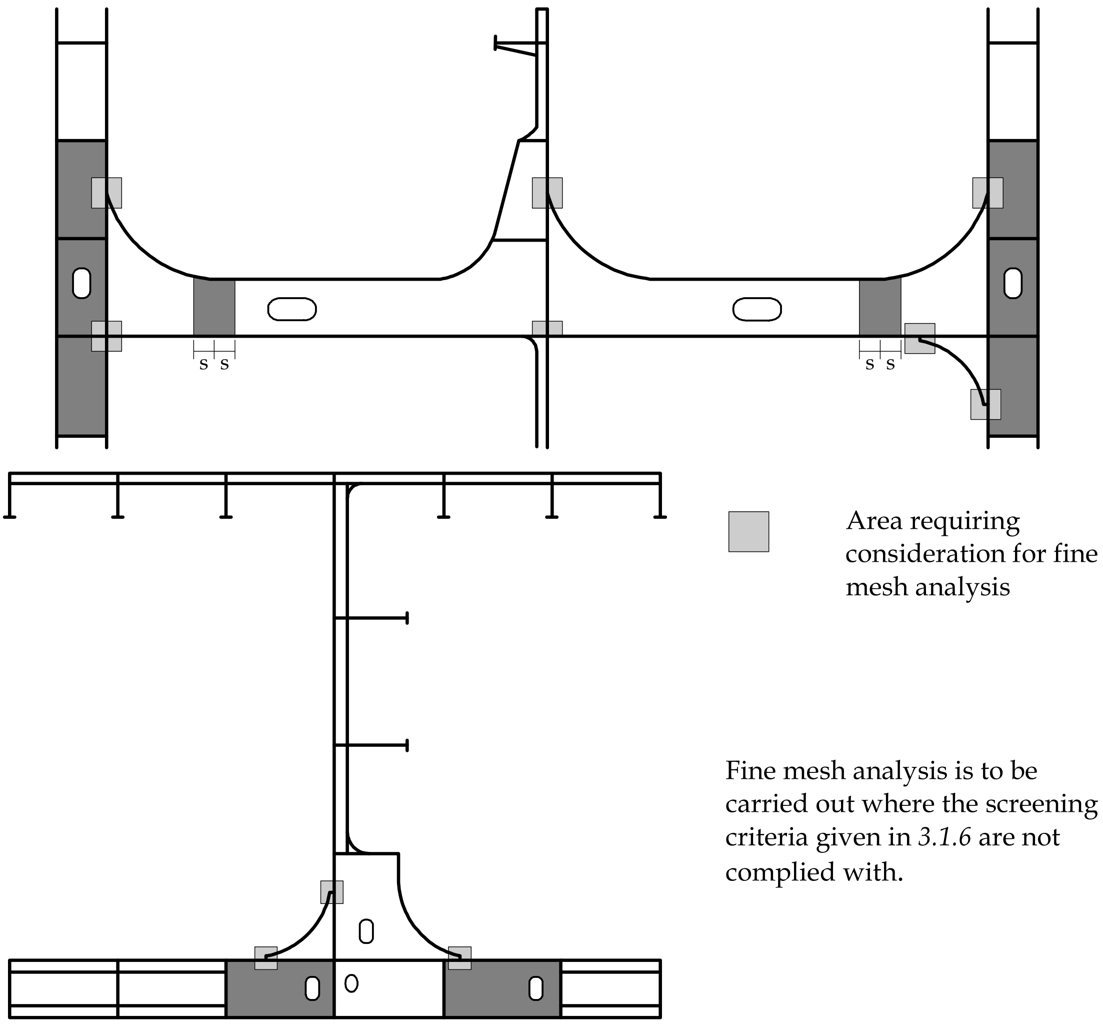
Areas Requiring Consideration for Fine Mesh Analysis on a Typical Transverse Web Frame, Wash Bulkhead and Web Frame adjacent to Transverse Bulkhead

	Upper hopper knuckle	Fine mesh analysis of upper hopper knuckle is required for cargo tank typical web frame, see *3.1.2*. Fine mesh analysis is not required for upper hopper knuckles on web frame adjacent to transverse bulkhead.
	Bracket toes	Fine mesh analysis is to be carried out where the screening criteria given in *3.1.6* are not complied with
	Openings (shaded regions)	Fine mesh analysis is to be carried out for all openings in shaded regions where the screening criteria given in *3.1.6* are not complied with
	Openings (un-shaded regions)	Fine mesh analysis or evaluation based on screening criteria given in *3.1.6* is not required for openings in un-shaded regions if: • $h_o/h < 0.35$ and $g_o < 1.2$, and, • each end of the opening forms a semi circle arc (i.e. radius of opening equal to $b/2$). where h_o, h and g_o are defined in *Table B.2.2* and b is the smallest of the length and breadth of the opening. Other openings in the un-shaded regions are subjected to fine mesh analysis where the screening criteria given in *3.1.6* are not complied with.

Figure B.3.2
Areas Requiring Consideration for Fine Mesh Analysis on Horizontal Stringer and Transverse Bulkhead to Double Bottom Connections



Bracket toes and heels	Fine mesh analysis is to be carried out where the screening criteria given in *3.1.6* are not complied with
Openings (shaded regions)	Fine mesh analysis is to be carried out for all openings in shaded regions where the screening criteria given in *3.1.6* are not complied with
Openings (un-shaded regions)	Fine mesh analysis or evaluation based on screening criteria given in *3.1.6* is not required for openings in un-shaded regions if: • $h_o/h < 0.35$ and $g_o < 1.2$, and, • each end of the opening forms a semi circle arc (i.e. radius of opening equal to $b/2$). where h_o, h and g_o are defined in *Table B.2.22* and b is the smallest of the length and breadth of the opening. Other openings in the un-shaded regions are subjected to fine mesh analysis where the screening criteria given in *3.1.6* are not complied with.

3.1.3 Transverse bulkhead stringers, buttress and adjacent web frame

3.1.3.1 Fine mesh analysis is to be carried out for the following locations where the screening criteria given in *3.1.6* are not complied with:

(a) main bracket toes, heels and openings on horizontal stringers of a transverse bulkhead specified in *Figure B.3.2*. The stringers of the forward and aft transverse bulkheads of the middle tank of the FE model which indicate highest

von Mises stresses in way of the structural details from the cargo tank analysis is to be selected for the fine mesh analysis.

(b) main bracket toes and openings on transverse bulkhead to double bottom connection or buttress structure specified in *Figure B.3.2*. The double bottom connection/buttress structure in way of the forward and aft transverse bulkheads of the middle tank of the FE model which indicates highest von Mises stresses in way of the structural details from the cargo tank analysis is to be selected for the fine mesh analysis.

(c) main bracket toes and openings specified in *Figure B.3.1* on a web frame adjacent to the transverse bulkhead. Both web frames in way of the horizontal stringers of the forward and aft transverse bulkheads of the middle tank of the cargo tank FE model are to be considered. The web frame which indicates highest von Mises stresses in way of the structural details from the cargo tank analysis is to be selected for the fine mesh analysis.

3.1.3.2 Where the stress level at the heel connection of the transverse bulkhead horizontal stringer to the side horizontal girder exceeds the permissible criteria, it is recommended that a backing bracket be fitted in accordance with *Appendix C/2.5* to reduce the stresses.

3.1.4 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners

3.1.4.1 End connections and attached web stiffeners of the following structural members are to be assessed:

(a) at least one pair of inner and outer bottom longitudinal stiffeners and adjoining vertical stiffener of transverse bulkhead

(b) at least one longitudinal stiffener on deck and adjoining vertical stiffener of transverse bulkhead

3.1.4.2 The selection of the longitudinal and vertical stiffeners to be analysed is to be based on the maximum relative deflection between supports, e.g. between floor and transverse bulkhead. Where there is a significant variation in end connection arrangement and scantlings between stiffeners, analysis of additional stiffeners may be required. *Figure B.3.3* shows the areas that require fine mesh analysis in way of deck, inner bottom and bottom longitudinal and transverse bulkhead vertical stiffeners.

3.1.5 Corrugated bulkheads

3.1.5.1 Where no shedder plate or shedder plate without a gusset plate is fitted to a corrugated transverse or longitudinal corrugated bulkhead, connection of corrugation and below supporting structure to lower stool shelf plate, as shown in *Figure B.3.4,* is to be evaluated by fine mesh analysis. Where no lower stool is fitted, connection of corrugation and below supporting structure to inner bottom plate is to be evaluated by fine mesh analysis.

3.1.5.2 Where shedder plate with a gusset plate is fitted to a corrugated transverse or longitudinal corrugated bulkhead, connection of the corrugation at the upper corner of the gusset plate is to be evaluated by fine mesh analysis.

3.1.5.3 The selection of the location of the corrugation unit for fine mesh analysis is to be based on the stress result from the cargo tank analysis. The location with the highest von Mises stress in way of the corrugation connection is to be selected for the analysis.

3.1.5.4 Where transverse and longitudinal corrugated bulkheads are of different arrangements or scantlings, the fine mesh analysis is to be carried out for both bulkheads.

3.1.5.5 Where the stress level at the connection of corrugation to the lower stool exceeds the permissible criteria, it is recommended that shedder plate and gusset plate be fitted in accordance with *Appendix C/2.5* to reduce the stresses. See *Section 8/2.5.7.9* for required arrangement of supporting structure for corrugated bulkhead without a lower stool.

Figure B.3.3
Areas Requiring Fine Mesh Analysis on Deck, Inner and Outer Bottom Longitudinals

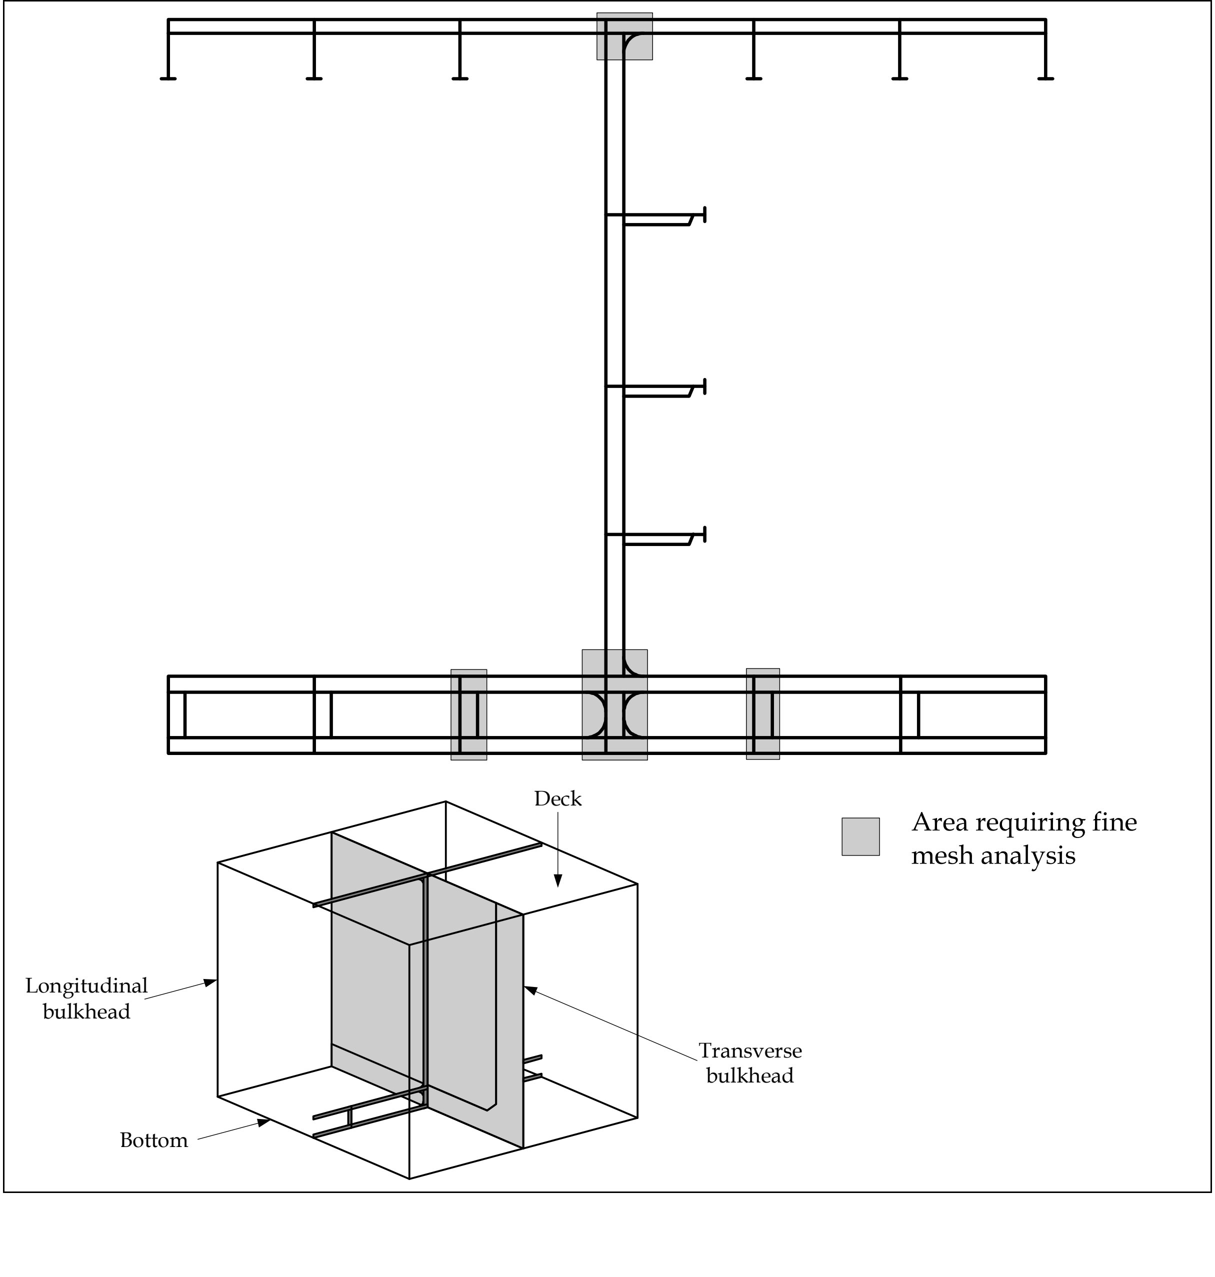


Figure B.3.4
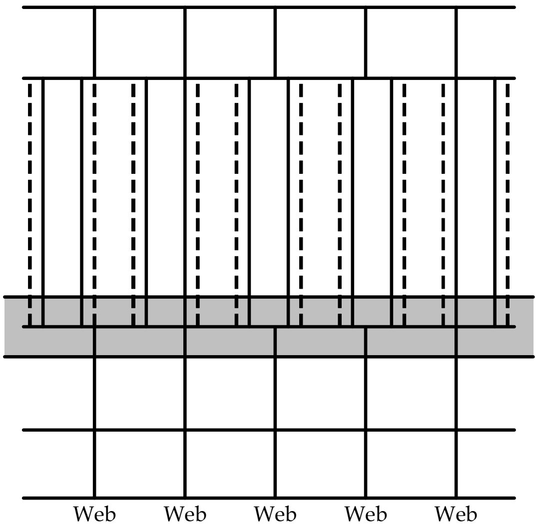
Areas Requiring Fine Mesh Analysis at Connections of Corrugated Bulkhead to Bottom Stool



Note

Exact location of corrugation unit to be examined using fine mesh analysis is to be selected based on stress result from cargo tank analysis.

3.1.6 Screening criteria for Fine Mesh Analysis

3.1.6.1 The criteria given in this section are intended to identify areas that require to be investigated by means of fine mesh finite element analysis. These criteria apply to openings, bracket toes and heels of transverse web frames, vertical and transverse webs of wash bulkheads, horizontal stringers of transverse bulkhead and adjoining side horizontal girders, buttress and bottom girders.

3.1.6.2 Where the criteria given in this section for the structural detail are complied with, fine mesh finite element analysis of the structural detail may be waived with the exception of *3.1.6.3.* The compliance with these criteria is to be verified for all finite element load cases.

3.1.6.3 Large openings, for which their geometry is required to be represented in the cargo tank FE model in accordance with *Table B.2.*2, are to be investigated by fine mesh analysis.

Table B.3.1
Fine Mesh Analysis Screening Criteria for Openings in Primary Support Members

A fine mesh finite element analysis is to be carried out where:

$\lambda_y > 1.7$ (load combination S + D)

$\lambda_y > 1.36$ (load combination S)

Where:

λ_y	yield utilisation factor	
	$= 0.85 C_h \left(\lvert \sigma_x + \sigma_y \rvert + \left(2 + \left(\frac{l_0}{2r} \right)^{0.74} + \left(\frac{h_0}{2r} \right)^{0.74} \right) \lvert \tau_{xy} \rvert \right) \frac{k}{235}$	
C_h	$= 1.0 - 0.23 \left(\frac{h_0}{h} \right) + 2.12 \left(\frac{h_0}{h} \right)^2$	for openings in vertical web and horizontal girder of wing ballast tank, double bottom floor and girder and horizontal stringer of transverse bulkhead
	= 1.0	for opening in web of main bracket and buttress (see figures below)
r	radius of opening, in mm	
h_0	height of opening parallel to depth of web, in mm	
l_0	length of opening parallel to girder web direction, in mm	
h	height of web of girder in way of opening, in mm	
σ_x	axial stress in element x direction determined from cargo tank FE analysis according to the coordinate system shown, in N/mm^2	
σ_y	axial stress in element y direction determined from cargo tank FE analysis according to the coordinate system shown, in N/mm^2	
τ_{xy}	element shear stress determined from cargo tank FE analysis, in N/mm^2, (2)	
k	higher strength steel factor, as defined in *Section 6/1.1.4* but not to be taken as less than 0.78 for load combination S + D	

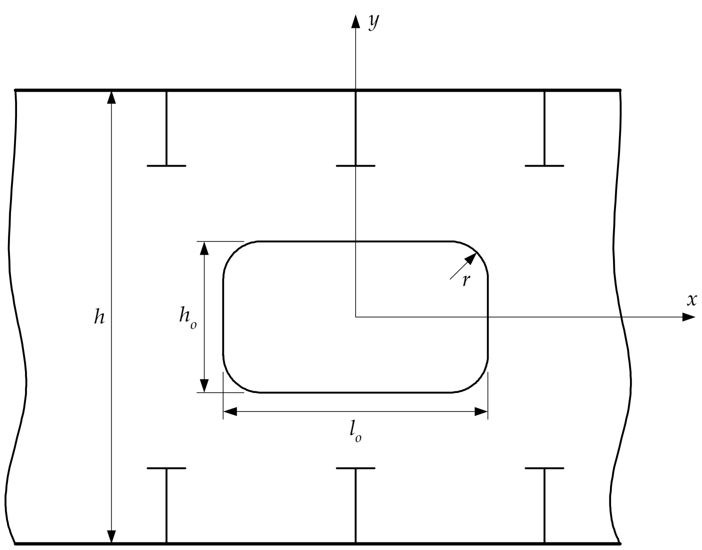


Table B.3.1 (Continued)
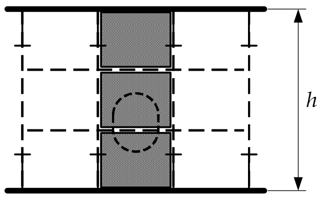
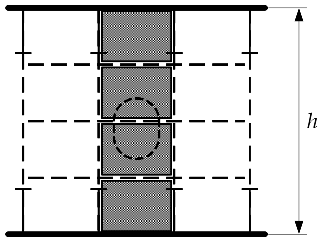
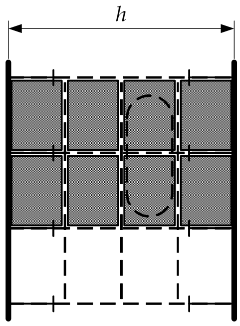
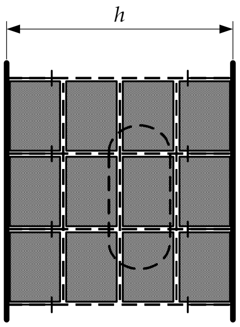
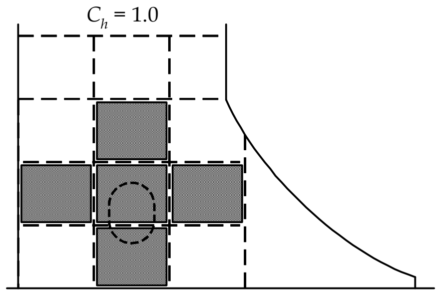
Fine Mesh Analysis Screening Criteria for Openings in Primary Support Members











Individual element in web to be verified against criteria

Notes

1. For opening where the modelled shear area in way of the opening is different from the actual net shear area the element shear stress is to be adjusted using the formula given in *B.2.7.2.4* prior to the evaluation of yield utilisation factor for verification against the screening criteria.
2. Where the geometry of the opening is required to be modelled in accordance with *Table B.2.2*, fine mesh FE analysis is to be carried out to determine the stress level. The screening criteria given in this table are not applicable.
3. Screening criteria is only valid if the cargo tank finite element analysis and the derivation of element stresses is carried out in accordance with *B/2*.

RCN 2 to July 2008 version (effective from 1 July 2010)

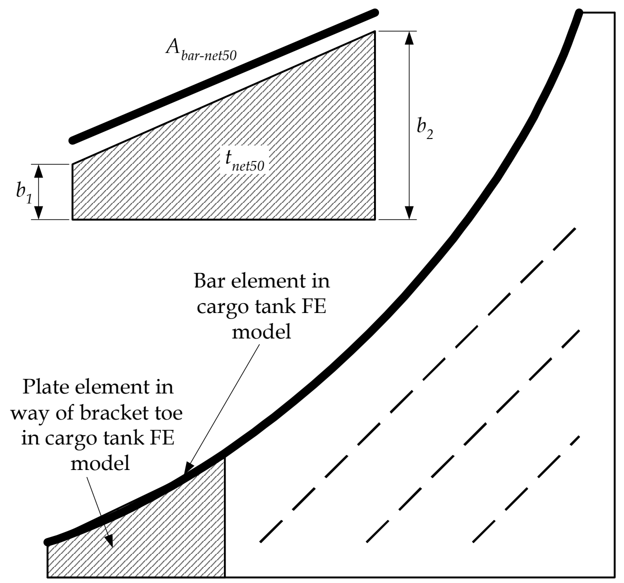
Table B.3.2
Fine Mesh Analysis Screening Criteria for Bracket Toes of Primary Support Members

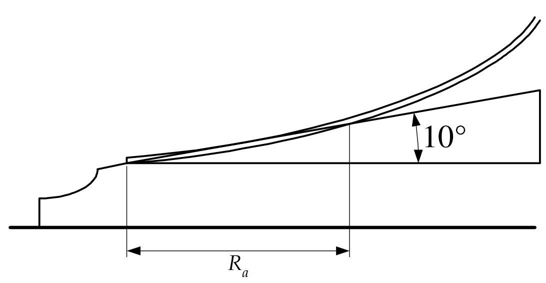
A fine mesh finite element analysis is to be carried out where:

$\lambda_y > 1.5$　(load combination S + D)
$\lambda_y > 1.2$　(load combination S)

Where:

λ_y	yield utilisation factor $= C_a\left(0.75\left(\frac{b_2}{b_1}\right)^{0.5}\lvert\sigma_{vm}\rvert + 0.55\left(\frac{A_{bar-net50}}{b_1 t_{net50}}\right)^{0.5}\lvert\sigma_{bar}\rvert\right)\frac{k}{235}$
C_a	$= 1.0 - 0.2\left(\frac{R_a}{1400}\right)^2$
b_1, b_2	height of plate element in way of bracket toe in cargo tank FE model, in mm
$A_{bar-net50}$	sectional area of bar element in cargo tank FE model representing the face plate of bracket, in mm^2
σ_{bar}	bar element axial stress determined from cargo tank FE analysis, in N/mm^2
σ_{vm}	von Mises stress of plate element in way of bracket toe determined from cargo tank FE analysis, in N/mm^2
t_{net50}	thickness of plate element in way of bracket toe, in mm
R_a	leg length distance in mm, not to be taken as greater than 1400mm
k	higher strength steel factor, as defined in *Section 6/1.1.4,* but not to be taken as less than 0.78 for load combination S + D





Note

1. Screening criteria is only valid if the cargo tank finite element analysis and the derivation of element stresses is carried out in accordance with *B/2*.

Table B.3.3
Fine Mesh Analysis Screening Criteria for Heels of Transverse Bulkhead Horizontal Stringers

A fine mesh finite element analysis is to be carried out where:

$\lambda_y > 1.5$ (load combination S + D)
$\lambda_y > 1.2$ (load combination S)

Where:

λ_y yield utilisation factor

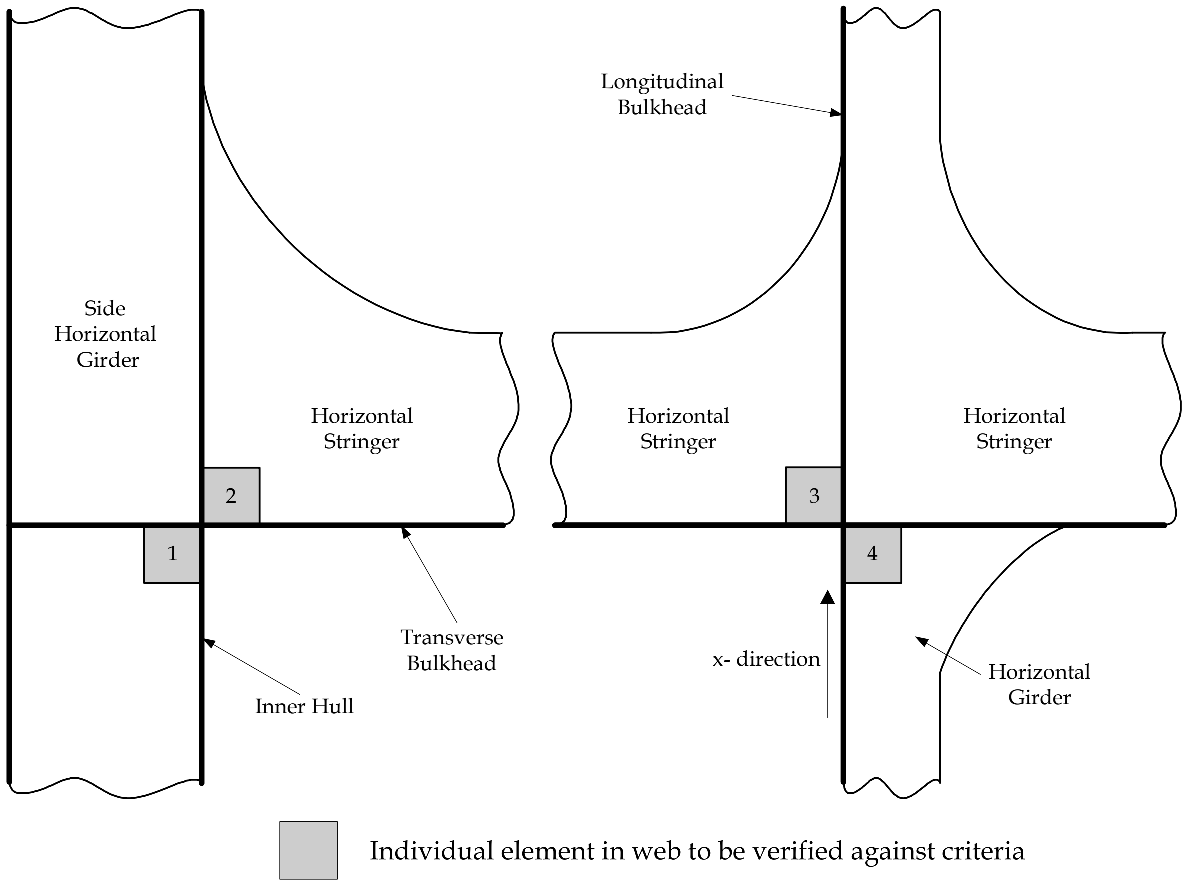
$= 3.0\left|\sigma_{vm}\right|\dfrac{k}{235}$ for heels at side horizontal girder and transverse bulkhead horizontal stringer, i.e. locations 1, 2 and 3 in figures.

$= 5.2\left|\sigma_{x}\right|\dfrac{k}{235}$ for heel at longitudinal bulkhead horizontal stringer, i.e. location 4.

σ_x axial stress in element x direction determined from cargo tank FE analysis in accordance with the coordinate system shown, in N/mm²

σ_{vm} von Mises stress of plate element in way of heel determined from cargo tank FE analysis, in N/mm²

k higher strength steel factor, as defined in *Section 6/1.1.4*, but not to be taken as less than 0.78 for load combination S + D



Note

1. Screening criteria is only valid if the cargo tank finite element analysis and the derivation of element stresses is carried out in accordance with *B/2*.

3.2 Structural Modelling

3.2.1 General

3.2.1.1 Evaluation of detailed stresses requires the use of refined finite element mesh in way of areas of high stress. This fine mesh analysis can be carried out by means of separate local finite element model with fine mesh zones in conjunction with the boundary conditions obtained from the cargo tank model. Alternatively, fine mesh zones incorporated into the cargo tank model may be used.

3.2.1.2 The extent of the local finite element model is to be such that the calculated stresses at the areas of interest are not significantly affected by the imposed boundary conditions and application of loads. The boundary of the fine mesh model is to coincide with primary support members, such as girders, stringers and floors, in the cargo tank model.

3.2.1.3 The mesh size in the fine mesh zones is not to be greater than 50mm x 50mm. In general, the extent of the fine mesh zone is not to be less than 10 elements in all directions from the area under investigation.

3.2.1.4 All plating within the fine mesh zone is to be represented by shell elements. A smooth transition of mesh density is to be maintained. The aspect ratio of elements within the fine mesh zone is to be kept as close to 1 as possible. Variation of mesh density within the fine mesh zone and the use of triangular elements are to be avoided. In all cases, the elements are to have an aspect ratio not exceeding 3. Distorted elements, with element corner angle less than 60° or greater than 120°, are to be avoided. Stiffeners inside the fine mesh zone are to be modelled using shell elements. Stiffeners outside the fine mesh zones may be modelled using beam elements.

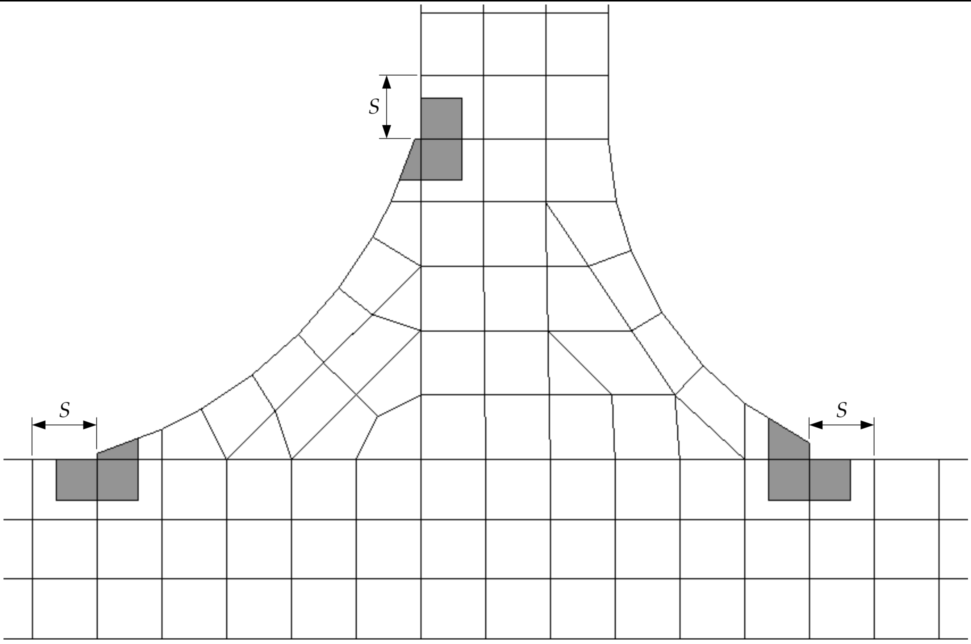
3.2.1.5 The element inside the fine mesh zone is to be modelled based on the net thickness, obtained by deducting the full corrosion addition, t_{corr}, from the gross thickness. The structure outside the fine mesh zone is to be modelled based on the net thickness obtained by deducting half the corrosion addition, $0.5t_{corr}$, from the gross thickness, as specified in *2.2.1.5*, for use in the cargo tank FE analysis.

3.2.1.6 Where fine mesh analysis is required for main bracket end connections, the fine mesh zone is to be extended at least 10 elements in all directions from the area of interest, see *Figure B.3.5*. The modelling scantlings in the fine mesh zone are to be in accordance with *3.2.1.5*.

3.2.1.7 Where fine mesh analysis is required for an opening, the first two layers of elements around the opening are to be modelled with mesh size not greater than 50mm x 50mm, based on the net thickness with deduction of full corrosion addition, t_{corr},. The elements outside the first two layers are to be based on the net thickness with a deduction of corrosion addition, $0.5t_{corr}$, see *3.2.1.5*. A smooth transition from the fine mesh to the coarser mesh is to be maintained. Edge stiffeners which are welded directly to the edge of an opening are to be modelled with plate elements. Web stiffeners close to an opening may be modelled using rod or beam elements located at a distance of at least 50mm from the edge of the opening. Typical fine mesh zone around an opening is shown in *Figure B.3.6*.

3.2.1.8 Face plates of openings, primary support members and associated brackets are to be modelled with at least three elements across their width.

Figure B.3.5
Fine Mesh Zone Around Bracket Toes



Fine mesh zone
Element size ≤ 50mm x 50mm
Extent - at least 10 elements in all directions
Face plate modelled by plate elements

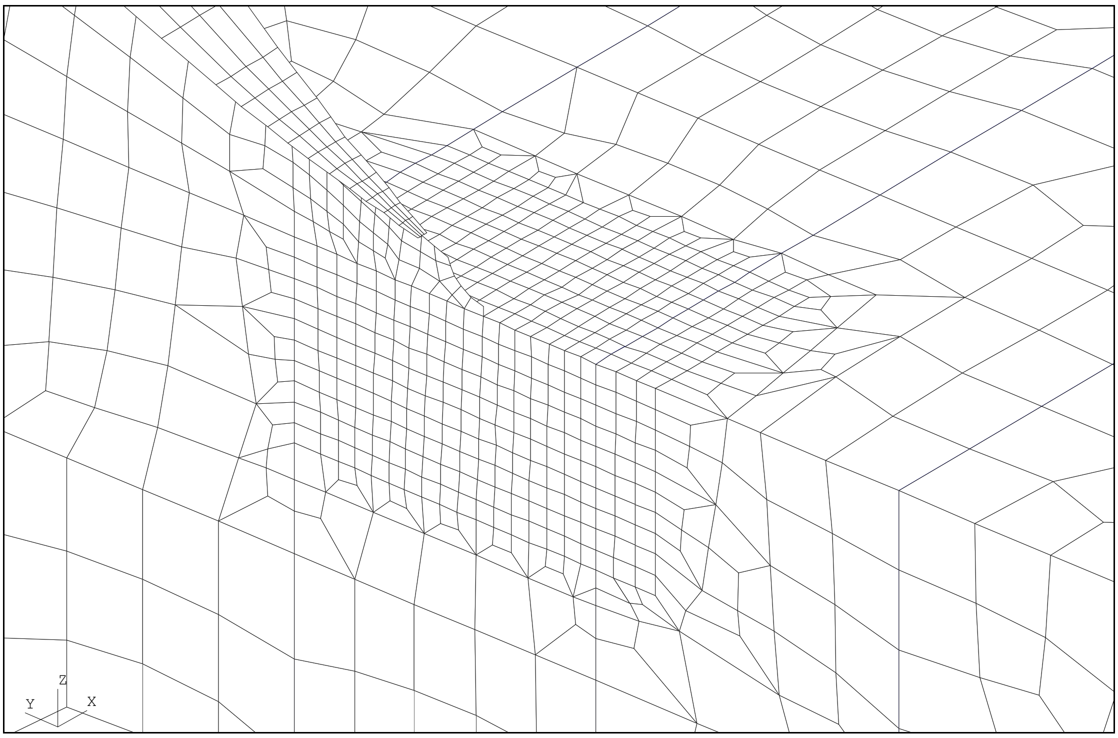


Figure B.3.6
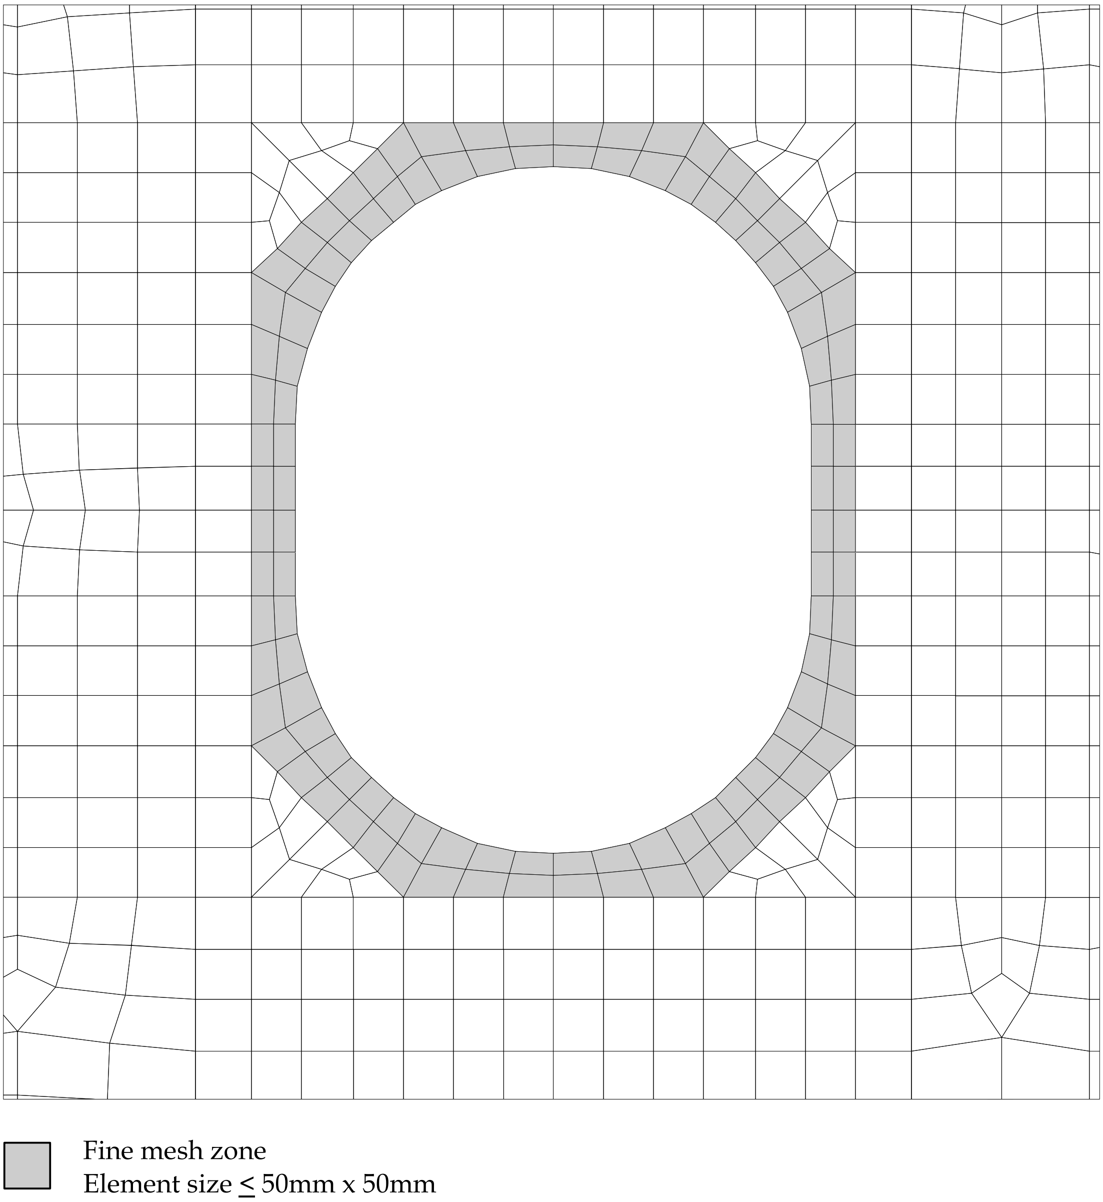
Fine Mesh Zone Around an Opening



3.2.2 Transverse web frames

3.2.2.1 In addition to the requirements of *3.2.1*, the modelling requirements in this sub-section are applicable to the analysis of typical transverse web frame.

3.2.2.2 Where a FE sub model is used, the model is to have an extent of at least 1 + 1 web frame spaces, i.e. one web frame space extending either side of the transverse web frame under investigation. The transverse web frames forward and aft of the web frame under investigation need not be included in the sub model.

3.2.2.3 The full depth and full breadth of the ship shall be modelled, see *Figure B.3.7*.

3.2.2.4 *Figure B.3.8* shows a close up view of the finite element mesh at the lower part of the vertical web and backing brackets.

Figure B.3.7
Extent of Sub-Model for Fine Mesh Analysis of Web Frame Bracket Connections and Openings

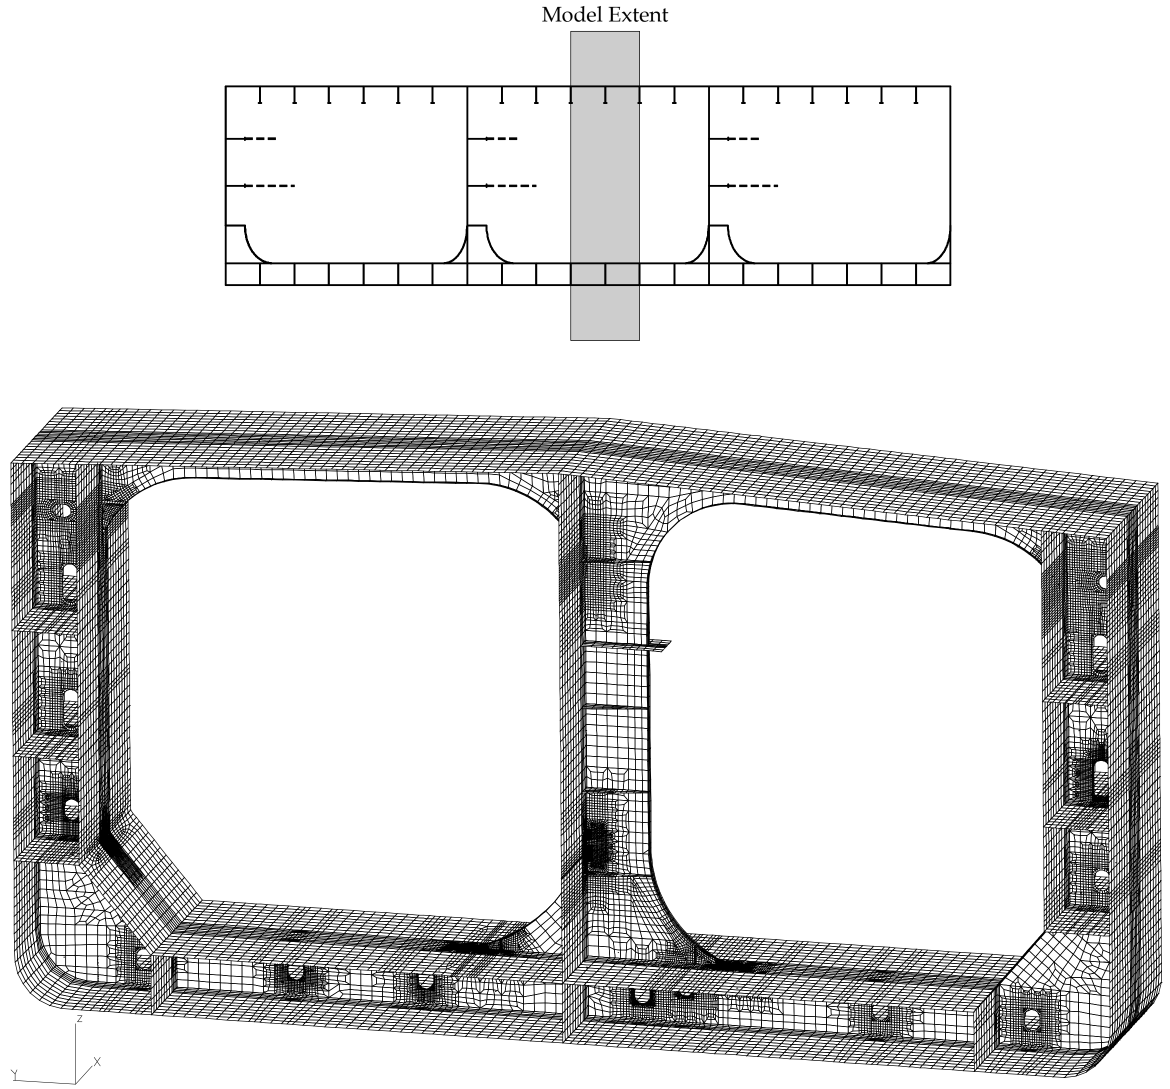


Figure B.3.8
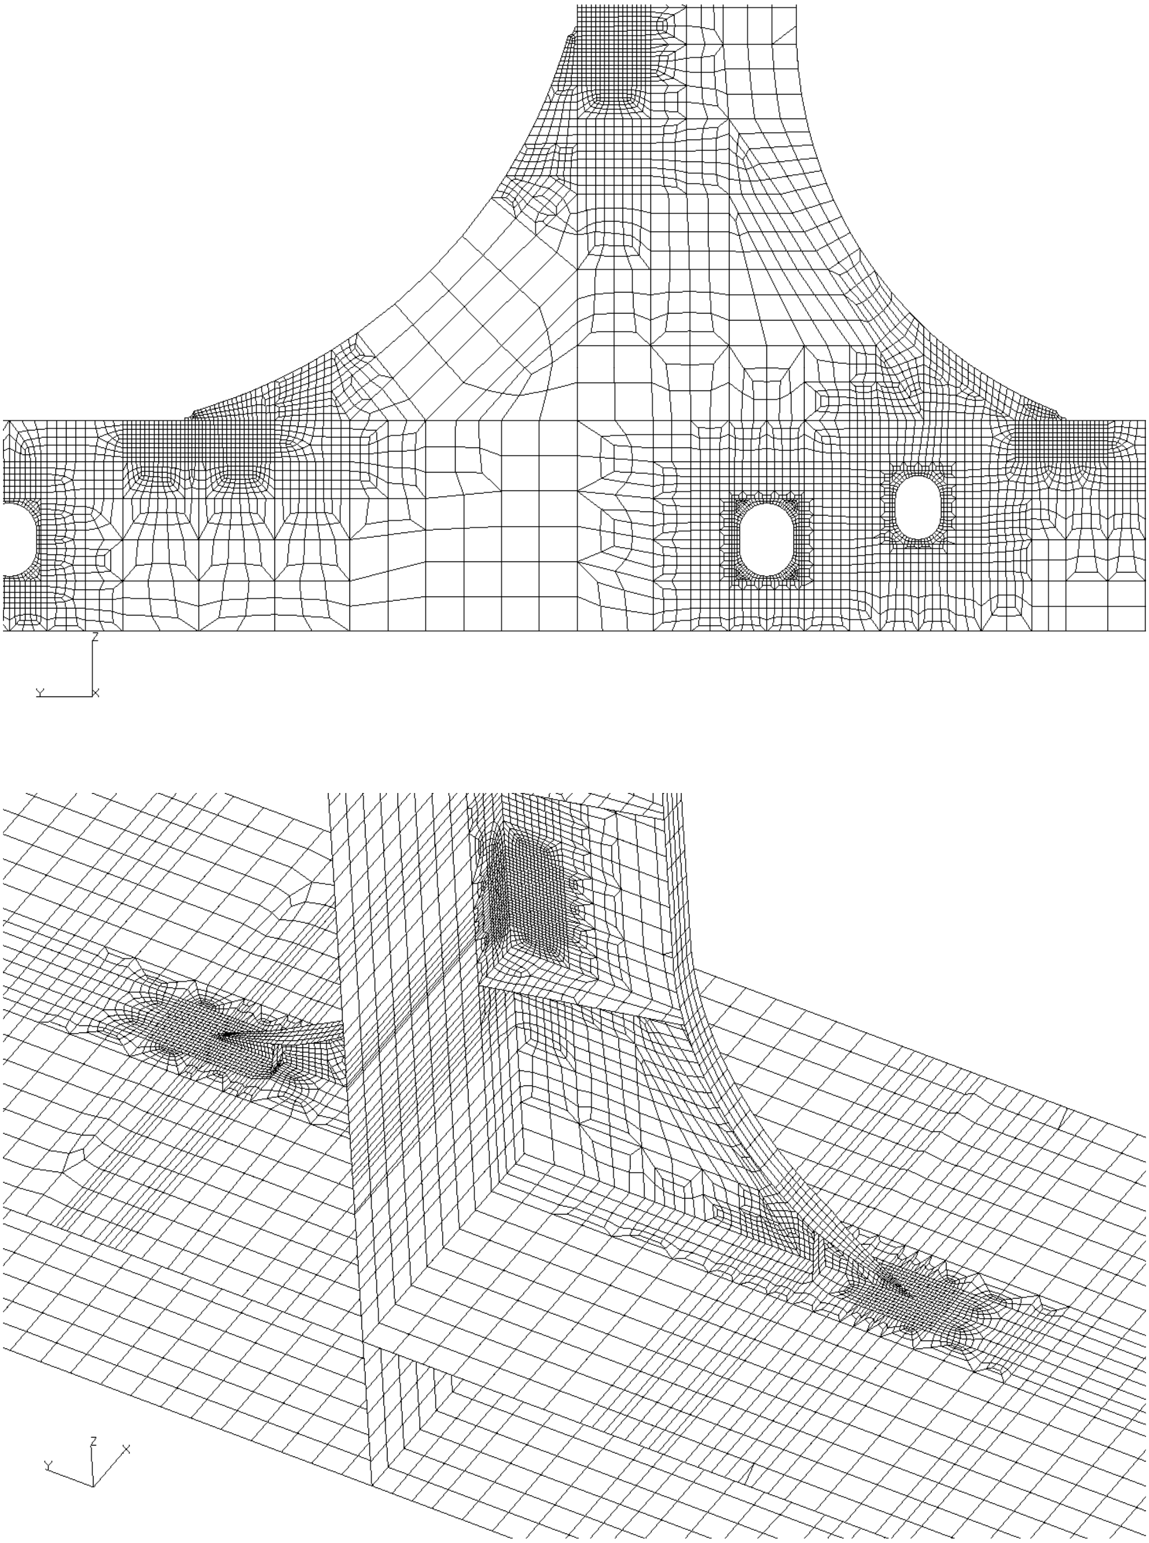
Close-up View of Finite Element Mesh at the Lower Part of a Vertical Web Frame and Backing Brackets



3.2.3 Transverse bulkhead stringers, buttress and adjacent web frame

3.2.3.1 In addition to *3.2.1*, the modelling requirements in this sub-section are applicable to the analysis of transverse bulkhead and adjacent web frame as described in *3.1.3*.

3.2.3.2 Due to the structural interaction between the transverse bulkhead, horizontal stringers, web frames, deck and bottom, it is recommended that the FE sub-model represents a full section of the hull. Longitudinally, the ends of the model should at least be extended one web frame space beyond the areas that require investigation, see *Figure B.3.9*. The full breadth and depth of the ship should be modelled.

3.2.3.3 Alternatively, it is acceptable to use a number of sub-models, as shown in *Figure B.3.10,* to analyse different parts of the structure. For the analysis of the transverse bulkhead horizontal stringers the full breadth of the ship should be modelled. For the analysis of buttress structure, the sub-model width should be at least 4 + 4 longitudinal spaces, i.e. four longitudinal spaces at each side of the buttress.

3.2.3.4 *Figure B.3.11* shows the finite element mesh on a transverse bulkhead horizontal stringer. *Figure B.3.12* shows the sub-model for the analysis of buttress connections to transverse bulkhead and double bottom structure, and openings.

Figure B.3.9
Extent of Sub-Model for Fine Mesh Analysis of Transverse Bulkhead and Adjacent Structure

Analysis of Transverse Bulkhead Structure Using Sub-Models

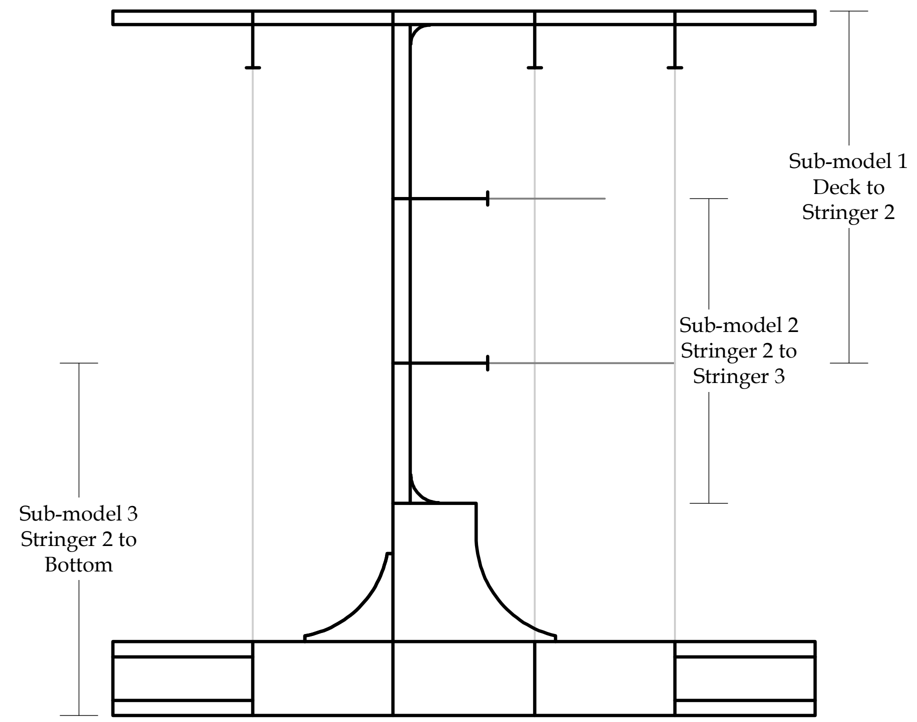

Figure B.3.11
Finite Element Mesh on Transverse Bulkhead Horizontal Stringer
(figure shows port side of model)

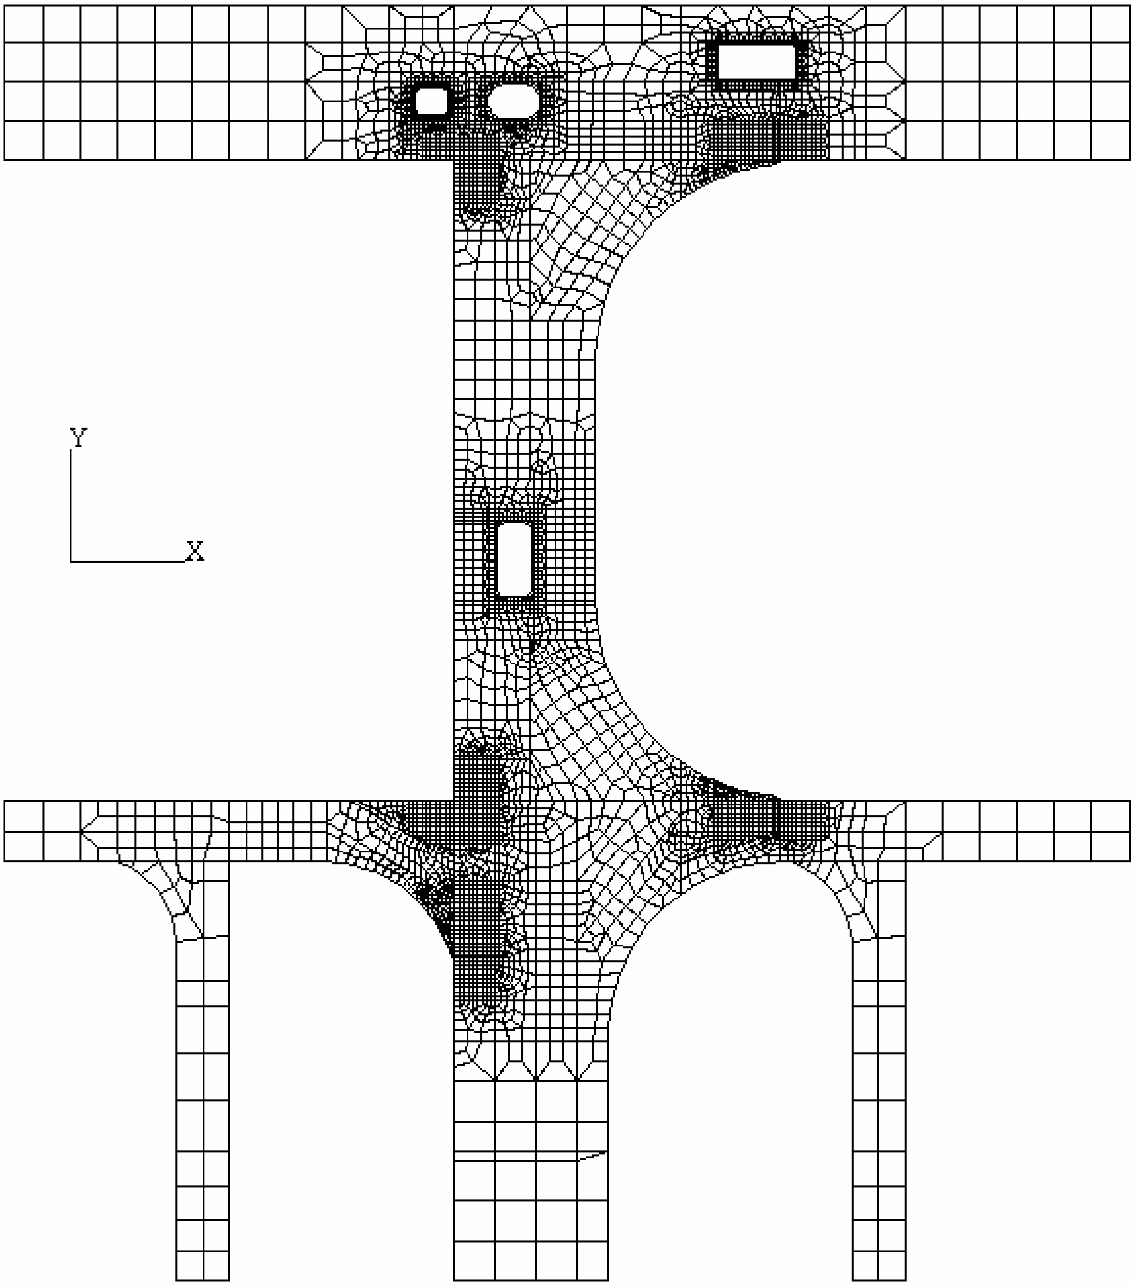

Figure B.3.12
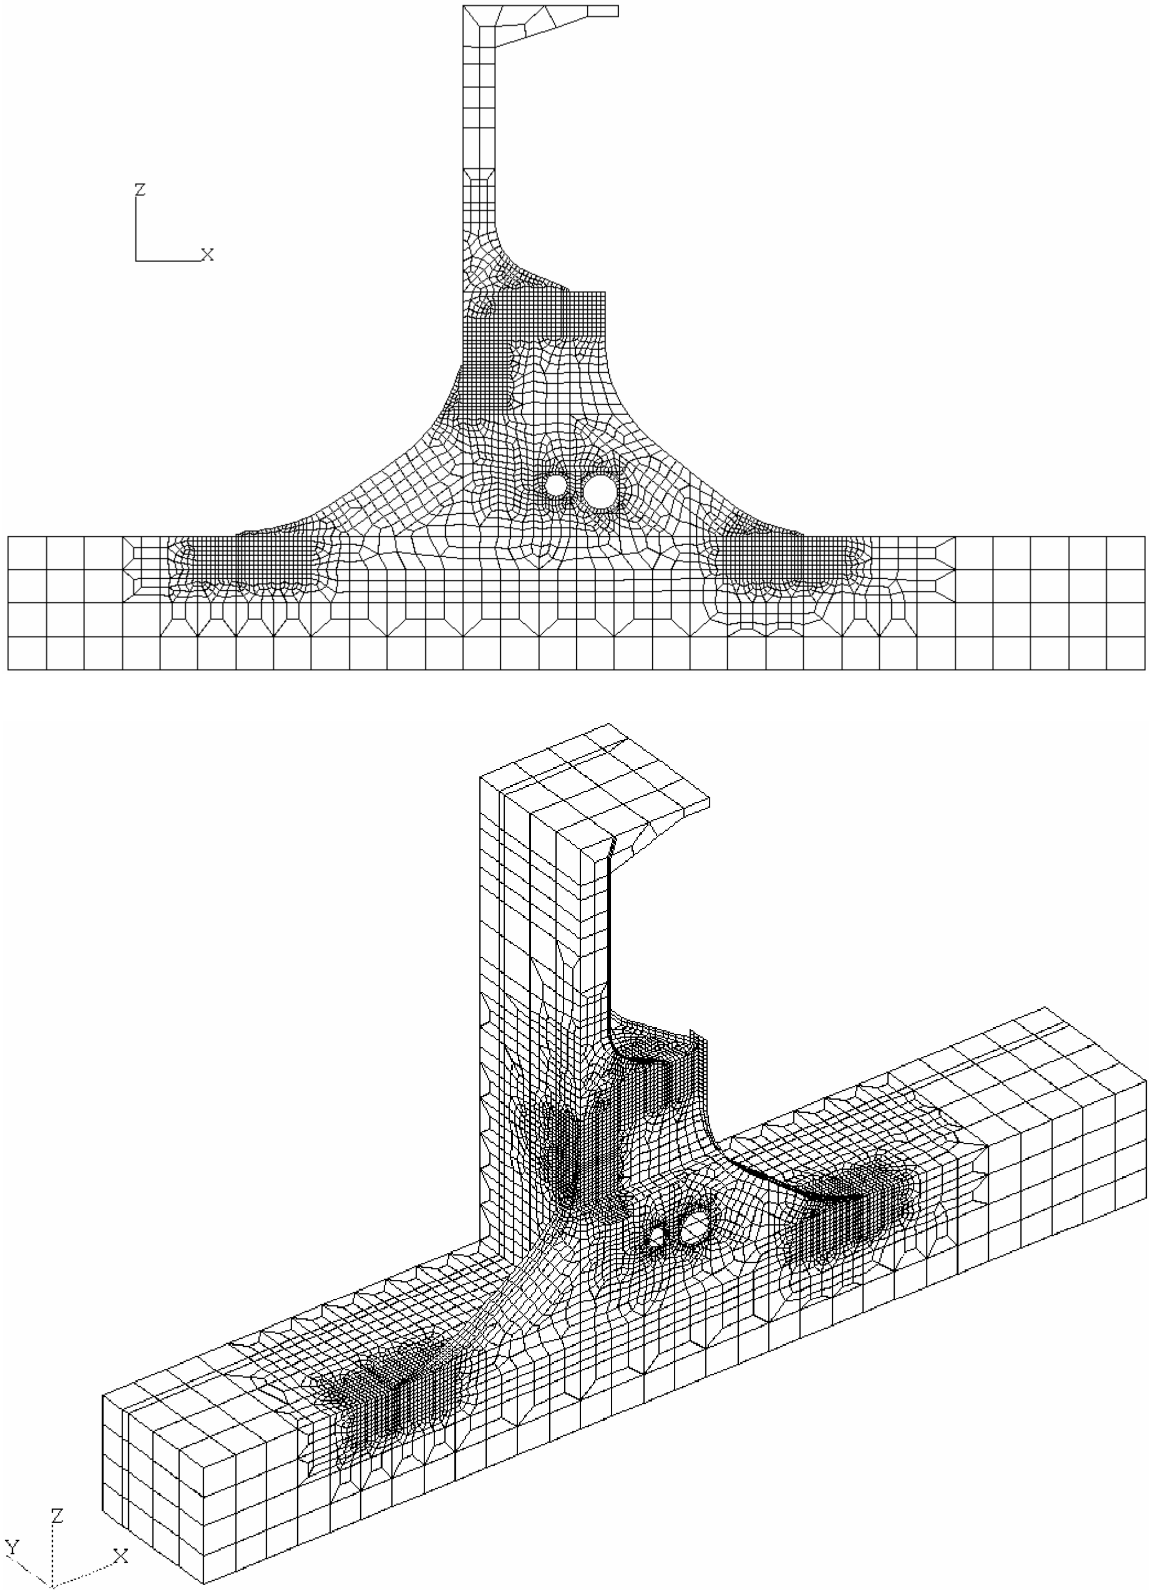
Sub-Model for the Analysis of Buttress Connections to Bulkhead and Double Bottom Structure (figure shows port half of model)



3.2.4 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners

3.2.4.1 The modelling requirements in this sub-section are applicable specifically to the analysis of longitudinal and vertical stiffener end connections and attached web stiffeners as described in *3.1.4.*

3.2.4.2 Where a local FE model is used, each end of the model is to be extended longitudinally at least two web frame spaces from the areas under investigation. The model width is to be at least 2 + 2 longitudinal spaces. *Figure B.3.13* shows the longitudinal extent of the sub-model for the analysis of deck and double bottom longitudinal stiffeners and adjoining transverse bulkhead vertical stiffener.

3.2.4.3 The prescribed displacements or forces obtained from the cargo tank FE model should be applied to all boundary nodes which coincide with the cargo tank model.

3.2.4.4 The longitudinal and vertical stiffeners under investigation, including web, faceplate, attached plating (within ½ + ½ longitudinal spaces) and associated brackets are to be modelled based on the gross thickness with deduction of the full corrosion addition t_{corr}. Other areas are to be based on gross thickness with deduction of half corrosion addition, $0.5t_{corr}$.

3.2.4.5 The web of the longitudinal stiffeners should be represented by at least 3 shell elements across its depth. Similar size elements should be used to represent the plating of the bottom shell and inner bottom. The face plate of the longitudinal stiffeners and brackets should be modelled with at least three elements across its width.

3.2.4.6 The mesh size and extent of the fine mesh zone is to be in accordance with *3.2.1.3*, see also *Figure B.3.13*.

Figure B.3.13
Sub-Model for Fine Mesh Analysis of End Connections and Web Stiffeners of Deck and Double Bottom Longitudinals

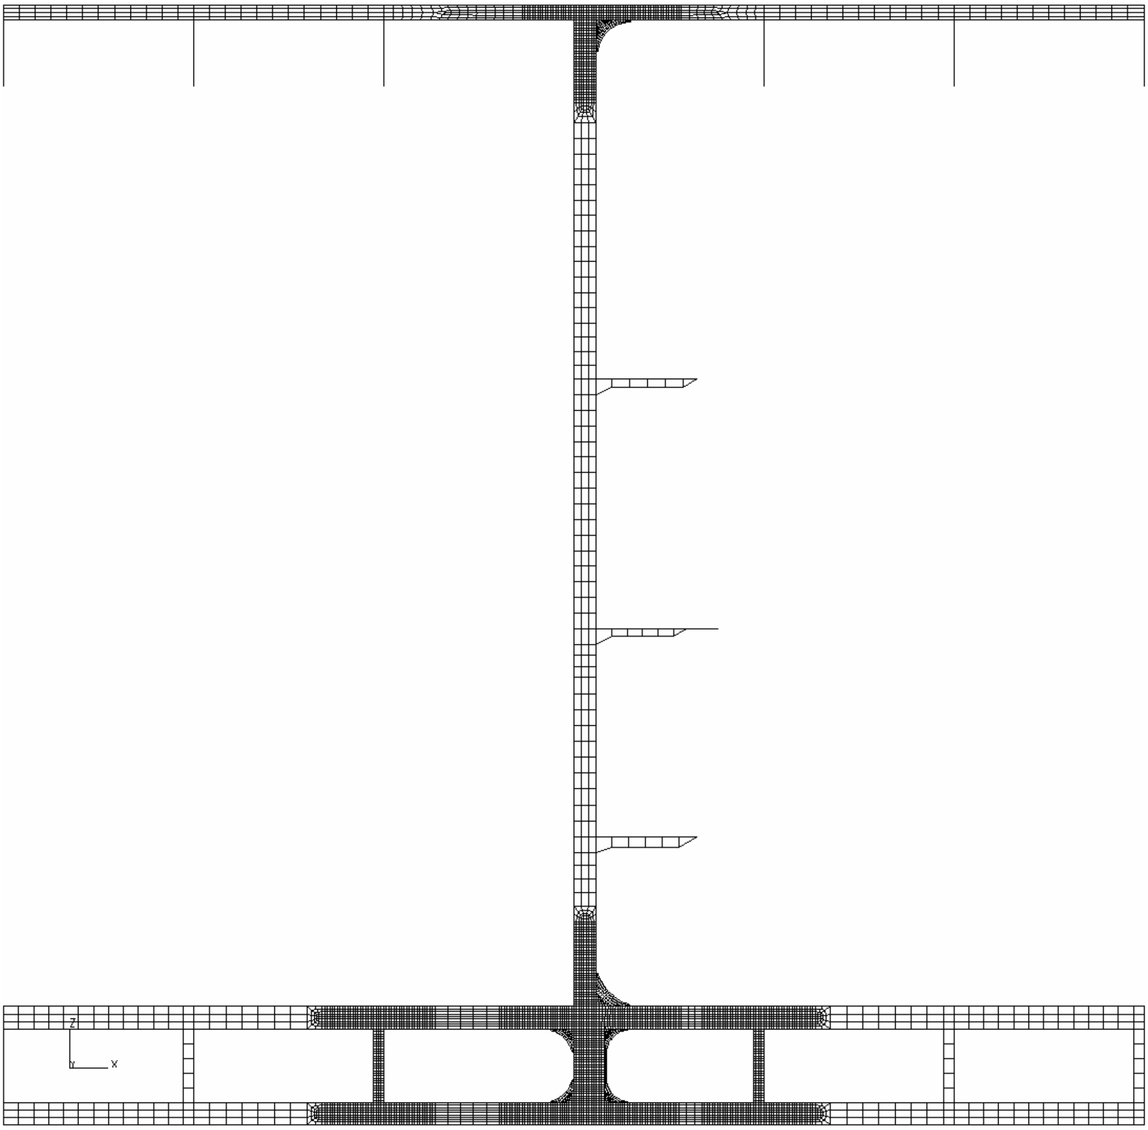


Figure B.3.13 (Continued)
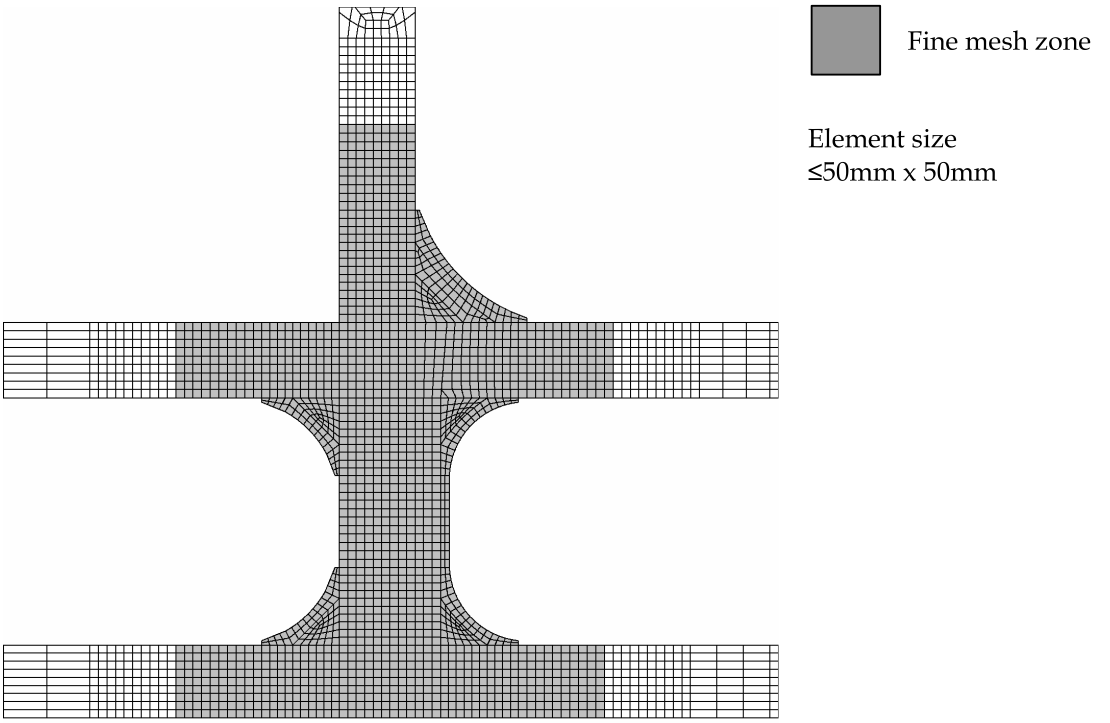
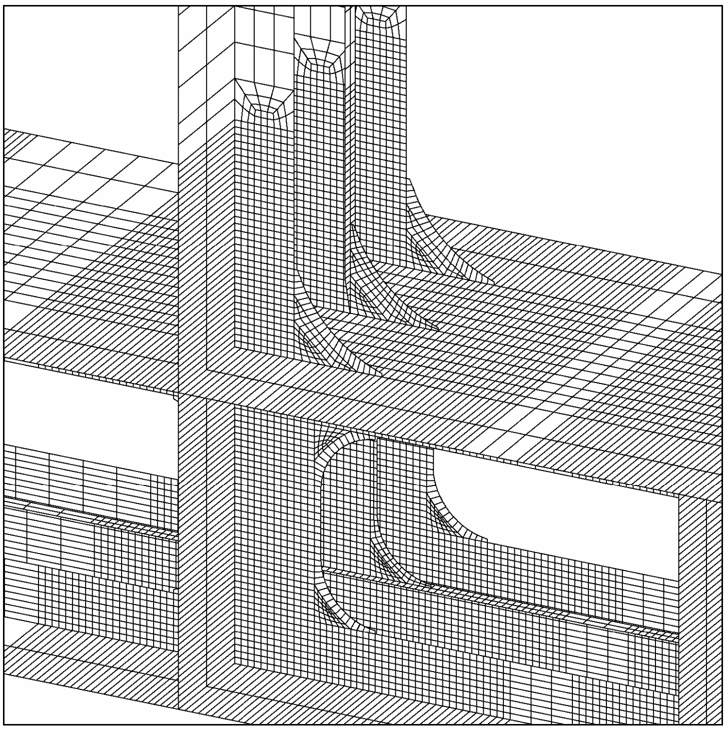
Sub-Model for Fine Mesh Analysis of End Connections and Web Stiffeners of Deck and Double Bottom Longitudinals





3.2.5 Corrugated bulkheads

3.2.5.1 In addition to *3.2.1*, the modelling requirements in this sub-section are applicable to the analysis of connections of corrugated bulkheads to lower bulkhead stools as described in *3.1.5*.

3.2.5.2 The minimum extent of the sub-model is as follows, see also *Figure B.3.14*:

(a) vertically, from the bottom of the bottom bulkhead stool to a level at least 2m above the connection of the corrugation to the upper part of the bulkhead stool. The upper boundary of the sub-model should be coincident with the horizontal mesh line of the cargo tank FE model

(b) for transverse corrugated bulkheads, the sub-model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. the sub-model covers two bulkhead stool transverse web spaces). The end diaphragms need not be modelled

(c) for longitudinal corrugated bulkheads, the sub-model is to be extended to the nearest web frame on each side of the fine mesh zone (i.e. the sub-model covers two frame spaces). The end web frames need not be modelled

(d) where the area under investigation is located close to the intersection of transverse and longitudinal corrugated bulkheads, the sub-model should cover the structure between the diaphragms (in transverse direction) and web frames (in longitudinal direction) closest to the detail, whichever relevant. In addition the sub-model is to be extended at least one diaphragm/web frame outside the intersection of the stools.

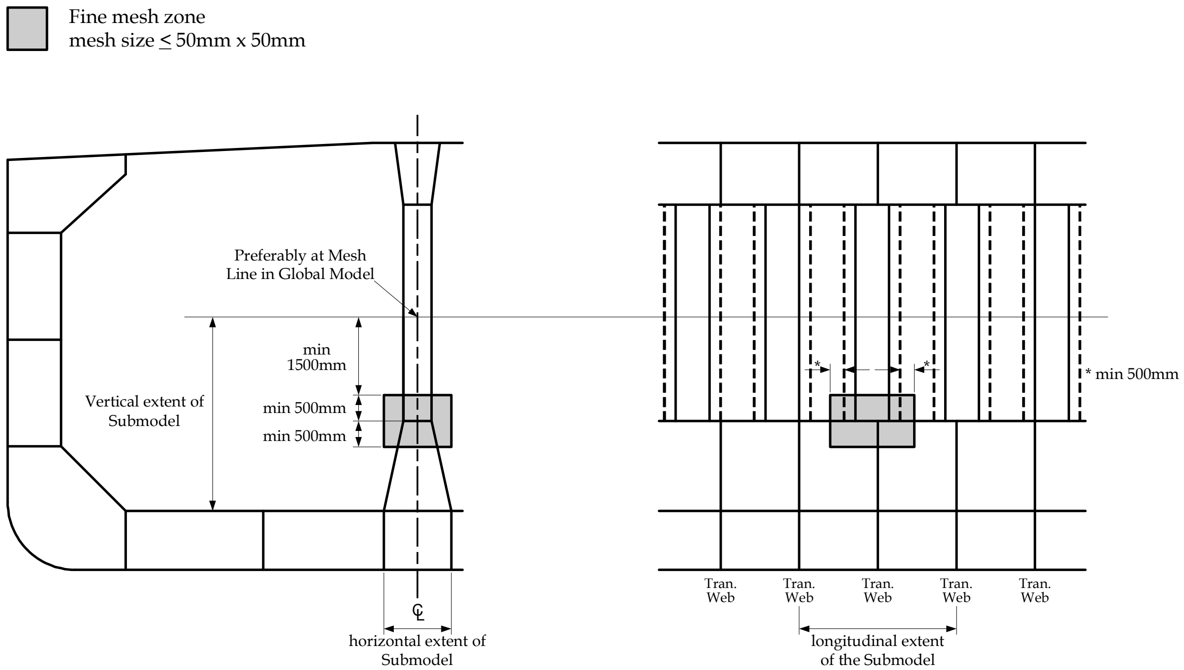
3.2.5.3 The fine mesh zone is to be extended at least 500mm (10 elements) from the corrugation connection in a vertical direction, see *Figure B.3.1.4*. In a horizontal direction, the fine mesh zone is to cover at least the corrugation flange under investigation, the adjacent corrugation webs and a further extension of 500mm from each end of the corrugation web (i.e. the fine mesh zone covers four corrugation knuckles), see *Figure B.3.14*. The mesh size within the fine mesh zone is not to be greater than 50mm x 50mm.

3.2.5.4 Diaphragm webs, brackets inside the lower stool and vertical stiffeners on the stool side plate are to be modelled at their actual positions within the extent of the sub-model. Shell elements are to be used for modelling of diaphragm, bracket and stiffener webs. Beam elements may be used to represent the flange of stiffeners and brackets.

3.2.5.5 Horizontal stiffeners on the lower stool side plate are to be represented by beam elements.

3.2.5.6 *Figure B.3.15* shows the finite element sub-model for the fine mesh analysis of longitudinal bulkhead to lower stool connection.

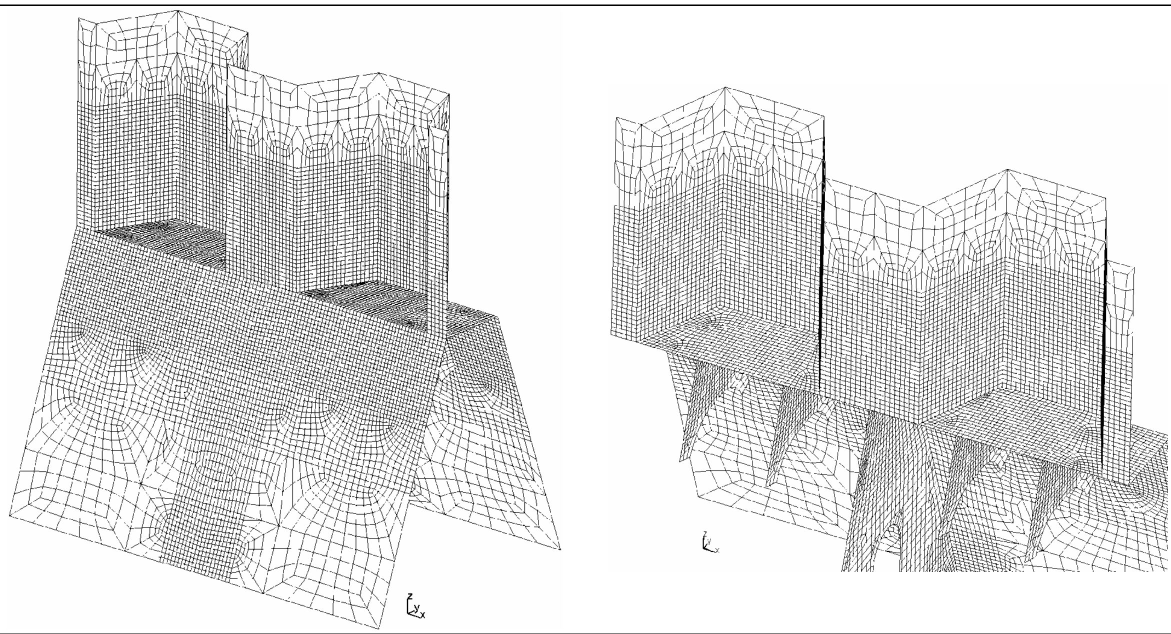
Figure B.3.14
Extent of Sub-Model and Fine Mesh Zone for the Analysis of Corrugated Bulkhead Connection to Lower Stool



Note

Above figures show extent of sub-model and fine mesh zone on longitudinal corrugated bulkhead connection to lower stool. Similar extent applies to transverse corrugated bulkhead.

Figure B.3.15
Sub-Model for the Analysis of Connection of Longitudinal Corrugated Bulkhead to Lower Stool



3.3 Loading Conditions

3.3.1 Stress analysis

3.3.1.1 The fine mesh detailed stress analysis is to be carried out for the standard load cases specified in *2.3.1*, and any other load cases specially considered as required by *Section 9/2.2.3*.

3.4 Application of Loads and Boundary Conditions

3.4.1 General

3.4.1.1 Where a separate local finite element model is used for the fine mesh detailed stress analysis, the nodal displacements from the cargo tank model are to be applied to the corresponding boundary nodes on the local model as prescribed displacements. Alternatively, equivalent nodal forces from the cargo tank model may be applied to the boundary nodes.

3.4.1.2 Where there are nodes on the local model boundaries which are not coincident with the nodal points on the cargo tank model, it is acceptable to impose prescribed displacements on these nodes using multi-point constraints. The use of linear multi-point constraint equations connecting two neighbouring coincident nodes is considered sufficient.

3.4.1.3 All local loads, including any vertical loads applied for hull girder shear force correction, in way of the structure represented by the separate local finite element model are to be applied to the model.

3.5 Result Evaluation and Acceptance Criteria

3.5.1 Stress assessment

3.5.1.1 Stress assessment of the fine mesh analysis is to be carried out for the load cases specified in *3.3.1.*

3.5.1.2 The von Mises stress, σ_{vm}, is to be calculated based on the membrane direct axial and shear stresses of the plate element evaluated at the element centroid. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element.

3.5.1.3 The resulting von Mises stresses are not to exceed the permissible membrane values specified in *Section 9/2.3.5*.

3.5.1.4 The maximum permissible stresses are based on the mesh size of 50mm x 50mm as specified in *3.2.1*. Where a smaller mesh size is used, an average von Mises stress calculated over an area equal to the specified mesh size may be used to compare with the permissible stresses. The averaging is to be based only on elements with their entire boundary located within the desired area. The average stress is to be calculated based on stresses at element centroid; stress values obtained by interpolation and/or extrapolation are not to be used. Stress averaging is not to be carried across structural discontinuities and abutting structure.

4 EVALUATION OF HOT SPOT STRESS FOR FATIGUE ANALYSIS

4.1 Application

4.1.1 General

4.1.1.1 This Section describes the procedure to perform a finite element analysis using very fine meshes for the evaluation of geometric hot spot stresses for use in the determination of fatigue damage ratio in accordance with *Appendix C/2*.

4.1.1.2 The locations where a finite element analysis based fatigue assessment is to be carried out are specified in *Section 9/3.3*.

4.2 Structural Modelling

4.2.1 General

4.2.1.1 Evaluation of hot spot stresses for fatigue assessment requires the use of very fine finite element meshes in way of areas of high stress concentration. This very fine mesh analysis can be carried out by means of separate local finite element models with very fine mesh zones in conjunction with the boundary conditions obtained from a cargo tank model. Alternatively, very fine mesh zones incorporated into the cargo tank model may be used.

4.2.1.2 All structural parts, within an extent of at least 500mm in all directions leading up to the fatigue hot spot position, are to be modelled based on the net thickness, obtained by deducting half the corrosion addition (i.e. $0.5t_{corr}$) from the gross thickness.

4.2.1.3 The cargo tank finite element model for fatigue assessment is to be modelled in accordance with 2.2, but based on net thickness obtained by deducting a quarter of the corrosion addition (i.e. $0.25t_{corr}$) from the proposed thickness. Alternatively, if the cargo tank FE model for the strength assessment is used, which is based on a thickness deduction of $0.5t_{corr}$, the calculated stresses are to be corrected using the modelling reduction factor, f_{model}, given in *Appendix C/2.4.2.7*.

4.2.1.4 Where a separate local finite element model is used, the extent of the local model is to be such that the calculated stresses are not significantly affected by the imposed boundary conditions and application of loads. The boundary of the fine mesh model is to coincide with the primary support members, such as girders, stringers and floors, in the cargo tank model. The extent of the local finite element model of a hopper knuckle is described in *4.2.2*.

4.2.1.5 The evaluation of hot spot stress is to be based on shell element of mesh size t_{net50} x t_{net50}, where t_{net50} is the net thickness of the plate where a potential fatigue crack is most likely to initiate. This mesh size is to be maintained within the very fine mesh zone, extending over at least 10 elements in all directions leading to the fatigue hot spot position. A uniform quadratic mesh is to be used within the very fine mesh zone. A smooth transition of mesh density leading up to the very fine mesh zone is to be maintained.

4.2.1.6 Four-node shell elements with bending and membrane properties are to be used inside the very fine mesh zone. The shell elements are to represent the mid plane of the plating and the bending properties of the plate. The geometry of the weld and structural misalignment is not required to be modelled.

4.2.1.7 Where stresses are to be evaluated on a free edge or corner welds, such as cut-outs for stiffener connections at web frames, butt welds on edge of plating and around hatch corners, a rod element of negligible cross-section area, e.g. 1mm^2, is to be used to obtain the required stress value.

4.2.1.8 All structure in close proximity to the very fine mesh zones is to be modelled explicitly with shell elements. Triangular elements are to be avoided where possible. Use of extreme aspect ratio (e.g. aspect ratio greater than 3) and distorted elements (e.g. element's corner angle less than 60° or greater than 120°) are to be avoided.

4.2.2 Hopper knuckle connection

4.2.2.1 In addition to the general requirements in *4.2.1*, the modelling requirements in this sub-section are applicable to the modelling of welded hopper knuckle connections.

4.2.2.2 Fatigue assessment is to be carried out for the knuckle joint between inner bottom and hopper plate for at least one transverse frame in the midship cargo tank region, see *Section 9/3.3.3*. The fatigue assessment is only required to be carried out on the structural detail at one side of the hull.

4.2.2.3 In general, the hopper knuckle connection at the mid position between transverse bulkheads is to be assessed. Where a wash bulkhead exists, the hopper knuckle connection at the mid position between the wash bulkhead and cargo tank end bulkhead is generally to be assessed. The results from the cargo tank FE analysis described in *2.2* should be examined for the highest transverse in-plane stress on the inner bottom plate adjacent to the lower hopper knuckle line to identify the exact frame position and the side of the hull where the fatigue assessment should be carried out.

4.2.2.4 Where a separate local finite element model is used, the minimum extent of the local model is as follows:

(a) longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the transverse web frame of interest). Transverse web frames at the end of the local model need not to be represented in the sub-model

(b) vertically, the model is to extend from the base line to the lower stringer in the double side water ballast tank. Where a fatigue assessment is also carried out for the upper knuckle connection, the model is to be extended to 4 longitudinal spaces above the lower stringer in the double side ballast tank

(c) transversely, the model is to extend from the ship side to 4 longitudinal spaces inboard of the double bottom side girder.

4.2.2.5 Mesh size in way of the knuckle connection is to be t_{net50} x t_{net50}, where t_{net50} is the net thickness of the inner bottom plate in way of the connection obtained by deducting $0.5t_{corr}$ from the gross thickness as specified in *4.2.1.2*. The minimum extent of the t_{net50} x t_{net50} mesh is to be (see also *Figure B.4.1*):

(a) inner bottom plate – 10 elements from knuckle in transverse direction, 10 elements forward and aft of the floor in the longitudinal direction

(b) scarfing bracket/inner bottom overhang – 10 elements from knuckle in transverse direction, 10 elements forward and aft of the floor in the longitudinal direction

(c) hopper sloping plate – 10 elements from knuckle in transverse direction, 10 elements forward and aft of the hopper web in the longitudinal direction

(d) girder – 10 elements from knuckle in vertical direction, 10 elements forward and aft of the floor/hopper web in the longitudinal direction

(e) floor/hopper web – 10 elements from the hopper knuckle in transverse and vertical directions respectively.

4.2.2.6 Any scarfing brackets on the web frame adjoining the inner bottom plating, the first longitudinal stiffeners away from the knuckle as well as any carlings and brackets offset from the main frames are to be modelled explicitly using shell elements. Longitudinal stiffeners further away from the knuckle may be modelled by beam elements. The inner bottom plate "overhang" outboard of the girder is to be modelled using shell elements up to the extent of the scarfing bracket. Away from the scarfing bracket, the inner bottom plate "overhang" may be modelled using line elements of equivalent area. Any perforations, such as cut-outs for cabling, pipes and access that are within one stiffener space from the knuckle point are to be modelled explicitly.

4.2.2.7 *Figure B.4.1* shows extent of the t_{net50} x t_{net50} mesh zone and extension of the areas of local thickness reduction.

4.2.2.8 *Figures B.4.2* to *B.4.4* show typical local finite element models of the hopper knuckle connection and close-up views of the t_{net50} x t_{net50} mesh zone.

4.3 Loading Conditions

4.3.1 General

4.3.1.1 The ship loading conditions to be used to evaluate dynamic stress ranges for fatigue assessment are to be in accordance with *Appendix C/1.3.2*.

4.3.1.2 The cargo density to be used for the fatigue assessment is to be:

(a) longitudinal end connections - the greater of the cargo density specified for the homogeneous scantling draught condition and 0.9t/m^3

(b) connection between inner bottom and hopper plate – 0.9t/m^3.

RCN 2 to July 2008 version (effective from 1 July 2010)

4.3.2 Finite element load cases for hopper knuckle connection

4.3.2.1 The requirements given in this sub-section are specifically applicable to the evaluation of hot spot stress range at hopper knuckle connection.

4.3.2.2 Only dynamic loads are considered for the evaluation of fatigue stress range. Static loads need not be included in the finite element analysis.

4.3.2.3 The load cases required to derive the component stress ranges for determining the combined stress ranges, see *Appendix C/2.4.2.7*, are given in *Table B.4.1*.

4.3.2.4 Stresses induced by vertical and horizontal hull girder bending moments are not to be included in the stress range for fatigue assessment. Stress caused by the bending effect of the hull girder is to be calculated and deduced from the fatigue stress range result in accordance with the procedure described in *4.5.2*.

Table B.4.1
Load Cases for the Evaluation of Component Stress Range for Hopper Knuckle Joint

Load case	Component Stress	Applied Load	Parameters for calculation of loads
Full load condition			
L1	s_{e1}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is analysed.	Ship draught = midship draught from departure homogeneous full load condition in the ship loading manual, see *Appendix C/1.3.2.* GM: see *Section 7/3.1.3.4* $r_{roll\text{-}gyr}$: see *Section 7/3.1.3.4* Cargo density = 0.9t/m^3 (minimum, see *4.3.1.2*)
L2	s_{e2}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is not analysed.	
L3	s_{ix}	Dynamic tank pressure (full range) due to longitudinal acceleration.	
L4	s_{iy}	Dynamic tank pressure (full range) due to transverse accelerations.	
L5	s_{iz}	Dynamic tank pressure (full range) due to vertical acceleration.	
Ballast condition			
L6	s_{e1}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is analysed.	Ship draught = midship draught from departure normal ballast condition in the ship loading manual. If normal ballast condition is not defined, then the midship draught from light ballast condition is to be used, see *Appendix C/1.3.2*
L7	s_{e2}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is not analysed.	
Load cases for bending moment correction			
C1	s_{VBM}	Unit vertical bending moment applies to ends of cargo tank model	No other loads are to be applied
C2	s_{HBM}	Unit horizontal bending moment applies to ends of cargo tank model	

Table B.4.1 (Continued)
Load Cases for the Evaluation of Component Stress Range for Hopper Knuckle Joint

Where:

s_{e1}, s_{e2}, s_{ix}, s_{iy}, s_{iz}	component stresses (with proper sign convention used) before correction for bending moment effect (5)
s_{VBM}	stress response due to the application of unit vertical bending moment at ends of cargo tank model
s_{HBM}	stress response due to the application of unit horizontal bending moment at ends of cargo tank models

Notes

1. For dynamic wave pressure load cases, the pressure distribution is to be calculated at mid-ship and this distribution is to be applied along the full length of the cargo tank FE model.
2. For dynamic tank pressure load cases, vertical, transverse and longitudinal accelerations are calculated at the centre of gravity position of the midship cargo tanks. The accelerations calculated for each tank are to be applied to all corresponding cargo tanks along the length of the FE model.
3. Longitudinal, transverse and vertical accelerations at tank centre of gravity position are to be calculated in accordance with *Section 7/3.3.* The dynamic tank pressure amplitudes due to accelerations are to be calculated in accordance with *Section 7/3.5.4.7*. The dynamic tank pressure (full range) is to be obtained as two times the dynamic tank pressure amplitude and distributed in accordance with *Figure 7.3.9*. Note that these pressure distributions are different from those used for strength analysis.
4. The dynamic wave pressure amplitude is to be calculated according to *Section 7/3.5.2.3*. The dynamic wave pressure (full range) is to be obtained as two times the dynamic wave pressure amplitude. Note that the dynamic wave pressure and distribution is different from that used for strength analysis.
5. Component stresses (with proper sign convention used) calculated from load cases L1 to L7 are to be corrected to deduct the component due to vertical and horizontal bending moment effect, see *4.5.2.2.*

4.4 Boundary Conditions

4.4.1 Cargo tank model

4.4.1.1 The boundary conditions to be applied to the ends of the cargo tank model are to be in accordance with *2.6*. The application of unit vertical and horizontal bending moment at the model ends is to be in accordance with *2.5.4.5* or *2.5.4.6*.

4.4.2 Local finite element models

4.4.2.1 Where a separate local finite element model is used for evaluating the hot spot stress range, the nodal displacements or equivalent nodal forces from the cargo tank model are to be applied to the corresponding boundary nodes on the local model.

4.4.2.2 Where there are nodes on the local model boundaries which are not coincident with the nodal points on the cargo tank model, it is acceptable to impose prescribed displacements on these nodes using multi-point constraints. The use of linear multi-point constraint equations connecting two neighbouring coincident nodes is considered sufficient.

4.4.2.3 All local loads in way of the structure represented by the separate local finite element model are to be applied to the model.

4.5 Result Evaluation

4.5.1 General

4.5.1.1 The fatigue damage calculation is to be based on the hot spot stress range evaluated close to the potential crack location in a direction perpendicular to the potential direction of the crack.

4.5.1.2 For welded structural details, the hot spot stress range is to be obtained as surface stress acting in a direction perpendicular to the weld at a distance of $0.5t_{net50}$ from the weld toe location, where t_{net50} is the net thickness of the plate where the fatigue crack is likely to initiate, see *Appendix C/2.4.2.6*.

4.5.1.3 For fatigue assessment of the free edge, a rod element is used to obtain stress at free edge. The stress range is to be based on the axial stress in the rod element.

4.5.1.4 For fatigue damage calculation of hopper knuckle connection, see *4.5.2*.

4.5.2 Hopper knuckle connection

4.5.2.1 Hot spot stress ranges for fatigue assessment of welded hopper knuckle joints are to be based on element direct stress along a direction perpendicular to intersection of the inner bottom plate and hopper plate. The stress ranges are to be evaluated on the upper surface of the hopper and inner bottom plate at a distance of $0.5t_{net50} + x_{wt}$ from the intersection line, where t_{net50} is the net thickness of the inner bottom plate and x_{wt} is weld toe distance, see *Figure C.2.1.* The stress at the required location can be obtained by linear interpolation based on the surface stresses evaluated at the centroid of the 1st and 2nd elements from the intersection of the hopper slope plate, and the inner bottom plate.

4.5.2.2 The component stress ranges are to be obtained by eliminating the stress induced by hull girder vertical and horizontal bending moments from the component stress determined from load cases L1 to L7 in *Table B.4.1* as follows:

$$S_{c\_i} = \left| s_{c\_i} - M_{V\_i}\, s_{VBM} - M_{H\_i}\, s_{HBM} \right|$$

Where:

S_{c_i} S_{e1}, S_{e2}, S_{ix}, S_{iy} or S_{iz}, component stress range after correction for bending moment effects

s_{c_i} s_{e1}, s_{e2}, s_{ix}, s_{iy} or s_{iz}, component stress (with proper sign convention used) including vertical and horizontal bending moment effects obtained from load cases L1 to L7, see *Table B.4.1*

M_{V_i} is the vertical hull girder bending moment due to loads applied to the cargo tank FE model obtained from load case L1, L2, L3, L4, L5, L6 or L7. The bending moment is to be calculated at the longitudinal position where the centroid of shell element under evaluation is located

M_{H_i} is the horizontal hull girder bending moment due to loads applied to the cargo tank FE model obtained from load case L1, L2, L3, L4, L5, L6 or L7. The bending moment is to be calculated at the longitudinal position where the centroid of shell element under evaluation is located

s_{VBM} stress due to unit vertical bending moment obtained from load

case C1, see *Table B.4.1*

s_{HBM} stress due to unit horizontal bending moment obtained from load case C2, see *Table B.4.1*

4.5.2.3 The hull girder vertical and horizontal bending moments in *4.5.2.2* may be evaluated at the frame position where the hopper knuckle is under evaluation if the longitudinal distance from the element centroid to the frame position is less than 500mm.

4.5.2.4 The component stress range, S_i, due to dynamic tank pressure resulting from longitudinal, transverse and vertical accelerations for the full load condition is given by:

$$S_i = 0.4|S_{ix}| + 0.9|S_{iy}| + 0.9|S_{iz}|$$

4.5.2.5 The combined hot spot stress ranges required for fatigue damage calculation are to be calculated in accordance with *Appendix C/2.4.2.7*.

4.5.2.6 Fatigue damage and fatigue life calculation is to be in accordance with *Appendix C/1.4.1*.

APPENDIX C

FATIGUE STRENGTH ASSESSMENT

1 NOMINAL STRESS APPROACH

1.1 General

1.1.1 Applicability

1.1.1.1 This sub-section defines the procedure for a simplified fatigue assessment which is to be used to evaluate the fatigue strength of the ships structural details. The fatigue assessment uses a nominal stress approach based on beam theory.

1.1.1.2 The fatigue assessment is to be applied to welded connections where the steel has a minimum yield strength of less than 400N/mm^2.

1.1.2 Assumptions

1.1.2.1 The following assumptions are made in the fatigue assessment:

(a) a linear cumulative damage model, i.e. Palmgren-Miner's Rule, has been used in connection with the S-N data in *1.4.5*

(b) for longitudinal stiffener end connections, nominal stresses obtained by empirical formulae, see *1.4.2* to *1.4.4*, and Rule based loads, see *1.3*, form the basis of the nominal stress based fatigue assessment

(c) the long term stress ranges of a structural detail can be characterized using a modified Weibull probability distribution parameter, ξ, as described in *1.4.1.5* and *1.4.1.6*

(d) structural details are idealised and classified in *1.5*.

1.1.2.2 The structural detail classification in *1.5* is based on typical joint geometry under simple loadings. When a structural detail is considered different from those shown in *1.5*, a suitable finite element (FE) analysis should be used to demonstrate the adequacy of the detail in terms of fatigue strength. See *2.1.1.3*.

1.1.2.3 Where the loading or geometry considered is too complex for a simple classification, a finite element (FE) analysis of the detail is to be carried out to determine the fatigue stress of that detail. *Sub-section 2* defines the procedure for a finite element based assessment to determine hot spot stresses that is to be used for weld toe locations that are typically found at welded hopper knuckle connections in way of transverse primary support members. For bent type knuckle connections, recommendation is given in *2.1.1.2*.

1.2 Corrosion Model

1.2.1 Net thickness

1.2.1.1 The net thickness and corrosion additions, as indicated in *Section 6/3* are to be incorporated into the representation of the structural capacity models.

1.3 Loads

1.3.1 General

1.3.1.1 Ship structures are subjected to various types of loads, which include:

(a) static loads including cargo and lightship weights

(b) wave induced loads

(c) impact loads, such as bottom slamming, bow flare impacts and sloshing in partially filled tanks

(d) cyclic loads resulting from main engine or propeller induced vibratory forces

(e) transient loads such as thermal loads

(f) residual stresses.

1.3.1.2 The fatigue strength analysis considers the following wave induced loads for calculation of the long term distribution of stresses:

(a) hull girder loads (i.e. vertical and horizontal wave bending moments)

(b) dynamic wave pressures

(c) dynamic tank pressure loads resulting from ship motions.

1.3.2 Selection of loading conditions

1.3.2.1 Fatigue analyses are to be carried out for representative loading conditions according to the intended ship's operation. The following two loading conditions are to be examined:

(a) full load condition at design draught at departure, T_{full}, see *Section 4/1.1.5.4*

(b) ballast condition at normal ballast draught at departure, T_{bal-n}, see *Section 4/1.1.5.3*. If a normal ballast condition is not defined in the loading manual, minimum ballast draught, T_{bal}, see *Section 4/1.1.5.2*, should be used.

1.3.2.2 The relevant draught at midships is to be used for the determination of fatigue loads.

1.3.3 Determination of loads

1.3.3.1 Loads applied to the structure are to be calculated in order to determine the stress ranges for the relevant loading conditions.

1.3.3.2 Combined stresses resulting from the action of global and local loads are to be calculated in accordance with *1.4.4,* with consideration given to the probability level of 10^{-4}.

1.3.4 Vertical wave bending moment

1.3.4.1 The vertical wave bending moment is to be calculated based on *Section 7/3.4.1*. The pseudo amplitude (half range) values of the vertical wave bending moment, $M_{wv-v-amp}$, for full load and ballast condition are to be taken as:

$$M_{wv-v-amp} = 0.5(M_{wv-hog} - M_{wv-sag}) \quad \text{kNm}$$

Where:

M_{wv-hog} hogging vertical wave bending moment, in kNm

M_{wv-sag} sagging vertical wave bending moment, in kNm

1.3.5 Horizontal wave bending moment

1.3.5.1 The horizontal wave bending moment is to be calculated based on *Section 7/3.4.2*. The pseudo amplitude (half range) values of the horizontal wave bending moment, $M_{wv-h-amp}$, for full load and ballast condition are to be taken as:

$$M_{wv-h-amp} = 0.5(M_{wv-h-pos} - M_{wv-h-neg}) \quad \text{kNm}$$

Where:

$M_{wv-h-pos}$ positive horizontal wave bending moment, in kNm
$= M_{wv-h}$

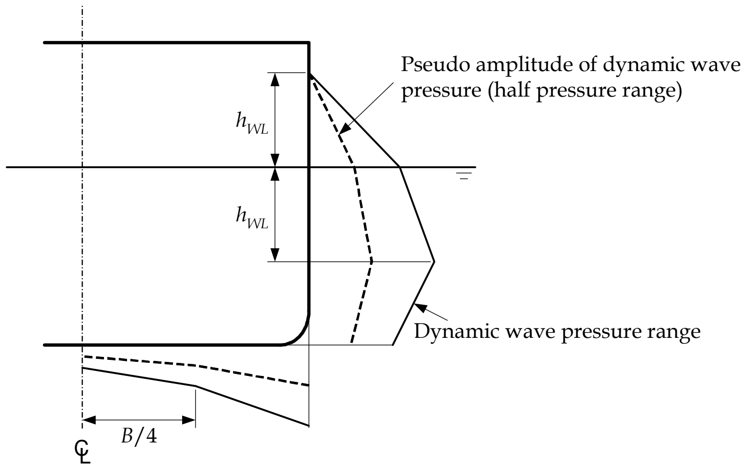
$M_{wv\text{-}h\text{-}neg}$ negative horizontal wave bending moment, in kNm
$= -M_{wv\text{-}h}$

1.3.6 Dynamic wave pressure

1.3.6.1 The dynamic wave pressure is to be calculated according to *Section 7/3.5.2*.

1.3.6.2 Considering the stretching of the external pressure due to intermittent wet and dry area, a pseudo amplitude of external pressure (half pressure range), $P_{ex\text{-}amp}$, is defined in *Section 7/3.5.2.3* in detail and illustrated in *Figure C.1.1*.

Figure C.1.1
Dynamic Pressure



1.3.7 Dynamic tank pressure

1.3.7.1 The dynamic tank pressure amplitude, $P_{in\text{-}amp}$, is to be calculated according to *Section 7/3.5.4.5* and *Section 7/3.5.4.6*. No dynamic internal pressure is considered for the deck.

1.4 Fatigue Damage Calculation

1.4.1 Fatigue strength determination

1.4.1.1 The fatigue assessment of the structure is based on the application of the Palmgren-Miner cumulative damage rule given below. When the cumulative fatigue damage ratio, *DM*, is greater than 1, the fatigue capability of the structure is not acceptable. *DM* is to be taken as:

$$DM = \sum_{i=1}^{i=n_{tot}} \frac{n_i}{N_i}$$

Where:

n_i number of cycles of stress range S_i

N_i number of cycles to failure at stress range S_i

n_{tot} total number of stress range blocks

1.4.1.2 Assessment of the fatigue strength of welded structural members includes the following three phases:

(a) calculation of stress ranges

(b) selection of the design S-N curve

(c) calculation of the cumulative damage.

1.4.1.3 The cumulative fatigue damage ratio, *DM*, is to be less than 1 for the design life of the ship. The design life is not to be less than 25 years. Unless otherwise specified the resultant cumulative damage is to be taken as:

$$DM = \sum_{i=1}^{2} DM_i$$

Where:

DM_i cumulative fatigue damage ratio for the applicable loading condition

i = 1 for full load condition

= 2 for normal ballast condition

1.4.1.4 Assuming the long term distribution of stress ranges fit a two-parameter Weibull probability distribution, the cumulative fatigue damage DM_i for each relevant condition is to be taken as:

$$DM_i = \frac{\alpha_i N_L}{K_2} \frac{S_{Ri}^m}{(lnN_R)^{m/\xi}} \mu_i \Gamma(1 + \frac{m}{\xi})$$

Where:

N_L Number of cycles for the expected design life. Unless stated otherwise, N_L to be taken as:

$$= \frac{f_0 U}{4logL}$$

The value is generally between 0.6×10^8 and 0.8×10^8 cycles for a design life of 25 years

f_o 0.85, factor taking into account non-sailing time for operations such as loading and unloading, repairs, etc.

U Design life, in seconds

= $0.788 \times 10_9$ for a design life of 25 years

L rule length, in m, as defined in *Section 4/1.1.1.1*

m S-N curve parameter as defined in *1.4.5.5*

K_2 S-N curve parameter as defined in *1.4.5.5*

α_i proportion of the ship's life:

α_1 = 0.5 for full load condition

α_2 = 0.5 for ballast condition

S_{Ri} stress range at the representative probability level of 10^{-4}, in N/mm^2

N_R 10 000, number of cycles corresponding to the probability level of 10^{-4}

ξ Weibull probability distribution parameter, as defined in *1.4.1.6*

Γ	Gamma function
μ_i	coefficient taking into account the change in slope of the S-N curve

$$\mu_i = 1 - \frac{\left\{ \gamma\left(1+\frac{m}{\xi}, \nu_i\right) - \nu_i^{-\Delta m/\xi} \gamma\left(1+\frac{m+\Delta m}{\xi}, \nu_i\right) \right\}}{\Gamma(1+\frac{m}{\xi})}$$

v_i	$\left(\frac{S_q}{S_{Ri}}\right)^{\xi} lnN_R$
S_q	stress range at the intersection of the two segments of the S-N curve, see *Table C.1.6*, in N/mm²
Δm	slope change of the upper-lower segment of the S-N curve =2
$\gamma(a,x)$	incomplete Gamma function, Legendre form

1.4.1.5 The probability density function of the long term distribution of stress ranges (hull girder + local bending) is to be represented by a two-parameter Weibull distribution. This assumption enables the use of a closed form equation for calculation of the fatigue life when the two parameters of the Weibull distribution are determined. The probability density function, *f(S)*, is to be taken as:

$$f(S) = \frac{\xi}{f_1}\left(\frac{S}{f_1}\right)^{\xi-1} exp\left(-\left(\frac{S}{f_1}\right)^{\xi}\right)$$

Where:

S	stress range, in N/mm²
ξ	Weibull probability distribution parameter, as defined in *1.4.1.6*
f_1	scale parameter $= \frac{S_R}{(lnN_R)^{1/\xi}}$
N_R	number of cycles corresponding to the probability of exceedance of 1/ N_R
S_R	stress range with probability of exceedance of 1/N_R, in N/mm²

1.4.1.6 For each structural detail considered, the Weibull shape parameter is to be selected with due consideration given to the load categories contributing to the cyclic stresses. The Weibull probability distribution parameter, ξ, is to be taken as:

$$\xi = f_{Weibull}\,(1.1 - 0.35\,\frac{L-100}{300})$$

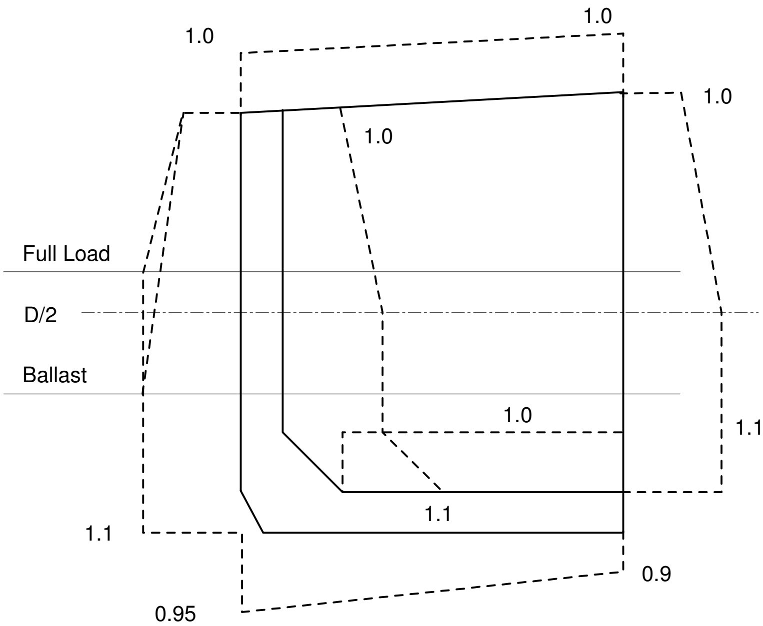
Where:

L	rule length, in m, as defined in *Section 4/1.1.1.1*
D	moulded depth, in m, as defined in *Section 4/1.1.4.1*
$f_{Weibull}$	area dependent modification factor, as given in *Table C.1.1* and *Figure C.1.2*

Table C.1.1
Distribution of $f_{Weibull}$ factors

Plating Area	$f_{Weibull}$ (see note)
Bottom	0.9 at centreline and 0.95 at side
Side and bilge	1.1 at up to draught T_{LC} and 1.0 at deck
Deck	1.0
Inner bottom	1.0
Inner Hull Longitudinal Bulkhead	1.1 up to D/2 and 1.0 at deck
Inner Longitudinal Bulkhead	1.1 up to D/2 and 1.0 at deck
Centreline Longitudinal Bulkhead	1.1 up to D/2 and 1.0 at deck
Note: Intermediate values to be linearly interpolated	

Figure C.1.2
Distribution of $f_{Weibull}$ factors



1.4.1.7 The cumulative fatigue damage ratio, DM, may be converted to a calculated fatigue life using the relationship given below. In this format, the calculated fatigue life is to be equal or greater than the design life of the ship.

$$Fatigue\ life = \frac{Design\ life}{DM} \quad \text{years}$$

1.4.2 Stresses to be used

1.4.2.1 The nominal stresses are to be determined taking into account the overall geometric changes of the detail. The effect of stress concentrations due to structural discontinuities, presence of attachments and the weld profile is not considered.

1.4.3 Nominal stress calculation

1.4.3.1 This Sub-Section outlines a simplified approach to determine the combination of global and local stress components of the stress response of the ship.

1.4.3.2 Stress responses are to be calculated with varying levels of detail. The following approach has been adopted in this simplified procedure:

(a) the hull girder is treated as a simple beam as a way of obtaining reasonable approximations to the nominal stress level in longitudinal hull girder elements. This is used for the evaluation of hull girder stress levels in way of critical details

(b) the structural member with effective attached plating is used in determining the nominal stress response of longitudinal and transverse frames due to dynamic wave pressure and dynamic tank pressure loads. The member end restraints and moments are considered.

1.4.4 Definition of stress components

1.4.4.1 Dynamic stress variations are referred to as either *stress range*, *S*, or *stress amplitude*, σ.

1.4.4.2 The global dynamic stress components (primary stresses) considered in fatigue analysis are vertical wave hull girder bending stress, σ_v, and horizontal wave hull girder bending stress, σ_h.

1.4.4.3 The local dynamic stress amplitudes considered are defined as the total local stress amplitude due to dynamic wave pressure loads or dynamic tank pressure loads, σ_{e-i}.

1.4.4.4 The local stress components are defined as secondary stress resulting from bending of girder systems, σ_2, stress amplitude produced by bending of stiffeners between girder supports, σ_{2A}, and tertiary stress amplitude produced by bending of un-stiffened plate elements between longitudinals and transverse frames, σ_3. See figure *C.1.3*.

1.4.4.5 The total local stress due to dynamic wave or dynamic tank pressure loads, σ_{e-i}, is to be taken as:

$$\sigma_{e-i} = \sigma_2 + \sigma_{2A} + \sigma_3 \quad \text{N/mm}^2$$

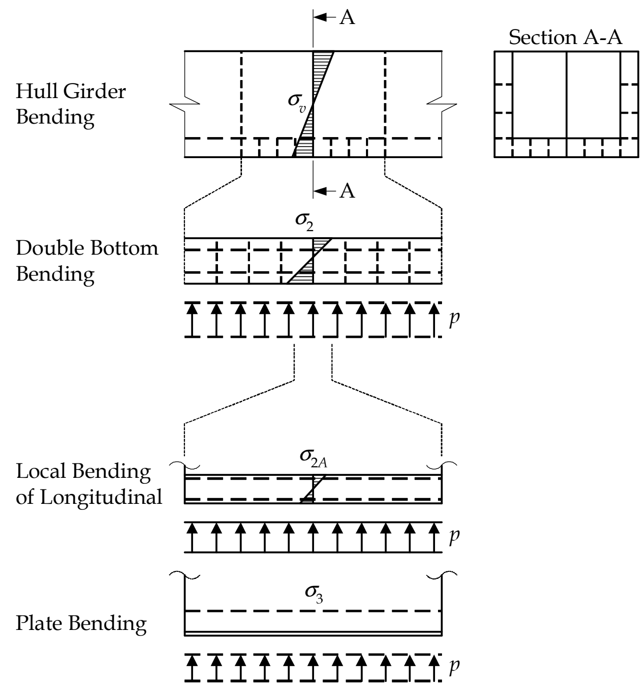
Where:

σ_2 local stress component, in N/mm², as defined in *1.4.4.4*

σ_{2A} local stress component, in N/mm², as defined in *1.4.4.4*

σ_3 local stress component, in N/mm², as defined in *1.4.4.4*

Figure C.1.3
Definition of Local Stress Components



1.4.4.6 For the calculation of stress components, the vertical wave hull girder stress, σ_v, is given by:

$$\sigma_v = \frac{M_{wv-v-amp}}{Z_{v-net75}} 10^{-3} \quad \text{N/mm}^2$$

Where:

$M_{wv-v-amp}$ pseudo amplitude (half range), in kNm, as defined in *1.3.4*

$Z_{v-net75}$ $= \dfrac{I_{v-net75}}{\left|z - z_{NA-net75}\right|}$ m^3 see *Section 4/2.6.1*

$I_{v-net75}$ net vertical hull girder moment of inertia, of hull cross-section about transverse neutral axis, in m^4

$I_{v-net75}$ is to be calculated based on gross thickness, minus the corrosion addition $0.25t_{corr}$ of all effective structural elements, see *Section 4/2.6.1*

z distance from baseline to the critical location of the considered member, i.e. top of flange of longitudinal stiffener, in m

$z_{NA-net75}$ distance from baseline to horizontal neutral axis consistent with $I_{v-net75}$, in m

RCN 2 to July 2008 version (effective from 1 July 2010)

1.4.4.7 The corresponding stress range due to vertical wave bending moment, S_v, is to be taken as:

$$S_v = 2\sigma_v \quad \text{N/mm}^2$$

Where:

σ_v vertical wave hull girder stress, in N/mm², as defined in *1.4.4.6*

1.4.4.8 The horizontal wave hull girder stress, σ_h, is to be taken as:

$$\sigma_h = \frac{M_{wv-h-amp}}{Z_{h-net75}} 10^{-3} \quad \text{N/mm}^2$$

Where:

$M_{wv-h-amp}$ in kNm, as defined in *1.3.5*

$Z_{h-net75}$ $\dfrac{I_{h-net75}}{|y|}$ m³ see *Section 4/2.6.2*

y distance from vertical neutral axis of hull cross section to the critical location of the considered member, in m. i.e. top of face plate of longitudinal stiffener

$I_{h-net75}$ net horizontal hull girder moment of inertia, of the hull cross-section about the vertical neutral axis, in m⁴.
$I_{h-net75}$ is to be calculated based on gross thickness, minus the corrosion addition $0.25t_{corr}$ for all effective structural elements, see *Section 4/2.6.2*

RCN 2 to July 2008 version (effective from 1 July 2010)

1.4.4.9 The corresponding stress range due to horizontal wave bending moment, S_h, is to be taken as:

$$S_h = 2\sigma_h \quad \text{N/mm}^2$$

Where:

σ_h horizontal wave hull girder stress, in N/mm², as defined in *1.4.4.8*

1.4.4.10 The effect of secondary stress σ_2, as defined in *1.4.4.4*, is in general small for double hull tankers and is therefore not taken into consideration.

1.4.4.11 The stress amplitude produced by bending of stiffeners between girder supports (e.g. frames, bulkheads), σ_{2A}, is to be taken as:

$$\sigma_{2A} = K_n K_d \frac{M}{Z_{net50}} 10^3 \quad \text{N/mm}^2$$

Where:

K_n stress factor for unsymmetrical profiles, as defined in *1.4.4.15*

K_d stress factor for bending stress in longitudinal stiffeners caused by relative deformation between supports, may be determined by FE analysis of the cargo hold model where the actual relative deformation is taken into account or taken as follows:

1.0 at frame connections

1.15 for all longitudinals at transverse bulkhead connections including wash bulkheads except:

(a) in full load condition:

1.3 for side and bilge longitudinals at mid position between lowest side stringer and deck at side

1.15 for side and bilge longitudinals at lowest side stringer and deck at side

to be linearly interpolated between these two positions

1.5 for bottom longitudinals at mid position between longitudinal bulkhead, bottom girders or buttress structure
1.15 for bottom longitudinals at longitudinal bulkhead, bottom girders or buttress structure
to be linearly interpolated between these two positions

See *Figure C.1.4*

(b) in ballast condition:
1.5 for bottom longitudinals in the mid position between longitudinal bulkhead, bottom girders or buttress structure
1.15 for bottom longitudinals at longitudinal bulkhead, bottom girders or buttress structure
to be linearly interpolated between these two positions

M moment at stiffener support adjusted to weld toe location at the stiffener (e.g. at bracket toe), in kNm:

$$= \frac{P s\, l_{bdg}^2 10^{-3}}{12} r_p$$

s stiffener spacing, in mm

l_{bdg} effective bending span, of longitudinal stiffener, as shown in *Figure C.1.5*, in m. See also *Figure 4.2.1* and *4.2.2* in *Section 4* for soft toe brackets. Top stiffeners with a soft toe are to be treated the same as flat bars with a soft toe bracket. The span point is to be taken at the point where the depth of the end bracket, measured from the face of the member, is equal to half the depth of the member

Z_{-net50} section modulus of longitudinal stiffener with associated effective plate flange b_{eff}, in cm^3, calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$.

b_{eff} as defined in *Section 4/2.3.3*

r_p moment interpolation factor, for interpolation to weld toe location along the stiffener length:

$$= \left| 6\left(\frac{x}{l_{bdg}}\right)^2 - 6\left(\frac{x}{l_{bdg}}\right) + 1.0 \right| \quad \text{where} \quad 0 \le x \le l_{bdg}$$

where x is the distance to the hot spot, in m. See *Figure C.1.5*.

P lateral dynamic pressure amplitude at the mid-span between the frame considered and the neighbouring frame, in kN/m^2.
P_{in-amp} for dynamic tank pressure, is to be taken as defined in *1.3.7*

P_{ex-amp} for dynamic wave pressure, is to be taken as defined in *1.3.6*

Figure C.1.4
Variation of Bulkhead Factor K_d in Full Load Condition for a Vessel with Two Longitudinal Bulkheads

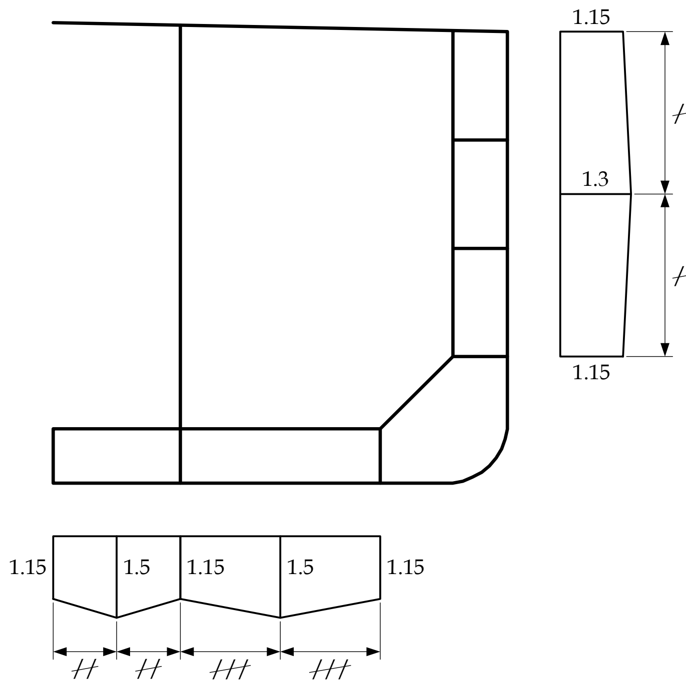


Figure C.1.5
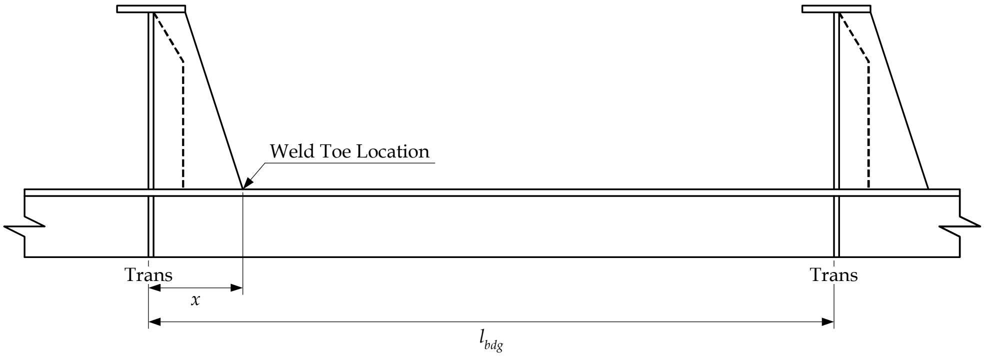
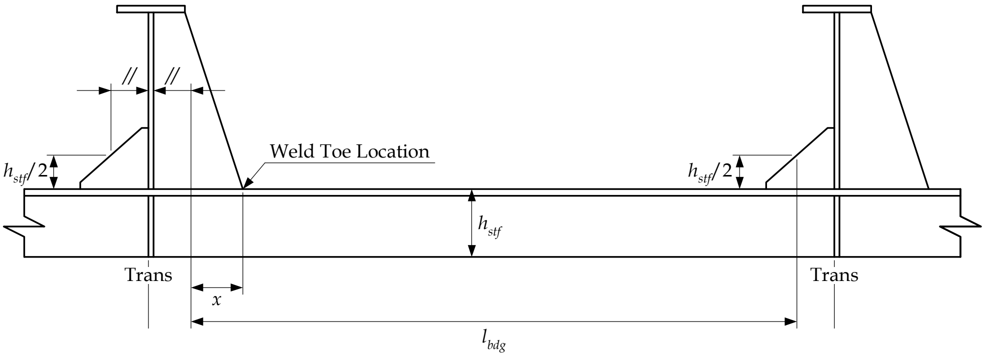
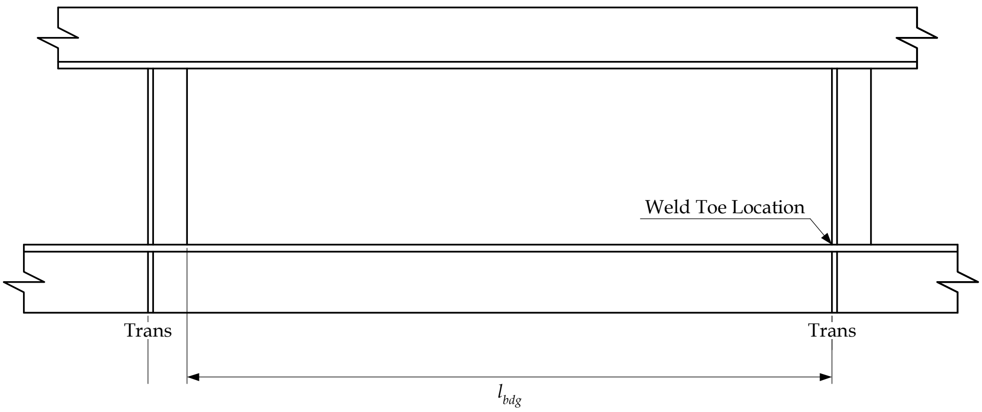
Definition of Effective Span Lengths



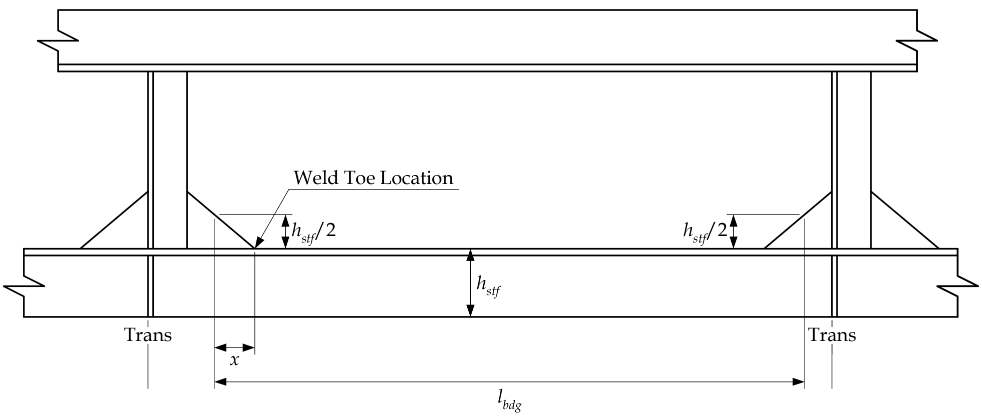
Supported by free flange transverses (1)



Supported by free flange transverses (2)



Supported by double skin / transverse bulkheads (1)



Supported by double skin / transverse bulkheads (2)

1.4.4.12 The stress range due to external wave or internal tank pressure, S_e or S_i, is to be determined as:

$S_e = 2\sigma_{2Ae}$ N/mm²

$S_i = 2\sigma_{2Ai}$ N/mm²

Where:

σ_{2Ae} stress amplitude, in N/mm², as defined in *1.4.4.11* when $P_{ex\text{-}amp}$ is used

σ_{2Ai} stress amplitude, in N/mm², as defined in *1.4.4.11* when $P_{in\text{-}amp}$ is used

1.4.4.13 Longitudinal local tertiary plate bending stress amplitude in the weld at the plate, transverse frame or bulkhead intersection, σ_3, is not relevant to the critical locations being considered and is to be neglected.

1.4.4.14 The effective breadth of plate flanges of stiffeners (longitudinals) in bending (due to the shear lag effect), exposed to uniform lateral load for bending at ends, is defined in *Section 4/2.3.3*.

1.4.4.15 The stress concentration factors at the flange of un-symmetrical stiffeners on laterally loaded panels, K_{n1} and K_{n2}, as shown in *Figure C.1.6*, are to be taken as:

$K_{n1} = \dfrac{1+\lambda\beta}{1+\lambda\beta^2\psi_z}$ at the flange edge

$K_{n2} = \dfrac{1+\lambda\beta^2}{1+\lambda\beta^2\psi_z}$ at the web

K_{n2} is typically used in the fatigue analysis of longitudinal end connections

Where:

β $1-\dfrac{2b_g}{b_f}$ for built-up profiles

$1-\dfrac{t_{w-net50}}{b_f}$ for rolled angle profiles

b_g breadth of flange from web centreline, in mm, see *Figure C.1.7*

$t_{w-net50}$ net web thickness, in mm

d_w depth of stiffener web, see *Figure C.1.7*, in mm

λ factor, as defined in *1.4.4.17*

ψ_z ratio between section modulus of the stiffener web with plate flange, as calculated at the flange and the section modulus of the complete panel stiffener

$\dfrac{d_w^2\, t_{w-net50}}{4Z_{net50}10^3}$ may be used as an approximate value

Z_{net50} section modulus of stiffener including the full width of the attached plate, s, with respect to a neutral axis normal to the stiffener web, in cm³. It is to be calculated based on the gross thickness minus the corrosion addition $0.5t_{corr}$

Figure C.1.6
Bending Stress in Symmetrical and Un-symmetrical Panel Stiffener with Same Web and Flange Areas

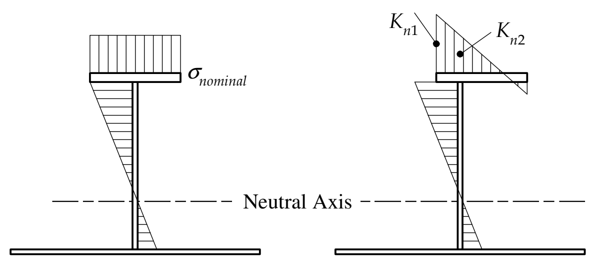


Figure C.1.7
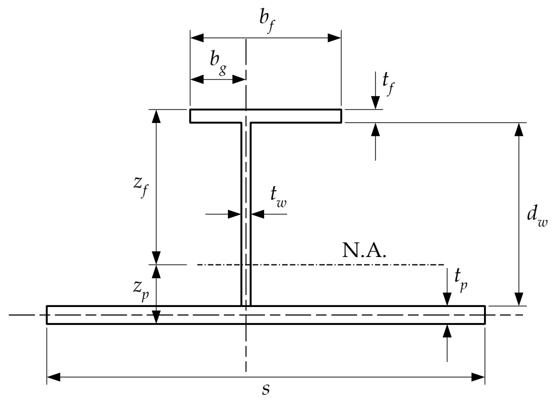
Stiffener Geometry



1.4.4.16 The formulations are not directly applicable for bulb profiles. For these, the equivalent built-up profile is to be considered, see *Figure C.1.8*. The assumed built-up flange is to have the same properties as the bulb flange for cross-sectional area and moment of inertia about the vertical axis and neutral axis position. For HP bulb profiles, the equivalent built up profile dimensions are to be determined. Several examples are tabulated in *Table C.1.2*.

1.4.4.17 For continuous stiffeners (fixed ends) the λ-factor at supports is to be taken as:

$$\lambda = \frac{3(1+\frac{\eta}{280})}{1+\frac{\eta}{40}}$$

Where:

η $$= \frac{l_{bdg}^4\, 10^{12}}{b_f^3\, t_{f-net50}\, h_{stf}^2 \left(\frac{4h_{stf}}{t_{w-net50}^3} + \frac{s}{t_{p-net50}^3}\right)}$$

l_{bdg} effective bending span, of longitudinal stiffener, in m

b_f breadth of flange, in mm

$t_{f-net50}$ net flange thickness, in mm

h_{stf} stiffener height, including face plate, in mm

$t_{w\text{-}net50}$	net web thickness, in mm
$t_{p\text{-}net50}$	net plate thickness, in mm
s	plate width between stiffeners, in mm

Figure C.1.8
Bulb Profile and Equivalent Built-up Flange

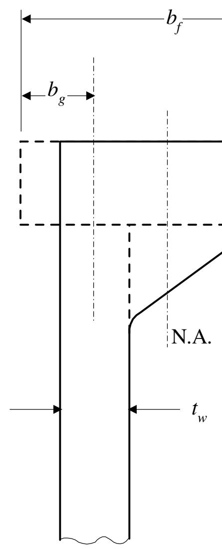


Table C.1.2
HP Equivalent Built-up Profile Dimensions

HP- bulb		Equivalent built-up flange		
Height (mm)	**Web thickness t_w (mm)**	**b_f (mm)**	**t_f (mm)**	**b_g (mm)**
200	9 – 13	t_w + 24.5	22.9	(t_w + 0.9)/2
220	9 - 13	t_w + 27.6	25.4	(t_w + 1.0)/2
240	10 – 14	t_w + 30.3	28.0	(t_w + 1.1)/2
260	10 – 14	t_w + 33.0	30.6	(t_w + 1.3)/2
280	10 – 14	t_w + 35.4	33.3	(t_w + 1.4)/2
300	11 – 16	t_w + 38.4	35.9	(t_w + 1.5)/2
320	11 – 16	t_w + 41.0	38.5	(t_w + 1.6)/2
340	12 – 17	t_w + 43.3	41.3	(t_w + 1.7)/2
370	13 – 19	t_w + 47.5	45.2	(t_w + 1.9)/2
400	14 – 19	t_w + 51.7	49.1	(t_w + 2.1)/2
430	15 – 21	t_w + 55.8	53.1	(t_w + 2.3)/2

1.4.4.18 For each loading condition, combined local stress components due to simultaneous dynamic tank and dynamic wave pressure loads are to be combined with global stress components induced by hull girder wave bending.

1.4.4.19 Total combined stress range, S, is given by:

$$S = f_{SN} \left| f_1 S_v + f_2 S_h + f_3 S_e + f_4 S_i \right| \quad \text{N/mm}^2$$

Where:

f_1, f_2, f_3 and f_4	stress range combination factors, representing the phase correlation between total stress range and each stress range component which is between 1.0 and –1.0, as defined in *Tables C.1.3* to *C.1.5*. Where the factor is greater than 1.0 it is to be taken as 1.0. Where the factor is less than -1.0 it is to be taken as -1.0
f_{SN}	1.06, factor to account for joints in combined protected and unprotected environment.
S_v	corresponding stress range due to vertical bending moment, in N/mm², as defined in *1.4.4.7*
S_h	corresponding stress range due to horizontal bending moment, in N/mm², as defined in *1.4.4.9*
S_e	stress range due to external wave or internal tank pressure, in N/mm², as defined in *1.4.4.12*
S_i	stress range due to external wave or internal tank pressure, in N/mm², as defined in *1.4.4.12*

1.4.4.20 The stress range combination factors, f_1, f_2, f_3 and f_4, which are to be applied to the following zones, are given in *Tables C.1.3* to *C.1.5*:

(a) Zone M: Midship region. This zone extends over the full length of all tanks where the tank LCG lies between 0.35L and 0.8L from AP.

(b) Zone A: Aft region. This zone starts at the middle of the tank immediately aft of Zone M and extends aftwards to include all the aftmost tanks.

(c) Zone F: Forward region. This zone starts at the middle of the tank immediately forward of Zone M and extends forwards to include all the foremost tanks.

(d) Zone AT: Aft transition region between Zone M and Zone A. The stress range combination factors are to be calculated by linear interpolation between the stress range combination factors for Zones M and A.

(e) Zone FT: Forward transition region between Zone M and Zone F. The stress range combination factors are to be calculated by linear interpolation between the stress range combination factors for Zones M and F.

Note

Where ballast tanks, centre and wing cargo tanks do not have the same lengths e.g. if slop tank is present, the middle position is to be taken at the middle of the longer tank.

RCN 1 to July 2010 version (effective from 1 July 2012)

1.4.5 Selection of S-N curves

1.4.5.1 The capacity of welded steel joints with respect to fatigue strength is characterized by S-N curves which give the relationship between the stress ranges applied to a given detail and the number of constant amplitude load cycles to failure.

1.4.5.2 For ship structural details, S-N curves are represented by:

$$S^m N = K_2$$

Where:

S stress range, in N/mm², as defined in *1.4.4.19*

N predicted number of cycles to failure under stress range S

m constant depending on material and weld type, type of loading, geometrical configuration and environmental conditions (air or sea water), as defined in *1.4.5.5*.

K_2 constant depending on material and weld type, type of loading, geometrical configuration and environmental conditions (air or sea water), as defined in *1.4.5.5*.

1.4.5.3 Experimental S-N curves are defined by their mean fatigue life and standard deviation. The mean S-N curve gives the stress level S at which the structural detail will fail with a probability level of 50 percent after N loading cycles. S-N curves considered in the present Rules are based upon a statistical analysis of appropriate experimental data and represent two standard deviations below the mean lines.

1.4.5.4 Unless direct experimental measurements are available, the S-N curves described in *1.4.5.5* to *1.4.5.16* are to be used for assessment of the fatigue strength of structural details.

1.4.5.5 As shown in *Figure C.1.9*, the basic design curves consist of linear relationships between log(S) and log(N), which are to be expressed as follows. The S-N curves have a change of inverse slope from m to $m + 2$ at $N = 10^7$ cycles (which corresponds to stress range S_q).

$$\log(N) = \log(K_2) - m\log(S)$$

Where:

$\log(K_2)$ $= \log(K_1) - 2\delta$

N predicted number of cycles to failure under stress range S

K_1 constant relating to the mean S-N curve, as given in *Table C.1.6*

δ standard deviation of log(N)

m inverse slope of the S-N curve, as given in *Table C.1.6*

S_q Stress range corresponding to 10^7 cycles of the S-N curve, in N/mm², as given in *Table C.1.6*

Table C.1.6

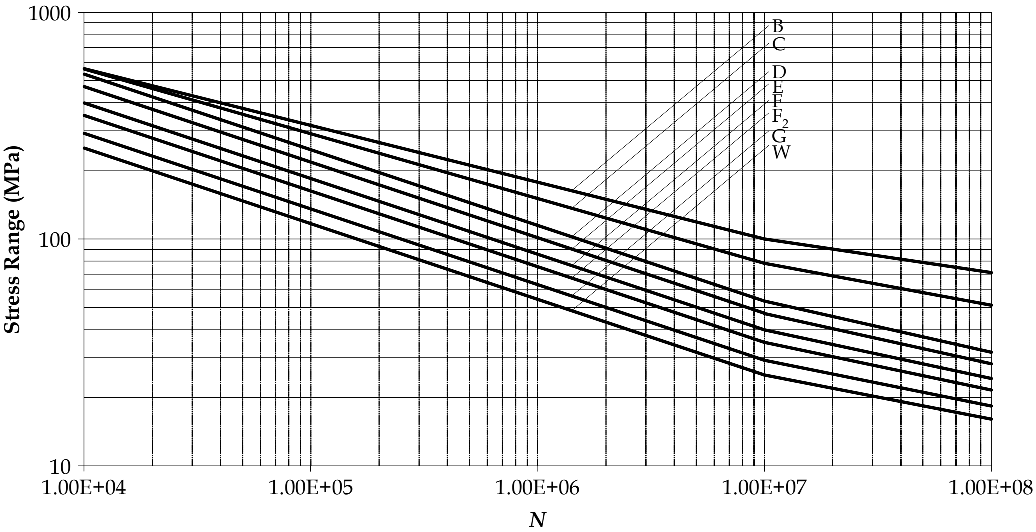
Figure C.1.9
Basic design S-N curves, In-Air



1.4.5.6 The class of S-N curve selected for determination of the cumulative fatigue damage, *DM*, is to be consistent with the fatigue assessment methods used and the type of detail to be analyzed.

1.4.5.7 Experimental S-N curves give the relationship between the nominal stress range and the number of cycles to failure. Therefore, when using these S-N curves, the calculated stresses are to correspond to the nominal stresses used in creating these curves.

1.4.5.8 The basic S-N curves to be used in this Appendix for fatigue assessment of longitudinal stiffener end connections are given in *1.4.5.5*, with the S-N curve parameters given in *Table C.1.6*.

1.4.5.9 Generally, adjustments to the S-N curves to take into account the following can be made:

a) effect of mean stresses
b) effect of plate thickness
c) weld improvement
d) influence of the environment.

1.4.5.10 The stress range may be reduced depending on whether the mean stress is tensile or compressive. In the event that it can be demonstrated that a compressive stress exists and can be quantified, the effect of mean stress may be considered by assuming a stress range equal to the tensile component plus 60% of the compressive component. The actual still water bending moment (SWBM) and the applicable static sea and tank pressures for the full load condition or ballast condition as appropriate are to be used in determining the mean stress level.

1.4.5.11 The total stress range considering the mean stress effect is to be taken as follows:

$S_{Ri} = \sigma_{tensile} - 0.6\,\sigma_{compressive}$ if $\sigma_{compressive} < 0$ and $\sigma_{tensile} > 0$

$S_{Ri} = S$ if $\sigma_{compressive} \geq 0$

$S_{Ri} = 0.6S$ if $\sigma_{tensile} \leq 0$

Where:

$\sigma_{tensile}$ mean stress plus half stress range, in N/mm²
$= \sigma_{mean} + S/2$

$\sigma_{compressive}$ mean stress minus half stress range, in N/mm²
$= \sigma_{mean} - S/2$

σ_{mean} mean stress due to static load components in the full load condition or ballast condition as appropriate, in N/mm², see *1.3.2*

For the nominal stress approach, S and σ_{mean} are to be calculated as follows:

S total combined stress range, in N/mm², as defined in *1.4.4.19*
$= \sigma_{tensile} - \sigma_{compressive}$

σ_{mean} $= \sigma_{hg} + \sigma_{ex} + \sigma_{in}$

σ_{hg} mean stress due to hull girder bending, to be derived using σ_v from *1.4.4.6* with $M_{wv\text{-}v\text{-}amp}$ taken as the actual SWBM for the full load condition or ballast condition as appropriate, see *1.3.2*.

σ_{ex} mean local bending stress due to external static sea pressure, if applicable. σ_{ex} is to be derived using σ_{2A} from *1.4.4.11* with P calculated based on the actual draught for the full load condition or ballast condition as appropriate, see *1.3.2*, where $P = P_{hys}$, see *Section 7/2.2.2.1*.

σ_{in} mean local bending stress due to internal static tank pressure, if applicable. σ_{in} is to be derived using σ_{2A} from *1.4.4.11* with P calculated based on the head to the top of tank and the tank contents for the full load condition or ballast condition as appropriate, see *1.3.2*, where $P = P_{in\text{-}tk}$, see *Section 7/2.2.3.1*.

Notes

1 P is to be taken as negative when the pressure is acting on the plate side and positive when acting on the stiffener side. This gives compressive stress with a negative sign

2 Where the stiffener is on the boundary between two cargo tanks, then the mean stress is to be taken as the net stress acting on the stiffener.

3 It is to be assumed that water ballast and cargo tanks are 100% full. The fluid density is to be taken in accordance with *Section 7/2.2.3.1*, where cargo density is not to be less than 0.9 tonnes/m³

For the hot spot stress approach in *Sub Section 2*, the mean stress, σ_{mean}, is to be calculated by applying the applicable static loads to the FE model for the full load condition or ballast condition as appropriate. Alternatively, in lieu of applying the static loads to the FE model, the total stress range is to be calculated in accordance with *2.4.2.8*.

RCN 2 to July 2008 version (effective from 1 July 2010)

1.4.5.12 The fatigue performance of a structural detail depends on member thickness. For the same stress range the joint's fatigue resistance may decrease as the member thickness increases. This effect (also called the 'scale effect') is caused by the local geometry of the weld toe in relation to the thickness of the adjoining plates and the stress gradient over the thickness. The basic design S-N curves are applicable to thicknesses that do not exceed the reference thickness of 22mm. For members with thickness greater than 22mm, the S-N curve for a joint member, with net thickness, t_{net50}, in mm, is to be taken as:

$$\log(N) = \log(K_2) - m\log\left(\frac{S_{Ri}}{(22/t_{net50})^{0.25}}\right)$$

Where:

$\log(K_2)$ $= \log(K_1) - 2\delta$

N the predicted number of cycles to failure under stress range S

K_1 constant relating to the mean S-N curve, as given in *Table C.1.6*

δ standard deviation of $\log(N)$

m inverse slope of the S-N curve, as given in *Table C.1.6*

S_{Ri} stress range, as defined in *1.4.5.11*, in N/mm²

1.4.5.13 Where the longitudinal stiffeners are flat bars or bulb plates, the thickness effect described in *1.4.5.12* is not applicable.

1.4.5.14 The benefits of weld toe grinding should not be taken into consideration at the design stage. However, an exception may be made for the weld connection between the hopper plate and inner bottom if the calculated fatigue life is greater than one half of the design fatigue life or minimum 17 years excluding the grinding effects, whichever is greater. Where grinding is applied, full details of the grinding standard including the extent, smoothness particulars, final weld profile, and grinding workmanship and quality acceptance criteria are to be clearly shown on the applicable drawings and submitted for review together with supporting calculations indicating the proposed factor on the calculated fatigue life. Grinding is preferably to be carried out by rotary burr and to extend below the plate surface in order to remove toe defects and the ground area is to have effective corrosion protection. The treatment is to produce a smooth concave profile at the weld toe with the depth of the depression penetrating into the plate surface to at least 0.5mm below the bottom of any visible undercut. The depth of groove produced is to be kept to a minimum, and, in general, kept to a maximum of 1mm. In no circumstances is the grinding depth to exceed 2mm or 7% of the plate gross thickness, whichever is smaller. Grinding has to extend to areas well outside the highest stress region. Provided these recommendations are followed, an improvement in fatigue life up to the design fatigue life will be granted.

RCN 1 to July 2008 version (effective from 1 February 2010)

1.4.5.15 The basic design S-N curves, as shown in *Figure C.1.9*, are valid for joints located in air or details exposed to sea water but adequately protected from corrosion by effective coating. For unprotected joints in sea water, the basic S-N curves are to be reduced by a factor of 2 on fatigue life.

1.4.5.16 The basic design S-N curves, as shown in *Figure C.1.9*, are used in this Appendix. To account for the fact that the joint will spend part of the time in a protected environment and part of time in an unprotected environment, a factor f_{SN}, has been introduced into the total nominal stress range calculation.

1.5 Classification of Structural Details

1.5.1 General

1.5.1.1 The joint classification of structural details is to be made using *Table C.1.7* where the design of soft toes and backing brackets corresponds to those shown in *Figure C.1.10*. When alternative designs are proposed, the adequacy in terms of fatigue strength is to be demonstrated using a suitable finite element analysis. See *2.1.1.3*.

1.5.1.2 Where the primary support member web stiffeners are omitted or not connected to the longitudinals in way of bottom, side and inner hull, see Note 6 of *Table C.1.7*.

Table C.1.7
Classification of Structural Details

Notes

1. Where the attachment length is less than or equal to 150mm, the S-N curve may be upgraded one class from those specified in the table. For example, if the class shown in the table is F2, upgrade to F. Attachment length is defined as the length of the weld attachment on the longitudinal stiffener face plate without deduction of scallop.
2. Where the longitudinal stiffener is a flat bar and there is a stiffener/bracket welded to the face, the S-N curve is to be downgraded by one class from those specified in the table. For example, if the class shown in the table is F, downgrade to F2; if the class shown in the table is F2, downgrade to G. This also applies to unsymmetrical profiles where there is less than 8mm clearance between the edge of the stiffener flange and the face of the attachment, e.g. bulb or angle profiles where the stated clearance cannot be achieved.
3. Lapped connections (attachments welded to the web of the longitudinals) should not be adopted and therefore these are not covered by the table.
4. For connections fitted with a soft heel, class F may be used if it is predominantly subjected to axial loading. Stiffeners fitted on deck and within 0.1D below deck at side are considered to satisfy this condition.
5. For connections fitted with a collar around the face plate (i.e., connection type ID25 through 30) or full collar (i.e., connection type ID31), class F may be used if subjected to axial loading. Stiffeners fitted on deck and within 0.1D below deck at side are considered to satisfy this condition
6. ID31 and 32 show details where web stiffeners are omitted or are not connected to the longitudinal stiffener face plate. A full collar (i.e. connection type ID31) or alternatively a detail design for cut-outs as shown in Figure C.1.11 or equivalent is required in way of:
   - Side below the highest point of the wave wetted zone or below 0.1D from the deck at side, whichever is lower.
   - Bottom
   - Inner hull longitudinal bulkhead below 0.1D from the deck at side
   - Hopper
   - Inner bottom

   The highest point of the wave wetted zone is defined as the full load draft plus h_{WL} as shown in Fig. C.1.1. Equivalence to Figure C.1.11 is to be demonstrated through a satisfactory fatigue assessment by using comparative FEM based hot spot stress of the cut-out in the primary support member and the collar.
7. For connection type ID32 having no collar welded to the face plate, class F is to be used in way of longitudinals in the strength deck irrespective of slot configuration. In other areas class E may be used irrespective of slot configuration.

<u>Notes</u>

1. Soft toes marked "*" are to be dimensioned to suit the weld leg length such that smooth transition from the weld to the radiused part can be achieved. Max. 15 mm.
2. Configurations 1 and 4 indicate acceptable lapped lug plate connections, alternatively, butted lug plates with similar shape may be adopted.
3. Designs that are different than shown in the above sketches are acceptable subject to a satisfactory fatigue assessment by using comparative FEM based hot spot stress.

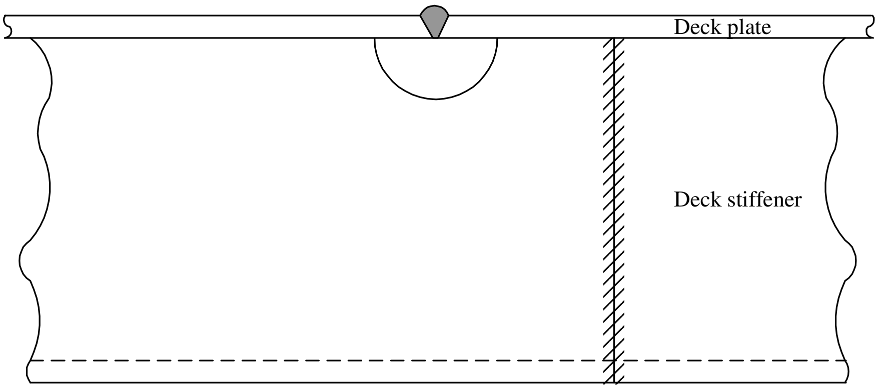
1.6 Other Details

1.6.1 Scallops in way of block joints

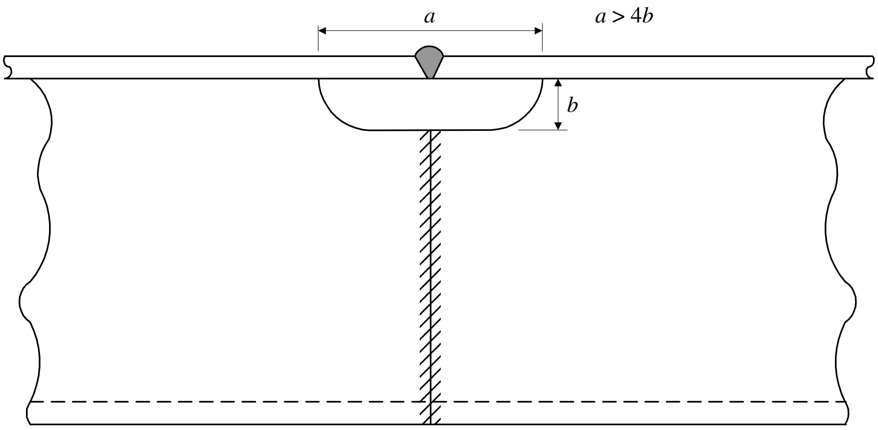
1.6.1.1 Scallops in way of block joints in the cargo tank region, located on the strength deck, and down to 0.1*D* from the deck at side are to be designed according to *Figure C.1.12* unless the specification in *Section 8/1.5.1.3* for class F2 is satisfied.

Figure C.1.12
Welding of Deck Stiffeners in way of Block Joints

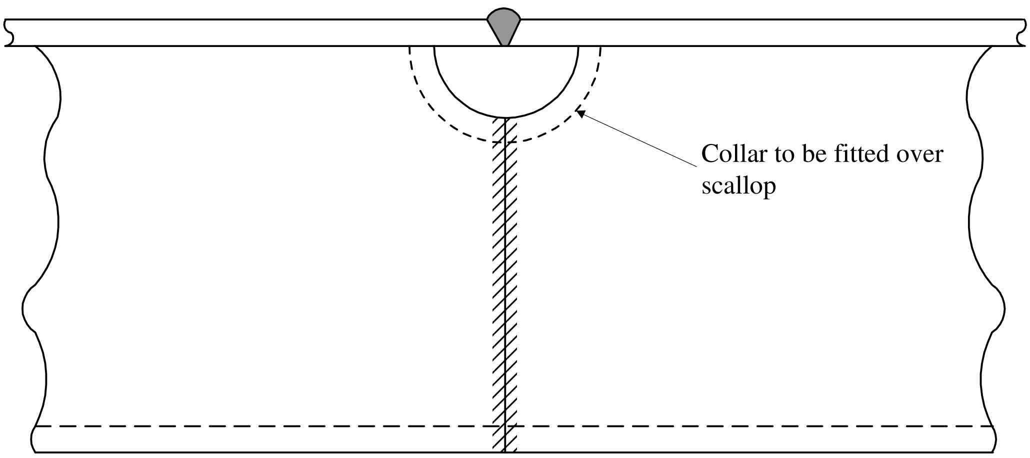
(I) Offset butt on stiffener



(II) Elongated scallop on stiffener



(III) Closing scallop with collar



Notes

Alternative scallop geometry to that shown in option II may be accepted subject to demonstration of satisfactory fatigue life based on hull girder loads taking into account additional stress concentration factor in way of weld, determined using fine mesh FEM and applying class D S-N curve.

2 HOT SPOT STRESS (FE BASED) APPROACH

2.1 General

2.1.1 Applicability

2.1.1.1 The procedure in this section applies to welded knuckles between inner bottom and hopper plate fatigue analysis using a finite element (FE) based hot spot stress approach. A similar application method as described in *Sub-Section 1* for the nominal stress approach is used except where indicated in the following sections.

2.1.1.2 Where the hopper knuckle between inner bottom and hopper plate is of the bent type, hot spot stress fatigue assessment is not a requirement provided the detail design standard described in *2.5.1.2* is followed. When alternative design is proposed, a suitable finite element (FE) analysis should be used to demonstrate the equivalency of the detail in terms of fatigue strength.

2.1.1.3 Where the hot spot stress approach is considered necessary for demonstration of the adequacy of longitudinal stiffener end connection in lieu of the nominal stress approach, the procedure described in *Sub-Section 1* is generally to be followed with the exception that S_v, S_h, S_i, and S_e are to be determined directly from the finite element analysis using the surface hot spot stress component perpendicular to the weld obtained by linear extrapolation to the centre-line of the attachment, and then to the weld toe position. The S-N curve according to *2.4.3* is applicable.

2.1.2 Assumptions

2.1.2.1 The assumptions made are given in *1.1.2*.

2.2 Corrosion Model

2.2.1 Net thickness

2.2.1.1 The net thickness and corrosion additions given in *Section 6/3* are to be incorporated into the representation of the FE structural capacity models as described in *Appendix B/4*.

2.3 Loads

2.3.1 General

2.3.1.1 Dynamic wave and tank pressures are to be considered for the FE based fatigue analysis of knuckles between inner bottom and hopper plates, see *1.3.6* and *1.3.7*.

2.4 Fatigue Damage Calculation

2.4.1 Fatigue strength determination

2.4.1.1 The procedure outlined in *1.4* is to be applied.

2.4.1.2 The Weibull probability distribution parameter applicable to welded knuckles between inner bottom and hopper plate, ξ, is to be taken as:

$$\xi = 1.1 - 0.35\frac{L-100}{300}$$

Where:

L rule length, in m, as defined in *Section 4/1.1.1.1*

2.4.2 Stresses to be used

2.4.2.1 To determine hot spot stresses, local 2D or 3D very fine mesh stress analyses, in conjunction with a 3D coarse mesh analysis are to be used. In highly stressed areas, in particular in the vicinity of structural discontinuities, the level of stresses depends on the size of elements because of the high stress gradient. If the stress field is more complex than a uniaxial field, the stresses adjacent to the potential crack location are to be used. A uniform mesh is to be used with smooth transition and avoidance of abrupt changes in mesh size.

2.4.2.2 The following defines a general basis for the modelling of local structures:

(a) hot spot stresses are to be calculated using an idealized welded joint with no misalignments. The finite element mesh is to be fine enough near the hot spot such that stresses and stress gradients can be determined with sufficient accuracy

(b) plating, webs and face plates of primary and secondary members are modelled by 4-node thin shell elements. In cases of steep stress gradients, 8-node thin shell elements are to be used.

(c) when thin shell elements are used, the structure is to be modelled at the mid face of the plates. For practical purposes, adjoining plates of different thickness may be assumed to be median line aligned, i.e., no staggering in way of thickness change is required.

(d) the aspect ratio of elements is not to be greater than three in the vicinity of the hot spot.

(e) the size of elements located in the vicinity of the hot spot is to be comparative to the net thickness of the structural member

(f) stresses are to be calculated at the surface of the plate with a view to taking into account the plate bending moment, where relevant.

2.4.2.3 A detailed description of hot spot stress calculation using finite element modelling is given by *Appendix B/4*.

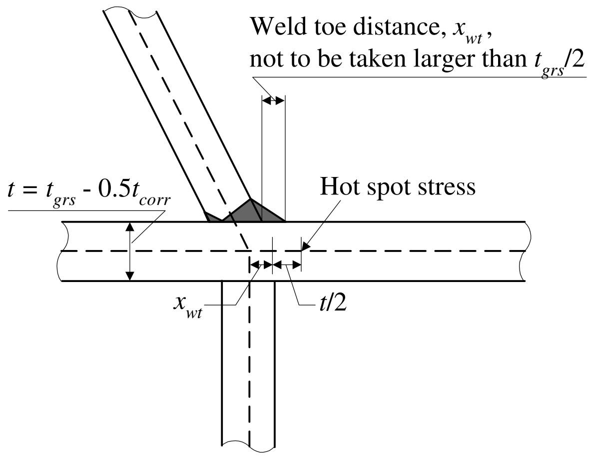
2.4.2.4 Generally, the element stresses are derived at the Gaussian integration points. Depending on the element type, it may be necessary to perform several interpolations in order to determine the actual stress at the considered hot spot location.

2.4.2.5 For critical structural details, hot spot stresses are generally highly dependent on the finite element model used for representation of the structure. Alternative procedures to those described here, for the derivation of the hot spot stress, are to be confirmed or documented by reference to available fatigue test results for similar structural details.

2.4.2.6 The hot spot stress is defined as the surface stress at $0.5t$ away from the weld toe location, as shown in *Figure C.2.1*. The hot spot stress is to be obtained by linear interpolation in the ship's transverse direction using the respective stress at the 1st and 2nd element from the structure intersection.

RCN 2 to July 2008 version (effective from 1 July 2010)

Figure C.2.1
Hot Spot Stress



2.4.2.7 Stress range components along the direction perpendicular to the weld, due to the loads defined in *2.3*, are to be calculated based on *Appendix B/4*. The total combined stress range, S, is to be taken as:

$S = f_{model}\left|0.85(S_{e1} + 0.25S_{e2}) - 0.3S_i\right|$ for full load condition

$S = f_{model}\left|0.85(S_{e1} - 0.2S_{e2})\right|$ for ballast load condition

Where:

S_{e1} stress range due to dynamic wave pressure applied to FE-model on the side where the hopper knuckle is to be investigated, in N/mm^2, see *Table B.4.1*

S_{e2} stress range due to dynamic wave pressure applied to FE-model on the side of the hull where the hopper knuckle is not analysed, in N/mm^2, see *Table B.4.1*

S_i stress range due to dynamic tank pressure applied to FE-model, in N/mm^2, see *Appendix B/4.5.2.4* and *Table B.4.1*

f_{model} 1.0 if the FE model is made according to net thickness for fatigue, i.e. using corrosion addition of 0.25t_{corr} for the FE model except in way of critical location (in way of a knuckle and within 500mm in all directions), which uses corrosion addition of 0.5t_{corr}

0.95 if the FE model for strength assessment is used. FE model for strength assessment applies a corrosion addition of 0.5t_{corr} for the whole model including structure in way of critical location

2.4.2.8 To account for the mean stress effect, in lieu of applying the static loads to the FE model, the total stress range may be taken as:

$S_{Ri} = 1.0S$ for full load condition

$S_{Ri} = 0.6S$ for ballast load condition

Where:

S total combined stress range, in N/mm², as defined in *2.4.2.7*

2.4.3 Selection of S-N curves

2.4.3.1 The fatigue analysis is to be carried out applying the Class D S-N curve for welded details if the hot spot stress is calculated according to *2.4.2.8*. The thickness effect according to *1.4.5.12* will be applicable.

2.5 Detail Design Standard

2.5.1 Hopper knuckles

2.5.1.1 Design details for the welded knuckle between hopper plating and inner bottom plating are to be as shown in *Figure C.2.2*.

Guidance Note:

Figure C.2.3 may be used as an option to increase fatigue strength at the hopper connection.

2.5.1.2 Design details for the bent knuckle between hopper plating and inner bottom plating are to be as shown in *Figure C.2.4*.

2.5.2 Transverse Bulkhead Horizontal Stringer Heel

2.5.2.1 Detail design improvement given in *Figure C.2.5* is recommended for reducing the stress level and increasing fatigue strength at the horizontal stringer heel location between transverse oil-tight and wash bulkhead plating and inner hull longitudinal bulkhead plating. This recommendation should be considered in association with fine mesh FE analysis as required in *Appendix B/3.1.3.*

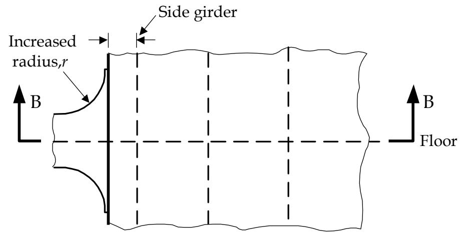
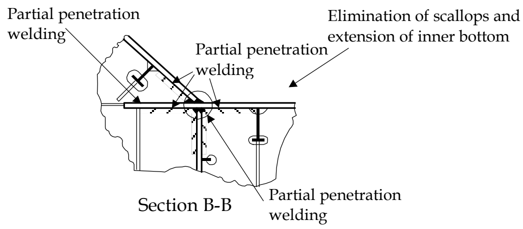
Section A-A

DETAIL DESIGN STANDARD A





Weld between hopper plating and inner bottom plating to be extended and ground smooth. Visible undercuts are to be removed. Weld extension and grinding to be applied 200 mm either side of the floor.

Note:

1. A root face with a maximum of 1/3 of the abutting plate thickness is acceptable for the partial penetration welding, see *Section 6/5.3.4*.
2. Grinding need not be applied in the No.1 tank in which floor spans are reduced due to shape.
3. Grinding need not be applied for the knuckle joints at transverse bulkhead positions, or at the floor adjacent to the transverse bulkhead.

Minimum Requirement	As a minimum, detail design standard A or B is to be fitted. Further consideration will be given where the hopper angle exceeds 50 degrees. The ground surface is to be protected by a stripe coat, of suitable paint composition, where the lower hopper knuckle region of cargo tanks is not coated.
Critical Location	Hopper sloping plating connections to inner bottom plating in way of floors. Floor connections to inner bottom plating and side girders in way of hopper corners.
Detail Design Standard	Elimination of scallops in way of hopper corners, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket thickness is to be close to that of the inner bottom in way of knuckle.
Building Tolerances	Median line of hopper sloping plate is to be in line with the median line of the girder with an allowable tolerance of t/3 or 5mm, whichever is less, where *t* is the inner bottom thickness. The allowable tolerance is to be measured parallel to the inner bottom.
Welding Requirements	Partial penetration welding (hopper sloping plating to inner bottom plating). Partial penetration weld (connection of floors to inner bottom plating and to side girders, connection of hopper transverse webs to sloping plating, to inner bottom plating, and to side girders in way of hopper corners).

(RCN 1, effective from 1 April 2007)

RCN 2 to July 2008 version (effective from 1 July 2010)

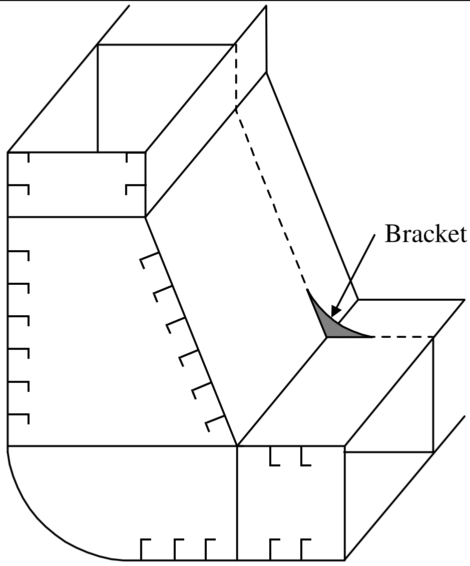
Section A-A

DETAIL DESIGN STANDARD B



Note:

1. Bracket to be fitted inside cargo tank
2. Bracket to extend approximately to the first longitudinal
3. The bracket toes are to have a soft nose design
4. Full penetration welding at bracket toes
5. Bracket material to be same as that of inner bottom
6. Buckling of bracket to be checked:

$$\frac{d}{t_{bkt}} < 21\sqrt{\frac{235}{\sigma_{yd}}}$$

where:

d = bracket max depth, as defined in *Table 10.2.3*

t_{bkt} = bracket thickness

σ_{yd} = specified minimum yield stress of material

Minimum Requirement	As a minimum, detail design standard A or B is to be fitted. Further consideration will be given where hopper angle exceeds 50 degrees.
Critical Location	Hopper sloping plating connections to inner bottom plating in way of floors. Floor connections to inner bottom plating and side girders in way of hopper corners.
Detail Design Standard	Elimination of scallops in way of hopper corners, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket thickness to be close to that of the inner bottom in way of knuckle.
Building Tolerances	Median line of hopper sloping plate is to be in line with the median line of girder with an allowable tolerance of t/3 or 5mm, whichever is less, where *t* is the inner bottom thickness.
Welding Requirements	Partial penetration welding (hopper sloping plating to inner bottom plating). Partial penetration weld (connection of floors to inner bottom plating and to side girders, connection of hopper transverse webs to sloping plating, to inner bottom plating, and to side girders in way of hopper corners).

(RCN 1, effective from 1 April 2007)

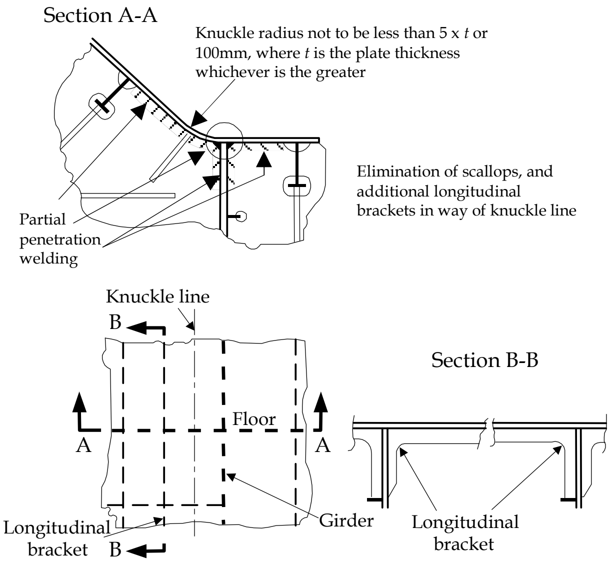
DETAIL DESIGN STANDARD C



Note: Longitudinal brackets may be omitted if it can be demonstrated that the girder provides sufficient support at the knuckle line.

Minimum Requirement	As a minimum, the detail design standard C is to be fitted.
Critical Location	Side girder connections to inner bottom plating in way of floors. Floor and hopper transverse web connections to inner bottom plating and to side girders in way of hopper corners.
Detail Design Standard	Elimination of scallops in way of hopper corners and additional longitudinal brackets to reduce peak and range of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure, and hull girder global loading.
Building Tolerances	Enhanced alignment standard. The nominal distance between the centres of thickness of the two abutting members (e.g. floor and hopper web plate and additional supporting brackets) should not exceed 1/3 of the table member thickness.
Welding Requirements	Partial penetration welding with a maximum root face of 1/3 of the abutting plate thickness (Connection of side girders to inner bottom plating. Connection of floors to inner bottom plating and to side girders. Connection of hopper transverse webs to sloped inner bottom plating and to side girders in way of hopper corners).

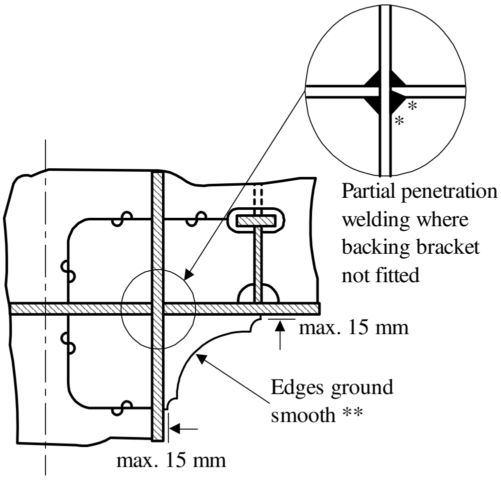
DETAIL DESIGN IMPROVEMENT



Note:

* Weld toe to be ground smooth, visible undercuts to be removed where brackets not fitted.

** Where a face plate is considered necessary, it is recommended that design features be adopted to reduce the stress concentration at the face plate termination (e.g., taper and soft nose).

Critical Location	Intersections of webs of transverse bulkhead horizontal stringer and double side tank horizontal girder forming square corners.
Detail Design Improvement	Elimination of scallops in way of cruciform joint and fitting a localized 'D' grade steel insert plate, with minimum thickness of 7 mm in addition to the Rule required thickness, to reduce the peak and range of resultant stresses arising from cyclic cargo inertia pressure and hull girder global loading. In addition, a soft toed backing bracket of suitable dimension is to be fitted. The following bracket sizes are recommended: • VLCC: 800x800x30 R600 with soft toe as shown in Figure • Suezmax and Aframax tankers: 800x600x25 R550 with soft toe as shown in Figure, where the longer arm length is in way of the inner skin. The actual bracket design is to be verified by fine mesh finite element analysis in accordance with *Appendix B/3.1.3.*
Building Tolerances	Enhanced alignment standard. The nominal distance between the centres of thickness of the two abutting members should not exceed 1/3 of the table member thickness.
Welding Requirements	Fillet welding having minimum weld factor of 0.44, where backing bracket is fitted or partial penetration welding where backing bracket is not fitted. The extent of partial penetration should be of the order of longitudinal spacing. A small scallop of suitable shape, which is to be closed by welding after completion of the continuous welding of bulkhead, should be provided where scallop is eliminated.

2.5.3 Transverse and longitudinal corrugated bulkhead connection to lower stool

2.5.3.1 Detail design improvement given in *Figure C.2.6* is recommended for reducing the stress level at the connection of transverse and longitudinal corrugated bulkhead to lower stool. This recommendation should be considered in association with fine mesh FE analysis as required in *Appendix B/3.1.5*.

Figure C.2.6

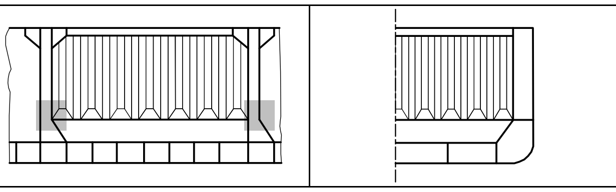
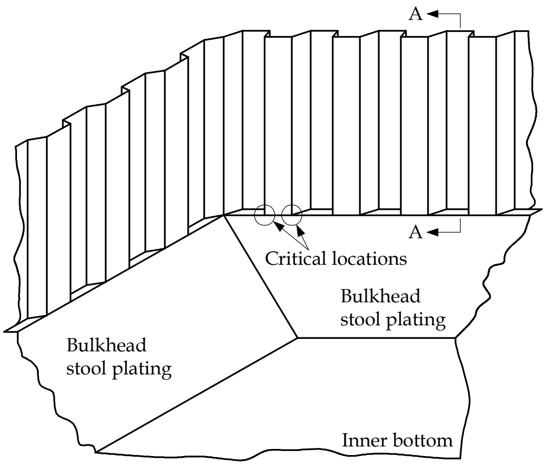
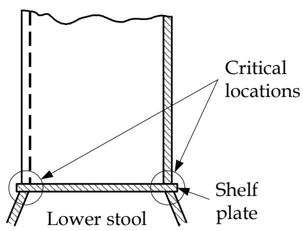
CRITICAL AREAS



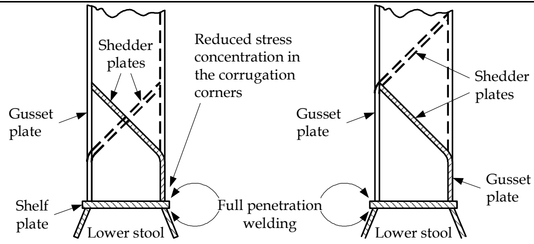
CRITICAL LOCATIONS



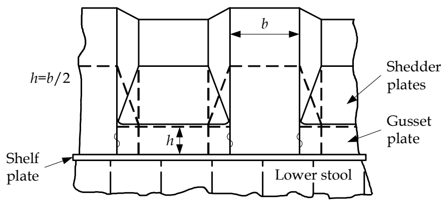
Section A-A



DETAIL DESIGN IMPROVEMENT



Section A-A improvement



Note:

* Full penetration weld is to be applied at the connection of the corrugated bulkhead and stool plate to the shelf plate of the lower stool.

** Where adjacent shedder plates cross, a bracket stiffener is to be provided at the crossing point.

Critical Location	1. Connections of corrugated bulkhead to lower stool and shelf plate 2. Connections of corrugated bulkhead to shedder plate if fitted without a gusset plate
Detail Design Improvement	1. Gusset plate should be fitted to the shelf plate in line with the face of the corrugation to reduce stress concentrations at the corrugated corners. The minimum height of the gusset plate should be taken as half the corrugated bulkhead flange width. 2. To reduce stress concentration at the crossing of the shedder plates, shedder plates may be arranged in an alternate configuration as shown in figure. Alternatively, bracketed stiffener may be fitted at the crossing points underneath the shedder plates.
Building Tolerances	Ensure good alignment between lower stool sloping plates and corrugation faces as far as possible. The nominal distance between the centres of thickness of the two abutting members should not exceed 1/3 of the table member thickness.
Welding Requirements	Full penetration welding should be used at the connections of the bulkhead corrugations, gusset plates and the lower stool sloping plates to the lower stool shelf plate (Grade Z steel is recommended). Start and stop of welding should be as far away as practicable from the corners of the corrugations.

APPENDIX D

BUCKLING STRENGTH ASSESSMENT

1 ADVANCED BUCKLING ANALYSIS

1.1 General

1.1.1 Scope

1.1.1.1 This appendix describes the advanced buckling analysis method and its application as required by the Rules. The advanced buckling analysis method is to be based on nonlinear analysis techniques, or equivalent, which predict the complex behaviour of stiffened and un-stiffened panels.

1.1.2 Alternative procedures

1.1.2.1 While this appendix describes the general purpose or direct calculation techniques to be employed, alternative advanced buckling and ultimate strength analysis procedures may be used provided they give comparable and consistent results to those obtained using the reference advanced buckling procedure given in the *Background to Appendix D* which is the basis for the permissible buckling utilisation factors in *Section 9/Table 9.2.2*. See also *1.1.2.3*.

1.1.2.2 Where an alternative advanced procedure is used, documentation of the alternative advanced buckling analysis methodologies and detailed comparison of its results with those of the reference advanced buckling procedure given in *Background to Appendix D* and software tools are to be supplied for review and acceptance.

1.1.2.3 Use of alternative buckling procedures to the reference advanced buckling procedure is acceptable provided that the alternative procedure is verified against the test cases specified in the *Background to Appendix D* and where the permissible utilisation buckling factor for the alternative method, $\eta_{all-alt}$, complies with:

$$\eta_{all-alt} \le \eta_{all} \cdot \left(\frac{\eta_{alt-i}}{\eta_{reft-i}} \right)_{\min}$$

Where:

η_{all}	permissible utilisation factor against buckling for plate and stiffened panels as specified in *Section 9/Table 9.2.2*
η_{ref-i}	utilisation factor for reference advanced buckling procedure for test case *I* specified in *Background to Appendix D*
η_{alt-i}	utilisation factor for alternative buckling procedure for test case *I* specified in *Background to Appendix D*

1.1.3 Definitions

1.1.3.1 "Buckling" is used as a generic term to describe the strength of structures, generally under in-plane compressions and/or shear. The buckling strength or capacity can take into account the internal redistribution of loads depending on the situation.

1.1.3.2 Buckling capacity accepting local elastic plate buckling with load redistribution is referred to as Method 1. The buckling capacity is the load that results in the first occurrence of membrane yield stress anywhere in the stiffened panel. Buckling capacity based on this principle gives a lower bound estimate of ultimate capacity, or the maximum load the panel can carry without suffering major permanent set. Method 1 buckling capacity assessment utilizes the positive elastic post-buckling effect for plates and accounts for load redistribution between the structural components, such as between plating and stiffeners. For slender structures the

capacity calculated using this method is typically higher than the ideal elastic buckling stress (minimum Eigen-value). Accepting elastic buckling of structural components in slender stiffened panels implies that large elastic deflections and reduced in-plane stiffness will occur at higher buckling utilization levels.

1.1.3.3 Method 2 buckling capacity does not accept load redistribution between structural components and refers to the minimum of value of the ideal elastic buckling stress and the Method 1 buckling capacity. Method 2 buckling capacity normally equals the same strength as Method 1 for stocky panels, while it is the ideal elastic buckling stress (minimum Eigen-value cut-off) for slender panels. By applying the ideal elastic buckling stress limitation, large elastic deflections and reduced in-plane stiffness will be avoided at higher buckling utilization levels.

1.1.3.4 A "buckling failure mode" refers to a specific pattern of buckling failure. Typical failure modes of stiffened panels with open profiles are:

(a) plate buckling

(b) torsional stiffener buckling

(c) stiffener web plate buckling

(d) lateral stiffener buckling.

2 ADVANCED BUCKLING ANALYSIS METHOD

2.1 General

2.1.1 Effects to consider

2.1.1.1 The advanced buckling assessment method is to be capable of considering the following effects:

(a) non linear geometrical behaviour

(b) inelastic material behaviour

(c) initial deflections – geometrical imperfections/out-of flatness

(d) welding residual stresses

(e) interactions between buckling modes and structural elements; plates, stiffeners, girders etc.

(f) simultaneous acting loads; bi-axial compression/tension, shear and lateral pressure

(g) boundary conditions.

2.1.1.2 Detailed requirements for items listed in *2.1.1.1* are given in *2.1.2* to *2.1.8*. Additional requirements applicable to non-linear finite element models are given in *2.1.9* and *2.1.10*.

2.1.2 Non linear geometrical behaviour

2.1.2.1 The buckling method is to be based on non-linear large deflection plate theory or equivalent. Second order membrane strains due to geometrical non-linearity are to be accounted for.

2.1.2.2 Non-linear plate theory according to von Karman and Marguerre is acceptable for assessing the strength beyond the ideal elastic buckling level.

2.1.3 Material behaviour and properties

2.1.3.1 Inelastic material behaviour is to be considered. If the buckling method is not capable of handling non linear material and spread of plasticity, then the redistributed stress fields due to non-linear geometrical behaviour and geometrical imperfections are to be limited to below the von Mises yield criterion.

2.1.3.2 Alternatively, if the buckling method is capable of handling non linear material, then a bi-linear material model is to be used with a conservative strain-hardening coefficient in the plastic region.

2.1.3.3 The material property assumptions are to use the characteristic values of yield strength and Young's Modulus. Where appropriate, a bi-linear isotropic elasto-plastic material model excluding strain rate effects is to be used or the Tangent Modulus is to be taken as a conservative value. A plastic tangent modulus of 1000Mpa is acceptable for normal and higher strength steel.

2.1.4 Initial deflections – geometrical imperfections/out-of-flatness

2.1.4.1 Initial deflections are to be included in the buckling assessment.

2.1.4.2 For the deterministic strength assessment the geometrical imperfections are to be transformed to a regular model pattern.

2.1.4.3 The imperfections may be divided into local imperfections (plate out-of-flatness and stiffener sideways out-of-straightness), and global imperfections of the stiffeners (stiffener lateral/vertical out-of-straightness).

2.1.4.4 The shape of the initial deflections is to be such that the most critical failure modes are represented and triggered by the analysis. In general, a combination of the lowest buckling Eigen-modes will be appropriate. Consideration is to be given in the case of plates with high slenderness and in the case of simultaneously acting loads, where the critical failure mode may be different from the lowest Eigen-modes.

2.1.4.5 The default maximum values of the imperfections are to be taken to be consistent with the *IACS Shipbuilding and Quality Repair Standard*. However, regular model imperfection amplitudes may generally be taken less than the maximum tolerance specified. The regular model imperfections may typically be case dependant (load ratio dependant) and are also to cover imperfections due to welding. The actual level of model imperfections will depend on the method of analysis, extension of model, etc. and is to be approved by the individual Classification Society.

2.1.5 Welding induced residual stress

2.1.5.1 Residual stresses are not required to be explicitly included in the buckling assessment, see *2.1.4.5*.

2.1.6 Interactions between buckling modes and structural elements

2.1.6.1 The advanced buckling analysis method is to accurately model the interactions between the various structural components and hence between the different buckling modes.

2.1.6.2 All the critical initial imperfection shapes are to be included, see *2.1.4*.

2.1.7 Simultaneous acting loads

2.1.7.1 The method is to be able to model any combination of biaxial in-plane compressive and shear membrane loads and lateral pressure.

2.1.7.2 Any lateral pressure is to be applied first, in order to generate the deformed shape. The lateral pressure is then to be kept constant.

2.1.7.3 The effect of lateral pressure enforcing deflections in different patterns than in-plane loads is to be included in such a way that the most critical buckling mode is developed.

2.1.8 Boundary conditions

2.1.8.1 The boundary conditions are to represent the actual response of the plate or stiffened panel. In-plane and out-of-plane boundary conditions are to be considered.

2.1.8.2 Where a panel is an integral part of a larger continuous area of stiffened plating, such as bottom or side panels, the edges may be taken as free to move in-plane, but forced to remain straight. Where a panel is not supported in-plane by adjacent structure, such as a stringer web panel or bottom girder web, then the edges are to be considered as completely free.

2.1.8.3 Rotational restraint on the plate from the stiffeners is to be accounted for by direct analysis of the plate and stiffener interaction. Prescribed boundary conditions are, in general, not acceptable.

2.1.8.4 The panels can be taken as supported in the lateral/vertical direction at the primary support members. The stiffeners may be taken as horizontally supported at the crossing of primary support members (preventing tilting at crossings). Geometrical rotational restraint of the plate from the primary support members is to be neglected.

2.1.9 Model extent

2.1.9.1 The extent of the model used in the buckling assessment is to be sufficient to account for the structure that is surrounding the panel of interest, and to reduce the uncertainties introduced through the boundary conditions.

2.1.9.2 In general, the model is to include more than one stiffener span in the stiffener direction and the portion between two primary support members in the direction normal to the stiffeners.

2.1.10 Element size for non-linear finite element models

2.1.10.1 The element size is to be small enough to describe the buckling deflections accurately.

2.1.10.2 The mesh size will depend on the complexity of the geometry and loads and the type of element used, but a minimum of five elements across a half-buckling wave length is generally required.

3 APPLICATION AND STRUCTURAL MODELLING PRINCIPLES

3.1 General

3.1.1 Scope

3.1.1.1 The following specifies the standard assumptions to be applied for the application of the advanced buckling method. These assumptions may be refined when the advanced buckling method is capable of more accurate representation of the structure.

3.1.2 Boundary conditions

3.1.2.1 The boundary conditions are to accurately account for the in-plane and rotational constraints imposed by the adjacent structures (such as stiffeners, primary support members and adjacent plates). The assumptions defined in *3.1.2.3* to *3.1.2.4* are to be applied.

3.1.2.2 The boundary conditions are divided into two main groups being representative for "free edge plating" and "continuous plating". The latter group represents large stiffened panels such as deck plating, bottom plating, ship sides, etc., while the other represents girders, floors, stringers, etc.

3.1.2.3 The continuous plating condition is representative for elements having in-plane support conditions by the surrounding structure. The boundary conditions for stiffened panels are to be taken as:

(a) panel edges perpendicular to stiffeners are to be considered simply supported

(b) panel edges parallel to stiffeners are to be considered as having rotational support equivalent to that provided by stiffeners within the panel

(c) the ends of stiffeners are to be considered as part of a continuous panel and supported sideways by the primary support members

(d) all edges of the panel are to be constrained to remain straight but are free to displace inwards.

3.1.2.4 Free edge plating conditions are representative for elements having weak in-plane support along one or more edges, e.g. vertically stiffened double bottom floors. The boundary conditions for stiffened panels are to be taken as:

(a) panel edges perpendicular to stiffeners are to be considered simply supported

(b) panel edges parallel to stiffeners are to be considered as having rotational support equivalent to that provided by stiffeners within the panel

(c) the ends of stiffeners are to be considered as supported sideways when attached directly to adjacent structure, otherwise they are to be assumed simply supported

(d) all free edges of the panel are free to displace inwards. Rotational restraints of the edge reinforcements on the free edges may be considered.

3.1.2.5 The boundary conditions for un-stiffened panels are to be taken as:

(a) panel edges are to be considered simply supported unless otherwise stated

(b) free edges of the panel, if any, are free to displace inwards. The continuous edges are to be constrained to remain straight.

3.1.3 Structural idealisation

3.1.3.1 The structural modelling and buckling assessment method applicable for free edge plating is to be taken as:

(a) parallel to the stiffener direction: one frame bay is normally sufficient for structures having significant stress gradients. For uniformly compressed elements with the free edges parallel to the stiffener direction, such as longitudinal girders, multi-bay models are to be considered

(b) normal to the stiffener direction: between primary support members, but may be limited to six stiffener spacings

(c) assessment method: Method 2 – buckling capacity with no allowance for redistribution of load unless otherwise specified.

3.1.3.2 The structural modelling and buckling assessment method applicable for continuous plating is to be taken as:

(a) parallel to the stiffener direction: at least two frame bays, in order to model imperfections between adjacent panels

(b) normal to the stiffener direction: between primary support members, but may be limited to six stiffener spacings

(c) assessment method: Method 1 – buckling capacity with allowance for redistribution of load unless otherwise specified.

4 ASSESSMENT CRITERIA

4.1 General

4.1.1 Buckling strength assessment methods

4.1.1.1 The buckling capacity value is to be based on one of the following assessment methods:

1. Buckling Capacity with allowance for redistribution of load
2. Buckling Capacity with no allowance for redistribution of load

The application of which assessment method to use is given in *3.1.3*

4.1.2 Method 1: Buckling capacity with allowance for redistribution of load

4.1.2.1 The buckling capacity value is to be taken as the load that results in the first occurrence of membrane yield stress anywhere in the stiffened panel. This includes the redistribution of load as indicated in *1.1.3.2*. In particular the following locations are to be checked for von Mises stresses equivalent to yield:

(a) at the edges of the plate

(b) along the line of intersection of the plate and stiffeners, especially at the ends of the stiffener and at the stiffener mid point

(c) along the flanges of the stiffeners, especially at the ends of the stiffener and at the stiffener mid point.

4.1.3 Method 2: Buckling capacity with no allowance for redistribution of load

4.1.3.1 The buckling capacity value or the load that results in the first occurrence of membrane yield stress anywhere in the stiffened panel, see *1.1.3.3*.

4.2 Utilisation Factors

4.2.1 General

4.2.1.1 The utilisation factor, η, is used as a measure of safety margin against buckling strength failure. The utilisation factor is defined as the ratio between the applied loads and the corresponding ultimate capacity or buckling strength.

4.2.1.2 A structure is considered to have an acceptable buckling strength if it satisfies the following criteria:

$$\eta_{act} \le \eta_{allow}$$

Where:

η_{allow} allowable buckling utilisation factor, as defined in *Section 9/2.2.5*

η_{act} actual buckling utilisation factor based on the applied design loads

4.2.1.3 For combined loads, the utilisation factor, η, is to be taken as the ratio between the applied equivalent load and the corresponding buckling capacity, see *Figure D.4.1*, and is to be taken as:

$$\eta = \frac{W_{act}}{W_u}$$

Where:

W_{act} applied equivalent load due to the combined membrane loads

$= \sqrt{\sigma_{dx}^2 + \sigma_{dy}^2 + \tau_d^2}$ N/mm²

W_u equivalent load due to the combined membrane loads which results in the buckling capacity point, see *Figure D.4.1*

$= \sqrt{\sigma_{cx}^2 + \sigma_{cy}^2 + \tau_{cr}^2}$ N/mm²

Where the combined loads are all factored by the same ratio and the applied pressure load is to be kept constant

σ_{dx} applied axial stress in x direction, in N/mm²

σ_{dy} applied axial stress in y direction, in N/mm²

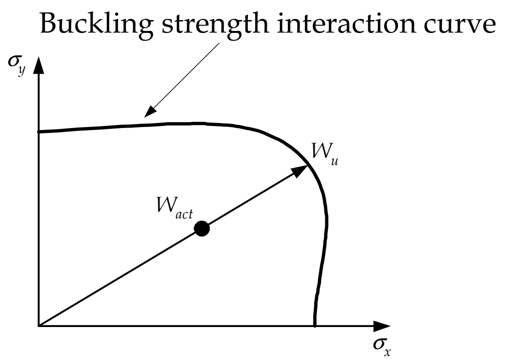
τ_d applied shear stress, in N/mm²

σ_{cx} buckling strength due to compression in x direction, in N/mm²

σ_{cy} buckling strength due to compression in y direction, in N/mm²

τ_{cr} buckling strength in shear, in N/mm²

Figure D.4.1
Definition of Utilisation Factor Example Showing a Bi-Axial Loading Pattern



5 STRENGTH ASSESSMENT (FEM) – BUCKLING PROCEDURE

5.1 General

5.1.1 Scope

5.1.1.1 The following procedure is to be used for the assessment of the buckling requirements for the Strength Assessment (FEM) as part of the Design Verification procedure, see *Section 9/2*.

5.1.1.2 All structural elements in the finite element analysis are to be assessed individually. Each stiffener with attached plate and all un-stiffened panels are to be assessed.

5.1.1.3 The buckling performance of each member is considered acceptable if it satisfies the following criterion:

$$\eta_{act} \leq \eta_{allow}$$

Where

η_{allow} allowable buckling utilisation factor, as defined in *Section 9/2.2.5*

η_{act} actual buckling utilisation factor based on the applied design loads, see *4.2.1*

5.2 Structural Modelling and Capacity Assessment Method

5.2.1 General

5.2.1.1 The longitudinally effective structure of the hull girder is to be modelled as stiffened panels or un-stiffened panels as specified in *Table D.5.1* and *Figure D.5.1*. These provide the standard assumptions to be used for the buckling capacity assessment method.

5.2.1.2 The structural models are to be based on the net thickness obtained by deducting the full corrosion addition, i.e. -1.0t_{corr}, and any owner's extras from the proposed thickness. This thickness reduction applies to the plating and the stiffener web and face plate.

5.2.2 Stiffened panels

5.2.2.1 Each stiffener with attached plate is to be represented as a stiffened panel of the extent defined in *Table D.5.1* and hence is assumed to be part of a larger structural entity to correctly model the overall buckling behaviour.

5.2.2.2 In general, the assessment method is to model changes in plate thickness, stiffener size and spacing. However where the advanced buckling method is unable to correctly model these changes, the calculations are to be performed separately for each stiffener and plate between the stiffeners. Plate thickness, stiffener properties and stiffener spacing at the considered location are to be assumed for the whole panel. If the plate thickness, stiffener properties and stiffener spacing varies within the stiffened panel, the calculations are to be performed for all configurations of the panel. Where the panel between stiffeners consists of several plate thickness the weighted average thickness may by used for the thickness of the plating for assessment of the corresponding stiffener/plating combination. Calculation of weighted average is to be in accordance with *5.2.3.3*. See *Figure D.5.6.*

5.2.3 Un-stiffened panels

5.2.3.1 The assessment method is to model changes in plate thickness and panel geometry.

5.2.3.2 In way of web frames, stringers and brackets, the geometry of the panel (i.e. plate bounded by web stiffeners/face plate) may not have a rectangular shape. Where the advanced buckling method is unable to correctly model the panel geometry, then an equivalent rectangular panel is to be defined as shown in *Figure D.5.5*. Where web stiffeners are not connected to the intersecting stiffeners, then the panel may be defined as shown in *Figure D.5.6*. The FE analysis is to represent the actual structure in order to derive realistic stress values for application to the equivalent rectangular panel. The stresses of all elements whose centroids are within the equivalent plate panel are to be considered for stress average in accordance with *5.3.2.1*.

5.2.3.3 Where the advanced buckling method is unable to correctly model changes in net plate thickness across a panel, and the panel consists of a number of finite plate elements, then the average thickness is to be taken as:

$$t_{avr} = \frac{\sum A_j \ t_j}{\sum A_j}$$

Where:

A_j area of the jth plate element making up the panel

t_j net thickness of the jth plate element making up the panel

Table D.5.1
Structural Elements for the Strength Assessment (FEM)

Structural Elements	Idealisation	Assessment method(1)	Normal panel definition(2)
Longitudinal structure, see *Figure D.5.1*			
Longitudinally stiffened panels Shell envelope Deck Inner hull Hopper tank side Longitudinal bulkheads Centreline bulkheads	Stiffened panel	Method 1	Length: between web frames Width: between primary support members (PSM)(2)
Double bottom longitudinal girders in line with longitudinal bulkhead or connected to hopper tank side	Stiffened panel	Method 1	Length: between web frames Width: full web depth
Web of horizontal girders in double side tank connected to hopper tank side	Stiffened panel	Method 1	Length: between web frames Width: full web depth
Web of double bottom longitudinal girders not in line with longitudinal bulkhead or not connected to hopper tank side	Stiffened panel	Method 2	Length: between web frames Width: full web depth
Web of horizontal girders in double side tank not connected to hopper tank side	Stiffened panel	Method 2	Length: between web frames Width: full web depth
Web of single skin longitudinal girders	Un-stiffened panel	Method 2	Between local stiffeners/face plate/PSM
Transverse structure, see *Figure D.5.2*			
Web of transverse deck girders including brackets	Un-stiffened panel	Method 2	Between local stiffeners/face plate/PSM
Vertical web in double side tank	Stiffened panel	Method 2	Length: full web depth Width: between primary support members
All irregularly stiffened panels, e.g. Web panels in way of hopper tank and bilge	Un-stiffened panel	Method 2	Between local stiffeners/face plate/PSM
Double bottom floors	Stiffened panel	Method 2	Length: full web depth Width: between primary support members
Vertical web frame including brackets	Un-stiffened panel	Method 2	Between vertical web stiffeners/face plate/PSM
Cross tie web plate	Un-stiffened panel	Method 2	Between vertical web stiffeners/face plate/PSM
Transverse Oil-tight and Watertight bulkheads, see *Figure D.5.3* and Transverse wash bulkheads, see *Figure D.5.4*			
All regularly stiffened bulkhead panels	Stiffened panel	Method 1	Length: between primary support members Width: between primary support members
Regularly stiffened bulkhead with secondary buckling stiffeners perpendicular to regular stiffeners (3)	Stiffened panel	Method 1	Length: between primary support members Width: between primary support members
All irregularly stiffened bulkhead panels, e.g. web panels in way of hopper tank and bilge	Un-stiffened panel	Method 2	Between local stiffeners/face plate
Web plate of bulkhead stringers including brackets	Un-stiffened panel	Method 2	Between web stiffeners /face plate
Transverse Corrugated bulkheads			
Upper/lower stool including stiffeners	Stiffened panel	Method 1	Length: between internal web diaphragms Width: length of stool side
Stool internal web diaphragm	Un-stiffened panel	Method 2	Between local stiffeners /face plate / PSM

<u>Note</u>

1. The assessment method specifies which buckling strength assessment method is to be used, see *4.1*
2. See structural idealisation, *3.1.3*.

3. The secondary stiffener can be modelled as “sniped” or “continuous”. The stiffener is considered “sniped” unless rotational end supports are provided at both ends

An area stiffened by irregular buckling stiffeners only should be assessed by considering each plate in the panel as Unstiffened panel using Method 2.

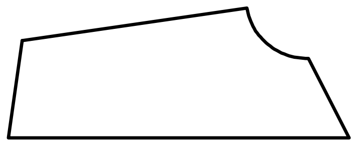
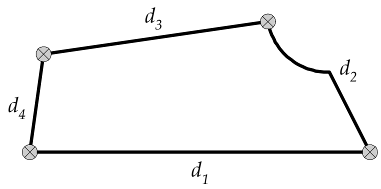
Figure D.5.5
Modelling of an Un-stiffened Panel with Irregular Geometry

(a) The four corners closest to a right angle, 90 degrees, in the bounding polygon for the plate are identified

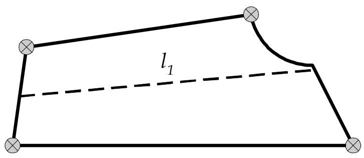


(b) The distances along the plate bounding polygon between the corners are calculated, i.e. the sum of all the straight line segments between the end points



(c) The pair of opposite edges with the smallest total length is identified, i.e. minimum of d_1+d_3 and d_2+d_4

(d) A line is joined between the middle points of the chosen opposite edges (i.e. a mid point is defined as the point at half the distance from one end). This line defines the longitudinal direction, x_1, for the capacity model. The length of the line defines the length of the capacity model, l_1 or d_2 measured from one end point.

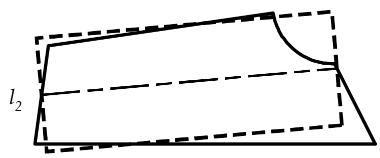


(e) The width of the model, l_2, is to be taken as:

$l_2 = A_{pt}/l_1$

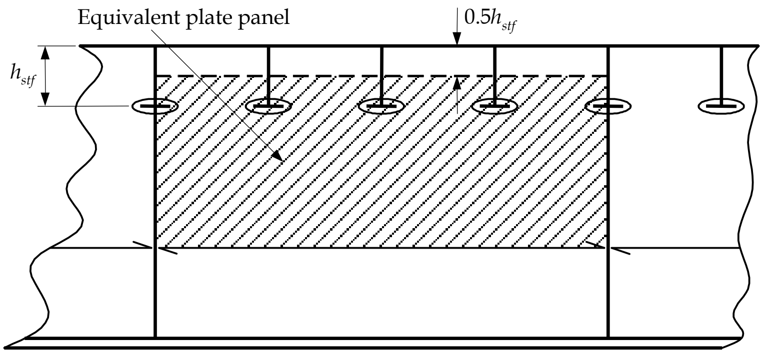
Where:

A_{pt} area of the plate



(f) The stress from the FE analysis are to be resolved into the local coordinate system of the equivalent rectangular panel. These stresses are to be used for the buckling assessment.

Figure D.5.6
Capacity Model for Web Plate



Note
The correction of panel breadth is applicable also for other slot configurations provided that the web or collar plate is attached to at least one side of the passing stiffener.

5.3 Load Application

5.3.1 General

5.3.1.1 The ultimate capacity or buckling strength is to be assessed for the effects of the combined bi-axial and shear membrane stresses acting on the structural panel.

5.3.1.2 The axial compressive and shear stress distribution is to be taken from the FE analysis and applied to the buckling model. The stresses from the FE analysis are not to be adjusted for the required change in thickness for buckling, i.e. -0.5t_{corr} used in the FE analysis and 1.0t_{corr} used for the buckling assessment.

5.3.1.3 The lateral pressure applied to the FE analysis is also to be applied to the buckling assessment.

5.3.1.4 The stresses may be applied by means of enforced displacements obtained from the finite element analysis to the panel edges or by loads applied to the panel edges.

5.3.1.5 Where the advanced buckling method is unable to correctly model changes in axial or shear stress across a panel, then the stresses and pressures may be averaged as defined in *5.3.2* and *5.3.3*.

5.3.2 Average membrane stresses

5.3.2.1 When the plate panel consists of a number of finite plate elements, the average membrane stress is to be calculated using a weighted average approach, as given by:

$$\sigma_{xm} = \frac{\sum_1^n A_i \sigma_{xmi}}{\sum_1^n A_i} \quad \text{N/mm}^2$$

$$\sigma_{ym} = \frac{\sum_1^n A_i \sigma_{ymi}}{\sum_1^n A_i} \quad \text{N/mm}^2$$

$$\tau_{xym} = \frac{\sum_1^n A_i \tau_{xymi}}{\sum_1^n A_i} \quad \text{N/mm}^2$$

Where:

σ_{xmi} membrane stress in x-direction at the centroid of the ith plate element of the panel, in N/mm²

σ_{ymi} membrane stress in y-direction at the centroid of the ith plate element of the panel, in N/mm²

τ_{xymi} membrane shear stress at the centroid of the ith plate element of the panel, in N/mm²

A_i area of the ith plate element making up the panel, in mm²

n number of elements in the panel

When σ_{xmi} or σ_{ymi} are in tension, then the respective value is to be taken as zero.

5.3.3 Average lateral pressure

5.3.3.1 Where the plate panel consists of a number of finite elements, the average pressure, P_{avr}, is to be calculated using a weighted average approach, as given by:

$$P_{avr} = \frac{\sum_1^n A_i \; P_i}{\sum_1^n A_i} \quad \text{kN/m}^2$$

Where:

P_i pressure acting on the ith plate element making up the panel, in kN/m²

A_i area of the ith plate element making up the panel, in mm²

n number of elements in the panel

5.4 Limitations of the Advanced Buckling Assessment Method

5.4.1 General

5.4.1.1 In the absence of a suitable advanced buckling method, then the following structural elements can be assessed according to *Table D.5.2.*

Table D.5.2
Requirements for structures where there is no advanced buckling method available

Structural elements	Buckling mode	Rule Reference
bilge plate	transverse elastic buckling	*Section 8/2.2.3*
primary support members	global (overall) buckling and torsional buckling	*Section 10/2.3*
web plate of primary support members in way of openings	buckling of web plate	*Section 10/3.4*
cross ties	global (overall) buckling	*Section 10/3.5*
corrugated bulkheads	flange panel buckling global (overall) buckling	*Section 10/3.2* *Section 10/3.5*

6 ULTIMATE HULL GIRDER STRENGTH ASSESSMENT

6.1 General

6.1.1 Scope

6.1.1.1 This procedure is required for the assessment of the ultimate hull girder strength assessment as part of the Design Verification procedure, see *Section 9/1*.

6.1.1.2 All structural elements of the strength deck are to be assessed individually.

6.2 Load Application

6.2.1 General

6.2.1.1 The uni-axial compressive stress used for the ultimate capacity assessment of longitudinally stiffened deck panels is to be calculated at the stiffener/plate intersection point.

6.2.1.2 The hull girder stresses are based on the section modulus properties using a deduction of half the corrosion addition, i.e. $-0.5t_{corr}$, and owner's extra from the proposed thickness.

6.2.1.3 Lateral pressure is not to be included in the buckling assessment for hull girder ultimate strength.

6.3 Structural Modelling and Buckling Assessment

6.3.1 General

6.3.1.1 The longitudinally effective structure of the strength deck is to be modelled as stiffened panels using Method 1 to derive the ultimate capacity.

6.3.1.2 Each deck stiffener with attached plate is to be represented as a stiffened panel with the transverse extent being between two adjacent primary support members.

6.3.1.3 The buckling capacity models are to be based on the net thickness obtained by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, and any owner's extras from the proposed thickness. This thickness reduction applies to the plating and the stiffener web and face plate.

6.3.1.4 In general, the assessment method is to correctly model changes in plate thickness, stiffener size and spacing. However where the advanced buckling method is unable to correctly model these changes, the calculations are to be performed separately for each stiffener and plate between the stiffeners. Plate thickness, stiffener properties and stiffener spacing at the considered location are to be assumed for the whole panel. If the plate thickness, stiffener properties and stiffener spacing varies within the stiffened panel, the calculations are to be performed for all configurations of the panel.

Common Structural Rules for Bulk Carriers and Oil Tankers

January 2014

Lloyd's Register

Common Structural Rules for Bulk Carriers and Oil Tankers

January 2014

Lloyd's Register

Foreword

These Rules were adopted on 18th December 2013.

These Rules enter into force on 1st July 2015 and supersede the following Rules:

- Common Structural Rules for double hull oil tankers, July 2012
- Common Structural Rules for bulk carriers, July 2012

These Common Structural Rules consist of two parts. Part One provides requirements common to both Double Hull Oil Tankers and Bulk Carriers and Part Two provides additional requirements applied to either Double Hull Oil Tankers or Bulk Carriers.

Revision History

The following table provides a revision history of these Rules.

No.	Issue Date	Adoption Date	Effective Date
1	1st Jan 2014	18th Dec 2013	1st Jul 2015

PART 1

GENERAL HULL REQUIREMENTS

Table of Contents

1 Jan 2014

Table of Contents

PART 1 CHAPTER 1

RULE GENERAL PRINCIPLES

Table of Contents

SECTION 1
APPLICATION

1 SCOPE OF APPLICATION

1.1 General

1.1.1

These Rules apply to the following ships:

a) Bulk carriers and double hull oil tankers and;

b) Being self-propelled ships with unrestricted navigation, and;

c) Contracted for construction on or after 1st July 2015.

Note 1: Unrestricted navigation means that the ship is not subject to any geographical restrictions (i.e. any oceans, any seasons) except that limited by the ship's capability for operation in ice.

Note 2: The 'contracted for construction' means the date on which the contract to build the ship is signed between the prospective owner and the builder. For further details regarding the date of 'contracted for construction', refer to IACS Procedural Requirement (PR) No. 29.

1.1.2

These Rules apply to ships constructed of welded steel structures and composed of stiffened plate panels. The ship's structure is to be longitudinally or transversely framed with full transverse bulkheads and intermediate web frames.

The typical arrangements of ships covered by the rules assume that the structural arrangements include:

- Double bottom, the depth of which is to be in accordance with applicable statutory requirements.
- Engine room located aft of the cargo tank/hold region.

1.1.3

Ships for which these Rules are not applicable are to comply with the relevant Rules of the Society.

1.2 Scope of application for bulk carriers

1.2.1

These Rules apply to the hull structures of single side skin and double side skin bulk carriers having a length *L* of 90 m or above.

Bulk carriers are ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo hold region and intended primarily to carry dry cargoes in bulk. Typical arrangements of bulk carriers are shown in Figure 1

Hybrid bulk carriers, where at least one cargo hold is constructed with hopper tank and topside tank, see typical arrangements in Figure 1, and other cargo holds are constructed without hopper tank and/or topside tanks, see examples of a transverse section in Figure 2, are to comply with the strength criteria defined in these Rules.

These Rules are not applicable to the following ship types:

- Ore carriers.
- Combination carrier.
- Woodchip carrier.
- Cement, fly ash and sugar carriers provided that loading and unloading is not carried out by grabs heavier than 10 tons, power shovels and other means which may damage cargo hold structure.
- Ships with inner bottom construction adapted for self-unloading.

Figure 1 : Typical arrangements of bulk carriers

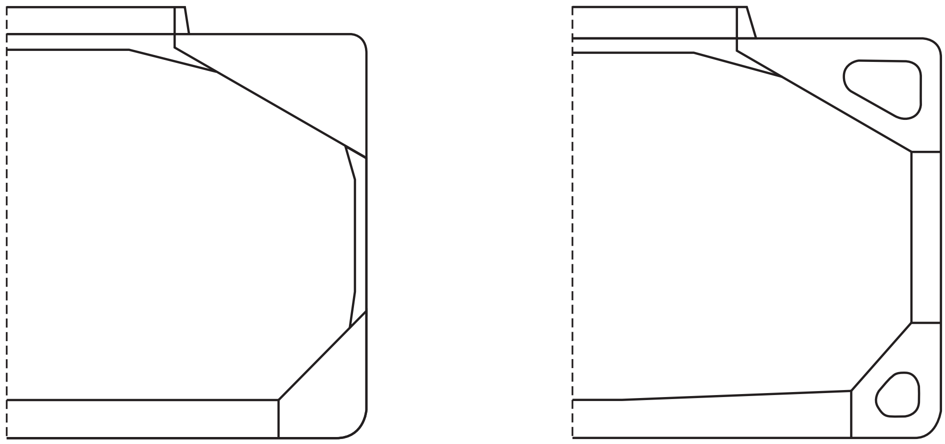

Figure 2 : Examples of transverse sections of cargo hold without hopper tank and/or topside tank

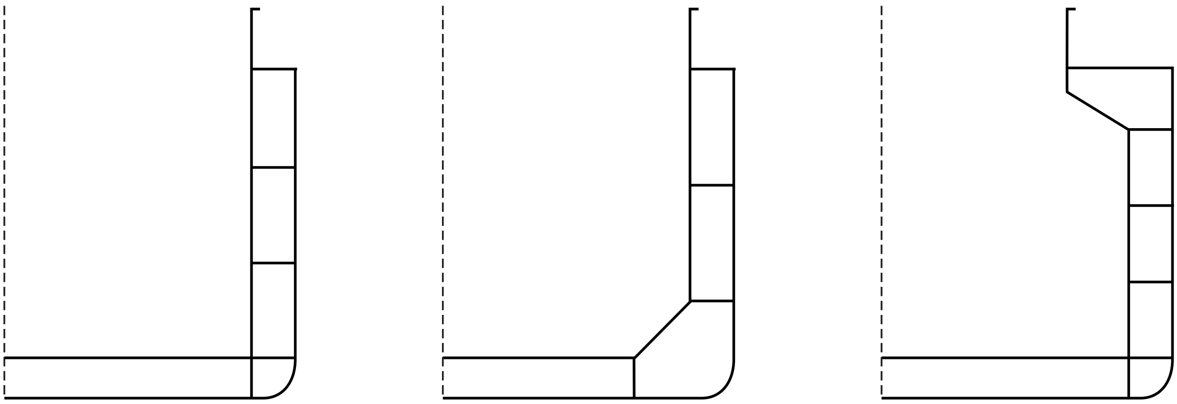


1.3 Scope of application for oil tankers

1.3.1 Length and structural arrangement application

These Rules apply to the hull structures of double hull oil tankers having length *L* of 150 m or above. Oil tanker is defined as a ship which has to comply with Annex I of MARPOL73/78.

The typical arrangements of oil tankers covered by the rules are shown in Figure 3 and assume that the structural arrangements include:

- Double side structure with breadth in accordance with statutory requirements.
- Side longitudinal, centreline longitudinal or transverse bulkheads of plane, corrugated or double skin construction.
- Single deck structure.

The cross sections shown in Figure 3 are typical examples only and other variations of cross tie and web frame arrangements are also covered.

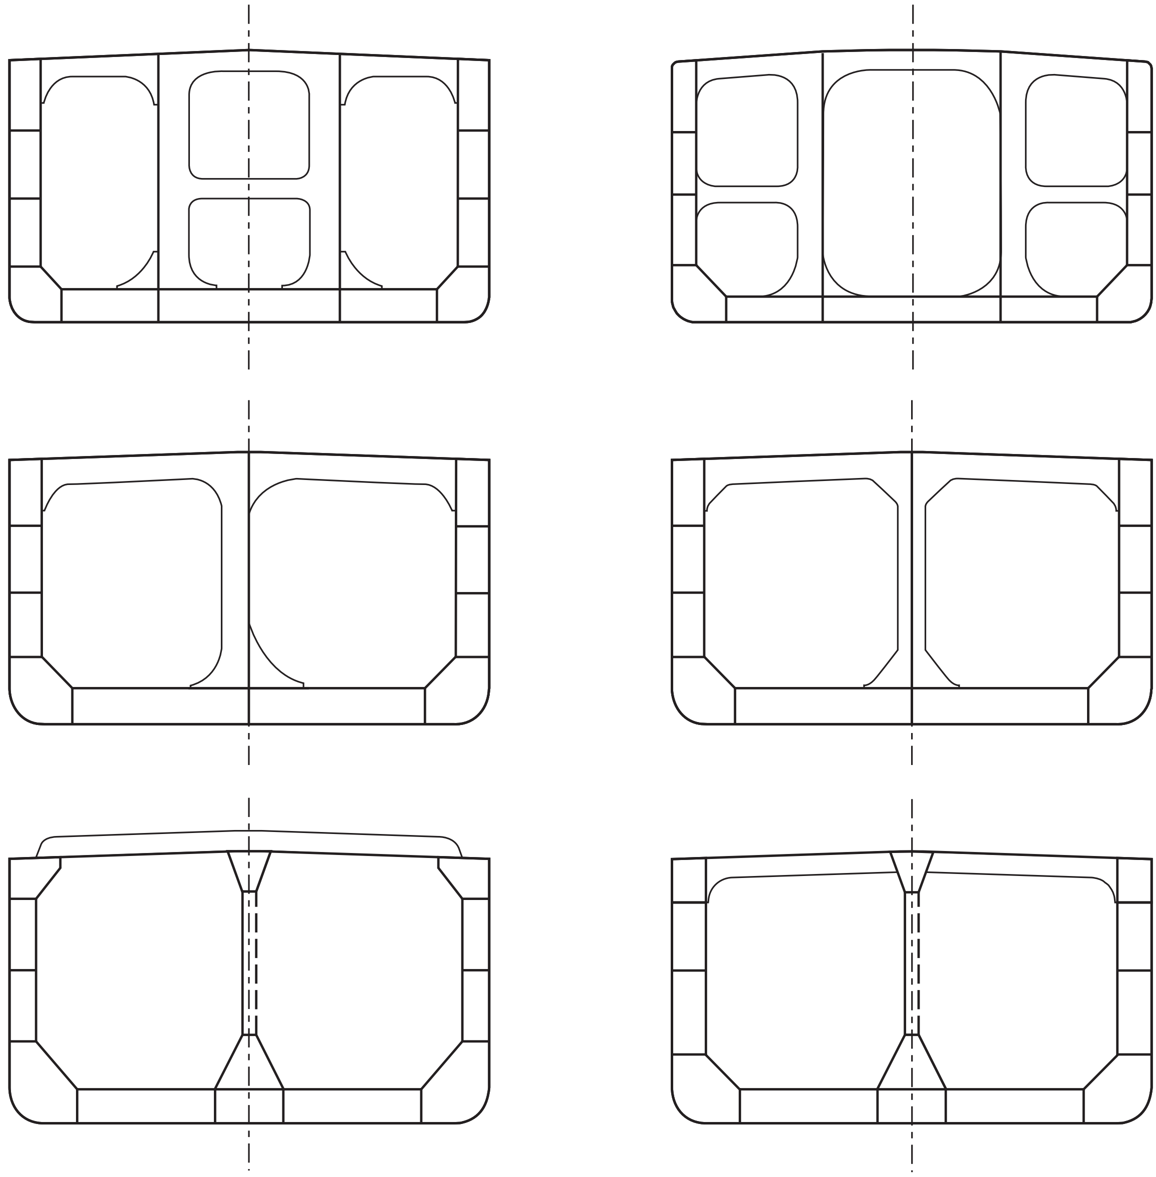
1.3.2 Cargo temperature application

The Rules are based on the following design temperatures for the cargo:

a) maximum temperature: 80°C

b) minimum temperature: 0°C.

Figure 3 : Typical arrangements of double hull oil tankers



2 RULE APPLICATION

2.1 Rule description

2.1.1 Rule structure

The rules contain 2 parts:

- Part 1: General hull requirements.
- Part 2: Ship types.

The parts are structured in chapters giving instructions for detail application and requirements which are applied in order to satisfy the rule objectives.

2.1.2 Numbering

The system of numbering is given in Table 1.

Table 1 : Rule numbering and abbreviations

Order	Levels	Example	Abbreviations
1	Part	Part 1 – General Hull Requirements	Pt 1
2	Chapter	Chapter 1 – Rule General Principle	Ch 1
3	Section	Section 1 – Application	Sec 1
4	Article	1. Scope of Application	[1]
5	Sub-article	1.1 General	[1.1]
6	Requirements	1.1.1 These Rules apply to...	[1.1.1]

2.2 Rule Requirements

2.2.1 Part 1

Part 1 of the Rules provides requirements common to all ship types as follow:

- Chapter 1: Rule General Principles.
- Chapter 2: General Arrangement Design.
- Chapter 3: Structural Design Principles.
- Chapter 4: Loads.
- Chapter 5: Hull Girder Strength.
- Chapter 6: Hull Local Scantling.
- Chapter 7: Direct Strength Analysis.
- Chapter 8: Buckling.
- Chapter 9: Fatigue.
- Chapter 10: Other Structure.
- Chapter 11: Superstructure, Deckhouses and Hull Outfitting.
- Chapter 12: Construction.
- Chapter 13: Ship in Operation - Renewal Criteria.

The provisions of the Ch 1, 2, 3, 4, 5, 6, 8, 12, 13 and Ch 10, Sec 4 are applicable all over the ships length.

The Ch 7, 9, 10 and 11 define their own scope of application.

2.2.2 Part 2

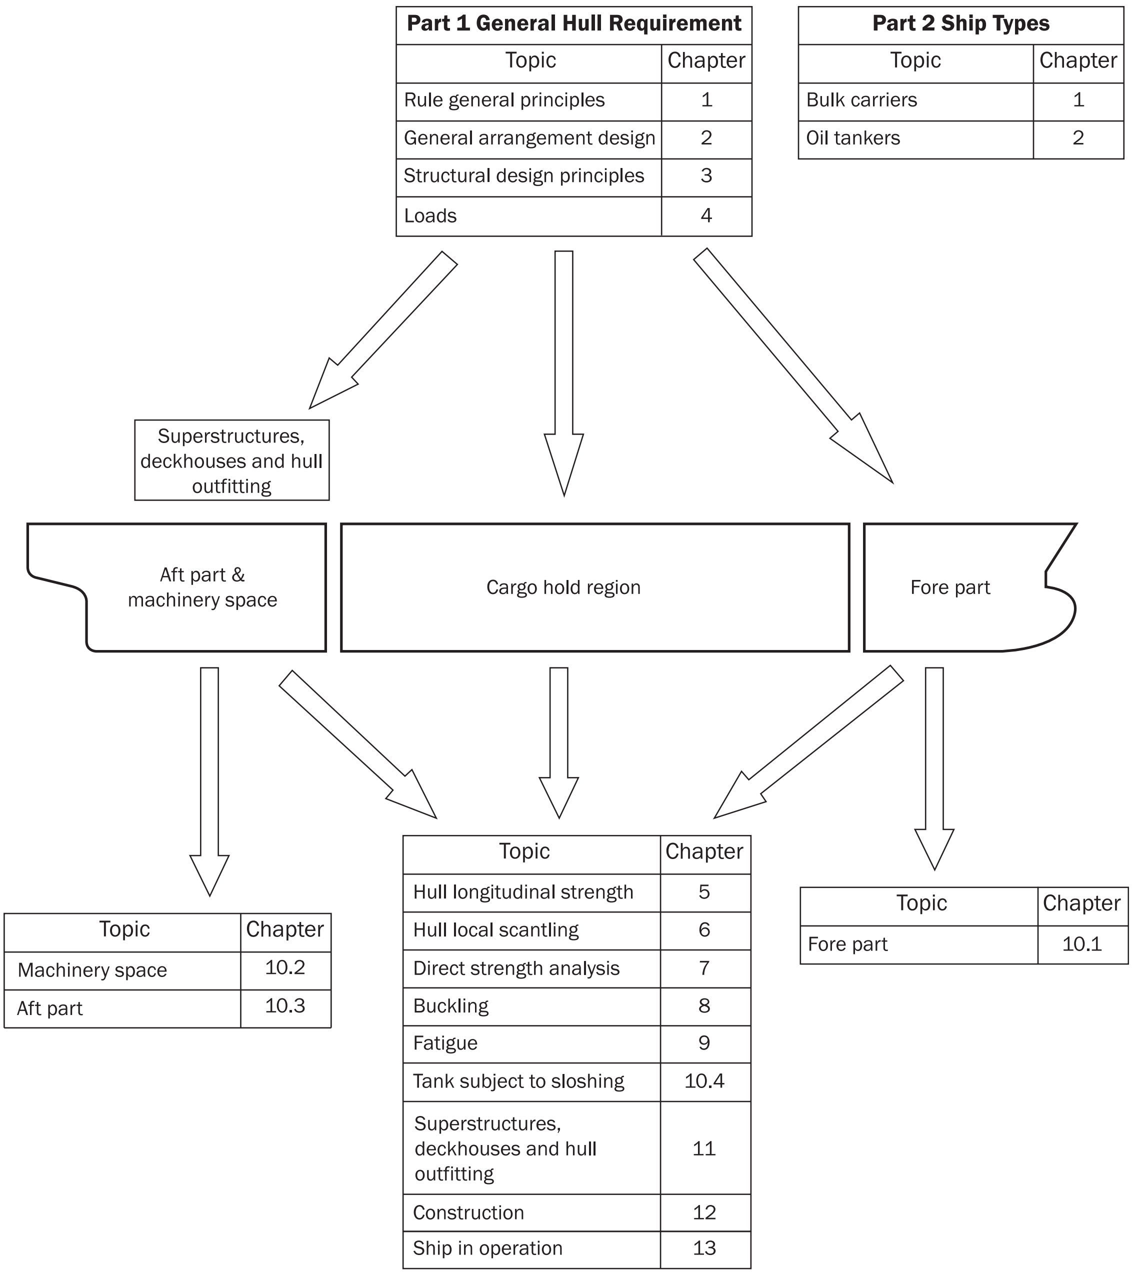
Part 2 of the Rules provides requirements coming in addition to those of Part 1 specific for ship types and is divided as follow:

- Chapter 1: Bulk Carriers.
- Chapter 2: Oil Tankers.

2.2.3 Application of the Rules

The ship arrangement and scantlings are to comply with the relevant parts and chapters of the Rules as it is given in Figure 4.

Figure 4 : Application of the Rules



2.2.4 General criteria

The ship arrangement, the proposed details and the offered scantling in net or gross, as the case may, are to comply with the requirements and the minimum scantling given in the Rules.

2.3 Structural requirements

2.3.1 Materials and welding

The Rules applies to welded hull structures made of steel having characteristics complying with requirements in Ch 3, Sec 1. The Rules applies also to welded steel ships in which parts of the hull, such as superstructures or small hatch covers, are built in material other than steel, complying with requirements in Ch 3, Sec 1.

Ships whose hull materials are different than those given in the first paragraph are to be individually considered by the Society, on the basis of the principles and criteria adopted in the present rules.

2.4 Ship parts

2.4.1 General

For the purpose of application of the present rules, the ship is considered as divided into the following five parts:

- Fore part.
- Cargo hold region.
- Machinery space.
- Aft part.
- Superstructures and deckhouses.

2.4.2 Fore part

The fore part is that part of the ship located forward of the collision bulkhead, i.e.:

- The fore peak structures.
- The stem.

2.4.3 Cargo hold region

The cargo hold region is the part of the ship that contains cargo holds, cargo tanks, and slop tanks. It includes the full breadth and depth of the ship, the collision bulkhead and the transverse bulkhead at its aft end. The cargo hold region does not include the pump room, if any.

2.4.4 Machinery space

The machinery space is the part of the ship between the aft peak bulkhead and the transverse bulkhead at the aft end of the cargo hold region and includes the pump room, if any.

2.4.5 Aft part

The aft part includes the structures located aft of the aft peak bulkhead.

2.4.6 Superstructures and deckhouses

A superstructure is a decked structure on the freeboard deck extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 0.04 B.

A deckhouse is a decked structure on the freeboard or superstructure deck which does not comply with the definition of a superstructure.

2.5 Limits of application to lifting appliances

2.5.1 Definition

The fixed parts of lifting appliances, considered as an integral part of the hull, are the structures permanently connected by welding to the ship's hull (for instance, crane pedestals, masts, king posts, derrick heel seatings, etc, excluding cranes, derrick booms, ropes, rigging accessories, and, generally, any removable parts), only for that part directly interacting with the hull structure.

2.5.2 Rule application for lifting appliances

The fixed parts of lifting appliances and their connections to the ship's structure may be covered by the Society's rules for lifting appliances, and/or by the certification (especially the issuance of the Register of ship's lifting appliances and cargo handling gear) of lifting appliances when required.

2.5.3 Structures supporting fixed lifting appliances

The design of the structure supporting fixed lifting appliances and the structure that might be called to support a mobile appliance is to be designed taking into account the additional loads that may be imposed on them by the operation of the appliance and environmental conditions as declared by the builder or its sub-contractors.

2.6 Novel designs

2.6.1

Ships with novel features or unusual hull design are to comply with Ch 1, Sec 3, [6.2].

3 CLASS NOTATIONS

3.1 Class notation CSR

3.1.1 Application

In addition to the class notations granted by the Society and to the service features and additional class notations defined hereafter, ships fully complying with these Rules are assigned the notation CSR.

3.2 Class notation for bulk carriers

3.2.1 Additional service features BC-A, BC-B and BC-C

The following requirements apply to ships, as defined in [1.2.1], having length *L* of 150 m or above.

Bulk carriers are to be assigned one of the following additional service features:

a) BC-A: For bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to BC-B conditions.

b) BC-B: For bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to BC-C conditions.

c) BC-C: For bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.

The following additional service features are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design in the following cases:

- {Maximum cargo density in t/m^3} for additional service features BC-A and BC-B if the maximum cargo density is less than 3.0 t/m^3, see also Ch 4, Sec 8, [4.1].
- {No MP} for all additional service features when the ship has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in Ch 4, Sec 8, [4.2.2].
- {Holds a, b, ... may be empty} for additional service feature BC-A, see also Ch 4, Sec 8, [4.1].

3.2.2 Additional class notation GRAB [X]

The additional class notation GRAB [X] is mandatory for ships having one of the additional service features BC-A or BC-B, according to [3.2.1]. For these ships, the requirements for the GRAB [X] notation given in Pt 2, Ch 1, Sec 6 are to comply with for an unladen grab weight X taken not less than:

- 35 t for ships with $L \geq 250$ m,
- 30 t for ships with $200 \text{ m} \leq L < 250$ m,
- 20 t otherwise.

For all other ships, the additional class notation GRAB [X] is voluntary.

4 APPLICATION OF THE RULES OF THE SOCIETY

4.1 Structural parts not covered by these Rules

4.1.1

Designer should take care that parts of the structure that these Rules do not cover comply with the relevant requirements of the Society's Rule.

SECTION 2
RULE PRINCIPLES

1 GENERAL

1.1 Rule objectives

1.1.1

The objectives of the Rules are to establish the classification minimum requirements to mitigate the risks of major hull structural failure in order to help improve the safety of life, environment and property and to contribute to the durability of the hull structure for the ship's design life.

1.1.2

The sub-sections contain:

- The general assumptions pertaining to the design, construction and operation of the ship and give information on the assumed roles of the Society, builders, designers and owners.
- The design basis which specifies the premises on which the Rules are based in terms of design parameters and assumptions about the ship operation.
- The design principles which define the fundamental principles used for the structural requirements in the Rules with respect to loads and structural capacity.
- The rule design methods which describe how the design principles are applied and the criteria are used in view of [1.1.1].

2 GENERAL ASSUMPTIONS

2.1 International and national regulations

2.1.1

Ships are to be designed, constructed and operated in compliance with the regulatory framework prescribed by the International Maritime Organisation (IMO) and implemented by National Administrations or the Society on their behalf. The builder is to give due consideration to the influence on the structural design and arrangement from the relevant requirements of the International Labour Organization (ILO) implemented by National Administrations or the Society on their behalf.

2.1.2

The Rules are based on the assumption that the applicable statutory requirements are complied with.

2.2 Application and implementation of the Rules

2.2.1

The Society develops and publishes the rules for classification of ships, containing minimum requirements for the hull structure and essential engineering systems. The Society verifies compliance with the classification requirements and the applicable international regulations when authorised by a National Administration during design, construction and operation of the ship.

2.2.2

These Rules address the hull structural aspects of classification and do not include requirements related to the verification of compliance with the Rules during construction and operation. In order to achieve the safety level targeted by the Rules, a number of aspects related to design, construction and operation of the ship are assumed to be adhered to by the parties involved in the application and implementation of the Rules. A summary of these assumptions are given in the following:

a) General aspects:

- Relevant information and documentation involved in the design, construction and operation is communicated between the builder, the designer, the Society and the owner as agreed between builder and owner. Design documentation according to Rule requirements is provided.
- Quality systems are applied to the design, construction, operation and maintenance activities by owners and other relevant parties to ensure the compliance with the requirements of the Rules.

b) Design aspects:

- The owner specifies the intended use of the ship, and the ship is designed according to operational requirements as well as the structural requirements given in the Rules.
- The builder identifies and documents the operational limits for the ship so that the ship can be safely and efficiently operated within these limits.
- Verification of the design is performed by the builder to check compliance with provisions contained in the Rules in addition to national and international regulations.
- The design is performed by appropriately qualified, competent and experienced personnel.
- The Society performs a technical appraisal of the design plans and related documents for a ship to verify compliance with the appropriate classification Rules.
- For spaces where lighting and ventilation are to be fitted, the builder is to give consideration to the influence on the structural design and arrangement from the relevant requirements of International Conventions such as SOLAS and MLC2006 Regulation 3.1 - Accommodation and recreational facilities, and Society's rules if any. For general guidance, human element factors may be considered based on IACS Recommendation No. 132 and/or an ergonomic standard accepted by the Society.
- For spaces normally occupied or manned by shipboard personnel where noise is to be minimised, the builder is to give consideration to the influence on the structural design and arrangement from the relevant requirements of SOLAS Ch II-1, Reg.3-12 and "The Code on Noise Levels Onboard Ships" adopted at MSC.337(91).
- For spaces normally occupied or manned by shipboard personnel where vibration is to be minimised, the builder is to give consideration to the influence on the structural design and arrangement from the relevant requirements of relevant statutory requirements such as MLC 2006 Regulation 3.1 - Accommodation and recreational facilities. For general guidance, human element factors may be considered based on IACS Recommendation No. 132 or on an ergonomic standard accepted by the Society.

c) Construction aspects:

- The builder provides adequate supervision and quality control during the construction.
- Construction is carried out by qualified and experienced personnel.
- Workmanship, including alignment and tolerances, is in accordance with acceptable shipbuilding standards.
- The Society performs surveys to verify that the construction and quality control are in accordance with the classification features of approved plans and procedures.

d) Operational aspects:

- Personnel involved in operations are aware of, and comply with, the operational limitations of the ship.

- Operations personnel receive sufficient training such that the ship is properly handled so that the loads and resulting stresses imposed on the structure are minimised.
- The ship is maintained in adequate condition and in accordance with the Society survey scheme and international and national regulations and requirements.
- The Society performs surveys to verify that the ship is maintained in class in accordance with the Society survey scheme.

3 DESIGN BASIS

3.1 General

3.1.1

This sub-section specifies the design parameters and the assumptions about the ship operation that are used as the basis of the design principles of the Rules.

3.1.2

Ships are to be designed to withstand, in the intact condition, the environmental conditions as defined in [5.3.2] and [5.3.3] anticipated during the design life, for the appropriate loading conditions. Structural strength is to be determined against buckling and yielding. Ultimate strength calculations have to include ultimate hull girder capacity and ultimate strength of plates and stiffeners.

3.1.3 Residual strength

Ships having a length *L* of 150 m or above are to be designed to have sufficient reserve strength to withstand the loads in damaged conditions, e.g. collision, grounding or flooded scenarios. Residual strength calculations are to take into account the ultimate reserve capacity of the hull girder, considering permanent deformation and post-buckling behaviour as specified in Ch 5, Sec 3.

3.1.4 Finite element analysis

The scantling of the structural members within the cargo hold region of ships having a length *L* of 150 m or above is to be assessed according to the requirements specified in Pt 1, Ch 7.

3.1.5 Fatigue life

Ships having a length *L* of 150 m or above are to be assessed according to the design fatigue life for structural details specified in Pt 1, Ch 9.

3.1.6

The Rules are applicable for ships in compliance with the specified design basis. Special consideration is given to deviations from this design basis.

3.1.7

The design basis used for the design of each ship, as communicated by the builder to the owner, is to be documented and submitted to the Society as part of the design review and approval. All changes of the design basis are to be formally advised to the Society and the owner for approval.

3.2 Hull form limit

3.2.1

The Rules assume the following hull form with respect to environmental loading:

- $L < 500$ m

- $C_B > 0.6$
- $L/B > 5$
- $B/D < 2.5$

For ships over 350 m in length, special consideration is to be made for the wave loads by the Society.

3.3 Design life

3.3.1

A design life of 25 years is assumed for selecting ship design parameters. The specified design life is the nominal period that the ship is assumed to be exposed to operating conditions.

3.4 Environmental conditions

3.4.1 North Atlantic wave environment

The rule requirements are based on a ship trading in the North Atlantic wave environment for its entire design life.

3.4.2 Wind and current

The effects of wind and current with regard to the strength of the structure are not considered.

3.4.3 Ice

The effects of ice and ice accretion are not taken into account by the Rules.

3.4.4 Design temperatures

The Rules assume that the structural assessment of hull strength members is valid for the following design temperatures:

- Lowest mean daily average temperature in air is -10°C.
- Lowest mean daily average temperature in seawater is 0°C.

Ships intended to operate in areas with lower mean daily average temperature, e.g. regular service during winter seasons to Arctic or Antarctic waters are subject to the requirements as specified by the Society.

In the above, the following definitions apply:

Mean : Statistical mean over observation period (at least 20 years).

Daily Average : Average during one day and night.

Lowest : Lowest during year.

For seasonally restricted service the lowest value within the period of operation applies.

3.4.5 Thermal loads

The effects of thermal loads and residual stresses are not taken into account in the Rules.

3.5 Operating conditions

3.5.1

The Rules specify minimum loading conditions that are to be assessed for compliance.

Specification of loading conditions other than those required by the Rules is the responsibility of the owner. These other loading conditions are to be documented and also be assessed for compliance.

3.5.2

The Rules assume the following:

- The ballast cargo hold of bulk carriers is not to be partly filled in seagoing operations.
- Ballasting and deballasting operations in the ballast cargo hold of bulk carriers are not to be performed when the weather is not fair.

3.6 Operating draughts

3.6.1

The design operating draughts are to be specified by the builder/designer subject to acceptance by the owner and are to be used to derive the appropriate structural scantlings. All operational loading conditions in the loading manual are to comply with the specified design operating draughts. The following design operating draughts are as a minimum to be considered:

- Scantling draught for the assessment of structure.
- Minimum ballast draught at midship for assessment of structure.
- Minimum heavy ballast draught at midship for assessment of bulk carrier structure.
- Minimum forward draughts for the assessment of bottom structure forward subjected to slamming loads, T_{F-e} and T_{F-f}, with and without ballast tanks in way filled.

  T_{F-e} and T_{F-f} are defined in Ch 4, Sec 5, [3.2.1]
- For oil tankers: maximum draughts amidships for both conditions:
  - with all cargo tanks abreast empty.
  - with centre cargo tank empty and wing cargo tanks full.
  - with centre cargo tank full and wing cargo tanks empty.
- For bulk carriers carrying steel coils: maximum draught amidships for steel coil loading conditions.

3.7 Internal environment

3.7.1 Oil cargo density for strength assessment

A density of 1.025 t/m^3, or a higher value if specified by the designer, is to be used for oil cargoes for the strength assessment of all relevant tank structures.

3.7.2 Oil cargo density for fatigue assessment

For the fatigue assessment of cargo tank structures, the mean density is to be taken as 0.9 t/m^3, or a higher value if specified by the designer.

3.7.3 Dry cargo density

The density for dry bulk cargo is to be taken according to the specifications in Ch 4, Sec 6, [2.3].

3.7.4 Water ballast density

A density of 1.025 t/m^3 is to be used for water ballast.

3.8 Structural construction and inspection

3.8.1

The structural requirements included in the Rules are developed with the assumption that construction and repair follow acceptable shipbuilding and repair standards and tolerances. The Society may require that

additional attention is paid to critical areas of the structure by the builder during construction and by the owner for repair after the ship's delivery.

3.8.2

As an objective, ships are to be built in accordance with controlled quality production standards using approved materials as necessary.

3.8.3

The Rules define the renewal criteria for the individual structural items. The structural requirements included are developed on the assumption that the structure is subject to appropriate monitoring by the owner once the ship is in operation and to periodical survey in accordance with Society rules and regulations.

3.8.4

Tank strength and tightness testing are to be carried out as a part of the verification scheme according to the Rules and/or documents of the individual Society which incorporate IACS UR S14.

3.8.5

Specifications for material manufacturing, assembling, joining and welding procedures, steel surface preparation and coating are to be included in the ship construction quality procedures. It is assumed that the owner has approved these builder specifications.

3.9 Maximum service speed

3.9.1

The maximum service speed is to be specified in the design specification. Although the hull structure verification criteria takes into account the service speed this does not relieve the responsibilities of the owner and personnel to properly handle the ship, see item (d) in [2.2.2].

3.10 Owner's extras

3.10.1

Owner's specification of requirements above the general classification or statutory requirements may affect the structural design. Owner's extras may include requirements for:

- Vibration analysis.
- Maximum percentage of high strength steel.
- Additional scantlings above that required by the Rules.
- Additional design margin on the loads specified by the Rules, etc.
- Improved fatigue resistance, in the form of a specified increase in design fatigue life or equivalent.

Owner's extras are not specified by these Rules. Owner's extras, if any, that may affect the structural design are to be clearly specified in the design documentation.

4 DESIGN PRINCIPLES

4.1 Overall principles

4.1.1 Introduction

This sub-section defines the underlying design principles of the Rules in terms of loads, structural capacity models and assessment criteria and also construction and in-service aspects.

4.1.2 General

The Rules are based on the following overall principles:

- The safety of the structure can be assessed by addressing the potential structural failure mode(s) when the ship is subjected to operational loads and environmental loads/conditions.
- The design complies with the design basis, see Ch 1, Sec 3.
- The structural requirements are based on consistent design load sets which cover the appropriate operating modes of a bulk carrier or oil tanker.

The ship's structure is designed such that:

- It has a degree of redundancy. The ship's structure should work in a hierarchical manner and, in principle, failure of structural elements lower down in the hierarchy do not result in immediate consequential failure of elements higher up in the hierarchy.
- It has sufficient reserve strength to withstand the wave and internal loads in damaged conditions that are reasonably foreseeable e.g. collision, grounding or flooding scenarios. Residual strength calculations are to take into account the ultimate reserve capacity of the hull girder, considering permanent deformation and post-buckling behaviour.
- The incidence of in-service cracking is minimised, particularly in locations which affect the structural integrity or containment integrity, affect the performance of structural or other systems or are difficult to inspect and repair.
- It has adequate structural redundancy to survive in the event that the structure is accidentally damaged by a minor impact leading to flooding of any compartment.

4.1.3 Limit state design principles

The rules are based on the principles of limit state design.

Limit state design is a systematic approach where each structural element is evaluated with respect to possible failure modes related to the design scenarios identified. For each retained failure mode, one or more limit states may be relevant. By consideration of all relevant limit states, the limit load for the structural element is found as the minimum limit load resulting from all the relevant limit states.

The limit states defined in Ch 3, Sec 5 are divided into the four categories: Serviceability Limit State (SLS), Ultimate Limit State (ULS), Fatigue Limit State (FLS) and Accidental Limit State (ALS).

The Rules include requirements to cover the relevant limit states for the various parts of the structure.

4.2 Loads

4.2.1 Design load scenarios

The structural assessment of the structure is based on the design load scenarios encountered by the ship. Refer to Ch 4, Sec 7.

The design load scenarios are based on static and dynamic loads as given below:

- Static design load scenario (S):

  Covers application of relevant static loads and typically covers load scenarios in harbour, sheltered water, or tank testing.

- Static plus Dynamic design load scenario (S+D):

  Covers application of relevant static loads and simultaneously occurring dynamic load components and typically cover load scenarios for seagoing operations.

- Impact design load scenario (I):

  Covers application of impact loads such as bottom slamming and bow impact encountered during seagoing operations.

- Sloshing design load scenario (SL):

  Covers application of sloshing loads encountered during seagoing operations.
- Fatigue design load scenario (F):

  Covers application of relevant dynamic loads.
- Accidental design load scenario (A):

  Covers application of some loads not occurring during normal operations.

4.3 Structural capacity assessment

4.3.1 General

The basic principle in structural design is to apply the defined design loads, identify plausible failure modes and employ appropriate capacity models to verify the required structural scantlings.

4.3.2 Capacity models for ULS, SLS and ALS

The strength assessment method is to be capable of analysing the failure mode in question to the required degree of accuracy.

The structural capacity assessment methods are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods.

The formulae used to determine stresses, deformations and capacity are deemed appropriate for the selected capacity assessment method and the type and magnitude of the design load set.

4.3.3 Capacity models for FLS

The fatigue assessment method provides Rule requirements to assess structural details against fatigue failure.

The fatigue capacity model is based on a linear cumulative damage summation (Palmgren-Miner's rule) in combination with a design S-N curve, a reference stress range and an assumed long-term stress distribution curve.

The fatigue capacity assessment models are in either a prescriptive format or require the use of more advanced calculations, such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads.

4.3.4 Net scantling approach

The objective of the net scantling approach is to:

- Provide a relationship between the thickness used for strength calculations during the newbuilding stage and the minimum thickness accepted during the operational phase.
- Enable the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

The net scantling approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the overall average corrosion of larger areas, such as primary supporting members and the hull girder. Both the local and global corrosion are used as a basis for the newbuilding review and are to be assessed during operation of the ship.

No credit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

The application of the net thickness approach to assess the structural capacity is specified in Ch 3, Sec 2.

4.3.5 Intact structure

All strength calculations for ULS, SLS and FLS are based on the assumption that the structure is intact. The residual strength of the ship in a structurally damaged condition is assessed for ALS.

5 RULE DESIGN METHODS

5.1 General

5.1.1 Design methods

Scantling requirements are specified to cover the relevant limit states (ULS, SLS, FLS and ALS) as necessary for various structural parts.

The criteria for the assessment of the scantlings are based on one of the following design methods:

- Working Stress Design (WSD) method, also known as the permissible or allowable stress method.
- Partial Safety Factor (PSF) method, also known as Load and Resistance Factor Design (LRFD).

For both WSD and PSF, two design assessment conditions and corresponding acceptance criteria are given. These conditions are associated with the probability level of the combined loads, A and B.

- The WSD method has the following composition:

  $W_{stat} \leq \eta_1 R$ for condition A.

  $W_{stat} + W_{dyn} \leq \eta_2 R$ for condition B.

  where:

  W_{stat} : Simultaneously occurring static loads (or load effects in terms of stresses).

  W_{dyn} : Simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components.

  R : Characteristic structural capacity (e.g. specified minimum yield stress or buckling capacity).

  η_i : Permissible utilisation factor (resistance factor). The utilisation factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure.

- The PSF method has the following composition:

  $\gamma_{stat-1} W_{stat} + \gamma_{dyn-1} W_{dyn} \leq \frac{R}{\gamma_R}$ for condition A.

  $\gamma_{stat-2} W_{stat} + \gamma_{dyn-2} W_{dyn} \leq \frac{R}{\gamma_R}$ for condition B.

  where:

  γ_{stat-i} : Partial safety factor that accounts for the uncertainties related to static loads.

  γ_{dyn-i} : Partial safety factor that accounts for the uncertainties related to dynamic loads.

  γ_R : Partial safety factor that accounts for the uncertainties related to structural capacity.

The acceptance criteria for both the WSD method and PSF method are calibrated for the various requirements such that consistent and acceptable safety levels for all combinations of static and dynamic load effects are derived.

5.2 Minimum requirements

5.2.1

Minimum requirements specify the minimum scantling requirements which are to be applied irrespective of all other requirements, hence thickness below the minimum is not allowed.

The minimum requirements are usually in one of the following forms:

- Minimum thickness, which is independent of the specified minimum yield stress.
- Minimum stiffness and proportion, which are based on buckling failure modes.

5.3 Load-capacity based requirements

5.3.1 General

In general, the Working Stress Design (WSD) method is applied in the requirements, except for the hull girder ultimate strength criteria where the Partial Safety Factor (PSF) method is applied. The partial safety factor format is applied for this highly critical failure mode to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

The identified load scenarios are addressed by the Rules in terms of design loads, design format and acceptance criteria set, as given in Table 2. The table is schematic and only intended to give an overview.

Load based prescriptive requirements provide scantling requirements for all plating, local support members, most primary supporting members and the hull girder and cover all structural elements including deckhouses, foundations for deck equipment.

In general, these requirements explicitly control one particular failure mode and hence several requirements may be applied to assess one particular structural member.

5.3.2 Design loads for SLS, ULS and ALS

The structural assessment of compartment boundaries, e.g. bulkheads, is based on loading condition deemed relevant for the type of ship and the operation the ship is intended for.

To provide consistency of approach, standardised Rule values for parameters, such as GM, R_{roll}, T_{sc} and C_B are applied to calculate the Rule load values.

The probability level of the dynamic global, local and impact loads (see Table 1) is 10^{-8} and is derived using the long-term statistical approach.

The probability level of the sloshing loads (see Table 1) is 10^{-4}.

The design load scenarios for structural verification apply the applicable simultaneously acting local and global load components. The relevant design load scenarios are given in Ch 4, Sec 7.

The simultaneously occurring dynamic loads are specified by applying a dynamic load combination factor to the dynamic load values given in Ch 4. The dynamic load combination factors that define the dynamic load cases are given in Ch 4, Sec 2.

Design load conditions for the hull girder ultimate strength are given in Ch 5, Sec 2.

5.3.3 Design loads for FLS

For the fatigue requirements given in Ch 9, the load assessment is based on the expected load history and an average approach is applied. The expected load history for the design life is characterised by the 10^{-2} probability level of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding stresses.

The considered wave induced loads include:

- Hull girder loads (i.e. vertical and horizontal bending moments).
- Dynamic wave pressures.
- Dynamic pressure from cargo.

The load values are based on Rule parameters corresponding to the loading conditions, e.g. GM, C_B, and the applicable draughts at amidships.

The simultaneously occurring dynamic loads are accounted for by combining the stresses due to the various dynamic load components. The stress combination procedure is given in Ch 9.

Table 1 : Load scenarios and corresponding rule requirements

Operation	Load type	Design load scenario (specified in Ch 4, Sec 7)	Acceptance criteria (specified in Ch 6 and Ch 7)
Seagoing operations			
Transit	Static and dynamic loads in heavy weather	S + D	AC-SD
	Impact loads in heavy weather	Impact (I)	AC-I
	Internal sloshing loads	Sloshing (SL)	AC-S
	Cyclic wave loads	Fatigue (F)	-
BWE by flow through or sequential methods	Static and dynamic loads in heavy weather	S + D	AC-SD
Harbour and sheltered operations			
Loading, unloading and ballasting	Typical maximum loads during loading, unloading and ballasting operations	S	AC-S
Tank testing	Typical maximum loads during tank testing operations	S	AC-S
Special conditions in harbour	Typical maximum loads during special operations in harbour, e.g. propeller inspection afloat or dry-docking loading conditions	S	AC-S
Accidental condition			
Flooded conditions	Typically maximum loads on internal watertight subdivision structure in accidental flooded conditions	A	AC-SD AC-S

Table 2 : Acceptance criteria - prescriptive requirements

Acceptance criteria	Plate panels and local support members (1)		Primary supporting members (1)		Hull girder members	
	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC-S AC-SD	Permissible stress: Ch 6, Sec 4 Ch 6, Sec 5	Control of stiffness and proportions: Ch 8, Sec 2	Permissible stress: Ch 6, Sec 6 Pt 2, Ch 1, Sec 4 Pt 2, Ch 2, Sec 3	Control of stiffness and proportions: Ch 8, Sec 1 Ch 8, Sec 2 Pillar buckling	Permissible stress: Ch 5, Sec 1	Allowable buckling utilisation factor: Ch 8, Sec 1, [3]
AC-I	Plastic criteria: Ch 10, Sec 1, [3]	Control of stiffness and proportions: Ch 8, Sec 2 Ch 10, Sec 1, [3]	Plastic criteria: Ch 10, Sec 1, [3]	Control of stiffness and proportions: Ch 8, Sec 2 Ch 10, Sec 1, [3]	N/A	N/A

(1) Refer to Ch 10 for Other structures and to Ch 11 for Superstructure, deckhouses and hull outfitting

Table 3 : Acceptance criteria - FE analysis

Acceptance criteria	Cargo hold analysis		Fine mesh analysis
	Yield	Buckling	Yield
AC-S AC-SD	Permissible stress: Ch 7, Sec 2, [5]	Allowable buckling utilisation factor: Ch 8, Sec 1, [3]	Permissible Von Mises stress: Ch 7, Sec 3, [6] Screening criteria: Ch 7, Sec 3, [3.3]

5.3.4 Structural response analysis

In general, the following approaches are applied for determination of the structural response to the applied design load combinations.

a) Beam theory:

- Used for prescriptive requirements.

b) FE analysis:

- Coarse mesh for cargo hold model.
- Fine mesh for local models.
- Very fine mesh for fatigue assessment.

5.4 Acceptance criteria

5.4.1 General

The acceptance criteria are categorised into three acceptance criteria sets. These are explained below and shown in Table 2 and Table 3. The specific acceptance criteria set that is applied in the rule requirements is dependent on the probability level of the characteristic combined load.

The acceptance criteria set AC-S is applied for the static design load combinations, and for the sloshing design loads. The allowable stress for such loads is lower than that for an extreme load to take into account effects of:

- Repeated yield.
- Allowance for some dynamics.
- Margins for some selected limited operational mistakes.

The acceptance criteria set AC-SD is applied for the S+D design load combinations where considered loads are extreme loads with a low probability of occurrence.

The acceptance criteria set AC-I is typically applied for impact loads, such as bottom slamming and bow impact loads.

5.4.2 Acceptance criteria

The specific acceptance criteria applied in the working stress design requirements are given in the detailed Rule requirements in Pt 1, Ch 5 to Ch 8, Ch 10, Ch 11 and Pt 2, Ch 1 and Ch 2.

To provide a general informational summary overview of the acceptance criteria, refer to Table 2 and Table 3 below for the different design load scenarios covered by these Rules for the yield and buckling failure modes. For the yield criteria the permissible stress is proportional to the specified minimum yield stress of the material. For the buckling failure mode, the acceptance criteria are based on the control of stiffness and proportions as well as on the buckling utilisation factor.

5.5 Design verification

5.5.1 Design verification – hull girder ultimate strength

The requirements for the ultimate strength of the hull girder are based on a Partial Safety Factor (PSF) method. A safety factor is assigned to each of the basic variables, the still water bending moment, wave bending moment and ultimate capacity. The safety factors were determined using a structural reliability assessment approach, the long-term load history distribution of the wave bending moment was derived using ship motion analysis techniques suitable for determining extreme wave bending moments.

The purpose of the hull girder ultimate strength verification is to demonstrate that one of the most critical failure modes of a ship is controlled.

5.5.2 Design verification – global finite element analysis

The global finite element analysis is used to verify the scantlings given by the load-capacity based prescriptive requirements to better consider the complex interactions between the ship's structural components, complex local structural geometry, change in thicknesses and member section properties as well as the complex load regime with sufficient accuracy.

A linear elastic three dimensional finite element analysis of the cargo region (a FE model length of three holds is required) is carried out to assess and verify the structural response of the proposed hull girder and primary supporting members and assist in specifying the scantling requirements for the primary supporting members. The purpose with the finite element analysis is to verify that the stresses and buckling capability of the primary supporting members are within acceptable limits for the applied design loads.

5.5.3 Design verification – fatigue assessment

The fatigue assessment is required to verify that the fatigue life of critical structural details is adequate. A simplified fatigue requirement is applied to details such as end connections of longitudinal stiffeners using stress concentration factors (SCF) to account the actual detail geometry. A fatigue assessment procedure using finite element analysis for determining the actual hot spot stress of the geometric detail is applied to selected details. In both cases, the fatigue assessment method is based on the Palmgren-Miner linear damage model.

5.5.4 Relationship between prescriptive scantling requirements and FE analysis

The scantlings defined by the prescriptive requirements are not to be reduced by any form of alternative calculations such as FE analysis, unless explicitly stated.

SECTION 3
VERIFICATION OF COMPLIANCE

1 GENERAL

1.1 Newbuilding

1.1.1

For newbuildings, the plans and documents submitted for approval, as indicated in [2], are to comply with applicable requirements in these Rules, taking account of the relevant criteria, such as additional service features and classification notations assigned to the ship or the ship length.

1.1.2

When a ship is surveyed by the Society during construction, the Society:

- Approves the plans and documentation submitted as required by the Rules.
- Proceeds with the appraisal of the design of materials and equipment used in the construction of the ship and their inspection at works.
- Carries out surveys or obtains appropriate evidence to satisfy itself that the scantlings and construction meet the Rule requirements in relation to the approved drawings.
- Attends tests and trials provided for in the Rules.
- Assigns the classification character of the Society's notation.

1.1.3

The Society defines in specific Rules which materials and equipment used for the construction of ships built under survey are, as a rule, subject to appraisal of their design and to inspection at works, and according to which particulars.

1.1.4

As part of his/her interventions during ship's construction, the surveyor:

- Conducts an overall examination of the parts of the ship covered by the Rules.
- Examines the construction methods and procedures when required by the Rules.
- Checks selected items covered by the Rule requirements.
- Attends tests and trials where applicable and deemed necessary.

1.1.5

Through all stages of ship construction, it is the builder's responsibility to inform promptly the Society of the modifications or departures from approved arrangements and to deal with as necessary. The builder is to ensure that deviations from the requirements of the Rules or approved plans, other than those of a minor nature not affecting the structural strength of the vessel, are, in any case, accepted by the Society's approval office.

1.2 Ships in service

1.2.1

For ships in service, the requirements in Ch 13 are to be complied with.

2 DOCUMENTS TO BE SUBMITTED

2.1 Documentation and data requirements

2.1.1 Loading information

Loading information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations is to be provided on board the ship. The loading information is to include an approved loading manual and loading instrument complying with the requirements given in Ch 1, Sec 5.

2.1.2 Calculation data and results

Where calculations have been carried out in accordance with the procedures given in the Rules, one copy of the following is to be submitted for information as applicable:

a) Reference to the calculation procedure and technical program used.

b) A description of the structural modelling.

c) A summary of the analysed parameter including properties and boundary conditions for direct analysis, when applicable.

d) Details of the loading conditions and the means of applying loads for direct analysis, when applicable.

e) A comprehensive summary of calculation results.

f) Sample calculations where appropriate.

The responsibility for error free specification and input of program data and the subsequent correct transposal of output resides with the designer.

Reference is made to Ch 7, Sec 1, [4.1] for required reporting of finite element analysis.

2.2 Submission of plans and supporting calculations

2.2.1 Plans and supporting calculations are to be submitted for approval

For the application of these Rules, the plans and supporting calculations to be submitted to the Society for approval are listed in Table 1.

Plans are to be submitted electronically or physically. When physically submitted plans are to be submitted in triplicate, with one copy necessary for supporting documents and calculations. In addition, the Society may request the submission of information, other plans and documents deemed necessary for the review of the design.

Structural plans are to show scantling, details of connection of the various parts and are to specify the design materials including, in general, their grades, manufacturing processes, welding procedures and heat treatments, and are to include information related to the renewal thickness as specified in Ch 13.

For welding requirements, see Ch 12, Sec 2 and Ch 12, Sec 3.

In case there are deviations from the design basis, then these are to be documented and submitted to the Society.

Table 1 : Plans and supporting calculation to be submitted for approval

Plan or supporting calculation	Containing also information on
Midship section Transverse sections Shell expansion Decks and profiles Double bottom Pillar arrangements Framing plan Deep tank and ballast tank bulkheads, Wash bulkheads Standard construction details	Class characteristics Ship's main dimensions Minimum ballast draught Frame spacing Maximum service speed Density of cargoes Design loads on decks and double bottom Steel grades Corrosion protection Openings in decks and shell and relevant compensations Boundaries of flat areas in bottom and sides Details of structural reinforcements and/or discontinuities Bilge keel with details of connections to hull structures Welding
Watertight subdivision bulkheads Watertight tunnels	Openings and their closing appliances, if any
Fore part structure	-
Aft part structure	-
Machinery space structures Foundations of propulsion machinery and boilers	Type, power and RPM of propulsion machinery Mass and centre of gravity of machinery and boilers
Superstructures and deckhouses Machinery space casing	Extension and mechanical properties of the aluminium alloy used (where applicable)
Hatch covers and hatch coamings	Design loads on hatch covers Sealing and securing arrangements, type and position of locking bolts Distance of hatch covers from the summer load waterline and from the fore end
Transverse thruster, if any, general arrangement, tunnel structure, connections of thruster with tunnel and hull structures	-
Bulwarks and freeing ports	Arrangement and dimensions of bulwarks and freeing ports on the freeboard deck and superstructure deck
Windows and side scuttles, arrangements and details	-
Scuppers and sanitary discharges	-
Mooring and towing arrangement	-
Supporting structure and foundations for shipboard fittings associated with mooring and towing operations	Design loads and directions of load actions, rated pull and holding load for mooring winches Reaction forces Details of connection of the foundations to the deck, including specifications for holding down bolts for mooring winches Material specifications and welding

Plan or supporting calculation	Containing also information on
Supporting structure and foundations for windlasses and chain stoppers	Design loads and directions of load actions Reaction forces Details of connection of the foundations to the deck, including specifications for holding down bolts for windlasses Material specifications and welding
Stern frame or sternpost, sterntube Propeller shaft boss and brackets (1)	-
Plan of watertight doors and scheme of relevant closing devices	Closing devices Electrical diagrams of power control and position indication circuits
Plan of weathertight or outer doors and hatchways	-
Supporting structure for lifting appliances	Design loads (forces and moments) SWL and self weight of lifting appliances Maximum sea state in offshore operation, if any Connections to the hull structures
Supporting structure for life saving appliances	Design loads (forces and moments) SWL and self weight of lifting appliances Connections to the hull structure
Sea chests, stabiliser recesses, etc	-
Plan of manholes	-
Plan of access to and escape from spaces	-
Plan of ventilation including ventilators and tank vents	Use of spaces and location and height of air vent outlets of various compartments
Plan of tank testing	Testing procedures for the various compartments Height of pipes for testing
Equipment number calculation	Geometrical elements for calculation List of equipment Construction and breaking load of steel wires Material, construction, breaking load and relevant elongation of synthetic ropes
Anchoring arrangement	-
Hawse pipes	-
Loading manual and/or trim and stability booklet	-
(1) Where other steering or propulsion systems are adopted (e.g. steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted.	

2.2.2 Plans to be submitted for information

In addition to those in [2.2.1], the following plans are to be submitted to the Society for information:

a) General arrangement.

b) Capacity plan, indicating the volume and position of the centre of gravity of all compartments and tanks.

c) Lines plan, when deemed necessary by the Society.

d) Hydrostatic curves.

e) Lightweight distribution.

f) Docking plan.

g) Arrangement of lifting appliances

2.2.3 Plans and instruments to be supplied onboard the ship

As a minimum, the following plans and instrument are to be supplied onboard:

a) One copy of the following plans indicating the newbuilding and renewal thickness for each structural item is to be supplied onboard the ship: plans of midship sections, construction profiles, shell expansion, transverse bulkheads, aft and fore part structures, machinery space structures and casing.

   One copy of the following plans indicating the newbuilding thickness for each structural item is to be supplied onboard the ship: plans of superstructures and deckhouses.

b) One copy of the final approved loading manual, see [2.1.1].

c) One copy of the final approved loading instrument, see [2.1.1].

d) Welding.

e) Details of the extent and location of higher tensile steel together with details of the specification and mechanical properties, and any recommendations for welding, working and treatment of these steels.

f) Details and information on use of special materials, such as an aluminium alloy, used in the hull construction.

g) Towing and mooring arrangements plan, see Ch 11, Sec 3.

h) Structural access manual.

Other plans or instrument may be required by the Society.

3 SCOPE OF APPROVAL

3.1 General

3.1.1

The attention of owners, designers and builders is directed to the regulations of international, national, canal, and other authorities dealing with those requirements which may affect structural aspects, in addition to or in excess of the classification requirements.

3.1.2

The documentation, plans and data requirements specified in [2] are to be submitted. The Society is to review such documentation to verify compliance with the requirements.

3.1.3

An appropriate term to indicate that the plans, reports or documents have been reviewed for compliance with these Rules is to be used according to the procedures of the Society.

3.2 Requirements of international and national regulations

3.2.1 Responsibility

It is the responsibility of the designer to ensure that the design complies with the national and international regulations applicable to the ship.

The Society is not responsible for assessing compliance with international and national regulations as part of the general classification process. However, the Society may enter into an agreement with the flag administration of the ship under which they are explicitly instructed to review and approve a ship design for compliance with specified regulations.

4 WORKMANSHIP

4.1 Requirements to be complied with by the manufacturer

4.1.1

The manufacturing plant is to be provided with suitable equipment and facilities to enable proper handling of the materials, manufacturing processes and structural components. The manufacturing plant is to have at its disposal sufficiently qualified personnel. The Society is to be advised of the names and areas of responsibility of the supervisory and control personnel in charge of the project.

4.2 Quality control

4.2.1

As far as required and expedient, the manufacturer's personnel has to examine all structural components both during manufacture and on completion, to verify that they are complete, that the dimensions are correct and that workmanship is satisfactory and meets the standard of good shipbuilding practice.

Upon inspection and corrections by the manufacturing plant, the structural components are to be shown to the surveyor of the Society for inspection, in suitable sections, normally unpainted condition and enabling proper access for inspection.

The Surveyor may reject components that have not been adequately checked by the plant and may demand their re-submission upon successful completion of such checks and corrections by the plant.

5 STRUCTURAL DETAILS

5.1 Details in manufacturing documents

5.1.1

Significant details concerning quality and functional ability of the component concerned are to be entered in the manufacturing documents (e.g. workshop drawing). This includes not only scantlings but, where relevant, such items as surface conditions (e.g. finishing of flame cut edges and weld seams), and special methods of manufacture involved as well as inspection and acceptance requirements and where relevant permissible tolerances. When a standard is used (works or national standard), it is to be submitted to the Society. For weld joint details, see Ch 12, Sec 2.

If, due to missing or insufficient details in the manufacturing documents, the quality or functional ability of the component is doubtful, the Society may require appropriate improvements to be submitted by the manufacturer. This includes the provision of supplementary or additional parts (for example, reinforcements) even if these were not required at the time of plan approval.

6 EQUIVALENCE PROCEDURES

6.1 Rule applications

6.1.1

These Rules apply to ships of normal form, proportions, speed and structural arrangements. Relevant design parameters defining the assumptions made are given in Ch 1, Sec 2, [3].

6.1.2

Special consideration is to be given to the application of the Rules incorporating design parameters which are outside the design basis as specified in Ch 1, Sec 2, [3], for example, increased fatigue life.

6.2 Novel designs

6.2.1

Ships of novel design, i.e. those of unusual form, proportions, speed and structural arrangements outside those specified in Ch 1, Sec 2, [3.2], are specially considered according to the contents of [6.2.2] to [6.2.4].

6.2.2

Information is to be submitted to the Society to demonstrate that the structural safety of the novel design is at least equivalent to that intended by the Rules.

6.2.3

In such cases, the Society is to be contacted at an early stage in the design process to establish the applicability of the Rules and additional information required for submission.

6.2.4

Dependent on the nature of the deviation, a systematic review may be required to document equivalence with the Rules.

6.3 Alternative calculation methods

6.3.1

Where indicated in specific sections of the Rules, alternative calculation methods to those shown in the Rules may be accepted provided it is demonstrated that the scantling and arrangements are of at least equivalent strength to those derived using the Rules.

SECTION 4
SYMBOLS AND DEFINITIONS

1 PRIMARY SYMBOLS AND UNITS

1.1 General

1.1.1

Unless otherwise specified, the general symbols and their units used in these Rules are those defined in Table 1.

Table 1 : Primary symbols

Symbol	Meaning	Units
A	Area	m²
	Sectional area of stiffeners and primary members	cm^2
C	Coefficient	-
F	Force and concentrated loads	kN
I	Hull girder inertia	m^4
	Inertia of stiffeners and primary members	cm^4
M	Bending moment	kNm
M	Mass	t
P	Pressure	kN/m^2
Q	Shear force	kN
T	Draught of ship, see [3.1.5]	m
Z	Hull girder section modulus	m^3
	Section modulus of stiffeners and primary supporting members	cm^3
a_i	Acceleration for the effect 'i'	m/s^2
b	Width of attached plating	mm
	Width of face plate of stiffeners and primary supporting members	mm
g	Gravity acceleration, taken equal to 9.81 m/s^2	m/s^2
h	Height	m
	Web height of stiffeners and primary supporting members	mm
ℓ	Length/span of stiffeners and primary supporting members	m
n	Number of items	-
r	Radius	mm
	Radius of curvature of plating or bilge radius	mm
t	Thickness	mm
x	*X* coordinate along longitudinal axis, see [3.6]	m
y	*Y* coordinate along transverse axis, see [3.6]	m
z	*Z* coordinate along vertical axis, see [3.6]	m
η	Permissible utilisation factor (usage factor)	-

Symbol	Meaning	Units
γ	Safety factor	-
δ	Deflection/displacement	mm
θ	Angle	deg
ρ	Density of seawater, taken equal to 1.025 t/m^3	t/m^3
σ	Normal stress	N/mm^2
τ	Shear stress	N/mm^2

2 SYMBOLS

2.1 Ship's main data

2.1.1

Unless otherwise specified, symbols regarding ship's main data and their units used in these Rules are those defined in Table 2.

Table 2 : Ship's main data

Symbol	Meaning	Units
L	Rule length	m
L_{LL}	Freeboard length	m
L_{PP}	Length between perpendiculars	m
L_0	Rule length, L, but not to be taken less than 110 m	m
L_1	Rule length, L, but need not be taken greater than 250 m	m
L_2	Rule length, L, but need not be taken greater than 300 m	m
B	Moulded breadth of ship	m
D	Moulded depth of ship	m
T	Moulded draught	m
T_{SC}	Scantling draught	m
T_{BAL}	Ballast draught (minimum midship)	m
T_{BAL-H}	Heavy ballast draught	m
T_{BAL-E}	Emergency ballast draught or gale ballast draught	m
T_{LC}	Midship draught at considered loading condition	m
T_{F-f}, T_{F-e}	Minimum draught at forward perpendicular for bottom slamming, with respectively all ballast tanks full or with any tank empty in bottom slamming area	m
Δ	Moulded displacement at draught T_{SC}	t
C_B	Block coefficient at draught T_{SC}	-
V	Maximum service speed	knot
x, y, z	X,Y, Z coordinates of the calculation point with respect to the reference coordinate system	m

2.2 Materials

2.2.1

Unless otherwise specified, symbols regarding materials and their units used in these Rules are those defined in Table 3.

Table 3 : Materials

Symbol	Meaning	Units
E	Young's modulus, see Ch 3, Sec 1, [2]	N/mm^2
G	Shear modulus, $G = \dfrac{E}{2(1+\nu)}$	N/mm^2
R_{eH}	Specified minimum yield stress, see Ch 3, Sec 1, [2]	N/mm^2
τ_{eH}	Specified shear yield stress, $\tau_{eH} = \dfrac{R_{eH}}{\sqrt{3}}$	N/mm^2
ν	Poisson's ratio, see Ch 3, Sec 1, [2]	-
k	Material factor, see Ch 3, Sec 1, [2]	-
R_m	Specified minimum tensile strength, see Ch 3, Sec 1, [2]	N/mm^2
R_Y	Nominal yield stress, taken equal to $235/k$	N/mm^2

2.3 Loads

2.3.1

Unless otherwise specified, symbols regarding loads and their units used in these Rules are those defined in Table 4.

Table 4 : Loads

Symbol	Meaning	Units
C_w	Wave coefficient	-
T_θ	Roll period	s
θ	Roll angle	deg
T_φ	Pitch period	s
φ	Pitch angle	deg
a_o	Common acceleration parameter	-
a_z	Vertical acceleration	m/s^2
a_y	Transverse acceleration	m/s^2
a_x	Longitudinal acceleration	m/s^2
f_p	Probability factor	-
k_r	Roll amplitude of gyration	m
GM	Metacentric height	m
λ	Wave length	m
S	Static load case	-
S+D	Dynamic load case	-
P_{ex}	Total sea pressure, see Ch 4, Sec 5, [1.1]	kN/m^2

Symbol	Meaning	Units
P_{in}	Total internal pressure due to liquid, see Ch 4, Sec 6, [1], or due to dry bulk cargo, see Ch 4, Sec 6, [2.4.1]	kN/m^2
P_s	Static sea pressure	kN/m^2
P_{ls}	Static tank pressure	kN/m^2
P_w	Dynamic wave pressure	kN/m^2
P_{ld}	Dynamic tank pressure	kN/m^2
P_D	Green sea deck pressure	kN/m^2
$P_{slh\text{-}j}$	Sloshing pressure, j=direction	kN/m^2
P_{dl}	Total pressure due to distributed load on deck or platform, see Ch 4, Sec 5, [2.3] or Ch 4, Sec 6, [5.2]	kN/m^2
P_{SL}	Bottom slamming pressure	kN/m^2
P_{FB}	Bow impact pressure	kN/m^2
P_{fs}	Static pressure in flooded conditions	kN/m^2
P_{fd}	Dynamic pressure in flooded conditions	kN/m^2
P_{ST}	Tank testing pressure (static)	kN/m^2
F_U	Total force due to concentrated load on deck or platform, see Ch 4, Sec 5, [2.3] or Ch 4, Sec 6, [5.3]	kN
$M_{sw\text{-}j}$	Vertical still water bending moment, $j = h, s, p$ (hog, sag, harbour)	kNm
Q_{sw}	Vertical still water shear force	kN
$M_{wv\text{-}j}$	Vertical wave bending moment, $j = h, s$ (hog, sag)	kNm
Q_{wv}	Vertical wave shear force	kN
M_{wt}	Torsional wave moment	kNm
M_{wh}	Horizontal wave bending moment	kNm

2.4 Scantlings

2.4.1

Unless otherwise specified, symbols regarding scantlings and their units used in these Rules are those defined in Table 5.

Table 5 : Scantlings

Symbol	Meaning	Units
$I_{y\text{-}n50}$	Net vertical moment of inertia of hull girder	m^4
$I_{z\text{-}n50}$	Net horizontal moment of inertia of hull girder	m^4
$Z_{D\text{-}n50}$, $Z_{B\text{-}n50}$	Net vertical hull girder section moduli, at deck and bottom respectively	m^3
z_n	Vertical distance from BL to horizontal neutral axis	m
a	Length of EPP, as defined in Ch 3, Sec 7, [2.1.1]	mm
b	Breadth of EPP, as defined in Ch 3, Sec 7, [2.1.1]	mm
s	Stiffener spacing (see Ch 3, Sec 7, [1.2.1])	mm
S	Primary supporting member spacing (see Ch 3, Sec 7, [1.2.2])	m
ℓ	Span of stiffeners or primary supporting member (see Ch 3, Sec 7, [1])	m
ℓ_b	Bracket arm length	m

Symbol	Meaning	Units
t	Net thickness with full corrosion reduction	mm
t_{n50}	Net thickness with half corrosion reduction	mm
t_c	Corrosion addition	mm
t_{gr}	Gross thickness	mm
t_{as_built}	As built thickness	mm
t_{gr_off}	Gross thickness offered	mm
t_{gr_req}	Gross thickness required	mm
t_{off}	Net thickness offered	mm
t_{req}	Net thickness required	mm
t_{vol_add}	Thickness for voluntary addition	mm
t_{res}	Reserve thickness	mm
t_{c1}, t_{c2}	Corrosion addition on each side of structural member	mm
h_w	Web height of stiffener or primary supporting member	mm
t_w	Web thickness of stiffener or primary supporting member	mm
b_f	Face plate width stiffener or primary supporting member	mm
h_{stf}	Height of stiffener	mm
t_f	Face plate/flange thickness of stiffener or primary supporting member	mm
t_p	Thickness of the plating attached to a stiffener or a primary supporting member	mm
d_e	Distance from the upper edge of the web to the top of the flange for *L3* profiles	mm
b_{eff}	Effective breadth of attached plating, in bending, for yield and fatigue	mm
A_{eff} or $A_{eff\text{-}n50}$	Net sectional area of stiffeners or primary supporting members, with attached plating (of width *s*)	cm^2
A_{shr} or $A_{shr\text{-}n50}$	Net shear sectional area of stiffeners or primary supporting members	cm^2
I_p	Net polar moment of inertia of stiffener about its connection to plating	cm^4
I	Net moment of inertia of the stiffener, with attached shell plating, about its neutral axis parallel to the plating	cm^4
Z or Z_{n50}	Net section modulus of a stiffener or primary supporting member with attached plating (of breadth b_{eff})	cm^3

3 DEFINITIONS

3.1 Principal Particulars

3.1.1 *L*, Rule length

The Rule length L is the distance, in m, measured on the waterline at the scantling draught T_{SC} from the forward side of the stem to the centre of the rudder stock. L is to be not less than 96% and need not exceed 97% of the extreme length on the waterline at the scantling draught T_{SC}.

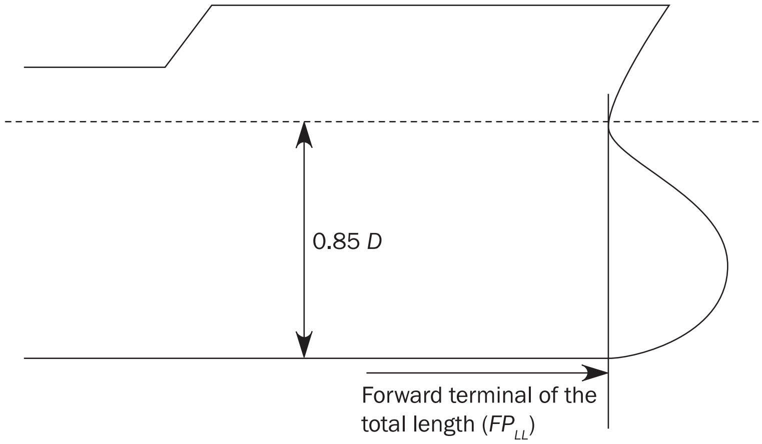
In ships without rudder stock (e.g. ships fitted with azimuth thrusters), the Rule length L is to be taken equal to 97% of the extreme length on the waterline at the scantling draught T_{SC}.

In ships with unusual stem or stern arrangements, the Rule length is considered on a case-by-case basis.

3.1.2 L_{LL}, freeboard length

The freeboard length L_{LL}, in m, is to be taken as 96% of the total length on a waterline at 85% of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that be greater.
For ships without a rudder stock, the length L_{LL} is to be taken as 96% of the waterline at 85% of the least moulded depth.
Where the stem contour is concave above the waterline at 85% of the least moulded depth, both the forward end of the extreme length and the forward side of the stem are to be taken at the vertical projection to that waterline of the aftermost point of the stem contour (above that waterline), see Figure 1.

Figure 1 : Concave stem contour



3.1.3 Moulded breadth

The moulded breadth B is the greatest moulded breadth, in m, measured amidships at the scantling draught, T_{SC}.

3.1.4 Moulded depth

D, the moulded depth, is the vertical distance, in m, amidships, from the moulded baseline to the moulded deck line of the uppermost continuous deck measured at deck at side. On ships with a rounded gunwale, D is to be measured to the continuation of the moulded deck line.

3.1.5 Draughts

T, the draught in m, is the summer load line draught for the ship in operation, measured from the moulded baseline at midship. Note this may be less than the maximum permissible summer load waterline draught.

T_{SC} is the scantling draught, in m, at which the strength requirements for the scantlings of the ship are met and represents the full load condition. The scantling draught T_{SC} is to be not less than that corresponding to the assigned freeboard. The draught of ships to which timber freeboards are assigned corresponds to the loading condition of timber, and the requirements of the Society are to be applied to this draught.

T_{BAL} is the minimum design normal ballast draught amidships, in m, at which the strength requirements for the scantlings of the ship are met. This normal ballast draught is the minimum draught of ballast conditions including ballast water exchange operation, for any ballast conditions in the loading manual including both departure and arrival conditions.

$T_{BAL\text{-}H}$ is the minimum design heavy ballast draught, in m, at which the strength requirements for the scantlings of the ship are met. This heavy ballast draught is to be considered for ships having heavy ballast condition.

3.1.6 Moulded displacement

Moulded displacement, in t, corresponds to the underwater volume of the ship, at a draught, in seawater with a density of 1.025 t/m³.

3.1.7 Maximum service speed

V, the maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest seagoing draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

3.1.8 Block coefficient

C_B, the block coefficient at the draught, T_{SC} is defined in the following equation:

$$C_B = \frac{\Delta}{1.025\ L\ B\ T_{SC}}$$

where:

Δ : Moulded displacement of the ship at draught T_{SC}.

3.1.9 Lightweight

The lightweight is the ship displacement, in t, complete in all respects, but without cargo, consumable, stores, passengers and crew and their effects, and without any liquids on board except that machinery and piping fluids, such as lubricants and hydraulics, are at operating levels.

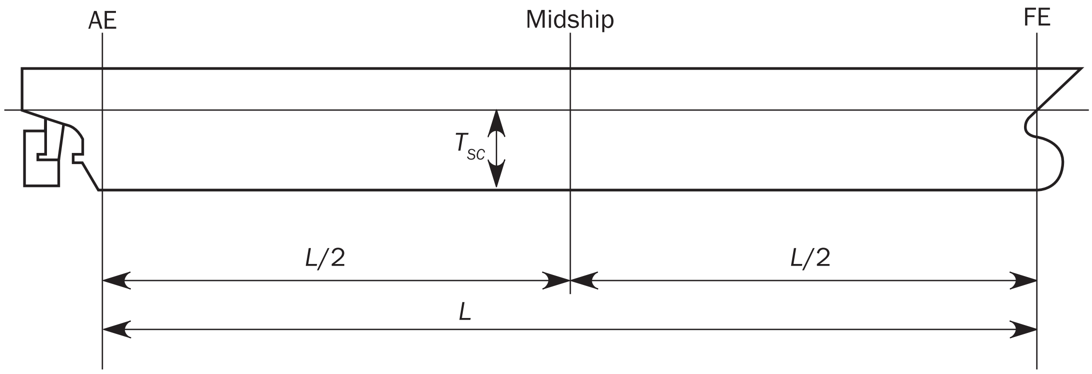
3.1.10 Deadweight

The deadweight DWT is the difference, in t, between the displacement, at the summer draught in seawater of density $\rho = 1.025$ t/m^3, and the lightweight.

3.1.11 Fore end

The fore end (FE) of the rule length L, see Figure 2, is the perpendicular to the scantling draught waterline at the forward side of the stem.

Figure 2 : Ends and midship



3.1.12 Aft end

The aft end (AE) of the rule length L, see Figure 2, is the perpendicular to the scantling draught waterline at a distance L aft of the fore end.

3.1.13 Midship

The midship is the perpendicular to the scantling draught waterline at a distance 0.5 L aft of the fore end.

3.1.14 Midship part

The midship part of a ship is the part extending 0.4 L amidships, unless otherwise specified.

3.1.15 Forward freeboard perpendicular

The forward freeboard perpendicular, FP_{LL}, is to be taken at the forward end of the length L_{LL} and is to coincide with the foreside of the stem on the waterline on which the length L_{LL} is measured.

3.1.16 After freeboard perpendicular

The after freeboard perpendicular, AP_{LL}, is to be taken at the aft end of the length L_{LL}.

3.2 Position 1 and Position 2

3.2.1 Position 1

Position 1 includes:

- Exposed freeboard and raised quarter decks.
- Exposed superstructure decks situated forward of 0.25 L_{LL} from FP_{LL}.

3.2.2 Position 2

Position 2 includes:

- Exposed superstructure decks situated aft of 0.25 L_{LL} from FP_{LL} and located at least one standard height of superstructure above the freeboard deck.
- Exposed superstructure decks situated forward of 0.25 L_{LL} from FP_{LL} and located at least two standard heights of superstructure above the freeboard deck.

3.3 Standard height of superstructure

3.3.1

The standard height of superstructure is defined in Table 6.

Table 6 : Standard height of superstructure

Freeboard length L_{LL}, in m	Standard height h_S, in m	
	Raised quarter deck	All other superstructures
$90 < L_{LL} \le 125$	$0.3 + 0.012\ L_{LL}$	$1.05 + 0.01\ L_{LL}$
$L_{LL} > 125$	1.80	2.30

3.3.2

A tier is defined as a measure of the extent of a deckhouse. A deckhouse tier consists of a deck and external bulkheads. In general, the first tier is the tier situated on the freeboard deck.

3.4 Type A and Type B freeboard ships

3.4.1 Type A ship

Type A ship is one which:

- Is designed to carry only liquid cargoes in bulk.
- Has a high integrity of the exposed deck with only small access openings to cargo compartments, closed by watertight gasketed covers of steel or equivalent material.
- Has low permeability of loaded cargo compartments.

Type A ship is to be assigned a freeboard following the requirements specified in the ICLL.

3.4.2 Type B ship

All ships which do not come within the provisions regarding Type A ships stated in [3.4.1] are to be considered as Type B ships.

Type B ship is to be assigned a freeboard following the requirements specified in ICLL.

3.4.3 Type B-60 ship

Type B-60 ship is any Type B ship of over 100 m in length which, according to applicable requirements of ICLL is assigned with a value of tabular freeboard which can be reduced up to 60% of the difference between the 'B' and 'A' tabular values for the appropriate ship lengths.

3.4.4 Type B-100 ship

Type B-100 ship is any Type B ship of over 100 m in length which, according to applicable requirements of ICLL is assigned with a value of tabular freeboard which can be reduced up to 100% of the difference between the 'B' and 'A' tabular values for the appropriate ship lengths.

3.5 Operation definition

3.5.1 Multiport

Multiport corresponds to short voyage with loading and unloading in multiple ports.

3.5.2 Sheltered water

Sheltered waters are generally calm stretches of water when the wind force does not exceed 6 Beaufort scale, i.e. harbours, estuaries, roadsteads, bays, lagoons.

3.6 Reference coordinate system

3.6.1

The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand coordinate system, see Figure 3:

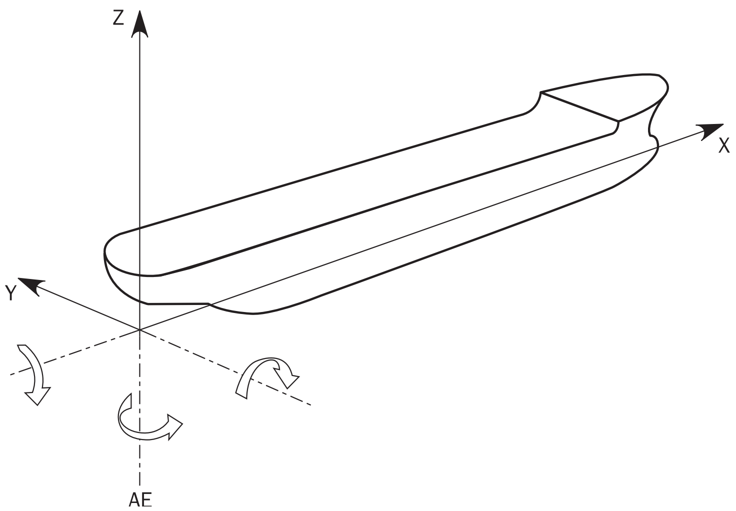
Origin : At the intersection among the longitudinal plane of symmetry of ship, the aft end of *L* and the baseline.

X axis : Longitudinal axis, positive forwards.

Y axis : Transverse axis, positive towards portside.

Z axis : Vertical axis, positive upwards.

Figure 3 : Reference coordinate system



3.7 Naming convention

3.7.1 Structural nomenclature

Figure 4 to Figure 8 show the common structural nomenclature used within these Rules.

Figure 4 : Corrugated transverse bulkhead of double hull tanker

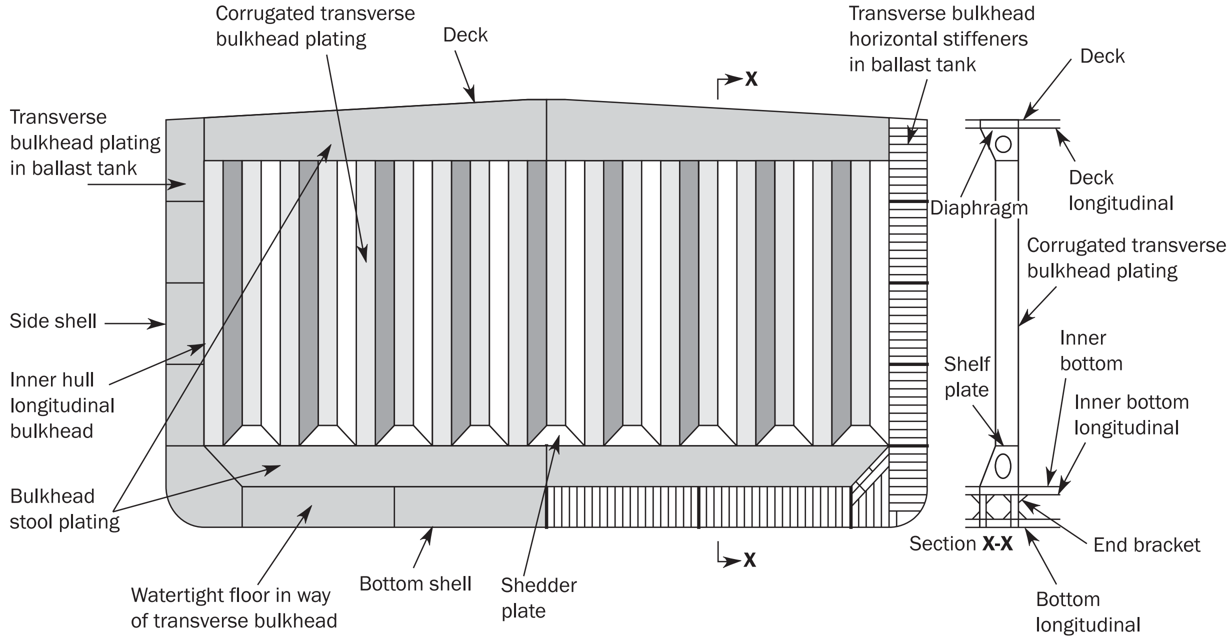


Figure 5 : Transverse bulkhead of double hull tanker

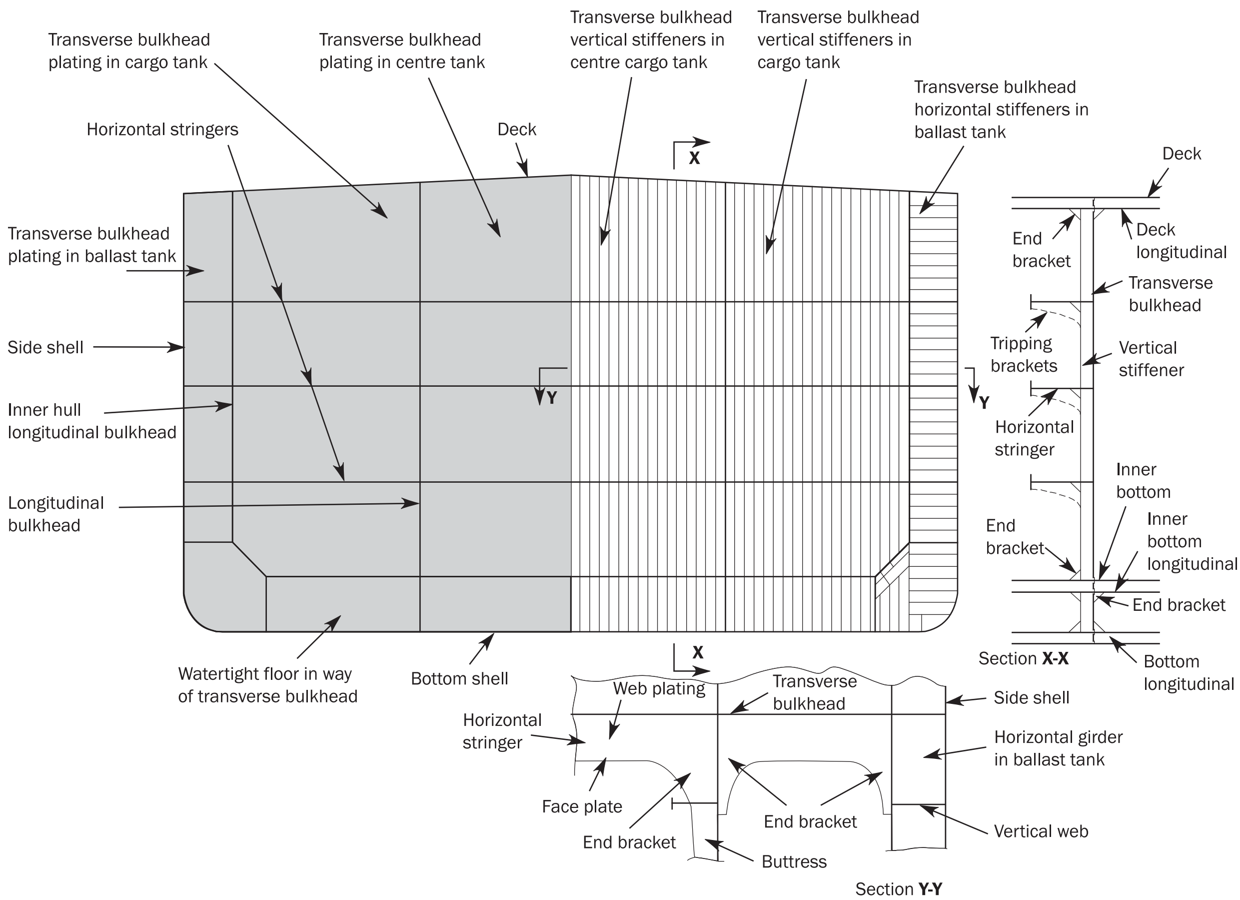

Figure 6 : Mid cargo hold transverse section of double hull tanker

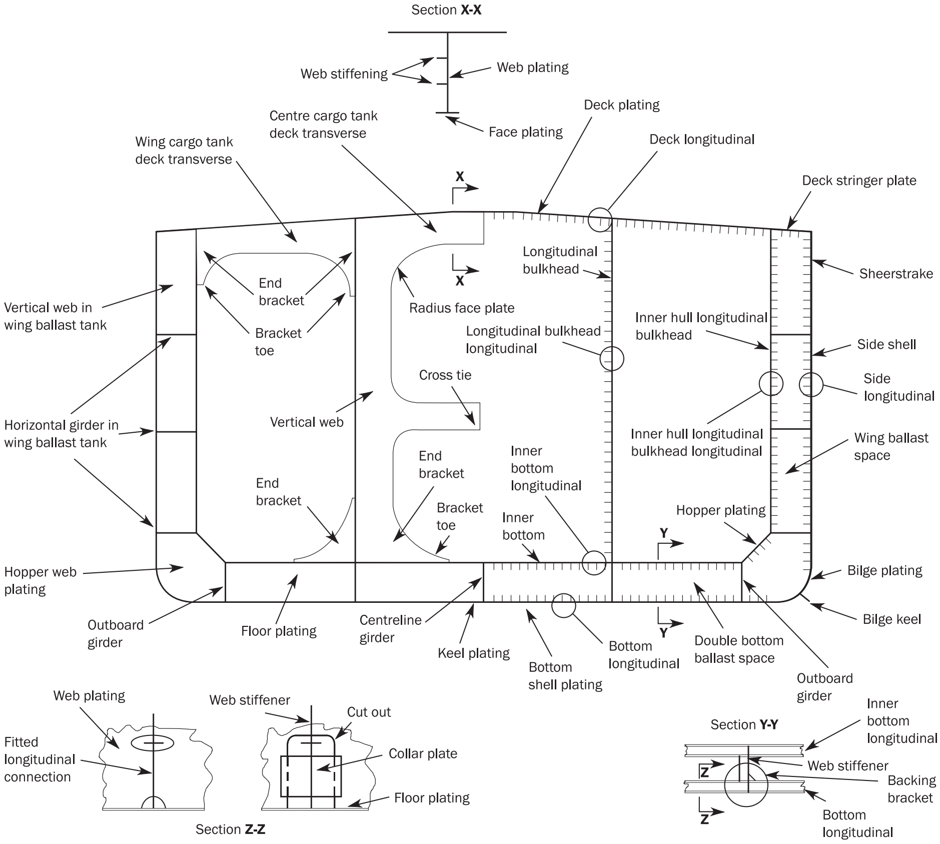

Figure 7 : Mid cargo hold transverse section of single side bulk carrier

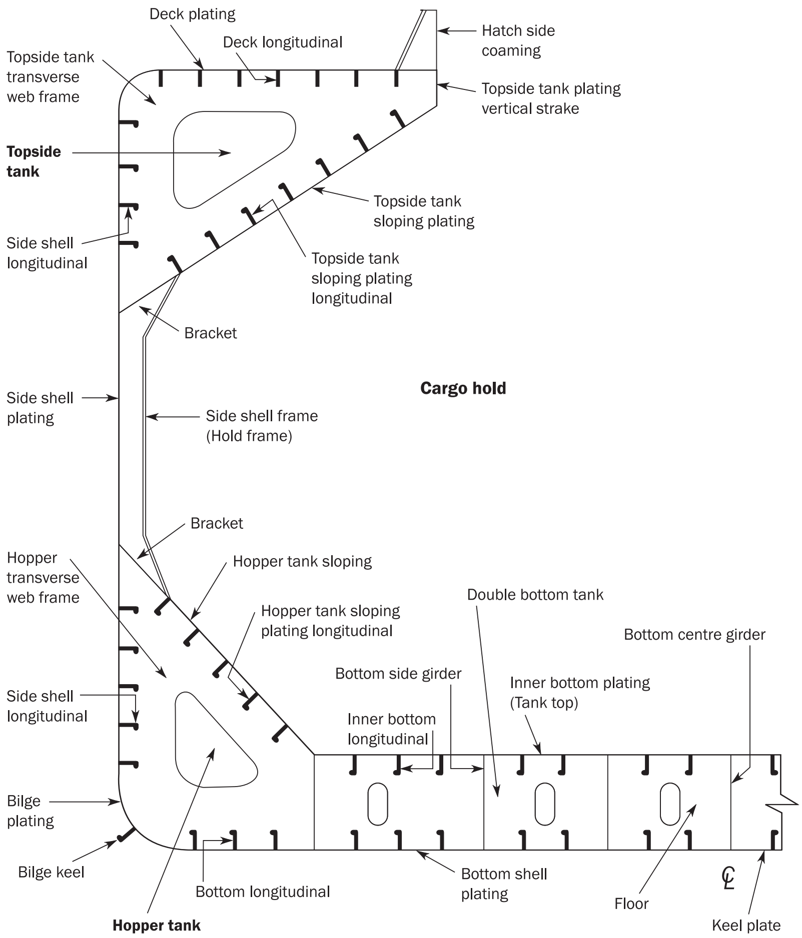

Figure 8 : Transverse bulkhead of bulk carrier

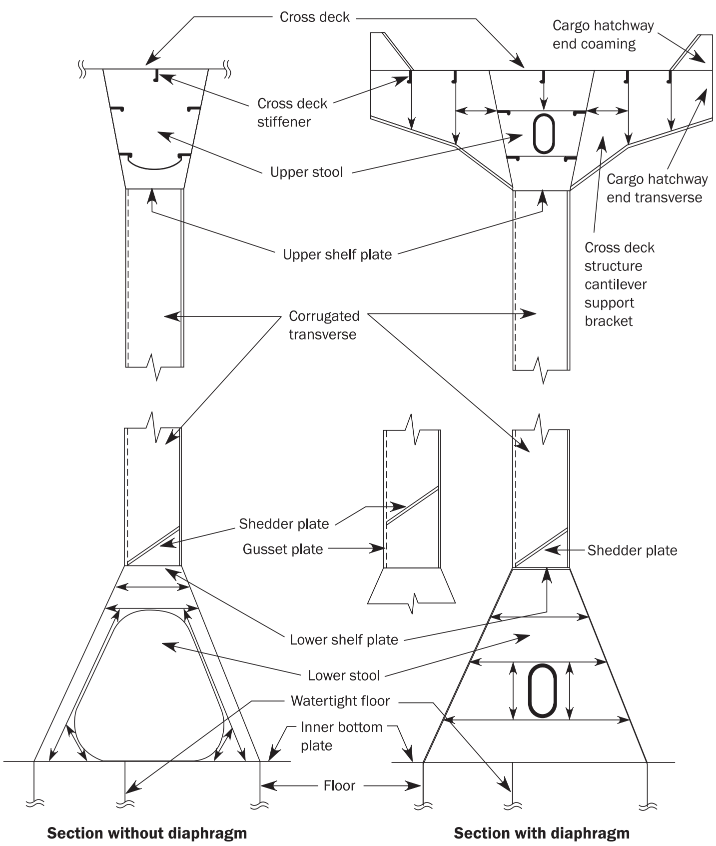

3.8 Glossary

3.8.1 Definitions of terms

Table 7 : Definition of terms

Terms	Definition
Accommodation deck	A deck used primarily for the accommodation of the crew.
Accommodation ladder	A portable set of steps on a ship's side for people boarding from small boats or from a pier.
Aft peak	The area aft of the aft peak bulkhead.
Aft peak bulkhead	The first main transverse watertight bulkhead forward of the stern.
Aft peak tank	The compartment in the narrow part of the stern aft of the aft peak bulkhead.
Anchor	A device which is attached to anchor chain at one end and lowered into the sea bed to hold a ship in position; it is designed to grip the bottom when it is dragged by the ship trying to float away under the influence of wind and current, usually made of heavy casting or casting.
Ballast tank	A compartment used for the storage of water ballast.
Bay	The area between adjacent transverse frames or transverse bulkheads.
Bilge hopper tank	The tank used for ballast or for stability when carrying certain cargoes in bulk carriers.
Bilge keel	A piece of plate set perpendicular to a ship's shell along the bilges to reduce the rolling motion.

Terms	Definition
Bilge plating	The bilge plating is the curved plating between the bottom shell and side shell. It is to be taken as follows: Within the cylindrical part of the ship: From the start of the curvature at the lower turn of bilge on the bottom to the end of the curvature at the upper turn of the bilge, Outside the cylindrical part of the ship: From the start of the curvature at the lower turn of the bilge on the bottom to the lesser of: • A point on the side shell located 0.2*D* above the baseline/local centreline elevation. • The end of the curvature at the upper turn of the bilge.
Bilge strake	The lower strake of bilge plating.
Boss	The boss of the propeller is the central part to which propeller blades are attached and through which the shaft end passes.
Bottom shell	The shell envelope plating forming the predominantly flat bottom portion of the shell envelope including the keel plate.
Bow	The structural arrangement and form of the forward end of the ship.
Bower anchor	An anchor carried at the bow of the ship.
Bracket	An extra structural component used to increase the strength of a joint between two structural members.
Bracket toe	The narrow end of a tapered bracket.
Breakwater	Inclined and stiffened plate structure on a weather deck to break and deflect the flow of water coming over the bow.
Breast hook	A triangular plate bracket joining port and starboard side structural members at the stem.
Bridge	An elevated superstructure having a clear view forward and at each side, and from which a ship is steered.
Buckling panel	Elementary plate panel considered for the buckling analysis.
Builder	The party contracted by the owner to build a ship in compliance with the specifications including Rules.
Bulb profile	A stiffener utilising an increase in steel mass on the outer end of the web instead of a separate flange.
Bulkhead	A structural partition wall sub-dividing the interior of the ship into compartments.
Bulkhead deck	The uppermost continuous deck to which transverse watertight bulkheads and shell are carried.
Bulkhead stool	The lower or upper base of a corrugated bulkhead.
Bulkhead structure	The transverse or longitudinal bulkhead plating with stiffeners and girders.
Bulwark	The vertical plating immediately above the upper edge of the ship's side surrounding the exposed deck(s).
Bunker	A compartment for the storage of fuel oil used by the ship's machinery.
Cable	A rope or chain attached to the anchor.
Camber	The upward rise of the weather deck from both sides towards the centreline of the ship.
Cargo hold region	See Ch 1, Sec 1, [2.4.3].
Cargo hold	Generic term for spaces intended to carry cargo, liquid or dry bulk.
Cargo tank	Tank carrying cargoes
Cargo tank bulkhead	A boundary bulkhead separating cargo tanks.

Terms	Definition
Carlings	A stiffening member used to supplement the regular stiffening arrangement.
Casing	The covering or bulkhead around or about any space for protection.
Cellular construction	A structural arrangement where there are two closely spaced boundaries and internal diaphragm plates arranged in such a manner to create small compartments.
Centreline girder	A longitudinal member located on the centreline of the ship.
Chain	Connected metal rings or links used for holding anchor, fastening timber cargoes, etc.
Chain locker	A compartment usually at the forward end of a ship which is used to store the anchor chain.
Chain pipe	A section of pipe through which the anchor chain enters or leaves the chain locker.
Chain stopper	A device for securing the chain cable when riding at anchor as well as securing the anchor in the housed position in the hawse pipe, thereby relieving the strain on the windlass.
Coaming	The vertical boundary structure of a hatch or skylight.
Cofferdams	See Ch 2, Sec 3, [1].
Collar plate	A patch used to, partly or completely, close a hole cut for a longitudinal stiffener passing through a transverse web.
Collision bulkhead	The foremost main transverse watertight bulkhead.
Companionway	A weathertight entrance leading from a ship's deck to spaces below.
Compartment	An internal space bounded by bulkheads or plating.
Confined space	A space identified by one of the following characteristics: limited openings for entry and exit, unfavourable natural ventilation or not designed for continuous worker occupancy.
Corrugated bulkhead	A bulkhead including corrugations and usually fitted with lower and upper stools.
Corrugation	Plating arranged in a corrugated fashion.
Cross deck	The area between cargo hatches.
Cross ties	Large transverse structural members joining longitudinal bulkheads or joining a longitudinal bulkhead with double side structures and used to support them against hydrostatic and hydrodynamic loads.
Deck	A horizontal structure element that defines the upper or lower boundary of a compartment.
Deckhouse	See Ch 1, Sec 1, [2.4.6].
Deck structure	The deck plating with stiffeners, girders and supporting pillars.
Deck transverse	Transverse PSM at the deck.
Deep tank	Any tank which extends between two decks or the shell/inner bottom and the deck above or higher.
Designer	A party who creates documentation submitted to the Society necessary for approval or for information. The designer can be the builder or a party contracted by the builder or owner to create this documentation.
Discharges	Any piping leading through the ship's sides for conveying bilge water, circulating water, drains etc.
Docking bracket	A bracket located in the double bottom to locally strengthen the bottom structure for the purposes of docking.

Terms	Definition
Double bottom structure	The shell plating with stiffeners below the top of the inner bottom and other elements below and including the inner bottom plating.
Doubler	Small piece of plate which is attached to a larger area of plate that requires strengthening in that location. Usually at the attachment point of a stiffener.
Double skin member	Double skin member is defined as a structural member where the idealised beam comprises webs, with top and bottom flanges formed by attached plating.
Duct keel	A keel built of plates in box form extending the length of the cargo tank. It is used to house ballast and other piping leading forward which otherwise would have to run through the cargo tanks.
Enclosed superstructure	The superstructure with bulkheads forward and/or aft fitted with weather tight doors and closing appliances.
Engine room bulkhead	A transverse bulkhead either directly forward or aft of the engine room.
EPP	Elementary plate panel, the smallest plate element surrounded by structural members, such as stiffeners, PSM, bulkheads, etc.
Face plate	The section of a stiffening member attached to the plate via a web and is usually parallel to the plated surface.
Flange	The section of a stiffening member, typically attached to the web, but is sometimes formed by bending the web over. It is usually parallel to the plated surface.
Flat bar	A stiffener comprised only of a web.
Floor	A bottom transverse member.
Forecastle	A short superstructure situated at the bow.
Fore peak	The area of the ship forward of the collision bulkhead.
Fore peak deck	A short raised deck extending aft from the bow of the ship.
Freeboard deck	Generally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all exposed openings.
Freeing port	An opening in the bulwarks to allow water shipped on deck to run freely overboard.
Gangway	The raised walkway between superstructure, such as between the forecastle and bridge, or between the bridge and poop.
Girder	A collective term for primary supporting structural members.
Gudgeon	A block with a hole in the centre to receive the pintle of a rudder; located on the stern post, it supports and allows the rudder to swing.
Gunwale	The upper edge of the ship’s sides.
Gusset	A plate, usually fitted to distribute forces at a strength connection between two structural members.
Hatch cover	A cover fitted over a hatchway to prevent the ingress of water into the ship’s hold.
Hatchways	Openings, generally rectangular, in a ship’s deck affording access into the compartment below.
Hawse pipe	Steel pipe through which the hawser or cable of anchor passes, located in the ship's bow on either side of the stem, also known as spurling pipe.
Hawser	Large steel wire or fibre rope used for towing or mooring.
Hopper plating	Plating running the length of a compartment sloping between the inner bottom and vertical portion of inner hull longitudinal bulkhead.
HP	Bulb profile in accordance with the Holland profile standard.

IACS

Terms	Definition
IACS	International Association of Classification Societies
ICLL	IMO International Convention on Load Lines, 1966, as amended.
IMO	International Maritime Organisation
Independent tank	A self supporting tank.
Inner hull	The innermost plating forming a second layer to the hull of the ship.
Intercostal	Non-continuous member between stiffeners or PSM.
JIS	Japanese industrial standard.
Keel	The main structural member or backbone of a ship running longitudinally along the centreline of the bottom. Usually a flat plate stiffened by a vertical plate on its centreline inside the shell.
Keel line	Keel line is the line parallel to the slope of the keel intersecting the top of the keel at amidships.
Knuckle	A discontinuity in a structural member.
Lightening hole	A hole cut in a structural member to reduce its weight.
Limber hole	A small drain hole cut in a frame or plate to prevent water or oil from collecting.
Local support members	Local stiffening members which only influence the structural integrity of a single panel, e.g. deck beams.
Longitudinal centreline bulkhead	A longitudinal bulkhead located on the centreline of the ship.
Longitudinal hull girder structural members	Structural members that contribute to the longitudinal strength of the hull girder, including: deck, side, bottom, inner bottom, inner hull longitudinal bulkheads including upper sloped plating where fitted, hopper, bilge plate, longitudinal bulkheads, double bottom girders and horizontal girders in wing ballast tanks.
Longitudinal hull girder shear structural members	Structural members that contribute to strength against hull girder vertical shear loads, including: side, inner hull longitudinal bulkheads, hopper, longitudinal bulkheads and double bottom girders.
Manhole	A round or oval hole cut in decks, tanks, etc, for the purpose of providing access.
Margin plate	The outboard strake of the inner bottom and when turned down at the bilge the margin plate (or girder) forms the outer boundary of the double bottom.
MARPOL	IMO International Convention for the Prevention of Pollution from Ships, 1973 and Protocol of 1978, as amended.
Mid-hold	Middle hold(s) of the three cargo hold length FE model as defined in Pt 1, Ch 7, Sec 2, [1.2.2]
Notch	A discontinuity in a structural member caused by welding.
Oil fuel tank	A tank used for the storage of fuel oil.
Outer shell	Same as shell envelope.
Owner	The party that has assumed all duties and responsibilities for registration and operation of the ship and who on assuming such responsibilities has agreed to take over all the duties and responsibilities on delivery of the ship from the builder with valid certificates prepared for the owner.
Pillar	A vertical support placed between decks where the deck is unsupported by the shell or bulkhead.
Pipe tunnel	The void space running in the midships fore and aft lines between the inner bottom and shell plating forming a protective space for bilge, ballast and other lines extending from the engine room to the tanks.

Terms	Definition
Plate panel	Unstiffened plate surrounded and supported by structural members, such as stiffeners, PSM, bulkheads, etc. See also EPP.
Plating	Sheet of steel supported by stiffeners, primary supporting members or bulkheads.
Poop	The space below an enclosed superstructure at the extreme aft end of a ship.
Poop deck	The first deck above the shelter deck at the aft end of a ship.
Primary supporting members PSM	Members of the beam, girder or stringer type which provide the overall structural integrity of the hull envelope and tank boundaries, e.g. double bottom floors and girders, transverse side structure, deck transverses, bulkhead stringers and vertical webs on longitudinal bulkheads.
Scallop	A hole cut into a stiffening member to allow continuous welding of a plate seam.
Scarfing bracket	A bracket used between two offset structural items.
Scantlings	The physical dimensions of a structural item.
Scupper	Any opening for carrying off water from a deck, either directly or through piping.
Scuttle	A small opening in a deck or elsewhere, usually fitted with a cover or lid or a door for access to a compartment.
Shedder plates	Slanted plates that are fitted to minimise pocketing of residual cargo in way of corrugated bulkheads.
Sheer strake	The top strake of a ship's side shell plating.
Shelf plate	A horizontal plate located on the top of a bulkhead stool.
Shell envelope plating	The shell plating forming the effective hull girder exclusive of the strength deck plating.
Side frame	A vertical member attached to the side shell in bulk carriers.
Side shell	The shell envelope plating forming the side portion of the shell envelope above the bilge plating.
Single skin member	A structural member where the idealised beam comprises a web, with a top flange formed by attached plating and a bottom flange formed by a face plate.
Skylight	A deck opening fitted with or without a glass port light and serving as a ventilator for engine room, quarters, etc.
Slop tank	A tank in an oil tanker which is used to collect the oil and water mixtures from cargo tanks after tank washing.
SOLAS	IMO International Convention for the Safety of Life at Sea, 1974 as amended.
Spaces	Separate compartments including tanks.
Stay	Bulwark and hatch coaming brackets.
Stem	The piece of bar or plating at which a ship's outside plating terminates at forward end.
Stern frame	The heavy strength member in single or triple screw ships, combining the rudder post.
Stern tube	A tube through which the shaft passes to the propeller; and acts as an after bearing for the shafting. It may be water or oil lubricated.
Stiffener	A collective term for secondary supporting structural members.
Stool	A structure supporting tank bulkheads.
Strake	A course, or row, of shell, deck, bulkhead, or other plating.
Strength deck	The uppermost continuous deck.

Terms	Definition
Stringer	Horizontal girders linking vertical web frames.
Stringer plate	The outside strake of deck plating.
Superstructure	See Ch 1, Sec 1, [2.4.6].
SWL	Safe working load
Tank	Generic term for spaces intended to carry liquid, such as, seawater, fresh water, oil, liquid cargoes, FO, DO, etc.
Tank top	The horizontal plating forming the bottom of a cargo tank.
Towing pennant	A long rope which is used to effect the tow of a ship.
Topside tank	The tank that normally stretches along the length of the ship's side and occupies the upper corners of the cargo hold in bulk carriers.
Transom	The structural arrangement and form of the aft end of the ship.
Transverse ring	All transverse material appearing in a cross section of the ship's hull, in way of a double bottom floor, vertical web and deck transverse girder.
Transverse web frame	The primary transverse girders which join the ships longitudinal structure.
Tripping bracket	A bracket used to strengthen a structural member under compression against torsional forces.
Trunk	A decked structure similar to a deckhouse, but not provided with a lower deck.
'Tween deck	An abbreviation of between decks, placed between the upper deck and the tank top in the cargo tanks.
Ullage	The quantity represented by the unoccupied space in a tank.
Void	An enclosed empty space in a ship.
Wash bulkhead	A perforated or partial bulkhead in a tank.
Watertight	Watertight means capable of preventing the passage of water through the structure under a head of water for which the surrounding structure is designed.
Weather deck	A deck or section of deck exposed to the elements which has means of closing weathertight, all hatches and openings.
Weathertight	Weathertight means that in any sea conditions water will not penetrate into the ship.
Web	The section of a stiffening member attached perpendicular to the plated surface.
Web frame	Transverse PSM including deck transverse.
Wind and water strakes	The strakes of a ship's side shell plating between the ballast and the deepest load waterline.
Windlass	A winch for lifting and lowering the anchor chain.
Wing tank	The space bounded by the inner hull longitudinal bulkhead and side shell.

SECTION 5
LOADING MANUAL AND LOADING INSTRUMENTS

1 GENERAL REQUIREMENTS

1.1 Application

1.1.1

This Section contains minimum requirements for loading guidance information.

1.1.2

An approved loading manual and an approved loading instrument are to be supplied onboard.

1.1.3

A ship may in actual operation be loaded differently from the loading conditions specified in the loading manual, provided limitations for longitudinal and local strength as defined in the loading manual and loading instrument onboard and applicable stability requirements are not exceeded.

1.1.4

The requirements concerning the loading manual are given in [2] and those concerning the loading instruments in [3].

1.2 Annual and class renewal survey

1.2.1

At each annual and class renewal survey, it is to be checked that the approved loading manual is available onboard.

1.2.2

The loading instrument is to be checked for accuracy at regular intervals by the ship's master by applying test loading conditions.

1.2.3

At each class renewal survey this checking is to be done in the presence of the surveyor.

2 LOADING MANUALS

2.1 General requirements

2.1.1 Definition

The approved loading manual is to be based on the final data of the ship.

A loading manual is a document which describes:

- The loading conditions on which the design of the ship has been based for seagoing and harbour/sheltered water, including permissible limits of still water bending moment and shear force. The conditions specified in the ballast water exchanging procedure and dry docking procedure are to be included in the loading manual,
- The results of the calculations of still water bending moments, shear forces and where applicable limitations due to lateral loads,
- The allowable local loading for the structure (e.g. hatch covers, decks, double bottom, etc), where applicable,
- The relevant operational limitations.

2.1.2 Condition of approval

The approved loading manual is to be based on the final data of the ship.

Modifications resulting in changes to the main data of the ship (e.g. lightship weight, buoyancy distribution, tank volumes or usage, etc), require the loading manual to be updated and re-approved, and subsequently the loading computer system to be updated and re-approved. However, new loading guidance and an updated loading manual need not be resubmitted provided that the resulting draughts, still water bending moments and shear forces do not differ from the originally approved data by more than 2%.

The loading manual is to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

2.1.3 Loading conditions

The loading manual is to include the design (cargo and ballast) loading conditions, subdivided into departure and arrival conditions as appropriate, upon which the approval of the hull scantlings is based, as defined in Ch 4, Sec 8.

The loading conditions common to both oil tankers and bulk carriers are listed in Ch 4, Sec 8, [2].

2.1.4 Operational limitations

The loading manual is to describe relevant operational limitations:

- Scantling draught,
- Design minimum ballast draught at midships,
- Design slamming ballast draught forward with forward double bottom ballast tanks filled,
- Design slamming ballast draught forward with any of the forward double bottom ballast tanks empty,
- Maximum allowable cargo density,
- Maximum cargo density in any loading condition in the Loading Manual,
- Maximum service speed,
- Envelope results and permissible limits of still water bending moments and shear forces.

The loading manual must indicate that bulk carriers cannot be operated in seagoing conditions with ballast cargo holds partially filled.

2.2 Requirements specific to oil tankers

2.2.1

The loading manual is to contain the loading conditions described in Ch 4, Sec 8, [3].

This requirement applies in addition to [2.1].

2.3 Requirements specific to bulk carriers

2.3.1

The loading manual is to contain the loading conditions described in Ch 4, Sec 8, [4].

This requirement applies in addition to [2.1].

2.3.2

The loading manual is to describe:

- Envelope results and permissible limits of still water bending moments and shear forces in the hold flooded condition according to Ch 4, Sec 4,
- The cargo hold(s) or combination of cargo holds that might be empty at full draught. If no cargo hold is allowed to be empty at full draught, this is to be clearly stated in the loading manual,
- Maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of the draught at mid-hold position as defined in Ch 4, Sec 8, [4.3],
- Maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions as defined in Ch 4, Sec 8, [4.3],
- Maximum allowable tank top loading together with specification of the nature of the cargo for cargoes other than bulk cargoes,
- Maximum allowable load on deck and hatch covers. If the ship is not approved to carry load on deck or hatch covers, this is to be clearly stated in the loading manual,
- Maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

2.3.3

The additional following loading conditions, subdivided into departure and arrival conditions as appropriate, are to be included in the loading manual:

- Homogeneous light and heavy cargo loading conditions at maximum draught,
- Alternate light and heavy cargo loading conditions at maximum draught, where applicable,
- *Ballast conditions. For ships having ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty,*
- Short voyage conditions, i.e. the ship is loaded to maximum draught but with a limited amount of bunkers, where appropriate,
- Multiple port loading/unloading conditions,
- Deck cargo conditions, where applicable,
- Typical sequences for change of ballast at sea, where applicable,
- Typical loading sequences where the ship is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions are also to be included. The typical loading/unloading sequences are also to be developed to not exceed applicable strength limitations. The typical loading sequences are also to be developed paying due attention to loading rate and the deballasting capability. Figure 1 contains, as guidance only, an example of a Loading Sequence Summary Form.

3 LOADING INSTRUMENT

3.1 General requirements

3.1.1 Definition

A loading computer system is a system, which is either analog or digital, by means of which it can be easily and quickly ascertained that, at specified read-out points, relevant operational limitations, such as the still water bending moments, shear forces, and lateral loads, where applicable, in any load or ballast condition do not exceed the specified permissible values.

The loading instrument is ship specific onboard equipment and the results of the calculations are only applicable to the ship for which it has been approved.

An approved loading instrument can not replace an approved loading manual.

3.1.2 Conditions of approval of loading instruments

The loading instrument is subject to approval based on the Rules of the individual Society. The approval is to include:

- Verification of type approval, if any,
- Verification that the final data of the ship has been used,
- Acceptance of number and position of read-out points,
- Acceptance of relevant limits for all read-out points,
- Checking of proper installation and operation of the instrument onboard, in accordance with agreed test conditions, and that a copy of the operation manual is available.

Modifications resulting in changes to the main data of the ship (e.g. lightship weight, buoyancy distribution, tank volumes or usage, etc), require the loading manual to be updated and re-approved, and subsequently the loading instrument to be updated and re-approved. However, new loading guidance and an updated loading instrument need not be resubmitted provided that the resulting draughts, still water bending moments and shear forces do not differ from the originally approved data by more than 2%.

An operational manual is always to be provided for the loading instrument. The operation manual and the instrument output are to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

The operation of the loading instrument is to be verified upon installation. It is to be checked that the agreed test conditions and the operation manual for the instrument is available onboard.

3.2 Requirements specific to bulk carriers

3.2.1 General

For BC-A, BC-B and BC-C ships, the loading instrument is to ascertain as applicable:

- The mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position,
- The mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds,
- That the still water bending moment and shear forces in the hold flooded conditions do not exceed the specified permissible values.

3.2.2 Condition of approval

For BC-A, BC-B and BC-C ships, the approval is to include, as applicable:

- Acceptance of hull girder bending moment limits for all read-out points,
- Acceptance of hull girder shear force limits for all read-out points,

- Acceptance of limits for the mass of cargo and double bottom contents of each hold as a function of draught,
- Acceptance of limits for the mass of cargo and double bottom contents in any two adjacent holds as a function of draught.

4 LOADING SPECIFIC TO BULK CARRIERS

4.1 Guidance for loading/unloading sequences

4.1.1 Scope of application

The requirements given in [4] are applicable to bulk carriers of 150 m in length and above.

4.1.2

The typical loading/unloading sequences are to be developed paying due attention to the loading/unloading rate, the ballasting/deballasting capacity and the applicable strength limitations.

4.1.3

Typical loading and unloading sequences are to be prepared and submitted for approval by the builder.

4.1.4

The typical loading sequences as relevant are to include:

- Alternate light and heavy cargo load condition,
- Homogeneous light and heavy cargo load condition,
- Short voyage condition where the ship is loaded to maximum draught but with limited bunkers,
- Multiple port loading/unloading condition,
- Deck cargo condition,
- Block loading.

4.1.5

The loading/unloading sequences may be port specific or typical.

4.1.6

The sequence is to be built up step by step from commencement of cargo loading to reach full deadweight capacity. Each time the loading equipment changes position to a new hold defines a step. Each step is to be documented and submitted to the Society. In addition to longitudinal strength, the local strength of each hold is to be considered.

4.1.7

For each loading condition, a summary of all steps is to be included. This summary is to highlight the essential information for each step, such as:

- How much cargo is filled in each hold during the different steps,
- How much ballast is discharged from each ballast tank during the different steps,
- The maximum still water bending moment and shear force at the end of each step,
- The ship's trim and draught at the end of each step.

PART 1 CHAPTER 2

GENERAL ARRANGEMENT DESIGN

Table of Contents

SECTION 1
GENERAL

1 GENERAL

1.1 General

1.1.1

This chapter covers the general structural arrangement requirements for the ship.

SECTION 2
SUBDIVISION ARRANGEMENT

1 WATERTIGHT BULKHEAD ARRANGEMENT

1.1 Number and disposition of watertight bulkheads

1.1.1

All ships are to have at least the following transverse watertight bulkheads:

a) One collision bulkhead.

b) One aft peak bulkhead.

c) One bulkhead at each end of the machinery space.

1.1.2

In the case of ships with an electrical propulsion plant, both the generator room and the engine room are to be enclosed by watertight bulkheads.

1.1.3

In addition to the requirements of [1.1.1] and [1.1.2], the number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the requirements of national regulations.

1.1.4

For bulk carriers less than 150 m in length not required to comply with subdivision requirements, bulkheads not less in number than indicated in Table 1 are to be fitted.

Table 1 : Number of bulkheads for bulk carriers less than 150 m in length

Length in m	Number of bulkheads for ships with aft machinery (1)
$90 \le L < 105$	4
$105 \le L < 120$	5
$120 \le L < 145$	6
$145 \le L < 150$	7
(1) Aft peak bulkhead and aft machinery bulkhead are the same.	

1.1.5

The bulkheads in the cargo hold region are to be spaced at uniform intervals as far as practicable.

1.2 Openings in watertight bulkheads

1.2.1

The number of openings in watertight bulkheads is to be kept a minimum, where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables. Arrangements are to be made to maintain the watertight integrity.

1.2.2

The tightness, operability and indication of the doors in watertight bulkheads are to be in accordance with Ch II-1, Reg 13-1 of SOLAS Convention, as amended.

2 COLLISION BULKHEAD

2.1 Extent and position of collision bulkhead

2.1.1

A collision bulkhead is to be fitted on all ships and is to extend to the freeboard deck. It is to be located between 0.05 L_{LL} or 10 m, whichever is less, and except as may be permitted by the Administration, 0.08 L_{LL} or 0.05 L_{LL} + 3 m, whichever is the greater, aft of the reference point, where the reference point is as defined in [2.1.2].

2.1.2

For ships without bulbous bows the reference point is to be taken where the forward end of L_{LL} coincides with the forward side of stem, on the waterline which L_{LL} is measured. For ships with bulbous bows, it is to be measured from the forward end of L_{LL} a distance x forward; where x is to be taken as the lesser of the following:

a) Half the distance, from FP_{LL} to the extreme forward end of the bulb extension.

b) 0.015 L_{LL}.

c) 3.0 m.

2.2 Arrangement of collision bulkhead

2.2.1

In general, the collision bulkhead is to be in one plane; however, the bulkhead may have steps or recesses provided that they are within the limits prescribed in [2.1.1] and [2.1.2].

2.2.2

Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck. Where the collision bulkhead is extended above the freeboard deck, the number of openings in the extension is to be kept to a minimum compatible with the design and proper working of the ship. Reference is made to Ch 1, Sec 2, [2.1].

3 AFT PEAK BULKHEAD

3.1 General

3.1.1

An aft peak bulkhead, enclosing the stern tube and rudder trunk in a watertight compartment, is to be provided. Where the shafting arrangements make enclosure of the stern tube in a watertight compartment impractical, alternative arrangements are specially considered.

3.1.2

The aft peak bulkhead may be stepped below the bulkhead deck, provided that the degree of safety of the ship as regards subdivision is not thereby diminished.

3.1.3

The aft peak bulkhead location on ships powered and/or controlled by equipment that do not require the fitting of a stern tube and/or rudder trunk are also subject to special consideration.

3.1.4

The aft peak bulkhead may terminate at the first deck above the deepest draught at the aft perpendicular, provided that this deck is made watertight to the stern or to the transom.

SECTION 3
COMPARTMENT ARRANGEMENT

1 COFFERDAMS

1.1 Definition

1.1.1

A cofferdam means an empty space arranged so that compartments on each side have no common boundary; a cofferdam may be located vertically or horizontally. As a rule, a cofferdam is to be kept gas-tight and is to be properly ventilated and of sufficient size to allow proper inspection, maintenance and safe evacuation.

1.2 Arrangement of cofferdams

1.2.1

Cofferdams are to be provided between compartments intended for liquid hydrocarbons (including fuel oil, lubricating oil) and those intended for fresh water (drinking water, water for propelling machinery and boilers) as well as tanks intended for the carriage of liquid foam for fire extinguishing.

1.2.2

Furthermore, tanks carrying fresh water for human consumption are to be separated from other tanks containing substances hazardous to human health by cofferdams or other means as approved by the Society.

Note 1: Normally, tanks for fresh water and water ballast are considered non-hazardous.

1.2.3

Where a corner to corner situation occurs, tanks are not considered to be adjacent.

2 DOUBLE BOTTOM

2.1 General

2.1.1

A double bottom need not be fitted in way of watertight tanks, including dry tanks of moderate size provided the safety of the ship is not impaired in the event of bottom or side damage as regulated in SOLAS II-1, Reg 9.

2.2 Extent of double bottom

2.2.1

For bulk carriers, a double bottom is to be fitted extending from the collision bulkhead to the aft peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

For oil tankers, a double bottom is to be fitted to protect the cargo hold region and pump rooms. However the double bottom below pump rooms may be omitted provided that it is in compliance with MARPOL, Annex I, Ch 4, Reg 22.

2.2.2

Where double bottom is required to be fitted, the inner bottom is to be continued out to the ship side in such a manner as to protect the bottom to the turn of the bilge in areas where hopper or double side spaces are not provided.

2.3 Height of double bottom

2.3.1

Unless otherwise specified, the height of the double bottom is not to be less than the lesser of:

- For oil tankers: $B/15$ or 2 m, however not less than 1.0 m.
- For bulk carriers: $B/20$ or 2 m, however not less than 0.76 m measured vertically from the plane parallel with keel line to inner bottom.

2.4 Small wells in double bottom tank

2.4.1

Small wells constructed in the double bottom are not to extend in depth more than necessary. A well extending to the outer bottom, may, however, be permitted at the after end of the shaft tunnel of the ship. Other wells may be permitted by the Society if it is satisfied that the arrangements give protection equivalent to that afforded by a double bottom that complies with [2.1].

3 DOUBLE SIDE

3.1 Double side width

3.1.1 Oil tankers

The minimum double side width, W_{ds}, in m, is to be taken as the lesser of:

$$W_{ds} = 0.5 + \frac{DWT}{20000} \text{ but not less than 1.0}$$

$$W_{ds} = 2.0$$

3.1.2 Bulk carriers

Double side skin means a configuration where each ship side is constructed by the side shell and a longitudinal bulkhead connecting the double bottom and the deck. Hopper side tanks and topside tanks may, where fitted, be integral parts of the double side skin configuration.

The minimum double side width, W_{ds}, is not to be less than 1 m measured perpendicular to the side shell.

3.2 Minimum clearance inside the double side

3.2.1 Definition

The minimum clearance is defined as the shortest distance measured between assumed lines connecting the inner surfaces of the stiffeners on the inner and outer hulls.

3.2.2 Minimum clearance dimensions

The minimum clearance between the inner surfaces of the stiffeners inside the double side is not to be less than:

- 600 mm when the inner and/or the outer hulls are transversely framed,
- 800 mm when the inner and the outer hulls are longitudinally framed.

Outside the parallel part of the cargo hold, the clearance may be reduced but is not to be less than 600 mm.

4 FORE END COMPARTMENTS

4.1 General

4.1.1

The fore peak and other compartments located forward of the collision bulkhead may not be arranged for the carriage of fuel oil or other flammable products.

5 FUEL OIL TANKS

5.1 Arrangement of fuel oil tanks

5.1.1

Fuel oil tanks are to be arranged in accordance with the requirements in SOLAS Ch II-2, Reg 4.2 and MARPOL, Annex I, Ch 3, Reg 12A.

6 AFT END COMPARTMENTS

6.1 Sterntube

6.1.1

Sterntubes are to be enclosed in a watertight space (or spaces) of moderate volume. Other measures to minimise the danger of water penetrating into the ship in case of damage to the sterntube arrangement may be taken at the discretion of the Society.

7 BALLAST TANKS

7.1 Capacity and disposition of ballast tanks

7.1.1

All ships are to have ballast tanks of sufficient capacity that the ship may operate safely on ballast voyage. The capacity of ballast is to be at least such that, in any ballast condition at any part of the voyage, including the conditions consisting of lightweight plus ballast only, the ship’s draught and trim can meet the requirements defined in:

- For oil tankers, Ch 4, Sec 8, [3.1].
- In addition, for oil tankers, the moulded draught amidships, T_{mid}, excluding any hogging or sagging correction, is not to be less than:

  $T_{mid} = 2.0 + 0.02\, L$, in m.

- For bulk carriers, Ch 4, Sec 8, [4.1].

SECTION 4
ACCESS ARRANGEMENT

1 CLOSED SPACES

1.1 General

1.1.1

All closed spaces are to be accessible for easy inspection. Special measures for inspection and maintenance are to be put in place for small closed spaces for which the design causes impracticality for the access.

1.1.2

For areas which are not explicitly covered by SOLAS, Ch II-1, Reg 3-6, the builder is to provide accesses in accordance with industry standards accepted by the Society. For general guidance, human element factors may be considered based on IACS Recommendation No. 132 or with an ergonomic standard accepted by the Society.

2 CARGO AREA AND FORWARD SPACES

2.1 General

2.1.1 Ship structure access manual

Ship structures subject to overall and close-up inspection and thickness measurements are to be provided with means of access which are to be described in a “Ship Structure Access Manual“. Reference is made to SOLAS, Ch II-1, Reg 3-6.

2.1.2

All tanks are to be accessible for easy inspection.

PART 1 CHAPTER 3

STRUCTURAL DESIGN PRINCIPLES

Table of Contents

SECTION 7
Structural Idealisation

SECTION 1
MATERIALS

1 GENERAL

1.1 Standard of material

1.1.1

Materials used during construction are to comply with the Rules for Materials of the Society.

1.1.2

Other materials than those covered under [1.1.1] may be accepted, provided their specification (e.g. manufacture, chemical composition, mechanical properties, welding) is submitted to the Society for approval.

1.2 Testing of materials

1.2.1

Materials are to be tested in compliance with the applicable requirements of Rules for Materials of the Society.

1.3 Manufacturing process

1.3.1

The requirements of this section presume that welding and other cold or hot manufacturing processes are carried out in compliance with current sound working practice defined in the Rules and/or documents of the individual Society which incorporate IACS UR W and the applicable requirements of Rules for Materials of the Society.

In particular:

- Parent material and welding processes are to be within the limits stated for the specified type of material for which they are intended.
- Specific preheating may be required before welding.
- Welding or other cold or hot manufacturing processes may need to be followed by an adequate heat treatment.

2 HULL STRUCTURAL STEEL

2.1 General

2.1.1 Young's modulus and Poisson's ratio

The Young's modulus for Carbon steel materials is equal to 206,000 N/mm^2 and the Poisson's ratio equal to 0.3.

2.1.2 Steel material grades and mechanical properties

Steel having a specified minimum yield stress of 235 N/mm^2 is regarded as normal strength hull structural steel and is denoted by 'MS' for mild steel. Steel having a higher specified minimum yield stress is regarded as higher strength hull structural steel and is denoted 'HT' for high tensile steel.

Material grades of hull structural steels are referred to as follows:

a) A, B, D and E denote normal strength steel grades.

b) AH, DH and EH denote higher strength steel grades.

Table 1 gives the mechanical characteristics of steels generally used in the construction of ships.

Table 1 : Mechanical properties of hull steels

Steel grades for plates with $t_{as\_built} \leq 100$ mm	R_{eH}, specified minimum yield stress, in N/mm^2	R_m, specified tensile strength, in N/mm^2
A-B-D-E	235	400 – 520
AH32-DH32-EH32-FH32	315	440 – 570
AH36-DH36-EH36-FH36	355	490 – 630
AH40-DH40-EH40-FH40	390	510 – 660

2.1.3

Higher strength steels other than those indicated in Table 1 are considered by the Society on a case-by-case basis.

2.1.4 High tensile steel

When steels with a specified minimum yield stress R_{eH} other than 235 N/mm^2 are used, hull girder strength and hull scantlings are to be determined by taking into account the material factor, k defined in [2.2].

2.1.5 Onboard documents

It is required to keep onboard a plan indicating the steel types and grades adopted for the hull structures. Where steels other than those indicated in Table 1 are used, their mechanical and chemical properties, as well as any workmanship requirements or recommendations, are to be available onboard together with the above plan.

2.2 Material factor, k

2.2.1

Unless otherwise specified, the material factor, k of normal and higher strength steel for hull girder strength and scantling purposes is to be taken as defined in Table 2, as a function of the specified minimum yield stress R_{eH}.

For intermediate values of R_{eH}, k is obtained by linear interpolation.

Steels with a specified minimum yield stress R_{eH}, greater than 390 N/mm^2 are considered by the Society on a case-by-case basis.

Table 2 : Material factor, k

R_{eH}, specified minimum yield stress, in N/mm^2	k
235	1.00
315	0.78
355	0.72
390	0.68

2.3 Steel grades

2.3.1

Materials in the various strength members are not to be of lower grade than those corresponding to the material classes and grades specified in Table 3 to Table 8. General requirements are given in Table 3, while additional minimum requirements for ships with length exceeding 150 m and 250 m, single side bulk carriers with length exceeding 150 m, and ships with ice strengthening are given in Table 4 to Table 7. The material grade requirements for hull members of each class depending on the thickness are defined in Table 8.

Table 3 : Material classes and grades

Structural member category		Material class/grade
Secondary	A1. Longitudinal bulkhead strakes, other than those belonging to the Primary category A2. Deck plating exposed to weather, other than that belonging to the Primary or Special category A3. Side plating	- Class I within 0.4 *L* amidships - Grade A/AH outside 0.4 *L* amidships
Primary	B1. Bottom plating, including keel plate B2. Strength deck plating, excluding that belonging to the Special category B3. Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings B4. Uppermost strake in longitudinal bulkhead B5. Vertical strake (hatch side girder) and uppermost sloped strake in topside tank	- Class II within 0.4 *L* amidships - Grade A/AH outside 0.4 *L* amidships
Special	C1. Sheer strake at strength deck (1) C2. Stringer plate in strength deck (1) C3. Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships (1)	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships
	C4. Strength deck plating at outboard corners of cargo hatch openings for ships with hatch opening configurations similar to those of container carriers	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships - Min. Class III within cargo hold region
	C5. Strength deck plating at corners of cargo hatch openings	- Class III within 0.6 *L* amidships - Class II within rest of cargo hold region
	C6. Bilge strake of ships with double bottom over the full breadth and with length less than 150 m	- Class II within 0.6 *L* amidships - Class I outside 0.6 *L* amidships
	C7. Bilge strake in other ships (1)	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships
	C8. Longitudinal hatch coamings of length greater than 0.15 *L* including coaming top plate and flange C9. End brackets and deckhouse transition of longitudinal cargo hatch coamings	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships - Not to be less than Grade D/DH
(1)	Single strakes required to be of class III within 0.4*L* amidships are to have breadths not less than 800+5*L*, in mm, need not be greater than 1800 mm, unless limited by the geometry of the ship's design.	

Table 4 : Minimum material grades for ships with length exceeding 150 m

Structural member category	Material grade
Longitudinal plating of strength deck where contributing to the longitudinal strength	Grade B/AH within 0.4 *L* amidships
Continuous longitudinal plating of strength members above strength deck	Grade B/AH within 0.4 *L* amidships
Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and the strength deck	Grade B/AH within cargo hold region

Table 5 : Minimum material grades for ships with length exceeding 250 m

Structural member category (1)	Material grade
Shear strake at strength deck	Grade E/EH within 0.4 *L* amidships
Stringer plate in strength deck	Grade E/EH within 0.4 *L* amidships
Bilge strake	Grade D/DH within 0.4 *L* amidships
(1) Single strakes required to be of Grade E/EH and within 0.4 *L* amidships are to have breadths not less than 800+5 *L* (mm), need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.	

Table 6 : Minimum material grades for single side skin bulk carriers with length exceeding 150 m

Structural member category	Material grade
Lower bracket of ordinary side frame (1), (2)	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125ℓ above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate (2)	Grade D/DH
(1) The term 'lower bracket' means webs of lower brackets and webs of the lower part of side frames up to the point of 0.125ℓ above the intersection of side shell and bilge hopper sloping plate or inner bottom plate. **(2)** The span of the side frame, ℓ, is defined as the distance between the supporting structures (see Pt 2, Ch 1, Sec 2, Figure 2).	

Table 7 : Minimum material grades for ships with ice strengthening

Structural member category	Material grade
Shell strakes in way of ice strengthening area for plates	Grade B/AH

Table 8 : Material grade requirements for classes I, II and III

Class	I		II		III	
As-built thickness, in mm	MS	HT	MS	HT	MS	HT
$t \leq 15$	A	AH	A	AH	A	AH
$15 < t \leq 20$	A	AH	A	AH	B	AH
$20 < t \leq 25$	A	AH	B	AH	D	DH
$25 < t \leq 30$	A	AH	D	DH	D	DH
$30 < t \leq 35$	B	AH	D	DH	E	EH
$35 < t \leq 40$	B	AH	D	DH	E	EH
$40 < t \leq 50$	D	DH	E	EH	E	EH

2.3.2

For strength members not mentioned in Table 3 to Table 7, Grade A/AH may be used upon agreement of the Society.

2.3.3

Plating materials for stern frames and shaft brackets are in general not to be of lower grades than corresponding to Class II.

2.4 Structures exposed to low air temperature

2.4.1

For ships intended to operate in areas with low air temperatures refer to Ch 1, Sec 2, [3.4.4].

2.5 Through thickness property

2.5.1

Where tee or cruciform connections employ partial or full penetration welds, and the plate material is subject to significant tensile strain in a direction perpendicular to the rolled surfaces, consideration is to be given to the use of special material with specified through thickness properties, in accordance with the Rules for Materials of the Society. These steels are to be designated on the approved plan by the required steel strength grade followed by the letter Z (e.g. EH36Z).

2.6 Stainless steel

2.6.1

The reduction of strength of stainless steel with increasing temperature is to be taken into account in the calculation of the material factor, *k* and in the material Young's modulus, *E*.

Stainless steels are considered by the Society on a case-by-case basis.

3 STEELS FOR FORGING AND CASTING

3.1 General

3.1.1

Mechanical and chemical properties of steels for forging and casting to be used for structural members are to comply with the applicable requirements of the Rules for Materials of the Society.

3.1.2

Steels of structural members intended to be welded are to have mechanical and chemical properties deemed appropriate for this purpose by the Society on a case-by-case basis.

3.1.3

The steels used are to be tested in accordance with the applicable requirements of the Rules for Materials of the Society.

3.2 Steels for forging

3.2.1

Rolled bars may be accepted in lieu of forged products, after consideration by the Society on a case-by-case basis. In such case, compliance with the applicable requirements of the Rules for Materials of the Society, relevant to the quality and testing of rolled parts accepted in lieu of forged parts, may be required.

3.3 Steels for casting

3.3.1

Cast parts intended for stems and stern frames in general may be made of C and C-Mn weldable steels, having specified minimum tensile strength, R_m = 400 N/mm^2, in accordance with the applicable requirements of the Society's Rules for Materials.

3.3.2

The welding of cast parts to main plating contributing to hull strength members is considered by the Society on a case-by-case basis.

The Society may require additional properties and tests for such casting, in particular impact properties which are appropriate to those of the steel plating on which the cast parts are to be welded and non-destructive examinations.

4 ALUMINIUM ALLOYS

4.1 General

4.1.1

The use of aluminium alloys in superstructures, deckhouses, hatch covers, helicopter platforms, or other local components is to be specially considered. A specification of the proposed alloys and their proposed method of fabrication is to be submitted for approval.

Material requirements and scantlings are to comply with the Rules for Materials of the Society. Series 5000 aluminium-magnesium alloys or series 6000 aluminium-magnesium-silicon alloys are to be used.

4.1.2

In the case of structures subjected to low service temperatures or intended for other specific applications, the alloys to be employed are to be agreed by the Society.

4.1.3

Unless otherwise agreed, the Young's modulus for aluminium alloys is equal to 70,000 N/mm^2 and the Poisson's ratio equal to 0.33.

4.1.4

Details of the proposed method of joining any aluminium and steel structures are to be submitted for approval.

4.2 Extruded plating

4.2.1

Extrusions with built-in plating and stiffeners, referred to as extruded plating, may be used.

4.2.2

In general, the application of extruded plating is limited to decks, bulkheads, superstructures and deckhouses. Other uses may be permitted by the Society on a case-by-case basis.

4.2.3

Extruded plating is to be oriented so that the stiffeners are parallel to the direction of main stresses.

4.2.4

Connections between extruded plating and primary members are to be given special attention.

4.3 Mechanical properties of weld joints

4.3.1

Welding heat input lowers locally the mechanical strength of aluminium alloys hardened by work hardening (series 5000 other than condition O or H111) or by heat treatment (series 6000).

4.3.2

The as-welded properties of aluminium alloys of series 5000 are in general those of condition O or H111. Higher mechanical characteristics may be considered, provided they are duly justified.

4.3.3

The as-welded properties of aluminium alloys of series 6000 are to be agreed by the Society.

4.4 Material factor, *k*

4.4.1

The material factor, *k* for aluminium alloys is to be obtained from the following formula:

$$k = \frac{235}{R'_{lim}}$$

where:

R'_{lim} : Minimum guaranteed yield stress of the parent metal in welded condition $R'_{p0.2}$, in N/mm^2, but not to be taken greater than 70% of the minimum guaranteed tensile strength of the parent metal in welded condition R'_m, in N/mm^2.

$R'_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of material in welded condition.

$$R'_{p0.2} = \eta_1 R_{p0.2}$$

R'_m : Minimum guaranteed tensile strength, in N/mm^2, of material in welded condition.

$$R'_m = \eta_2 R_m$$

$R_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of the parent metal in delivery condition.

R_m : Minimum guaranteed tensile strength, in N/mm^2, of the parent metal in delivery condition.

η_1, η_2 : Specified in Table 9.

Table 9 : Aluminium alloys - Coefficients for welded construction

Aluminium alloy	η_1	η_2
Alloys without work-hardening treatment (series 5000 in annealed condition O or annealed flattened condition H111)	1	1
Alloys hardened by work hardening (series 5000 other than condition O or H111)	$R'_{p0.2} / R_{p0.2}$	R'_m / R_m
Alloys hardened by heat treatment (series 6000) (1)	$R'_{p0.2} / R_{p0.2}$	0.6
(1) When no information is available, coefficient η_1 is to be taken equal to the metallurgical efficiency coefficient β as defined in Table 10.		

Table 10 : Aluminium alloys - Metallurgical efficiency coefficient β

Aluminium alloy	Temper condition	As-built thickness, in mm	β
6005A (Open sections)	T5 or T6	$t \leq 6$	0.45
		$t > 6$	0.40
6005A (Closed sections)	T5 or T6	All	0.50
6061 (Sections)	T6	All	0.53
6082 (Sections)	T6	All	0.45

4.4.2

In the case of welding of two different aluminium alloys, the material factor, *k* to be considered for the scantlings is the greater material factor of the aluminium alloys of the assembly.

4.5 Others

4.5.1

Aluminium fittings in tanks used for the carriage of oil, and in cofferdams and pump rooms are to be avoided. Where fitted, aluminium fittings, units and supports, in tanks used for the carriage of oil, cofferdams and pump rooms are to satisfy the requirements of Pt 2, Ch 2, Sec 2, [1.2] for aluminium anodes.

4.5.2

The underside of heavy portable aluminium structures such as gangways, is to be protected by means of a hard plastic or wood cover, or other approved means, in order to avoid the creation of smears. Such protection is to be permanently and securely attached to the structures.

5 OTHER MATERIALS AND PRODUCTS

5.1 General

5.1.1

Other materials and products such as parts made of iron castings, where allowed, products made of copper and copper alloys, rivets, anchors, chain cables, cranes, masts, derrick posts, derricks, accessories and wire ropes are to comply with the applicable requirements of the Rules for Materials of the Society.

5.1.2

The use of plastics or other special materials not covered by these Rules is to be considered by the Society on a case-by-case basis. In such cases, the requirements for the acceptance of the materials concerned are to be agreed by the Society.

5.2 Iron cast parts

5.2.1

As a rule, the use of grey iron, malleable iron or spheroidal graphite iron cast parts with combined ferritic/perlitic structure is allowed only to manufacture low stressed elements of secondary importance.

5.2.2

Ordinary iron cast parts may not be used for windows or sidescuttles; the use of high grade iron cast parts of a suitable type is to be considered by the Society on a case-by-case basis.

SECTION 2
NET SCANTLING APPROACH

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4

t : Net thickness in mm.

t_c : Corrosion addition in mm.

t_{gr} : Gross thickness in mm.

h_{stf} : Height of stiffener or primary supporting member in mm.

h_w : Web height of stiffener or primary supporting member in mm.

t_w : Web thickness of stiffener or primary supporting member in mm.

b_f : Face plate width of stiffener or primary supporting member in mm.

t_f : Face plate thickness of stiffener or primary supporting member in mm.

t_p : Thickness of the plating attached to a stiffener or to a primary supporting member in mm.

d_e : Distance in mm, from the upper edge of the web to the top of the flange for *L3* profiles, see Figure 3.

t_{as_built} : As-built thickness, in mm, taken as the actual thickness provided at the newbuilding stage.

t_{gr_off} : Gross offered thickness, in mm, as defined in [1.2.2].

t_{gr_req} : Gross required thickness, in mm, as defined in [1.2.1].

t_{off} : Net offered thickness, in mm, as defined in [1.2.3].

t_{dm} : Design production margin, in mm, taken as the thickness difference between offered gross thickness and required gross thickness (equal also to the difference between offered net and required net thickness) as a result of scantlings applied by the designer or builder to suit design or production situation. This difference in thickness is not to be considered as an additional corrosion margin.

t_{req} : Net required thickness, in mm, as required in [1.3.1].

t_{vol_add} : Thickness for voluntary addition, in mm, taken as the thickness voluntarily added as the owner's extra margin or builder's extra margin for corrosion wastage in addition to t_c.

t_{res} : Reserve thickness, in mm, taken equal to 0.5 mm.

t_{c1}, t_{c2} : Corrosion addition on one side of the considered structural member, in mm, as defined in Ch 3, Sec 3, Table 1.

1 GENERAL

1.1 Application

1.1.1 Net thickness approach

The net thickness, t, of a structural element is required for structural strength in compliance with the design basis. The corrosion addition, t_c, for a structural element is derived independently from the net scantling requirements as shown in Figure 1. This approach clearly separates the net thickness from the thickness added to address the corrosion that is likely to occur during the ship-in-operation phase. This approach

enables the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

1.1.2 Local and global corrosion

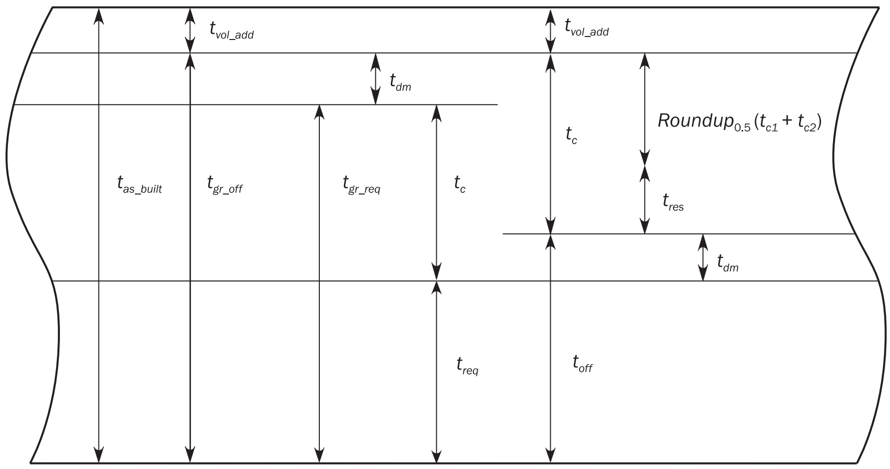
The net thickness approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the average corrosion of larger areas, such as primary supporting members and the hull girder.

1.1.3 Exceptions in gross scantling

Items that are directly determined in terms of gross scantlings do not follow the net scantling approach, i.e. they already include additions for corrosion but without any owner's extra margin. Gross scantling requirements are identified with the suffix "gr" and examples are:

- Scantlings of superstructures and deckhouses as given in Ch 11, Sec 1.
- Scantlings of massive pieces made of steel forgings and steel castings.

Figure 1 : Net scantling approach scheme



1.2 Gross and net scantling definitions

1.2.1 Gross required thickness

The gross required thickness, t_{gr_req}, is the thickness obtained by adding the corrosion addition as defined in Ch 3, Sec 3 to the net required thickness, as follows:

$$t_{gr\_req} = t_{req} + t_c$$

1.2.2 Gross offered thickness

The gross offered thickness, t_{gr_off}, is the gross thickness provided at the newbuilding stage, which is obtained by deducting any thickness for voluntary addition from the as-built thickness, as follows:

$$t_{gr\_off} = t_{as\_built} - t_{vol\_add}$$

1.2.3 Net offered thickness

The net offered thickness, t_{off}, is obtained by subtracting the corrosion addition from the gross offered thickness, as follows:

$$t_{off} = t_{gr\_off} - t_c = t_{as\_built} - t_{vol\_add} - t_c$$

1.3 Scantling compliance

1.3.1

The net required thickness, t_{req}, is obtained by rounding the net thickness calculated according to the Rules to the nearest half millimetre. For example:

- For $10.75 \le t < 11.25$ mm, the Rule required net thickness is 11.0 mm.
- For $11.25 \le t < 11.75$ mm, the Rule required net thickness is 11.5 mm.

1.3.2

Scantling compliance in relation to the Rules is as follow:

- The net offered thickness of plating is to be equal to or greater than the net required thickness of plating.
- The required net section modulus, moment of inertia and shear area properties of local supporting members are to be calculated using the net thickness of the attached plate, web and flange. The net sectional dimensions of local supporting members are defined in Figure 2. The required section modulus and web net thickness apply to areas clear of the end brackets.
- The offered net sectional properties of primary supporting members and the hull girder are to be equal to or greater than the required net sectional properties which are to be based on the gross offered scantling with a reduction of the applicable corrosion addition, as specified in Table 1, applied to all component structural members.
- The strength assessment methods prescribed are to be assessed by applying the corrosion reduction specified in Table 1 to the offered gross scantlings. Half of the applied corrosion addition specified in Table 1 is to be deducted from both sides of the structural members being considered.
- Corrosion additions are not to be taken less than those given in Ch 3, Sec 3, [1.2].

Any additional thickness specified by the owner or the builder is not to be included when considering the compliance with the Rules.

Table 1 : Assessment for corrosion applied to the gross scantlings

Structural requirement	Property/analysis type	Applied corrosion addition
Minimum thickness (all members including PSM)	Thickness	t_c
Local strength (plates, stiffeners, and hold frames)	Thickness/sectional properties	t_c
	Stiffness / proportions / Buckling capacity	t_c
Primary supporting members (prescriptive)	Sectional properties	$0.5\ t_c$
	Stiffness/proportions of web and flange Buckling capacity	t_c
Strength assessment by FEM	Cargo tank/cargo hold	$0.5\ t_c$
	Buckling capacity	t_c
	Local fine mesh	$0.5\ t_c$
	Specified fine mesh areas	$0.5\ t_c$
Hull girder strength	Sectional properties	$0.5\ t_c$
	Buckling capacity	t_c
Hull girder ultimate strength Hull girder residual strength	Sectional properties	$0.5\ t_c$
	Buckling/collapse capacity	$0.5\ t_c$
Fatigue assessment (simplified stress analysis)	Hull girder section properties Local support member	$0.5\ t_c$
Fatigue assessment (FE Stress analysis)	Coarse mesh FE model Very fine mesh portion	$0.5\ t_c$

Figure 2 : Net sectional properties of local supporting members

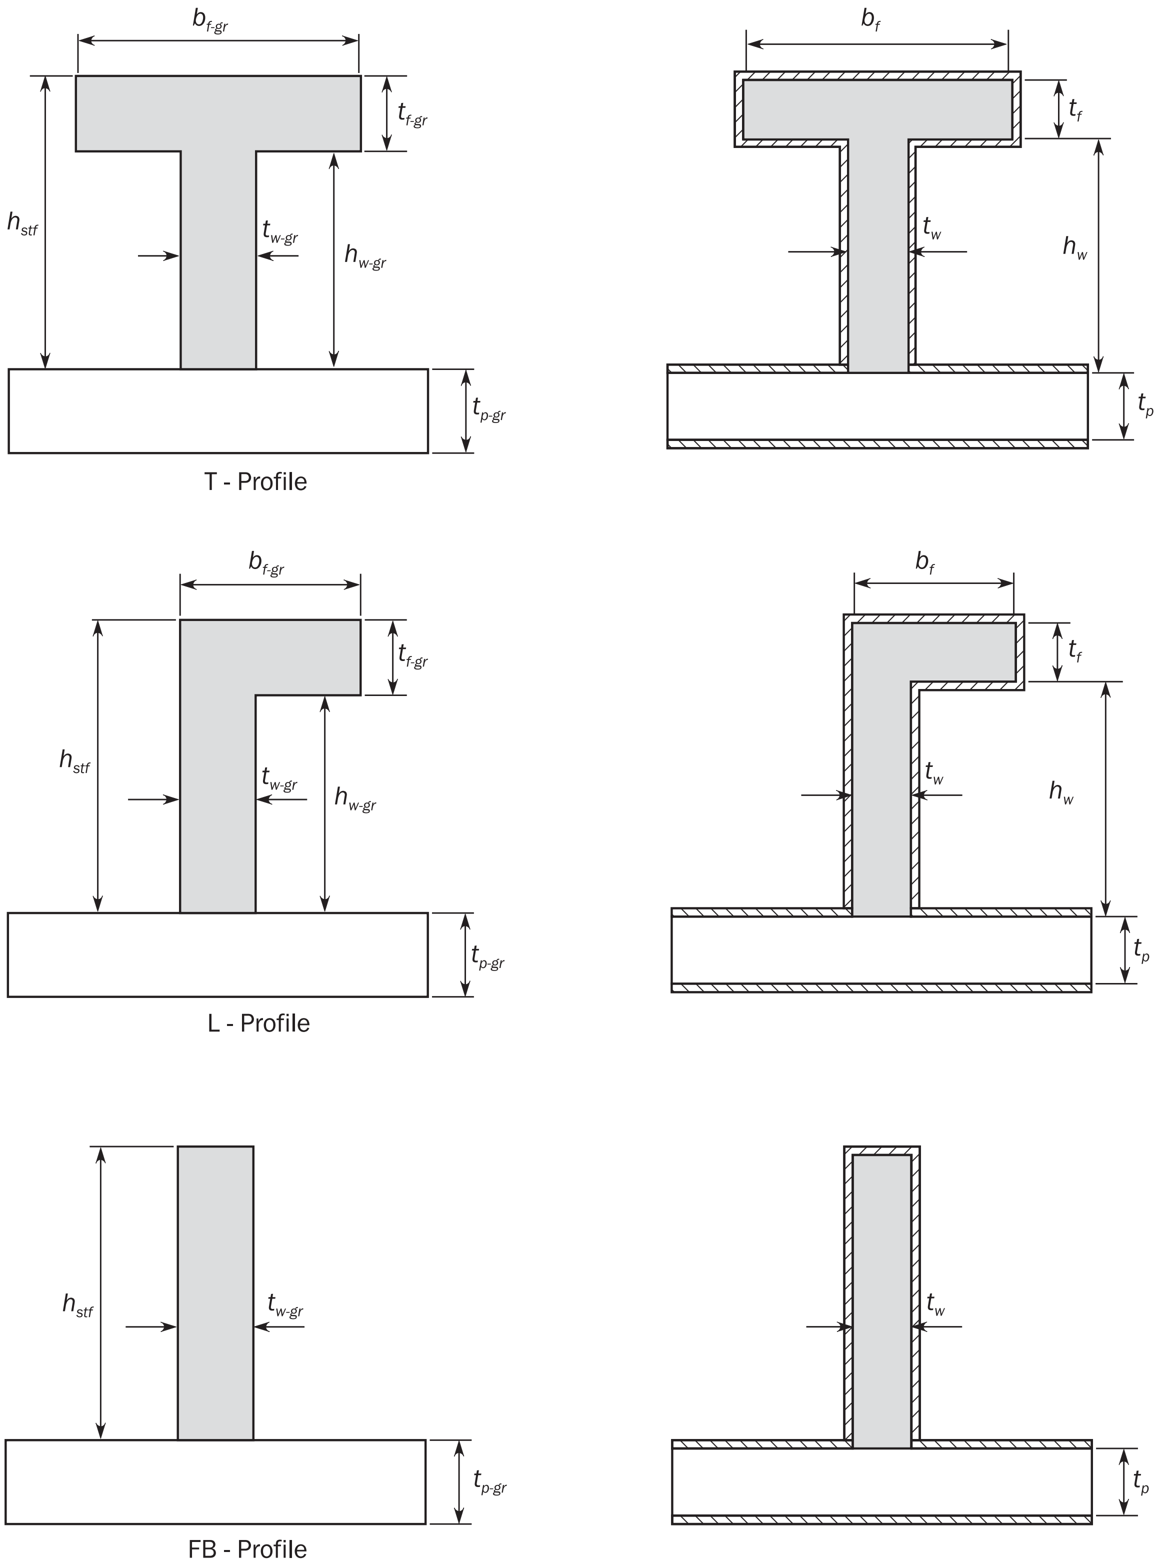


Figure 3 : Net sectional properties of local supporting members (continued)

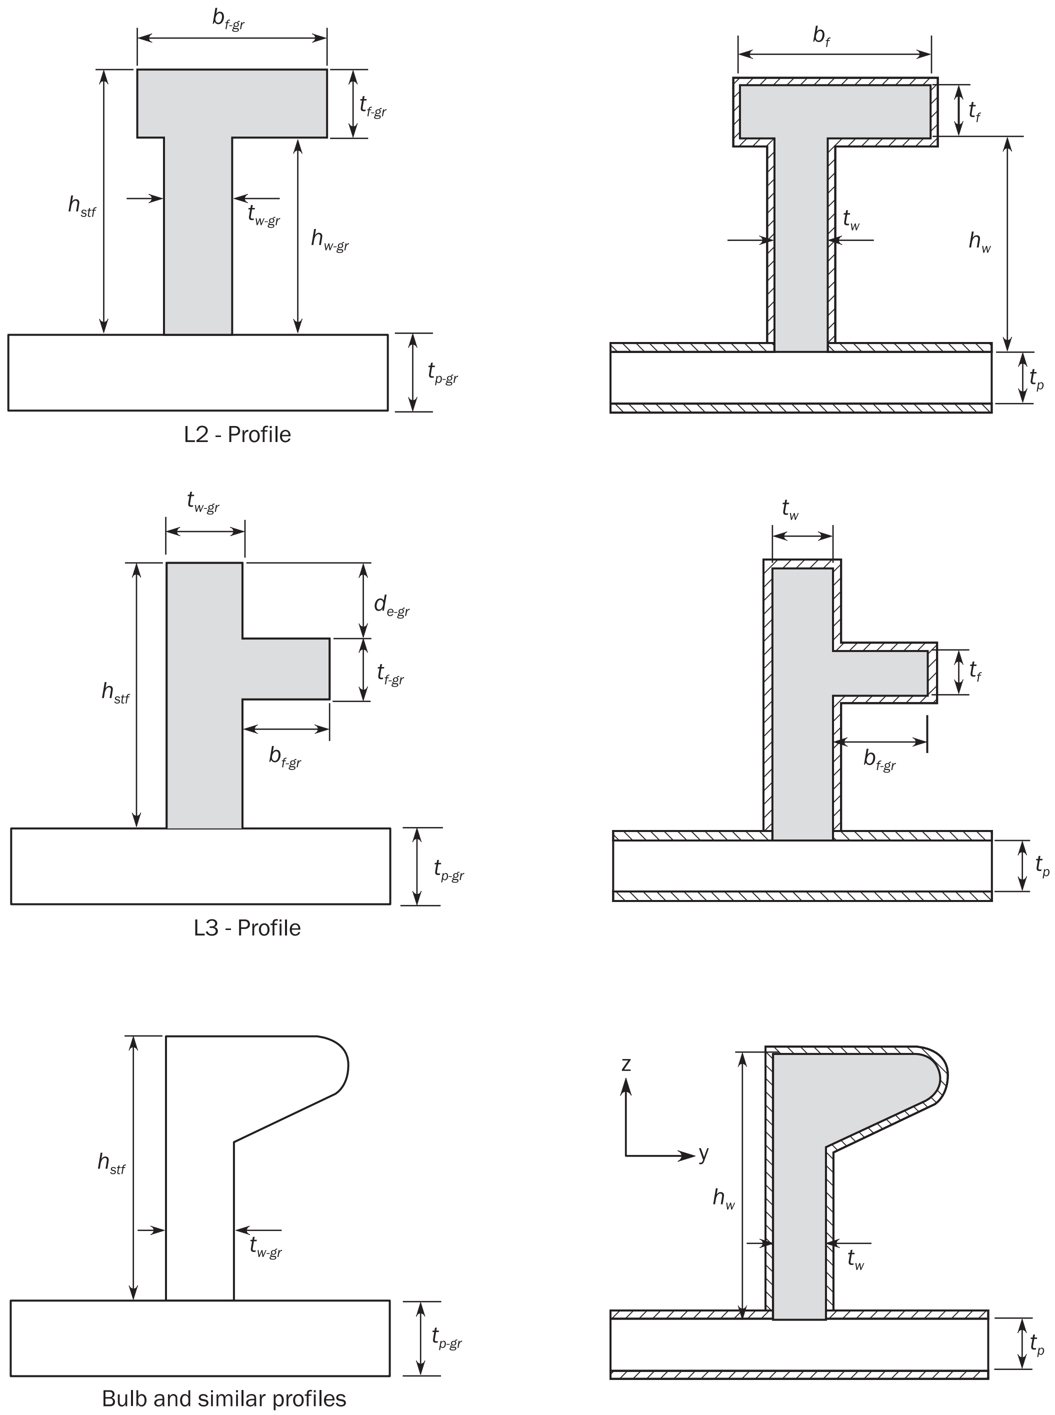

The net cross-sectional area, the moment of inertia about the y-axis and the assosiated neutral axis position are to be determined applying a corrosion magnitude of 0.5 t_c deducted from the surface of the profile cross-section.

SECTION 3
CORROSION ADDITIONS

SYMBOLS

t_c : Corrosion addition, in mm.

t_{c1}, t_{c2} : Corrosion addition, in mm, on one side of the considered structural member, as defined in Table 1.

t_{res} : Reserve thickness, taken as 0.5 mm.

1 GENERAL

1.1 Applicability

1.1.1

The corrosion additions given in these Rules are applicable to carbon-manganese steels, stainless steels, stainless clad steels and aluminium alloys. Corrosion addition for the exposed carbon steel side of stainless clad structure is to be as required in Table 1 for the corresponding compartment.

The corrosion additions for other materials are to be in accordance with the requirements of the Society.

1.2 Corrosion addition determination

1.2.1

The corrosion addition for each of the two sides of a structural member, t_{c1} or t_{c2}, is specified in Table 1.

The total corrosion addition, t_c, in mm, for both sides of the structural member is obtained by the following formula:

$$t_c = Roundup_{0.5}\,(t_{c1} + t_{c2}) + t_{res}$$

For an internal member within a given compartment, the total corrosion addition, t_c is obtained from the following formula:

$$t_c = Roundup_{0.5}\,(2t_{c1}) + t_{res}$$

where t_{c1} is the value specified in Table 1 for one side exposure to that compartment.

Roundup$_{0.5}$ (t) means that *t* is rounded to the upper half millimetre.

The total corrosion addition, t_c, in mm, for compartment boundaries and internal members made from stainless steel, or aluminium is to be taken as:

$$t_c = t_{res} = 0.5$$

In case of stainless clad steel, the corrosion additions, t_{c1}, for the carbon steel side and t_{c2}, for the stainless steel side are respectively to be taken as:

- t_{c1} as specified for the corresponding compartment in Table 1
- $t_{c2} = 0$

Table 1 : Corrosion addition for one side of a structural member

(1)	1.0 mm is to be added to the plate surface within 3m above the upper surface of the chain locker bottom.
(2)	0.5 mm is to be added to the plate surface exposed to ballast for the plate boundary between water ballast and heated cargo oil tanks. 0.3mm is to be added to each surface of the web and face plate of a stiffener in a ballast tank and attached to the boundary between water ballast and heated cargo oil tanks or heated fuel/lube oil tanks. Heated oil tanks are defined as tanks arranged with any form of heating capability (the most common type is heating coils).
(3)	0.7 mm is to be added to the plate surface exposed to ballast for the plate boundary between water ballast and heated fuel oil or lube oil tanks.
(4)	Only applicable to cargo tanks and ballast tanks with weather deck as the tank top. The 3 m distance is measured vertically from and parallel to the top of the tank.
(5)	Dry bulk cargo hold includes holds intended for the carriage of dry bulk cargoes, which may carry water ballast.
(6)	Upper part of the cargo holds correspond to an area above the connection between the topside and the inner hull or side shell. If there is no topside, the upper part corresponds to the upper one third of the cargo hold height (where a plane bulkhead is fitted in way of a dry bulk cargo hold, the upper part of the bulkhead is defined in the same manner).
(7)	If there is no lower stool fitted (i.e. engine room bulkhead or fore peak bulkhead) or if a plane bulkhead is fitted, then this corrosion addition should be applied up to a height level with the opposing bulkhead stool in that hold. In the case where a stool is not fitted on the opposing bulkhead, the vertical extent of this zone is to be from the inner bottom to a height level with the top of the adjacent hopper sloping plate.
(8)	For the determination of the corrosion addition of the outer shell plating, the pipe tunnel is considered as for a water ballast tank.

1.2.2 Minimum value of total corrosion addition

The total corrosion addition is not to be taken less than 2 mm except for web and face plate of stiffeners or in way of internals of dry spaces where 1.5 mm is applicable.

These minimum values of corrosion addition are not applicable to structural members made of stainless steels, stainless clad steels or aluminium alloys.

1.2.3 Stiffener

The corrosion addition of a stiffener is determined according to the location of its connection to the attached plating.

1.2.4

When a local structural member/plate is affected by more than one value of corrosion addition, the most onerous value is to be applied to the entire strake.

SECTION 4
CORROSION PROTECTION

1 GENERAL

1.1 Structures to be protected

1.1.1 Dedicated seawater ballast tanks

All dedicated seawater ballast tanks are to have an efficient corrosion prevention system.

1.1.2 Cargo oil tanks

Cargo oil tanks are to be protected in compliance with the requirements specified in Pt 2, Ch 2, Sec 2, [1].

1.1.3 Bulk carriers

Void double side skin spaces and cargo holds of bulk carriers are to be protected in compliance with the requirements specified respectively in Pt 2, Ch 1, Sec 2, [2.2] and Pt 2, Ch 1, Sec 2, [2.3].

1.1.4 Narrow spaces

Narrow spaces are generally to be filled by an efficient protective product, particularly at the ends of the ship where inspections and maintenance are not easily practicable due to their inaccessibility.

2 SACRIFICIAL ANODES

2.1 Attachment of anodes to the hull

2.1.1

All anodes are to be attached to the structure in such a way that they remain securely fastened both initially and during service even when it is wasted. The following methods are acceptable:

a) Steel core connected to the structure by continuous fillet welds.

b) Attachment to separate supports by bolting, provided a minimum of two bolts with lock nuts are used. However, other mechanical means of clamping may be accepted.

2.1.2

Anodes are to be attached to stiffeners or aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

2.1.3

Where cores or supports are welded to local support members or primary supporting members, they are to be kept clear of end supports, toes of brackets and similar stress raisers. Where they are welded to asymmetrical members, the welding is to be at least 25 mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate, but well clear of the free edges. Generally, anodes are not to be fitted to a face plate of higher strength steel.

2.1.4 Cargo oil tanks

Cathodic protection systems, if fitted in cargo oil tanks, are to comply the requirements specified Pt 2, Ch 2, Sec 2, [1].

SECTION 5
LIMIT STATES

1 GENERAL

1.1 Limit states

1.1.1 Definition

A limit state is defined as a state beyond which the structure no longer satisfies the requirements. The following categories of limit states are relevant for structures:

- Serviceability limit state (SLS), which corresponds to conditions beyond which specified requirements are no longer met.
- Ultimate limit state (ULS), which corresponds to the maximum load carrying-capacity or, in some cases, to the maximum applicable strain or deformation, under intact (undamaged) conditions.
- Fatigue limit state (FLS), which corresponds to degradation due to effect of time varying (cyclic) loading.
- Accidental limit state (ALS), which concerns the ability of the structure to resist accident situations.

1.1.2 Serviceability limit state

Serviceability limit state, which concerns the normal use, includes:

- Local damage which may reduce the working life of the structure or affect the efficiency or appearance of structural members or non-structural elements.
- Unacceptable deformations which affect the efficient use and appearance of structural or non-structural elements or the functioning of safety equipment.

In the context of serviceability limit state, the term 'appearance' is concerned with such criteria as high deflection and extensive cracking, rather than aesthetics.

1.1.3 Ultimate limit state

Ultimate limit state, which corresponds to the maximum load-carrying capacity, or in some cases, the maximum applicable strain or deformation, includes:

- Attainment of the maximum resistance capacity of sections, members or connections by rupture or excessive deformations or instability (buckling).
- Excessive yielding, transforming the structure or part of it into a plastic mechanism.

1.1.4 Fatigue limit state

Fatigue limit states assess that the fatigue capacity of structural members due to cyclic loads is greater than the design fatigue life.

1.1.5 Accidental limit state

Accidental limit states are concerned with the ability of the structure to resist accident situations or abnormal events. Flooded conditions of any compartment without progression of the flooding to another compartment are considered. The limit states are concerned with the following in intact (undamaged) conditions with

accidental or abnormal loads, or in damaged conditions with environmental loads the ship meets during a limited time frame:

- The safety of life.
- Environment.
- Property (ship and cargo).

Accidental limit state includes:

- Loss of structural strength without loss of containment.
- Loss of structural strength and loss of containment.

1.2 Failure modes

1.2.1

A number of possible failure modes may be relevant for the various parts of the ship structure. For each failure mode, one or more limit states may be relevant. The failure modes to be considered for the assessment of ship structural safety with relation to the limit states are shown in Table 1.

Table 1 : Failure modes in relation to the limit states to be considered

Possible failure modes to be considered	Limit states (1)			
	SLS	ULS	FLS	ALS
Yielding	Y	Y	-	Y
Plastic collapse	-	Y	-	Y
Buckling	Y	Y	-	Y
Rupture	-	Y	-	Y
Fatigue cracking	-	-	Y	-
Brittle fracture (2)	-	-	-	-

(1) "Y" indicates that the structural assessment is to be carried out.
(2) Controlled by the material rule requirement of steel grade.

1.2.2 Yielding

The yielding failure mode is the mode in which plastic strain locally occurs in the structural members to be considered under combined in-plane and normal stresses. Local plastic strain is controlled in SLS, ULS and ALS by checking that the stresses caused in the structural members remains below a permissible value.

1.2.3 Plastic collapse

The plastic collapse failure mode usually appears in the local structural members under large lateral impact pressure. In this failure mode, permanent lateral deflection in the local structural members occurs, but does not influence the global strength. This mode is controlled in ULS and ALS by using conventional plastic design method.

1.2.4 Buckling

The buckling failure mode is the instability phenomena of structural members under compressive loads. When the stress in structural members just attains the elastic buckling stress, elastic (reversible) buckling occurs during the compressive load. This buckling failure mode is controlled in SLS. By further increasing the compressive load, stress redistribution occurs due to buckling of the weakest structural member and the stress in some structural members reaches the yield stress. This buckling failure mode with large elastic deflection is controlled in ULS or ALS. When compression is unloaded, no consequence of failure due to buckling is seen.

On the other hand, plastic (irreversible) buckling occurs when the stress in structural members exceeds the yield stress. As a result, the substantial permanent deflections due to plastic buckling appear. This irreversible buckling failure mode is controlled only in ULS or ALS for global hull girder strength.

1.2.5 Rupture

The rupture failure mode is the mode in which breaking occurs in the structural members to be considered under large tensile stress beyond the yield stress of the material. This failure mode is controlled in ULS or ALS, but the assessment of this failure mode is covered by controlling the yielding failure.

1.2.6 Brittle fracture

Brittle fracture is dependent upon the material, temperature and thickness. Therefore, this mode is controlled by the material rule requirement of steel grade.

1.2.7 Fatigue cracking

This failure mode is different from the failure modes mentioned above and is controlled in FLS.

2 CRITERIA

2.1 General

2.1.1

Criteria are prescribed in the Rules to check the relevant limit states for the various structural elements. The strength assessments included in the Rules are defined in terms of yield check, buckling check, ultimate strength check, and fatigue check as indicated in Table 2.

Table 2 : Structural assessment

Structural Elements (1)		Yielding check	Buckling check	Ultimate strength check	Fatigue check
Local Structures	Stiffeners	Y	Y	Y (2)	Y
	Plating	Y	Y	Y (3)	-
Primary supporting members		Y	Y	Y (2)	Y
Hull girder		Y	Y (4)	Y	-

(1) "Y" indicates that the structural assessment is to be carried out.
(2) The ultimate strength check is included in the buckling check.
(3) The ultimate strength check of plating is included in the yielding check formula of plating.
(4) The buckling check of stiffeners and plating taking part in hull girder strength is performed against stress due to hull girder bending moment and hull girder shear force.

2.2 Serviceability limit states

2.2.1 Hull girder

For the yielding check of the hull girder, the stress corresponds to a load at 10^{-8} probability level.

2.2.2 Plating

For the yielding check and buckling check of platings constituting a primary supporting member, the stress corresponds to a load at 10^{-8} probability level.

2.2.3 Stiffeners

For the yielding check of stiffeners, the stress corresponds to a load at 10^{-8} probability level.

2.3 Ultimate limit states

2.3.1 Hull girder

The ultimate strength of the hull girder is to be checked against the hull girder loads at 10^{-8} probability level, amplified with the partial safety factor.

2.3.2 Plating

The ultimate strength of the plating between stiffeners and primary supporting members is to be checked against the loads at 10^{-8} probability level.

2.3.3 Stiffeners

The ultimate strength of stiffeners is to be checked against the loads at 10^{-8} probability level.

2.4 Fatigue limit state

2.4.1 Structural details

The fatigue life of representative welded structural details such as connections of stiffeners and primary supporting members and free edge of bulk carrier deck plating in way of hatch corner is to be assessed from long term distribution loads based on loads at 10^{-2} probability level including the whipping-springing effects.

2.5 Accidental limit state

2.5.1 Hull girder

For bulk carriers, the yielding and ultimate strength of the hull girder in cargo hold flooded condition and in the damaged condition is to be assessed in accordance with Ch 5, Sec 1 and Ch 5, Sec 2.

The residual strength of oil tankers and bulk carriers is to be assessed according to Ch 5, Sec 3, for damages resulting from collision or grounding.

2.5.2 Double bottom structure

For bulk carriers, the double bottom structure in cargo hold flooded condition is to be assessed in accordance with Pt 2, Ch 1, Sec 3.

2.5.3 Bulkhead structure

For bulk carriers, the bulkhead structure in cargo hold flooded condition is to be assessed in accordance with Pt 2, Ch 1, Sec 3 and Pt 2, Ch 1, Sec 4.

2.5.4 Plating, stiffeners and PSM

The plating, stiffeners and PSM are to be assessed in flooded conditions in accordance with Ch 6 for yielding criteria and with Ch 8, Sec 3 for buckling criteria.

3 STRENGTH CHECK AGAINST IMPACT LOADS

3.1 General

3.1.1

Structural response against impact loads such as forward bottom slamming, bow flare slamming and grab chocks depends on the loaded area, magnitude of loads and structural grillage.

3.1.2

The ultimate strength of structural members that constitute the grillage, i.e. platings between stiffeners and primary supporting members and stiffeners with attached plating, is to be checked against the maximum impact loads acting on them.

SECTION 6
STRUCTURAL DETAIL PRINCIPLES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 APPLICATION

1.1 General

1.1.1

If not specified otherwise, the requirements of this section apply to the hull structure except superstructures and deckhouses.

2 GENERAL PRINCIPLES

2.1 Structural continuity

2.1.1 General

Attention is to be paid to the structural continuity, in particular in the following areas:

- In way of changes in the framing system.
- At end connections of primary supporting members or ordinary stiffeners.
- In way of the transition zones between cargo hold region and fore part, aft part and machinery space.
- In way of side and end bulkheads of superstructures.

At the termination of a structural member, structural continuity is to be maintained by the fitting of suitable supporting structure.

Abrupt changes in transverse section properties of longitudinal members are to be avoided. Smooth transitions are to be provided.

2.1.2 Longitudinal members

Longitudinal members are to be arranged in such a way that continuity of strength is maintained.

Longitudinal members contributing to the hull girder longitudinal strength are to extend continuously as far as practicable towards the ends of the ship.

In particular, the structural continuity in way of longitudinal bulkheads within the cargo hold region, is to be maintained outside the cargo hold region. Large transition brackets (e.g. scarfing brackets) fitted in line with the longitudinal bulkhead are a possible means to achieve such structural continuity.

2.1.3 Primary supporting members

Primary supporting members are to be arranged in such a way that continuity of strength is maintained.

Abrupt changes of web height or cross section are to be avoided.

2.1.4 Stiffeners

Stiffeners are to be arranged in such a way that continuity of strength is maintained.

Stiffeners contributing to the hull girder longitudinal strength are to be continuous when crossing primary supporting members within the 0.4 *L* amidships and as far as practicable outside 0.4 *L* amidships.

Where stiffeners are terminated in way of large openings, foundations and partial girders, compensation is to be arranged to provide structural continuity in way of the end connection.

2.1.5 Plating

Where plates with different thicknesses are joined, the change in the as-built plate thickness is not to exceed 50% of larger plate thickness in the load carrying direction. This also applies to the strengthening by local inserts, e.g. insert plates in double bottom girders, floors and inner bottom.

2.1.6 Weld joints

Weld joints are to be avoided in areas with high stress concentration.

2.2 Local reinforcements

2.2.1 Reinforcements at knuckles

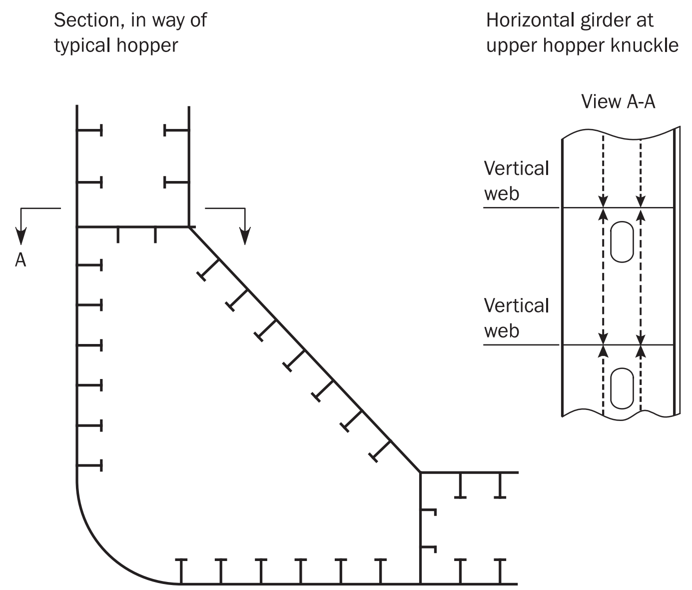
a) Knuckles are in general to be stiffened to achieve out-of-plane stiffness by fitting ordinary stiffeners or equivalent means in line with the knuckle.

b) Whenever a knuckle in a main member (shell, longitudinal bulkhead etc) is arranged, stiffening in the form of webs, brackets or profiles is to be connected to the members to which they are to transfer the load (in shear). See example of reinforcement at upper hopper knuckle in Figure 1.

c) For longitudinal shallow knuckles, closely spaced carlings are to be fitted across the knuckle, between longitudinal members above and below the knuckle. Carlings or other types of reinforcement need not be fitted in way of shallow knuckles that are not subject to high lateral loads and/or high in-plane loads across the knuckle, such as deck camber knuckles.

d) Generally, the distance between the knuckle and the support stiffening in line with the knuckle is not to be greater than 50 mm. Otherwise, fatigue analysis according to Ch 9 is to be submitted by the designer.

Figure 1 : Example of reinforcement at knuckles



2.2.2 Reinforcement in way of attachments for permanent means of access

Local reinforcement, considering location and strength, is to be provided in way of attachments to the hull structure for permanent means of access.

2.2.3 Reinforcement of deck structure in way of concentrated loads

The deck structure is to be reinforced in way of concentrated loads, such as anchor windlass, deck machinery, cranes, masts and derrick posts.

2.2.4 Reinforcement by insert plates

Insert plates are to be made of materials with, at least, the same specified minimum yield stress and the same grade as the plates to which they are welded. See also [2.1.5].

2.3 Connection of longitudinal members not contributing to the hull girder longitudinal strength

2.3.1

Where the hull girder stress at the strength deck or at the bottom as defined in Ch 5, Sec 1, [2.2.2] is higher than the permissible stress as defined in Ch 5, Sec 1, [2.2.1] for normal strength steel, longitudinal members not contributing to the hull girder longitudinal strength and welded to the strength deck or bottom plating and bilge strake, such as longitudinal hatch coamings, gutter bars, strengthening of deck openings, bilge keel, are to be made of steel with the same specified minimum yield stress as the strength deck or bottom structure steel.

2.3.2

The requirement in [2.3.1] is also applicable to non-continuous longitudinal stiffeners welded on the web of a primary structural member contributing to the hull girder longitudinal strength such as hatch coamings, stringers and girders or on the inner bottom when the hull girder stress on those members is higher than the permissible stress as defined in Ch 5, Sec 1, [2.2.1] for normal strength steel.

3 STIFFENERS

3.1 General

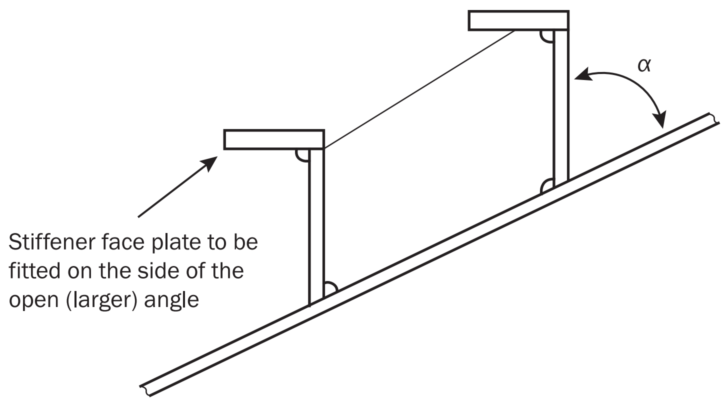
3.1.1

All types of stiffeners (excluding web stiffeners) are to be connected at their ends. However, in special cases such as isolated areas of the ship where end connections cannot be applied, sniped ends may be permitted. Requirements for the various types of connections (bracketed, bracketless or sniped ends) are given in [3.2] to [3.4].

3.1.2

Where the angle between the web plate of the stiffener and the attached plating is less than 50 deg as shown on Figure 2, a tripping bracket is to be fitted. If the angle between the web plate of an unsymmetrical stiffener and the attached plating is less than 50 deg, the face plate of the stiffener is to be fitted on the side of open angle.

Figure 2 : Stiffener on attached plating with an angle less than 50 deg



3.2 Bracketed end connections of non-continuous stiffeners

3.2.1

Where continuity of strength of longitudinal members is provided by brackets, the alignment of the brackets on each side of the primary supporting member is to be ensured, and the scantlings of the brackets are to be such that the combined stiffener/bracket section modulus and effective cross sectional area are not less than those of the member.

3.2.2

At bracketed end connections, continuity of strength is to be maintained at the stiffener connection to the bracket and at the connection of the bracket to the supporting member.

3.2.3

The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection, is the section modulus to be less than that required for the stiffener.

3.2.4 Net web thickness

The net bracket web thickness, t_b, in mm, is to comply with the following:

$$t_b \geq (2 + f_{bkt}\sqrt{Z})\sqrt{\frac{R_{eH-stf}}{R_{eH-bkt}}}$$ and need not be greater than 13.5 mm.

where:

f_{bkt} : Coefficient taken as:

f_{bkt} = 0.2 for brackets with flange or edge stiffener.

f_{bkt} = 0.3 for brackets without flange or edge stiffener.

Z : Net required section modulus, of the stiffener, in cm^3. In the case of two stiffeners connected, Z is the smallest net required section modulus of the two connected stiffeners.

$R_{eH\text{-}stf}$: Specified minimum yield stress of the stiffener material, in N/mm^2.

$R_{eH\text{-}bkt}$: Specified minimum yield stress of the bracket material, in N/mm^2.

3.2.5 Brackets at the ends of non-continuous stiffeners

Brackets are to be fitted at the ends of non-continuous stiffeners, with arm lengths, ℓ_{bkt}, in mm, taken as:

$$\ell_{bkt} = c_{bkt}\sqrt{\frac{Z}{t_b}}$$

ℓ_{bkt} is not to be taken less than:

- ℓ_{bkt} = 1.8 h_{stf} for connections where the end of the stiffener web is supported and the bracket is welded in line with the stiffener web or with offset necessary to enable welding, see item (c) in Figure 3.
- ℓ_{bkt} = 2.0 h_{stf} for other cases, see items (a), (b) and (d) in Figure 3.

where:

c_{bkt} : Coefficient taken as:

c_{bkt} = 65 for brackets with flange or edge stiffener.

c_{bkt} = 70 for brackets without flange or edge stiffener.

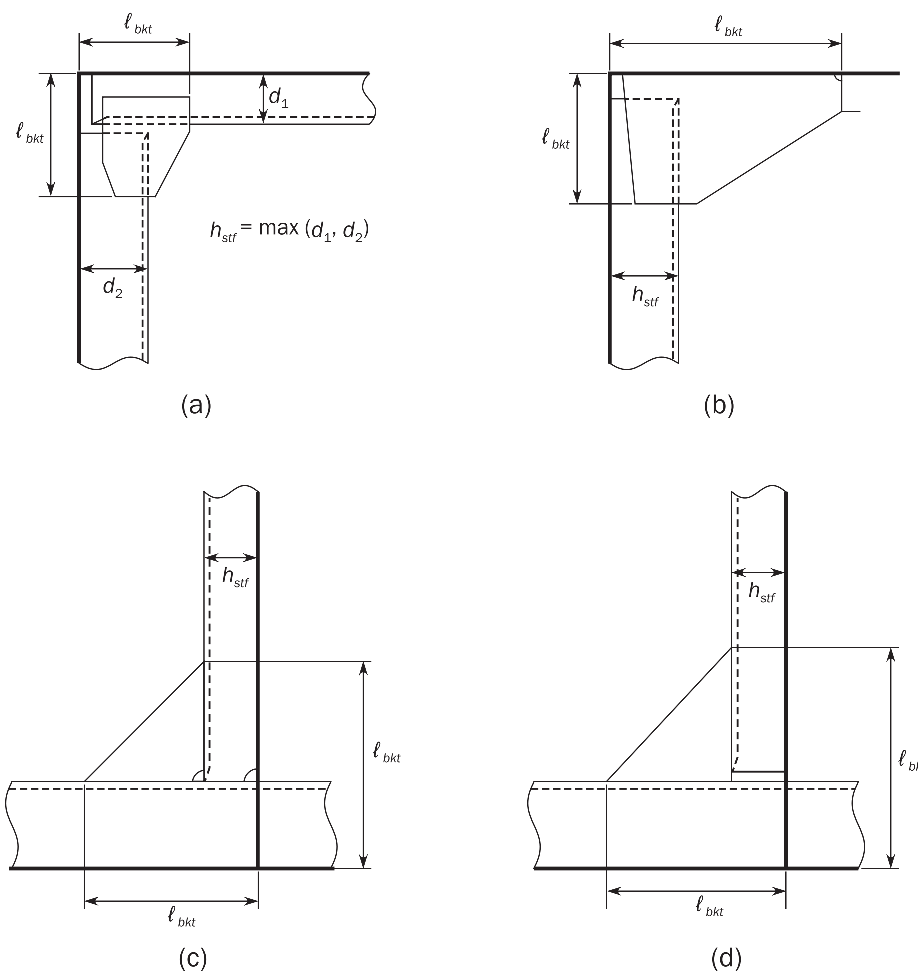
Z : Net required section modulus, for the stiffener, in cm^3, as defined in [3.2.4].

t_b : Minimum net bracket thickness, in mm, as defined in [3.2.4].

For connections similar to item (b) in Figure 3, but not lapped, the bracket arm length is to comply with $\ell_{bkt} \geq h_{stf}$.

For connections similar to items (c) and (d) in Figure 3 where the smaller stiffener is connected to a primary supporting member or bulkhead, the bracket arm length is not to be less than h_{stf}.

Figure 3 : Bracket arm length of non-continuous stiffeners



3.2.6 Brackets with different arm lengths

The lengths of the arms, measured from the plating to the toe of the bracket, are to be such that the sum of them is greater than 2 ℓ_{bkt} and each arm not to be less than 0.8 ℓ_{bkt}, where ℓ_{bkt} is as defined in [3.2.5].

3.2.7 Edge stiffening of bracket

Where an edge stiffener is required, the web height of the edge stiffener, h_w, in mm, is not to be less than:

$$h_w = 45\left(1 + \frac{Z}{2000}\right) \text{ but not less than 50 mm.}$$

where:

Z : Net section modulus, of the stiffener, in cm^3, as defined in [3.2.4].

3.3 Bracketless connections

3.3.1

The design of bracketless connections is to be such as to provide adequate resistance to rotation and displacement of the connection.

3.4 Sniped ends

3.4.1

Sniped ends may be used where dynamic loads are small, provided the net thickness of plating supported by the stiffener, t_p, is not less than:

$$t_p = c_1 \sqrt{\left(1000\ell - \frac{s}{2}\right)\frac{sPk}{10^6}}$$

where:

P : Design pressure for the stiffener for the design load set being considered, in kN/m^2.

c_1 : Coefficient for the design load set being considered, to be taken as:

$c_1 = 1.2$ for acceptance criteria set AC-S.

$c_1 = 1.1$ for acceptance criteria set AC-SD.

Sniped stiffeners are not to be used on structures in the vicinity of engines or generators or propeller impulse zone nor on the shell envelope.

3.4.2

Bracket toes and sniped stiffeners ends are to be terminated close to the adjacent member. The distance is not to exceed 40 mm unless the bracket or member is supported by another member on the opposite side of the plating. Tapering of the sniped end is not to be more than 30 deg. The depth of toe or sniped end is, generally, not to exceed the thickness of the bracket toe or sniped end member, but need not be less than 15 mm.

4 PRIMARY SUPPORTING MEMBERS (PSM)

4.1 General

4.1.1

Primary supporting members web stiffeners, tripping brackets and end brackets are to comply with [4.2] to [4.4]. Where the structural arrangement is such that these requirements cannot be complied with, adequate alternative arrangement has to be demonstrated by the designer.

4.2 Web stiffening arrangement

4.2.1

Web stiffeners arranged on primary supporting members are to comply with the requirements to scantlings of such stiffeners are given in Ch 8, Sec 2, [4.2].

4.3 Tripping bracket arrangement

4.3.1

Tripping brackets (see Figure 4) are generally to be fitted:

- At positions along the member span such that it satisfies the criteria of Ch 8, Sec 2, [5.1] for tripping bracket spacing and flange slenderness.
- At the toe of end brackets.
- At ends of continuous curved face plates.
- In way of concentrated loads.
- Near the change of section.

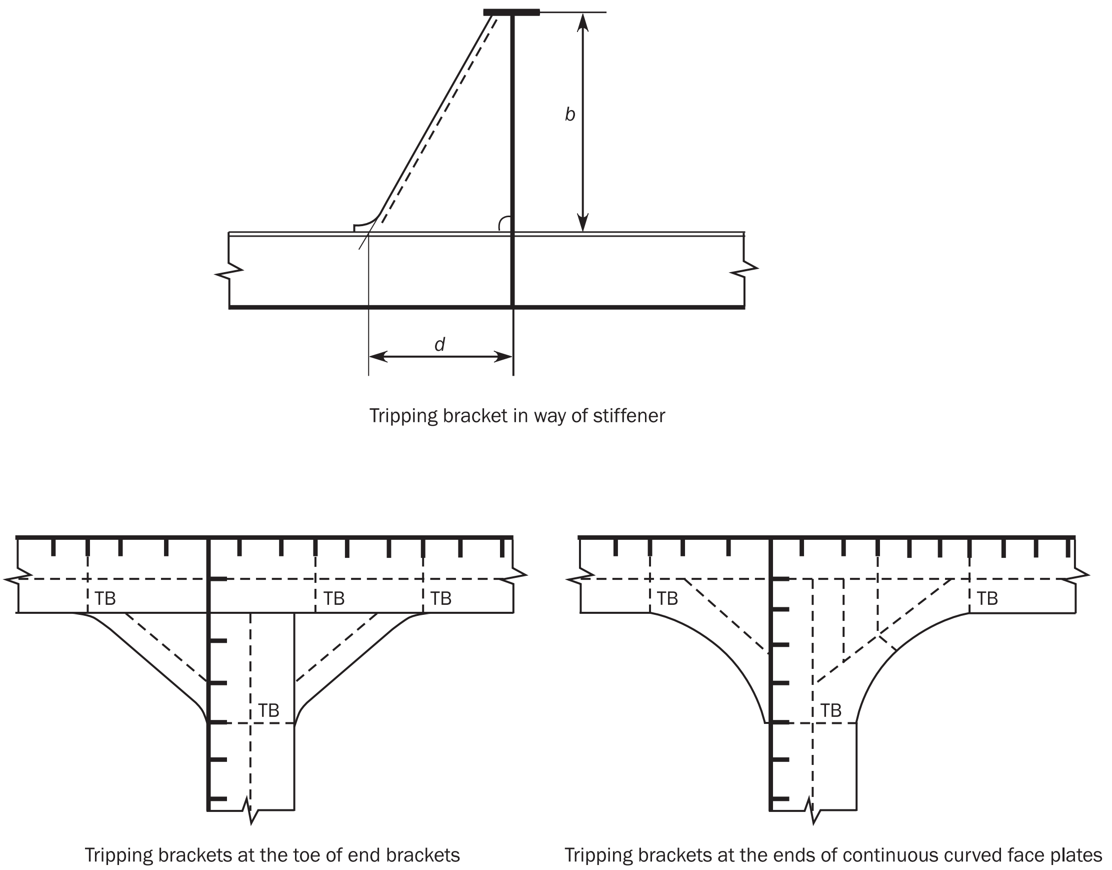
4.3.2

Where the width of the symmetrical face plate is greater than 400 mm, backing brackets are to be fitted in way of the tripping brackets.

4.3.3

Where the face plate of the primary supporting member exceeds 180 mm on either side of the web, a tripping bracket is to support the face plate.

Figure 4 : Primary supporting member: Tripping bracket arrangement



4.3.4 Arm length

The arm length of tripping brackets is not to be less than the greater of the following values, in m:

$$d = 0.38\, b$$

$$d = 0.85 b \sqrt{\frac{s_t}{t}}$$

where:

b : Height, in m, of tripping brackets, shown in Figure 4.

s_t : Spacing, in m, of tripping brackets.

t : Net thickness, in mm, of tripping brackets.

4.4 End connections

4.4.1 General

Brackets or equivalent structure are to be provided at ends of primary supporting members.

End brackets are generally to be soft-toed.

Bracketless connections may be applied provided that there is adequate support of adjoining face plates.

4.4.2 Scantling of end brackets

In general, the arm lengths of brackets connecting PSMs, as shown in Figure 5 are not to be less than the web depth of the member, and need not be taken greater than 1.5 times the web depth.

The thickness of the bracket is, in general, not to be less than that of the PSM web plate.

Scantlings of the end brackets are to be such that the section modulus of the PSM with end bracket, excluding face plate where it is sniped, is not to be less than that of the primary supporting member at mid-span.

The net cross sectional area, A_f, in cm^2, of face plates of brackets is not to be less than:

$$A_f = \ell_b\, t_b$$

where:

ℓ_b : Length of bracket edge, in m, see Figure 5. For brackets that are curved, the length of the bracket edge may be taken as the length of the tangent at the midpoint of the edge.

t_b : Minimum net bracket thickness, in mm, as defined in [3.2.4].

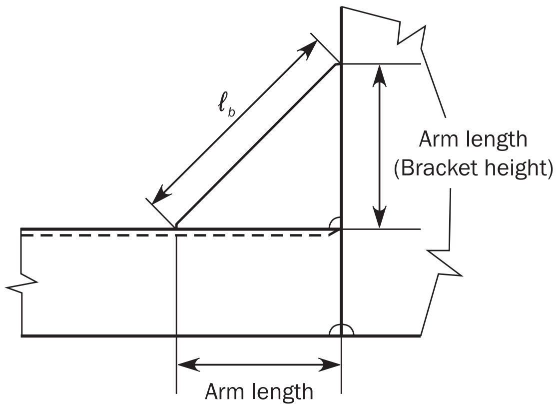
Moreover, the net thickness of the face plate is to be not less than that of the bracket web.

4.4.3 Arrangement of end brackets

Where the length of free edge of bracket, ℓ_b, is greater than 1.5 m, the web of the bracket is to be stiffened as follows:

- The net sectional area, in cm^2, of web stiffeners is to be not less than 16.5ℓ, where ℓ is the span, in m, of the stiffener.
- Tripping flat bars are to be fitted. Where the width of the symmetrical face plate is greater than 400 mm, additional backing brackets are to be fitted.

Figure 5 : Dimension of brackets



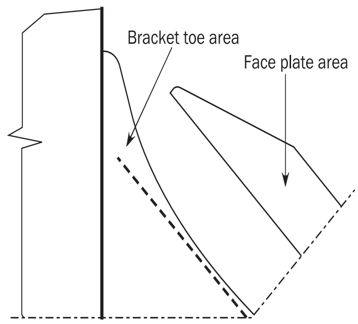
For a ring system where the end bracket is integral with the webs of the members and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained close to the mid-point of the bracket and gradually tapered to the smaller face plates. Butts in face plates are to be kept well clear of the bracket toes.

Where a wide face plate abuts a narrower one, the taper is not to be greater than 1 to 4.

The toes of brackets are not to land on unstiffened plating. The toe height is not to be greater than the thickness of the bracket toe, but need not be less than 15 mm. In general, the end brackets of primary supporting members are to be soft-toed. Where primary supporting members are constructed of higher strength steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations.

Where a face plate is welded onto the edge or welded adjacent to the edge of the end bracket (see Figure 6), the face plate is to be sniped and tapered at an angle not greater than 30°.

Figure 6 : Bracket face plate adjacent to the edge



The details shown in this figure are only used to illustrate items described in the text and are not intended to represent design guidance or recommendations.

5 INTERSECTION OF STIFFENERS AND PRIMARY SUPPORTING MEMBERS

5.1 Cut-outs

5.1.1

Cut-outs for the passage of stiffeners through the web of primary supporting members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and on the attached web stiffeners.

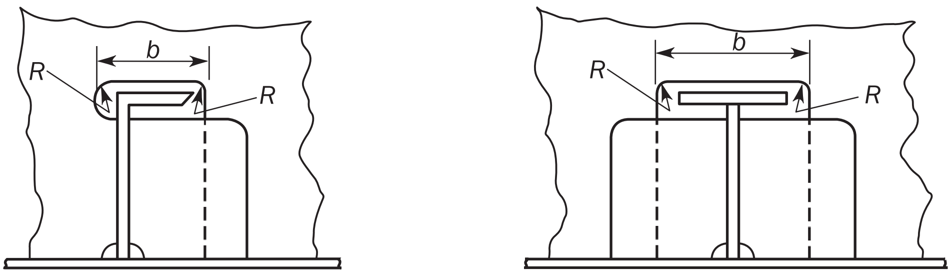
5.1.2

The total depth of cut-outs without collar plate is to be not greater than 50% of the depth of the primary supporting member.

5.1.3

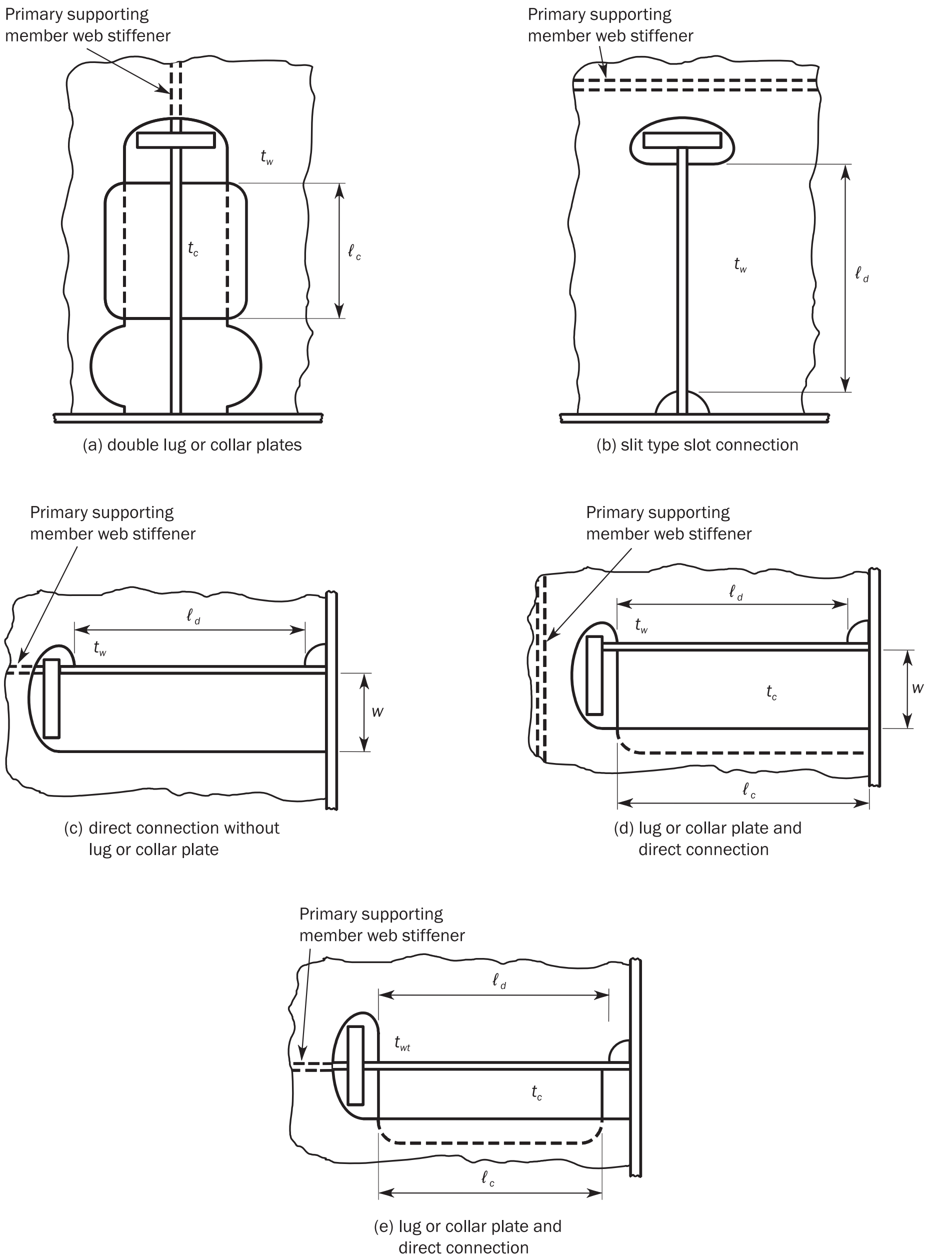
Cut-outs in way of cross tie ends and floors under bulkhead stools or in high stress areas are to be fitted with full collar plates, see Figure 7.

Figure 7 : Full collar plates



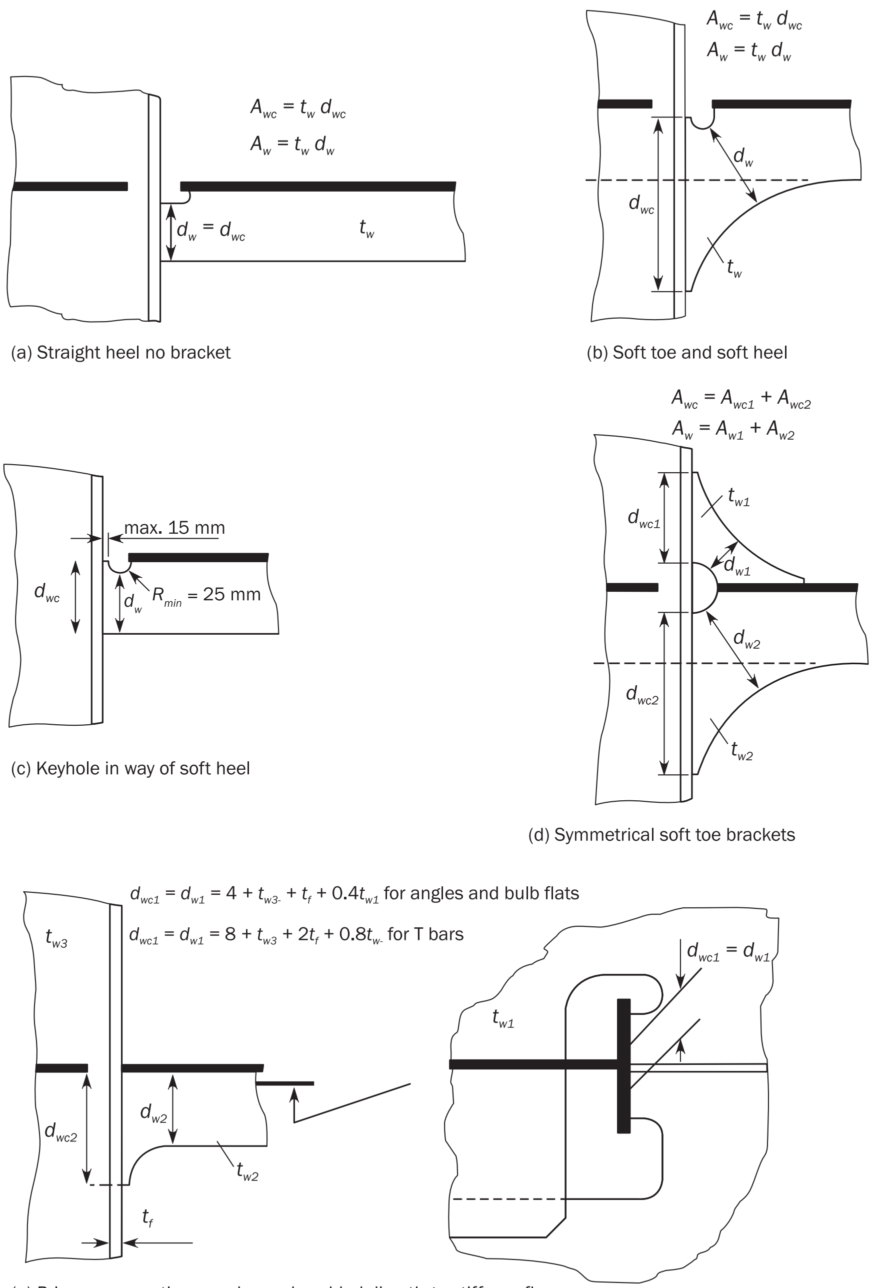
$R \geq 0.2b$ but not less than 25 mm.

Figure 8 : Symmetric and asymmetric cut-outs



The details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance.

Figure 9 : Primary supporting member web stiffener details



(a) Straight heel no bracket

(b) Soft toe and soft heel

(c) Keyhole in way of soft heel

(d) Symmetrical soft toe brackets

(e) Primary supporting member web welded directly to stiffener flange

t_{ws}, t_{ws1}, t_{ws2} : Net thickness of the primary supporting member web stiffener/backing bracket, in mm.
d_w, d_{w1}, d_{w2} : Minimum depth of the primary supporting member web stiffener/backing bracket, in mm.
d_{wc}, d_{wc1}, d_{wc2} : Length of connection between the primary supporting member web stiffener/backing bracket and the stiffener, in mm.

5.1.4

Lug type collar plates are to be fitted in cut-outs where required for compliance with the requirements of [5.2], and in areas of high stress concentrations, e.g. in way of primary supporting member toes. See Figure 8 for typical lug arrangements.

5.1.5

At connection to shell envelope longitudinals below the scantling draught, T_{sc} and at connection to inner bottom longitudinals, a soft heel is to be provided in way of the heel of the primary supporting member web stiffeners when the calculated direct stress, σ_w, in the primary supporting member web stiffener according to [5.2] exceeds 80% of the permissible values. The soft heel is to have a keyhole, similar to that shown in item (c) in Figure 9.

A soft heel is not required at the intersection with watertight bulkheads and primary supporting members, where a back bracket is fitted or where the primary supporting member web is welded to the stiffener face plate.

5.1.6

In general, cut-outs are to have rounded corners and the corner radii, R, are to be as large as practicable, with a minimum of 20% of the breadth, b, of the cut-out or 25 mm, whichever is greater. The corner radii, R, does not need to be greater than 50 mm, see Figure 7. Consideration is to be given to other shapes on the basis of maintaining equivalent strength and minimising stress concentration.

Note 1: Except where specific dimensions are noted for the details of the keyhole in way of the soft heel, the details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance or recommendations.

5.2 Connection of stiffeners to PSM

5.2.1 General

For connection of stiffeners to PSM in case of lateral pressure other than bottom slamming and bow impact loads, [5.2.2] and [5.2.3] are to be applied. In case of bottom slamming or bow impact loads, [5.2.4] is to be applied.

The cross sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.

5.2.2

The load, W_1, in kN, transmitted through the shear connection is to be taken as follows.

- If the web stiffener is connected to the intersecting stiffener:

$$W_1 = W\left(\alpha_a + \frac{A_1}{4f_c\,A_w + A_1}\right)$$

- If the web stiffener is not connected to the intersecting stiffener:

$$W_1 = W$$

where:

W : Total load, in kN, transmitted through the stiffener connection to the PSM taken equal to:

$$W = \frac{P_1 s_1\left(S_1 - \frac{s_1}{2000}\right) + P_2 s_2\left(S_2 - \frac{s_2}{2000}\right)}{2}\,10^{-3}$$

P_1, P_2 : Design pressure applied on the stiffener for the design load set being considered, in kN/m^2, on each side of the considered connection.

S_1, S_2 : Spacing between the considered and the adjacent PSM on each side of the considered connection, in m.

s_1, s_2 : Spacing of the stiffener, in mm, on each side of the considered connection.

α_a : Panel aspect ratio, not to be taken greater than 0.25.

$$\alpha_a = \frac{s}{1000\ S}$$

$$S = \frac{S_1 + S_2}{2}$$

$$s = \frac{s_1 + s_2}{2}$$

A_1 : Effective net shear area, in cm^2, of the connection, to be taken equal to:

$A_1 = A_{1d} + A_{1c}$

In case of a slit type slot connections area, A_1, is given by:

$A_1 = 2\ A_{1d}$

In case of a typical double lug or collar plate connection area, A_1, is given by:

$A_1 = 2\ A_{1c}$

A_{1d} : Net shear connection area, in cm^2, excluding lug or collar plate, as given by:

$A_{1d} = \ell_d\ t_w\ 10^{-2}$

ℓ_d : Length of direct connection between stiffener and PSM web, in mm.

t_w : Net web thickness of the primary supporting member, in mm.

A_{1c} : Net shear connection area, in cm^2, with lug or collar plate, given by:

$A_{1c} = f_1\ \ell_c\ t_c\ 10^{-2}$

ℓ_c : Length of connection between lug or collar plate and PSM, in mm.

t_c : Net thickness of lug or collar plate, not to be taken greater than the net thickness of the adjacent PSM web, in mm.

f_1 : Shear stiffness coefficient, taken as:

$f_1 = 1.0$, for stiffeners of symmetrical cross section.

$f_1 = 140/w$, not to be taken greater than 1.0, for stiffeners of asymmetrical cross section.

w : Width of the cut-out for an asymmetrical stiffener, measured from the cut-out side of the stiffener web, in mm, as indicated in Figure 8.

A_w : Effective net cross sectional area, in cm^2, of the PSM web stiffener in way of the connection including backing bracket where fitted, as shown in Figure 9. If the PSM web stiffener incorporates a soft heel ending or soft heel and soft toe ending, A_w is to be measured at the throat of the connection, as shown in Figure 9.

f_c : Collar load factor taken equal to:

For intersecting stiffeners of symmetrical cross section:

$f_c = 1.85$ for $A_w \le 14$
$f_c = 1.85 - 0.0441(A_w - 14)$ for $14 < A_w \le 31$
$f_c = 1.1 - 0.013(A_w - 31)$ for $31 < A_w \le 58$
$f_c = 0.75$ for $A_w > 58$

For intersecting stiffeners of asymmetrical cross section:

$$f_c = 0.68 + 0.0172\frac{\ell_s}{A_w}$$

ℓ_s : Connection length equal to:

For a single lug or collar plate connection to the PSM:

$\ell_s = \ell_c$

For a single sided direct connection to the PSM:

$\ell_s = \ell_d$

In the case of a lug or collar plus a direct connection:

$\ell_s = 0.5\ (\ell_c + \ell_d)$

5.2.3

The load, W_2, in kN, transmitted through the PSM web stiffener is to be taken as:

- If the web stiffener is connected to the intersecting stiffener:

$$W_2 = W\left(1 - \alpha_a - \frac{A_1}{4 f_c A_w + A_1}\right)$$

- If the web stiffener is not connected to the intersecting stiffener:

$W_2 = 0$

The values of A_w, A_{wc} and A_1 are to be such that the calculated stresses satisfy the following criteria:

- For the connection to the PSM web stiffener not in way of the weld: $\sigma_w \le \sigma_{perm}$
- For the connection to the PSM web stiffener in way of the weld: $\sigma_{wc} \le \sigma_{perm}$
- For the shear connection to the PSM web: $\tau_w \le \tau_{perm}$

where:

W : Load, in kN, as defined in [5.2.2].

f_c : Collar load factor as defined in [5.2.2].

α_a : Panel aspect ratio, as defined in [5.2.2].

A_1 : Effective net shear area, in cm^2, as defined in [5.2.2].

A_w : Effective net cross sectional area, in cm^2, as defined in [5.2.2].

σ_w : Direct stress, in N/mm^2, in the PSM web stiffener at the minimum bracket area away from the weld connection:

$$\sigma_w = \frac{10 W_2}{A_w}$$

σ_{wc} : Direct stress, in N/mm^2, in the PSM web stiffener in way of the weld connection:

$$\sigma_{wc} = \frac{10\ W_2}{A_{wc}}$$

τ_w : Shear stress, in N/mm^2, in the shear connection to the PSM web:

$$\tau_{wc} = \frac{10\ W_1}{A_1}$$

A_{wc} : Effective net area, in cm^2, of the PSM web stiffener in way of the weld as shown in Figure 9.

σ_{perm} : Permissible direct stress given in Table 1 for AC-S and AC-SD, in N/mm^2.

τ_{perm} : Permissible shear stress given in Table 1 for AC-S and AC-SD, in N/mm^2.

5.2.4 Bottom slamming and bow impact loads

For bottom slamming or bow impact loads, the load W, in kN, transmitted through the PSM web stiffener is to comply with the following criteria instead of those defined in [5.2.2] and [5.2.3]:

$$0.9 W \le \frac{(A_1\ \tau_{perm} + A_w\ \sigma_{perm})}{10}$$

where:

W : Load, in kN, as defined in [5.2.2].

A_1 : Effective net shear area, in cm^2, as defined in [5.2.2].

A_w : Effective net cross sectional area, in cm^2, as defined in [5.2.2].

σ_{perm} : Permissible direct stress given in Table 1 for AC-I, in N/mm^2.

τ_{perm} : Permissible shear stress given in Table 1 for AC-I, in N/mm^2.

5.2.5

Where a backing bracket is fitted in addition to the PSM web stiffener, it is to be aligned with the web stiffener. The arm length of the backing bracket is not to be less than the depth of the web stiffener. The net cross sectional area through the throat of the bracket is to be included in the calculation of A_w as shown in Figure 9.

5.2.6

Lapped connections of PSM web stiffeners or tripping brackets to stiffeners are not permitted in the cargo hold region.

5.2.7

Where built-up stiffeners have their face plate welded to the side of the web, a symmetrical arrangement of connection to the PSM is to be fitted. This may be achieved by fitting backing brackets on the opposite side of the PSM or bulkhead. In way of the cargo hold region, the PSM web stiffener and backing brackets are to be butt welded to the intersecting stiffener web.

5.2.8

Where the web stiffener of the PSM is parallel to the web of the intersecting stiffener, but not connected to it, the offset PSM web stiffener is to be located in close proximity to the slot edge as shown in Figure 10. The ends of the offset web stiffeners are to be suitably tapered and softened.

Locations where the web stiffener of the PSM are not connected to the intersecting stiffeners as well as the detail arrangements are to be specially considered on the basis of their ability to transmit load with equivalent effectiveness to that of [5.2.2] through [5.2.7]. Details of calculations made and/or testing procedures and results are to be submitted.

Table 1 : Permissible stresses for connection between stiffeners and PSMs

Item	Direct stress, σ_{perm}, in N/mm^2			Shear stress, τ_{perm}, in N/mm^2		
	Acceptance criteria set			Acceptance criteria set		
	AC-S	AC-SD	AC-I	AC-S	AC-SD	AC-I
PSM web stiffener	$0.83R_{eH}$ (2)	R_{eH}	R_{eH}	-	-	-
PSM web stiffener to intersecting stiffener in way of weld connection:						
• Double continuous fillet	$0.58R_{eH}$ (2)	$0.70R_{eH}$ (2)	R_{eH}	-	-	-
• Partial penetration weld	$0.83R_{eH}$ (1) (2)	R_{eH} (1)	R_{eH}	-	-	-
PSM stiffener to intersecting stiffener in way of lapped welding	$0.50R_{eH}$	$0.60R_{eH}$	R_{eH}	-	-	-
Shear connection including lugs or collar plates:						
• Single sided connection	-	-	-	$0.71\ \tau_{eH}$	$0.85\ \tau_{eH}$	τ_{eH}
• Double sided connection	-	-	-	$0.83\ \tau_{eH}$	τ_{eH}	τ_{eH}

(1) The root face is not to be greater than one third of the gross thickness of the PSM stiffener.
(2) Permissible stresses may be increased by 5 percent where a soft heel is provided in way of the heel of the PSM web stiffener.

5.2.9

The size of the fillet welds is to be calculated according to Ch 12, Sec 3, [2.5] based on the weld factors given in Table 2. For the welding in way of the shear connection the size is not to be less than that required for the PSM web plate for the location under consideration.

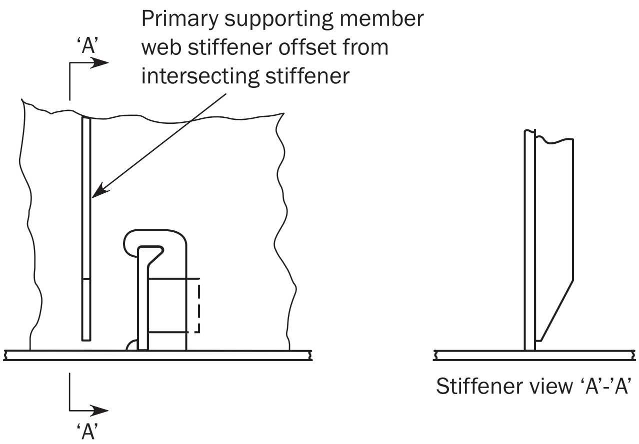
Table 2 : Weld factors for connection between stiffeners and PSMs

Item	Acceptance criteria	Weld factor
PSM stiffener to intersecting stiffener	AC-S AC-SD	$0.6\ \sigma_{wc}/\sigma_{perm}$ not to be less than 0.38
Shear connection inclusive of lug or collar plate	AC-S AC-SD	0.38
Shear connection inclusive of lug or collar plate, where the web stiffener of the PSM is not connected to the intersection stiffener	AC-S AC-SD	$0.6\ \tau_w/\tau_{perm}$ not to be less than 0.44
PSM stiffener to intersecting stiffener Shear connection inclusive of lug or collar plate	AC-I	$0.6\ \dfrac{9W}{A_1\ \tau_{perm} + A_w\ \sigma_{perm}}$

Note 1:

- τ_w : Shear stress, in N/mm², as defined in [5.2.3].
- σ_{wc} : Stress, in N/mm², as defined in [5.2.3].
- τ_{perm} : Permissible shear stress, in N/mm², see Table 1.
- σ_{perm} : Permissible direct stress, in N/mm², see Table 1.
- W : Load, in kN, as defined in [5.2.2].
- A_1 : Effective net shear area, in cm², as defined in [5.2.2].
- A_w : Effective net cross sectional area, in cm², as defined in [5.2.2].

Figure 10 : Offset PSM web stiffeners



6 OPENINGS

6.1 Openings and scallops in stiffeners

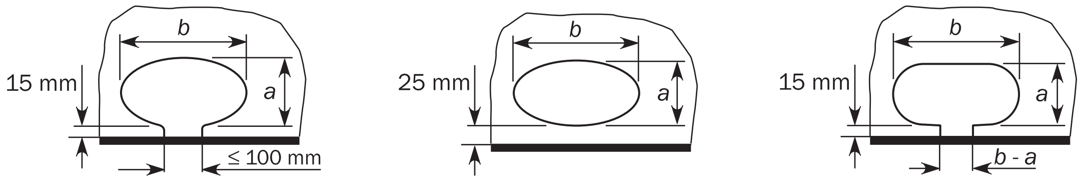
6.1.1

Figure 11 shows examples of air holes, drain holes and scallops. In general, the ratio of a/b, as defined in Figure 11, is to be between 0.5 and 1.0. In fatigue sensitive areas further consideration may be required with respect to the details and arrangements of openings and scallops.

6.1.2

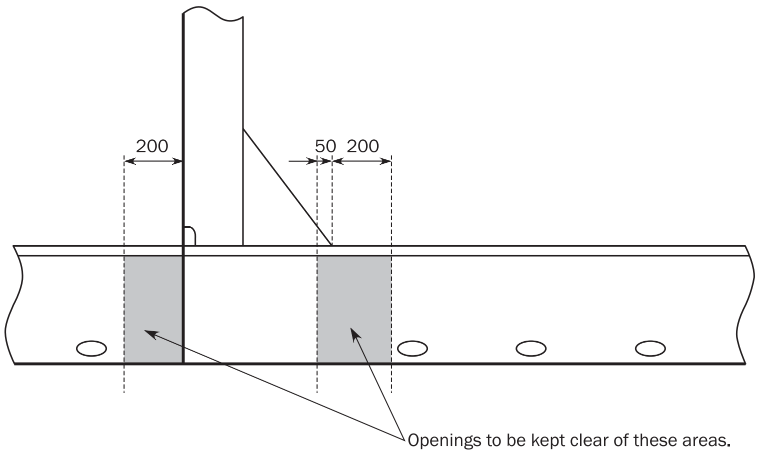
Openings and scallops are to be kept at least 200 mm clear of the toes of end brackets, end connections and other areas of high stress concentration, measured along the length of the stiffener toward the mid-span and 50 mm measured along the length in the opposite direction, see Figure 12. In areas where the shear stress is less than 60 percent of the permissible stress, alternative arrangements may be accepted.

Figure 11 : Examples of air holes, drain holes and scallops



The details shown in this figure are for guidance and illustration only.

Figure 12 : Location of air and drain holes



6.1.3

Closely spaced scallops or drain holes, i.e. where the distance between scallops/drain holes is less than twice the width *b* as shown in Figure 11, are not permitted in stiffeners contributing to the longitudinal strength. For other stiffeners, closely spaced scallops/drain holes are not permitted within 20% of the stiffener span measured from the end of the stiffener. Widely spaced air or drain holes may be permitted provided that they are of elliptical shape or equivalent to minimise stress concentration and are, in general, cut clear of the welds.

6.2 Openings in primary supporting members

6.2.1 General

Manholes, lightening holes and other similar openings are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are to be avoided in high stress areas unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

Examples of high stress areas include:

- Vertical or horizontal diaphragm plates in narrow cofferdams/double plate bulkheads within one-sixth of their length from either end.
- Floors or double bottom girders close to their span ends.
- Primary supporting member webs in way of end bracket toes.
- Above the heads and below the heels of pillars.

Where openings are arranged, the shape of openings is to be such that the stress concentration remains within acceptable limits.

Openings are to be well rounded with smooth edges.

6.2.2 Manholes and lightening holes

Web openings as indicated below do not require reinforcement

- In single skin sections, having depth not exceeding 25% of the web depth and located so that the edges are not less than 40% of the web depth from the faceplate.
- In double skin sections, having depth not exceeding 50% of the web depth and located so that the edges are well clear of cut outs for the passage of stiffeners.

The length of openings is not to be greater than:

- At the mid-span of primary supporting members: the distance between adjacent openings.
- At the ends of the span: 25% of the distance between adjacent openings.

For openings cut in single skin sections, the length of opening is not to be greater than the web depth or 60% of the stiffener spacing, whichever is greater.

The ends of the openings are to be equidistant from the cut outs for stiffeners.

Where lightening holes are cut in the brackets, the distance from the circumference of the hole to the free flange of brackets is not to be less than the diameter of the lightening hole.

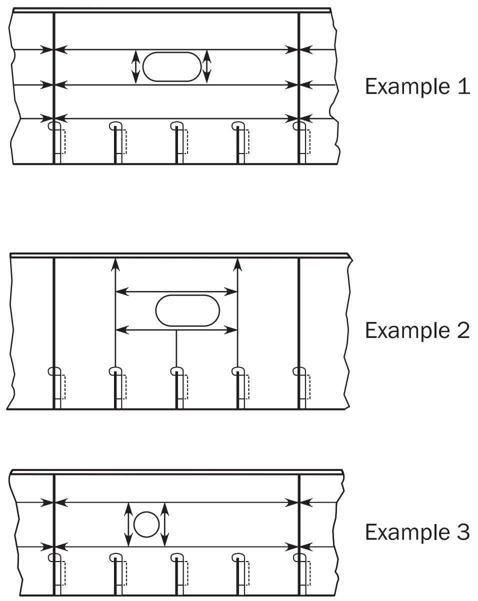
Openings not complying with this requirement are to be reinforced according to [6.2.3].

6.2.3 Reinforcements around openings

Manholes and lightening holes are to be stiffened according to this requirement, except where alternative arrangements are demonstrated as satisfactory, in accordance with the analysis methods described in Ch 7.

On members contributing to longitudinal strength, stiffeners are to be fitted along the free edges of the openings parallel to the vertical and horizontal axis of the opening. Stiffeners may be omitted in one direction if the shortest axis is less than 400 mm and in both directions if length of both axes is less than 300 mm. Edge reinforcement may be used as an alternative to stiffeners, see Figure 13.

Figure 13 : Web plate with openings



In the case of large openings in the web of PSMs (e.g. where a pipe tunnel is fitted in the double bottom), the secondary stresses in PSMs are to be considered for the reinforcement of these openings.

Where no FE analysis is performed, this may be carried out by assigning an equivalent net shear sectional area to the PSM obtained, in cm², according from the following formula:

$$A_{s-n50} = \frac{A_{1-n50}}{1 + \dfrac{32 l_{shr}^2 A_{1-n50}}{I_{1-n50}}} + \frac{A_{2-n50}}{1 + \dfrac{32 l_{shr}^2 A_{2-n50}}{I_{2-n50}}}$$

where:

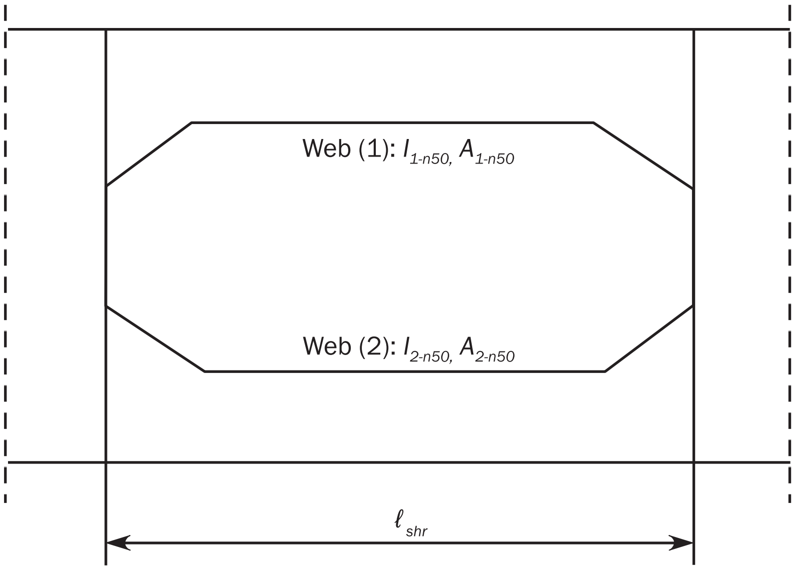
I_{1-n50}, I_{2-n50} : Net moments of inertia, in cm⁴, of deep webs (1) and (2), respectively, with attached plating around their neutral axes parallel to the plating.

A_{1-n50}, A_{2-n50} : Net shear sectional areas, in cm², of deep webs (1) and (2), respectively, taking account of the web height reduction by the depth of the cut out for the passage of the ordinary stiffeners, if any.

ℓ_{shr} : Shear span, in m, of deep webs (1) and (2) as defined in Ch 3, Sec 7, [1.1.2].

Deep web (1) and (2) are defined in Figure 14.

Figure 14 : Large openings in the web of primary supporting members



6.3 Openings in the strength deck

6.3.1 General

Openings in the strength deck are to be kept to a minimum and spaced as far as practicable from one another and from the ends of superstructures. Openings are to be located as far as practicable from high stress regions such as side shell platings, hatchway corners, or hatch side coamings.

6.3.2 Small opening location

Openings are generally to be located outside the limits as shown in Figure 15 in dashed area, defined by:

- The bent area of a rounded sheer strake, if any, or the side shell.
- $e = 0.25\ (B - b)$ from the edge of opening.
- $c = 0.07\ell + 0.1b$ or $0.25b$, whichever is greater.

where:

b : Width, in m, of the hatchway considered, measured in the transverse direction, see Figure 15.

ℓ : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction, see Figure 15.

Transverse distance between the above limits and openings or between hatchways and openings as shown in Figure 15 is not to be less than:

- $g_2 = 2\, a_2$ for circular openings.
- $g_1 = a_1$ for elliptical openings.

Transverse distance between openings as shown in Figure 16 is not to be less than:

- $2\,(a_1 + a_2)$ for circular openings.
- $1.5\,(a_1 + a_2)$ for elliptical openings.

where:

a_1 : Transverse dimension of elliptical openings, or diameter of circular openings.

a_2 : Transverse dimension of elliptical openings, or diameter of circular openings.

a_3 : Longitudinal dimension of elliptical openings, or diameter of circular openings.

Longitudinal distance between openings is not to be less than:

- $(a_1 + a_3)$ for circular openings.
- $0.75\,(a_1 + a_3)$ for elliptical openings and for an elliptical opening in line with a circular one.

If the opening arrangements do not comply with these requirements, the hull girder longitudinal strength assessment is to be carried out by subtracting such opening areas, see Ch 5, Sec 1, [1.2.11].

Figure 15 : Position of openings in strength deck

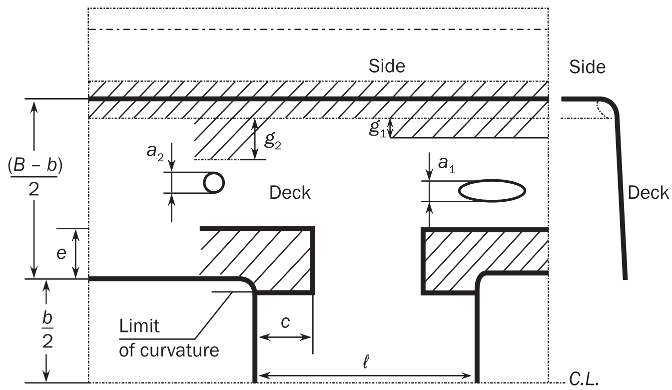


Figure 16 : Elliptical and circular openings in strength deck

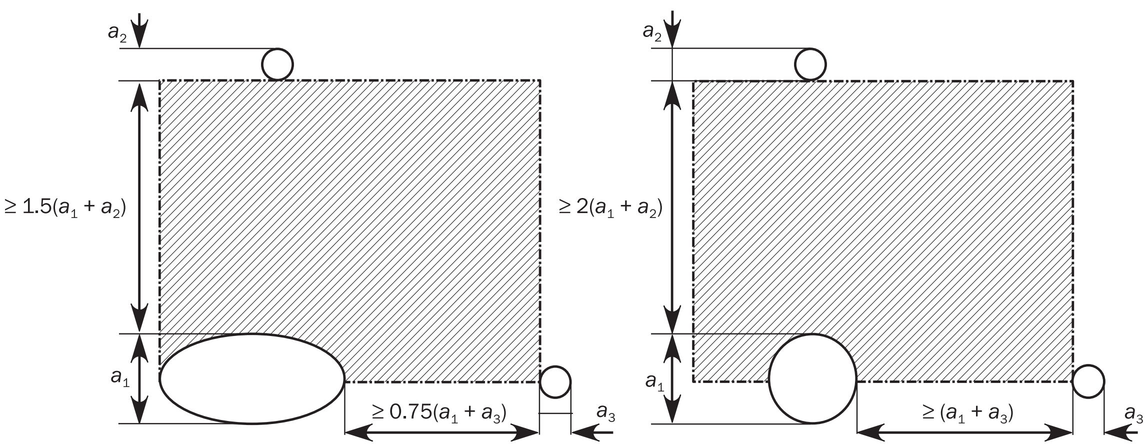


7 DOUBLE BOTTOM STRUCTURE

7.1 General

7.1.1 Framing system

For ships greater than 120 m in length, the bottom shell, the inner bottom and the sloped bulkheads of hopper tanks, if any, are to be longitudinally framed within the cargo hold region. Where it is not practicable to apply the longitudinal framing system to fore and aft parts of the cargo hold region due to the hull form, transverse framing may be accepted on a case-by-case basis subject to appropriate brackets and other arrangements being incorporated to provide structural continuity in way of changes to the framing system.

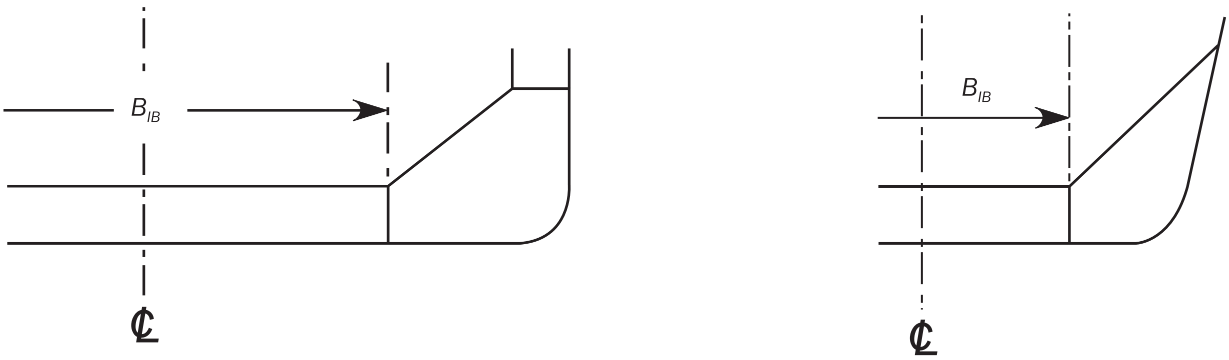
7.1.2 Variation in height of double bottom

Any variation in the height of the double bottom is generally to be made gradually and over an adequate length; the knuckles of inner bottom plating are to be located in way of plate floors. Where such arrangement is not possible, suitable longitudinal structures such as partial girders, longitudinal brackets, fitted across the knuckle are to be arranged.

7.1.3 Breadth of inner bottom

Breadth of inner bottom, in m, is to be measured at mid-length of the cargo hold as shown in Figure 17.

Figure 17 : Breadth of inner bottom



Ships with inclined slides

7.1.4 Drainage of tank top

For ships designed to carry solid cargoes, effective arrangements are to be provided for draining water from the tank top. Where wells are provided for the drainage, such wells are not to extend for more than one-half height of the double bottom.

7.1.5 Striking plate

Striking plates of adequate thickness or other equivalent arrangements are to be provided under sounding pipes to prevent the sounding rod from damaging the plating.

7.1.6 Duct keel

Where a duct keel is arranged, the centre girder may be replaced by two girders spaced, no more than 3 m apart. Otherwise, for a spacing wider than 3 m, the two girders are to be provided with support of adjacent structure and subject to the Society's approval.

The structures in way of the floors are to provide sufficient continuity of the latter.

7.2 Keel plate

7.2.1

Keel plating is to extend over the flat of bottom for the full length of the ship.

The width of the keel, in m, is not to be less than 0.8 + L/200, without being taken greater than 2.3 m.

7.3 Girders

7.3.1 Centre girder

When fitted, the centre girder is to extend within the cargo hold region and is to extend forward and aft as far as practicable. Structural continuity of the centre girder is to be maintained within the full length of the ship.

Where double bottom compartments are used for the carriage of fuel oil, fresh water or ballast water, the centre girder is to be watertight, except for the case such as narrow tanks at the end parts or when other watertight girders are provided within 0.25 B from the centreline.

7.3.2 Side girders

The side girders are to extend within the parallel part of the cargo hold region and are to extend forward and aft of the cargo hold region as far as practicable.

7.4 Floors

7.4.1 Web stiffeners

Floors are to be provided with web stiffeners in way of longitudinal ordinary stiffeners. Where the web stiffeners are not welded to the longitudinal stiffeners, design standard as given in Ch 9, Sec 6, [2] applies unless fatigue strength assessment for the cut out and connection of longitudinal stiffener is carried out.

7.5 Bilge keel

7.5.1 Material

The material of the bilge keel and ground bar is to be of the same yield stress as the material to which they are attached.

In addition, when the bilge keel extends over a length more than 0.15 L, the material of the bilge keel and ground bar is to be of the same grade as the material to which they are attached.

Figure 18 : Bilge keel construction

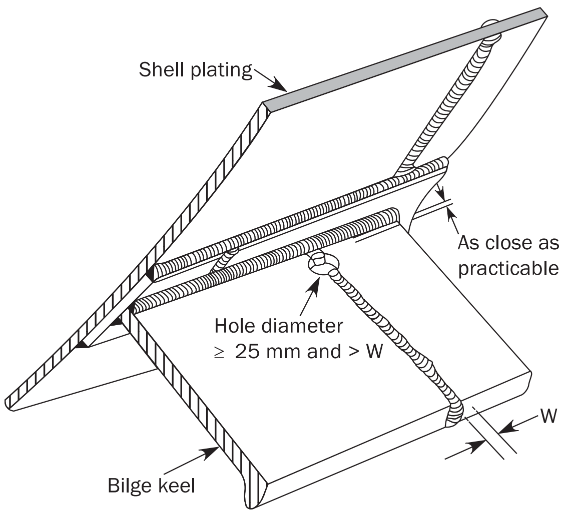


Figure 19 : Bilge keel end design

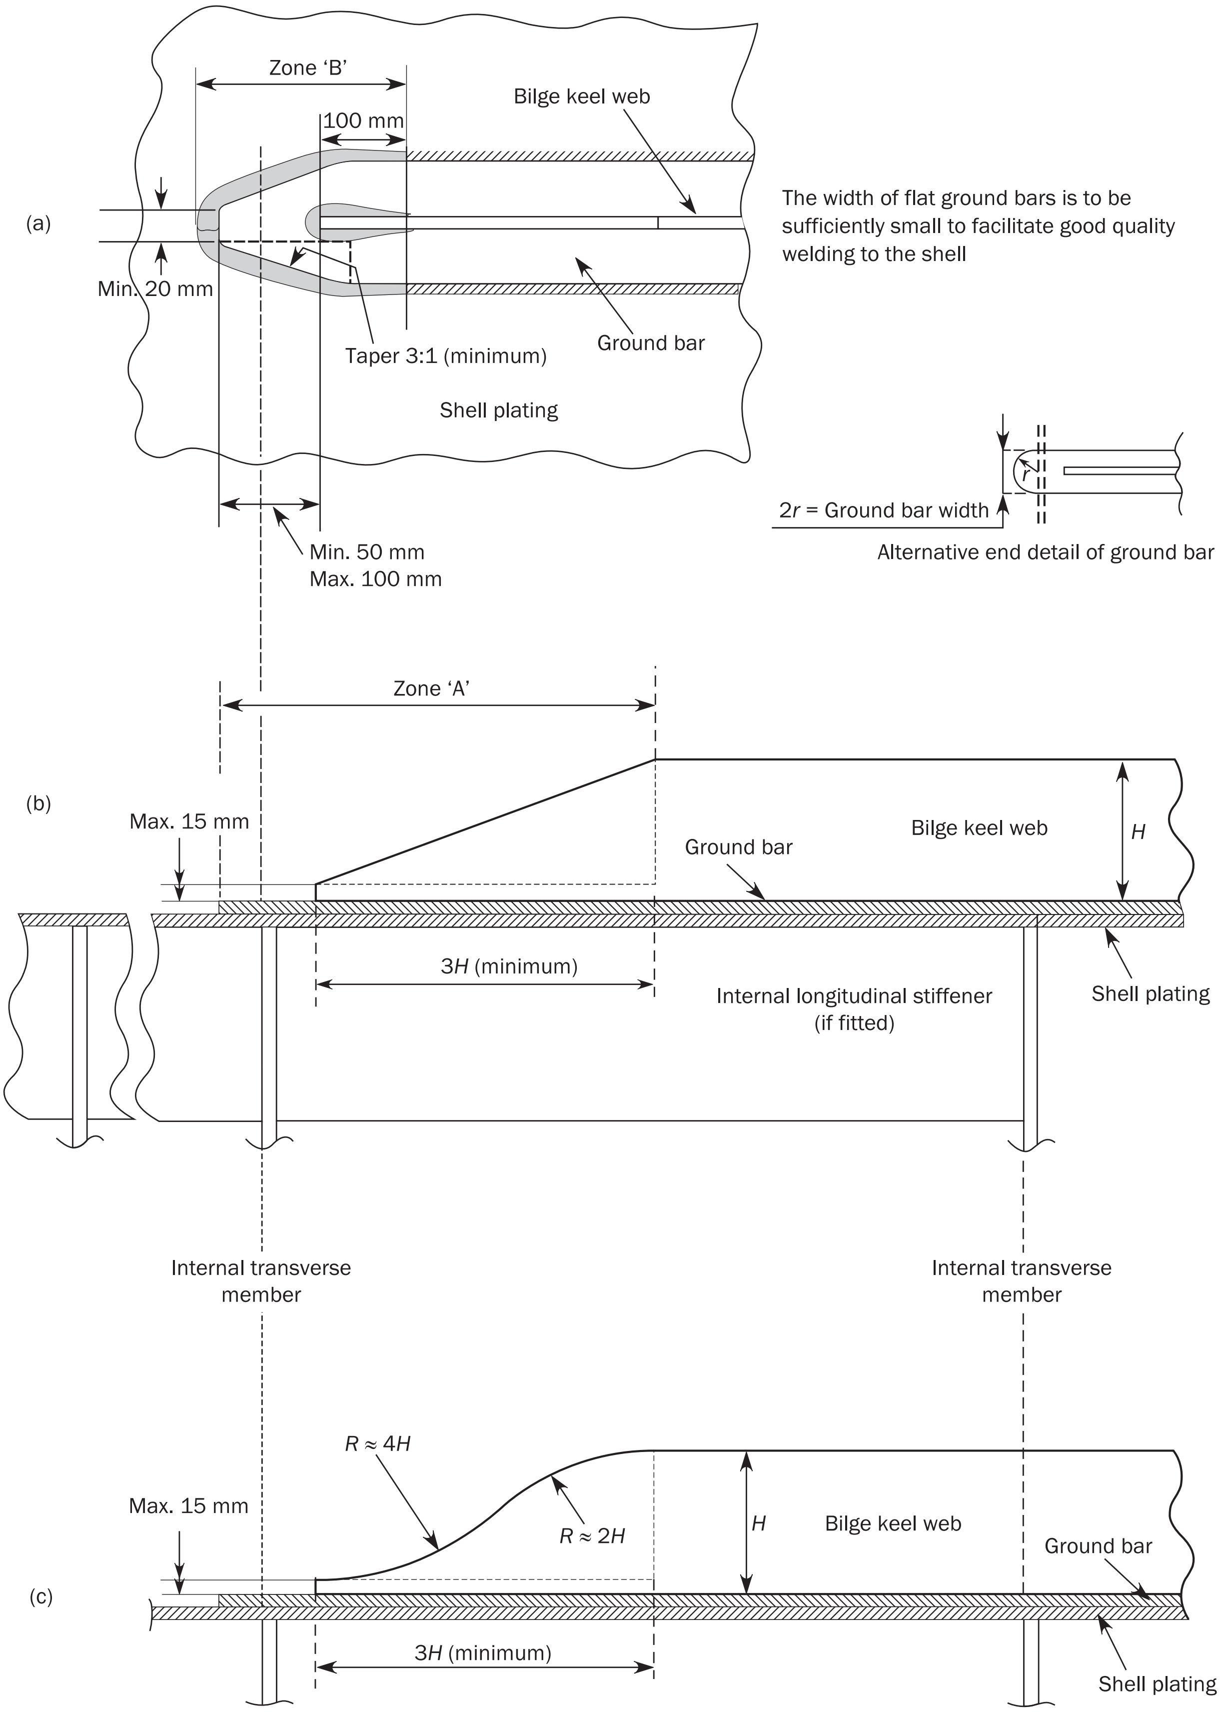

Figure 20 : Bilge keel end design (continued)

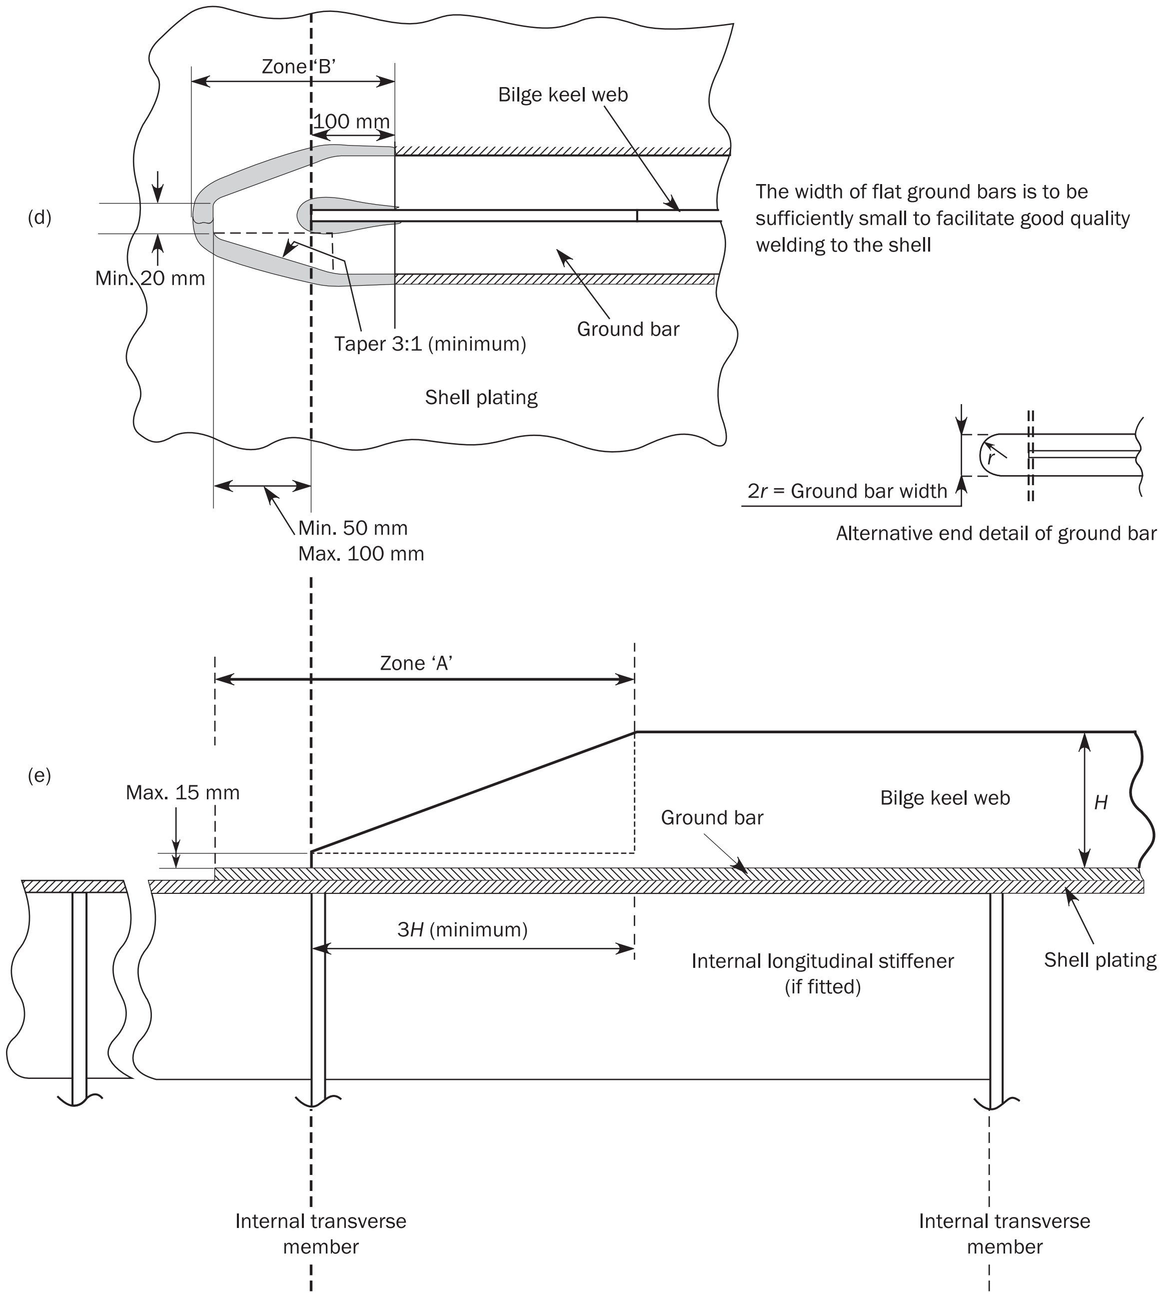


7.5.2 Design

The design of single web bilge keels is to be such that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of the bilge keel does not exceed that of the ground bar.

Bilge keels of a different design, from that shown in Figure 18, are to be specially considered by the Society.

7.5.3 Ground bars

Bilge keels are not to be welded directly to the shell plating. A ground bar, or doubler, is to be fitted on the shell plating as shown in Figure 18 and Figure 19. In general, the ground bar is to be continuous.

The gross thickness of the ground bar is not to be less than the gross thickness of the bilge strake or 14 mm, whichever is the lesser.

7.5.4 End details

The ground bar and bilge keel ends are to be tapered or rounded. Tapering is to be gradual with a minimum ratio of 3:1, see items (a), (b), (d) and (e) in Figure 19/Figure 20. Rounded ends are to be as shown in item (c) of Figure 19. Cut-outs on the bilge keel web, within zone 'A' (see items (b) and (e) of Figure 19/Figure 20) are not permitted.

The end of the bilge keel web is to be not less than 50 mm and not greater than 100 mm from the end of the ground bar, see items (a) and (d) of Figure 19/Figure 20.

Ends of the bilge keel and ground bar are to be supported by either transverse or longitudinal members inside the hull, as indicated as follows:

- Transverse support member is to be fitted at mid length between the end of the bilge keel web and the end of the ground bar, see items (a), (b) and (c) of Figure 19.
- Longitudinal stiffener is to be fitted in line with the bilge keel web, it is to extend to at least the nearest transverse member forward and aft of zone 'A' (see items (b) and (e) of Figure 19/Figure 20).

Alternative end arrangements may be accepted, provided that they are considered equivalent.

7.6 Docking

7.6.1 General

The drydocking arrangement itself is not covered in these Rules.

The bottom structure is to withstand the forces imposed by drydocking the ship.

7.6.2 Docking brackets

Docking brackets connecting the centreline girder to the bottom plating, are to be connected to the adjacent bottom longitudinals.

8 DOUBLE SIDE STRUCTURE

8.1 General

8.1.1

Side shell, inner hull bulkheads and longitudinal bulkheads are generally to be longitudinally framed. Where the side shell is longitudinally framed, the inner hull bulkheads are to be longitudinally framed. Alternative framing arrangements are to be specially considered by the Society.

8.1.2

Where the double side space of bulk carriers is void, the structural members bounding this space are to be structurally designed as a water ballast tank. In such a case the corresponding air pipe is considered as extending 0.76 m above the freeboard deck at side. For corrosion addition, the space is to be considered as a void space.

8.2 Structural arrangement

8.2.1 Primary supporting members

Double side web frames are to be fitted in line with web frames in hopper tanks. In addition, double side web frames are to be aligned with web frames or large brackets in topside tanks.

Vertical primary supporting members are to be fitted in way of hatch end beams of bulk carriers or similar large deck opening supporting transverse structure.

In general, horizontal side stringers are to be fitted aft of the collision bulkhead, up to 0.2 L aft of the fore end, in line with fore peak stringers.

8.2.2 Transverse stiffeners

Transverse stiffeners on side shell and inner side, where fitted, are to be continuous or fitted with bracket end connections within the height of the double side. The transverse stiffeners are to be effectively connected to stringers. At their upper and lower ends, shell and inner side transverse stiffeners are to be connected by brackets to supporting stringer plates.

8.2.3 Longitudinal stiffeners

Longitudinal stiffeners on side shell and inner side, where fitted, are to be continuous within the length of the parallel part of the cargo hold region. They are to be fitted with soft toe brackets in way of transverse bulkheads aligned with cargo hold bulkheads and are to be effectively connected to transverse web frames of the double side structure.

Longitudinal framing of the side shell is to extend outside the cargo hold region as far forward as practicable.

8.2.4 Sheer strake

Sheer strakes are to have breadths not less than 0.8 + L/200 m, measured vertically, but need not be greater than 1.8 m.

The sheer strake may be either welded to the stringer plate or rounded.

If the sheer strake is rounded, its radius, in mm, is to be not less than 17 t_s, where t_s is the net thickness, in mm, of the sheer strake.

The upper edge of the welded sheer strake is to be rounded smooth and free of notches. Fixtures such as bulwarks, eye plates are not to be directly welded on the upper edge of sheer strake, except in fore and aft parts. Drainage openings with a smooth transition in the longitudinal direction may be permitted.

Longitudinal seam welds of rounded sheer strake are to be located outside the bent area at a distance not less than 5 times the maximum net thicknesses of the sheer strake.

The welding of deck fittings to rounded sheer strakes is to be avoided within 0.6 L amidships.

The transition from a rounded sheer strake to an angled sheer strake associated with the arrangement of superstructures is to be designed to avoid any discontinuities.

8.2.5 Plating connection

Connection between the inner hull plating and the inner bottom plating is to be designed such that stress concentration is avoided.

The connections of hopper tanks plating with inner hull and with inner bottom are to be supported by a primary supporting member.

9 DECK STRUCTURE

9.1 Structural arrangement

9.1.1 Framing system

Deck areas contributing to the longitudinal strength are to be longitudinally framed.

9.1.2 Stringer plate

Stringer plates are to have breadths not less than 0.8 + L/200 m, measured parallel to the deck, but need not be greater than 1.8 m.

Rounded stringer plates, where adopted, are to comply with the requirements in [8.2.4].

9.1.3 Connection of deckhouses and superstructures

Connection of deckhouses and superstructures to the strength deck are to be designed such that loads are transmitted into the under deck supporting structure.

9.2 Deck scantlings

9.2.1

The web depth of deck stiffeners is not to be less than 60 mm.

The web depth of PSMs is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is the bending span as defined in Ch 3, Sec 7 or in case of a grillage structure, the distance between connections to other PSMs.

10 BULKHEAD STRUCTURE

10.1 Application

10.1.1

The requirements of this article apply to longitudinal and transverse bulkheads, which may be plane or corrugated.

10.2 General

10.2.1

The web height of vertical PSMs on bulkheads may be gradually tapered from bottom to deck.

10.2.2

Bulkheads are to be stiffened in way of deck girders.

10.2.3

Bulkheads that support girders, or pillars and longitudinal bulkheads which are fitted in lieu of girders, are to be stiffened to provide supports not less effective than required for stanchions or pillars that would be located at the same position.

10.2.4

Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way of the connection are to be adequate for the loads imparted to the bulkheads by the hydraulic forces in the pipes.

10.3 Plane bulkheads

10.3.1 General

Plane bulkheads may be horizontally or vertically stiffened.

Horizontally framed bulkheads are made of horizontal stiffeners supported by vertical primary supporting members.

Vertically framed bulkheads are made of vertical stiffeners supported by horizontal stringers, if needed.

The bulkhead stiffener webs of hopper and topside tank watertight bulkheads are to be aligned with the webs of longitudinal stiffeners of sloping plates of inner hull.

Floors are to be fitted in the double bottom in line with the plane transverse bulkhead.

10.3.2 End connection of stiffeners

The crossing of stiffeners through a watertight bulkhead is to be watertight.

End connections of stiffeners are to be bracketed. For isolated areas of the ship where bracketed end connections cannot be applied due to hull lines, other arrangements including sniped ends are acceptable.

10.3.3 Sniped end of stiffener

Sniped ends may be used on bulkheads subject to hydrostatic pressure provided they comply with [3.4].

10.4 Corrugated bulkheads

10.4.1 General

For bulk carriers of 190 m of length *L* and above and for oil tankers of 16 m moulded depth and above, the transverse vertically corrugated watertight bulkheads are to be fitted with a lower stool, and generally with an upper stool below deck. For bulk carriers having length *L* less than 190 m and for oil tankers having a moulded depth less than 16 m, corrugations may extend from inner bottom to deck.

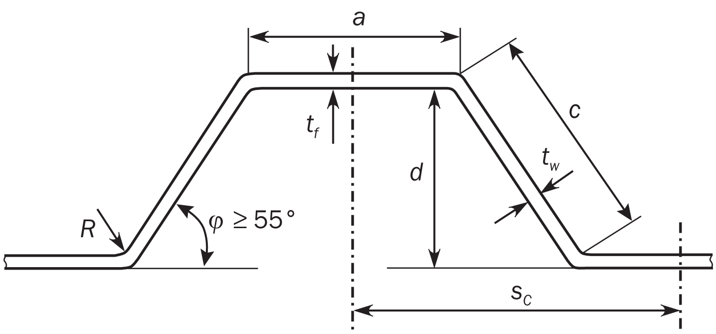
10.4.2 Construction

The main dimensions a, R, c, d, t_f, t_w, s_C of corrugated bulkheads are defined in Figure 21.

The corrugation angle φ is not to be less than 55°.

When welds in a direction parallel to the bend axis are provided in the zone of the bend, the welding procedures are to be submitted to the Society for approval.

Figure 21 : Dimensions of a corrugated bulkhead



10.4.3 Corrugated bulkhead depth

The depth of the corrugation, d, in mm, is not to be less than:

$$d = \frac{1000\ell_c}{C}$$

where:

ℓ_c : Mean span of considered corrugation, in m, as defined in [10.4.5].

C : Coefficient to be taken as:

C = 15 for tank and water ballast cargo hold bulkheads.

C = 18 for dry cargo hold bulkheads.

10.4.4 Actual section modulus of corrugations

The net section modulus of a corrugation may be obtained, in cm^3, from the following formula:

$$Z = \left[\frac{d(3at_f + ct_w)}{6}\right] 10^{-3}$$

where:

t_f, t_w : Net thickness of the plating of the corrugation, in mm, shown in Figure 21.

d, a, c : Dimensions of the corrugation, in mm, shown in Figure 21.

Where the web continuity is not ensured at ends of the bulkhead, the net section modulus of a corrugation is to be obtained, in cm^3, from the following formula:

$$Z = 0.5\ a\ t_f\ d\ 10^{-3}$$

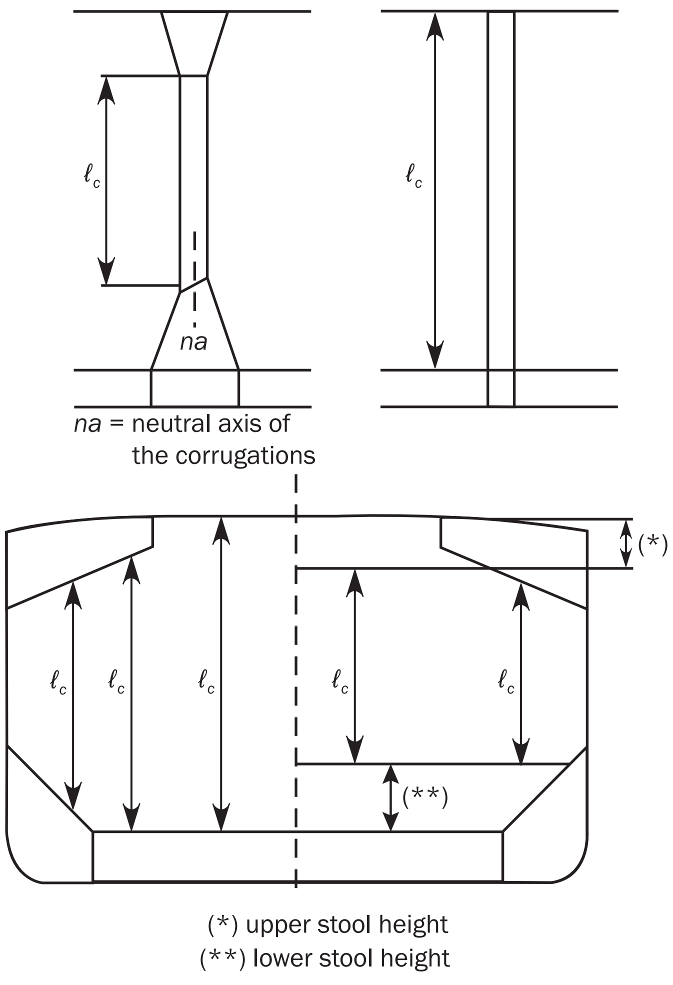
10.4.5 Span of corrugations

The span ℓ_C of the corrugations is to be taken as the distance shown in Figure 22.

For the definition of ℓ_C, the bottom of the upper stool is not to be taken more than a distance from the deck at the centre line equal to:

- 3 times the depth of corrugation, for non rectangular stool.
- 2 times the depth of corrugation, for rectangular stool.

Figure 22 : Span of the corrugations



10.4.6 Structural arrangements

Where corrugated bulkheads are cut in way of primary supporting members, corrugations on each side of the primary member are to be aligned with each other.

10.4.7 Bulkhead end supports

The strength continuity of corrugated bulkheads is to be maintained at the ends of corrugations.

Where a bulkhead is provided with a lower stool, floors or girders are to be fitted in line with both sides of the lower stool. Where a bulkhead is not provided with a lower stool, floors or girders are to be fitted in line with both flanges of the vertically corrugated transverse bulkhead.

The supporting floors or girders are to be connected to each other by suitably designed shear plates.

At deck, if no upper stool is fitted, transverse or longitudinal stiffeners are to be fitted in line with the corrugation flanges.

When the corrugation flange connected to the adjoining boundary structures (i.e. inner hull, side shell, longitudinal bulkhead, trunk, etc) is smaller than 50% of the width of the typical corrugation flange, an advanced analysis of the connection is required.

10.4.8 Bulkhead stools

Stool side plating is to be aligned with the corrugation flanges.

10.4.9 Lower stool

The lower stool, when fitted, is to have a height in general not less than:

- 3 corrugation depths, for bulk carriers.
- One corrugation depth, for oil tankers.

The ends of stool side ordinary stiffeners, when fitted in a vertical plane, are to be attached to brackets at the upper and lower ends of the stool. Lower stool side vertical stiffeners and their brackets in the stool are to be aligned with the inner bottom structures such as longitudinals or similar. Lower stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top plate.

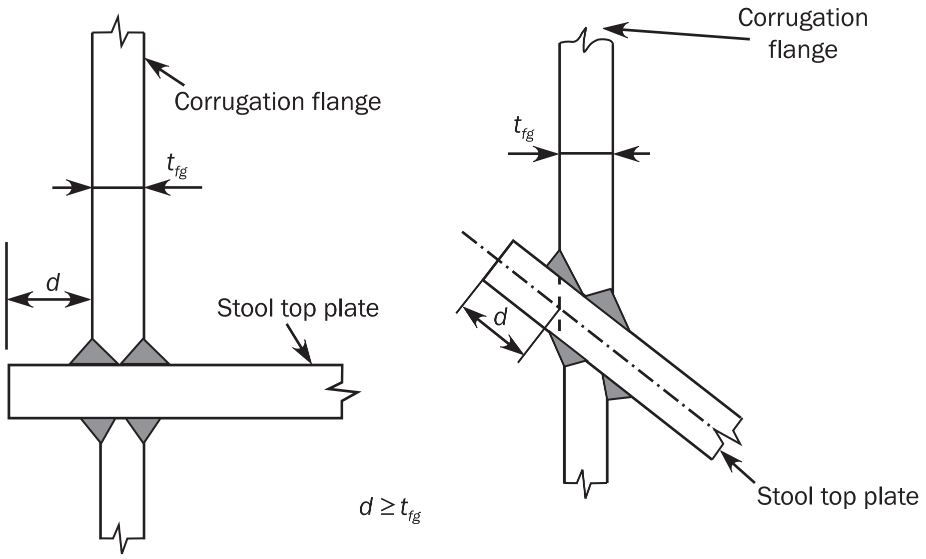
The distance *d* from the edge of the stool top plate to the surface of the corrugation flange is to be in accordance with Figure 23.

The lower part of the stool side plates is to be in line with double bottom floors or girders as the case may be, and the stool bottom is to have a width not less than:

- 2.5 corrugation depths, for bulk carriers.
- One corrugation depth, for oil tankers.

The stool is to be fitted with diaphragms in line with the longitudinal double bottom girders or floors. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided.

Figure 23 : Permitted distance, *d*, from the edge of the stool top plate to the surface of the corrugation flange



The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds. The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

10.4.10 Upper stool

The upper stool, when fitted, is to have a height:

- Between two and three times the corrugation depth, for bulk carriers.
- At least one corrugation depth, for oil tankers.

Rectangular stools are to have a height in general equal to twice the depth of corrugations, measured from the deck level and at the hatch side girder. Brackets or deep webs are to be fitted to connect the upper stool to the deck transverse or hatch end beams.

The upper stool of a transverse bulkhead is to be properly supported by deck girders or deep brackets between the adjacent hatch end beams. The width of the upper stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non-rectangular stools is to have a width not less than twice the depth of corrugations. The ends of stool side ordinary stiffeners when fitted in a vertical plane, are to be attached to brackets at the upper and lower end of the stool.

The stool is to be fitted with diaphragms in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders or transverse deck primary supporting members. Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

10.5 Non-tight bulkheads

10.5.1 General

In general, openings in wash bulkheads are to have generous radii and their aggregate area is not to be less than 10% of the area of the bulkhead.

10.5.2 Non-tight bulkheads not acting as pillars

In general, the maximum spacing of stiffeners fitted on non-tight bulkheads not acting as pillars is to be:

- 0.9 m, for transverse bulkheads.
- Two frame spacings, with a maximum of 1.5 m, for longitudinal bulkheads.

The net thickness of bulkhead stiffener, in mm, is not to be less than:

$t = 3 + 0.015\ L_2$

The depth of bulkhead stiffener of flat bar type is in general not to be less than 1/12 of stiffener length.

A smaller depth of stiffener may be accepted based on calculations showing compliance with Ch 6, Sec 5 and Ch 8.

10.5.3 Non-tight bulkheads acting as pillars

Non-tight bulkheads acting as pillars are to be provided with bulkhead stiffeners with a maximum spacing equal to:

- Two frame spacings, when the frame spacing does not exceed 0.75 m.
- One frame spacing, when the frame spacing is greater than 0.75 m.

Where non-tight bulkheads are corrugated, the depth of the corrugation is not to be less than 100 mm.

Each vertical stiffener, in association with a width of plating equal to 35 times the plating net thickness, 1/12 of stiffener length or the stiffener spacing, whichever is the smaller, is to comply with the applicable requirements in Ch 6, for the load being supported.

10.6 Watertight bulkheads of trunks and tunnels

10.6.1

Watertight trunks, tunnels, duct keels and ventilators are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing openings in them, are to be to the satisfaction of the Society.

11 PILLARS

11.1 General

11.1.1

Pillars are to be fitted in the same vertical line wherever possible. If not possible, effective means are to be provided for transmitting their loads to the supports below. Effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

11.1.2

Pillars are to be provided in line with the double bottom girder or as close thereto as practicable, and the structure above and below the pillars is to be of sufficient strength to provide effective distribution of the load. Where pillars connected to the inner bottom are not located in way of the intersection of floors and girders, partial floors or girders or equivalent structures are to be fitted as necessary to support the pillars.

11.1.3

Pillars provided in tanks are to be of solid or open section type.

Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45% of the specified minimum yield stress of the material.

11.2 Connections

11.2.1

Heads and heels of pillars are to be secured by thick doubling plates and brackets as necessary. Where the pillars are likely to be subjected to tensile loads, the head and heel of pillars are to be efficiently secured to withstand the tensile loads and the doubling plates replaced by insert plate.

In general, the net thickness of doubling plates is to be not less than 1.5 times the net thickness of the pillar. Pillars are to be attached at their heads and heels by continuous welding.

SECTION 7
STRUCTURAL IDEALISATION

SYMBOLS

Symbols

For symbols not defined in this section, refer to Ch 1, Sec 4.

φ_w : Angle, in deg, between the stiffener or primary supporting member web and the attached plating, see Figure 14. φ_w is to be taken equal to 90 deg if the angle is greater than or equal to 75 deg.

ℓ_{bdg} : Effective bending span, in m, as defined in [1.1.2] for stiffeners and [1.1.6] for primary supporting members.

ℓ_{shr} : Effective shear span, in m, as defined in [1.1.3] for stiffeners and [1.1.7] for primary supporting members.

ℓ : Full length of stiffener or of primary supporting member, in m, between their supports.

s : Stiffener spacing, in mm, as defined in [1.2].

S : Primary supporting member spacing, in m, as defined in [1.2].

a : Length, in mm, of EPP as defined in [2.1.1].

b : Breadth, in mm, of EPP as defined in [2.1.1].

h_{stf} : Stiffener height, including the face plate, in mm.

t_p : Net thickness of attached plate, in mm.

t_w : Net web thickness, in mm.

b_f : Breadth of flange, in mm, see Ch 3, Sec 2, Figure 2. For bulb profiles, see Table 1 and Table 2.

t_f : Net thickness of flange, in mm.

PSM : Primary Supporting Member.

EPP : Elementary Plate Panel.

LCP : Load Calculation Point.

1 STRUCTURAL IDEALISATION OF STIFFENERS AND PRIMARY SUPPORTING MEMBERS

1.1 Effective spans

1.1.1 General

Where arrangements differ from those defined in this article, span definition may be specially considered.

1.1.2 Effective bending span of stiffeners

The effective bending span ℓ_{bdg} of stiffeners is to be measured as shown in Figure 1 for single skin structures and Figure 2 for double skin structures.

If the web stiffener is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full length between PSMs unless a backing bracket is fitted, see Figure 1.

The effective bending span may be reduced where brackets are fitted to the flange or free edge of the stiffener. Brackets fitted on the side opposite to that of the stiffener with respect to attached plating are not to be considered as effective in reducing the effective bending span.

In single skin structures, the effective bending span of a stiffener supported by a bracket or by a web stiffener on one side only of the primary supporting member web, is to be taken as the total span between primary supporting members as shown in item (a) of Figure 1. If brackets are fitted on both sides of the primary supporting member, the effective bending span is to be taken as in items (b), (c) and (d) of Figure 1.

Figure 1 : Effective bending span of stiffeners supported by web stiffeners (single skin construction)

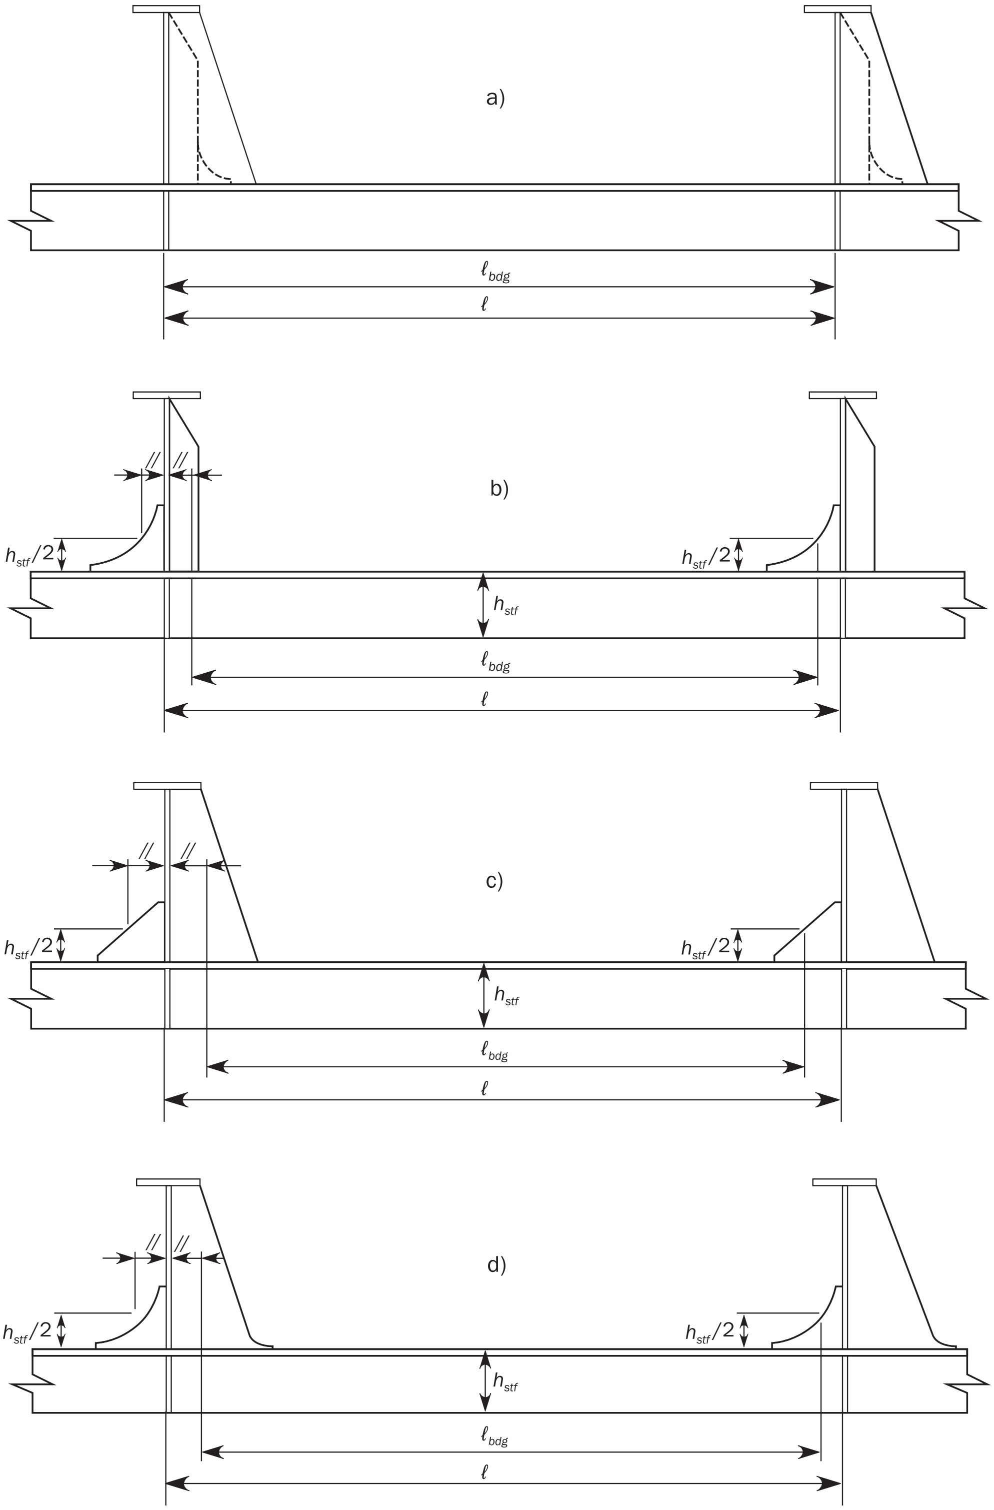


Figure 2 : Effective bending span of stiffeners supported by web stiffeners (double skin construction)

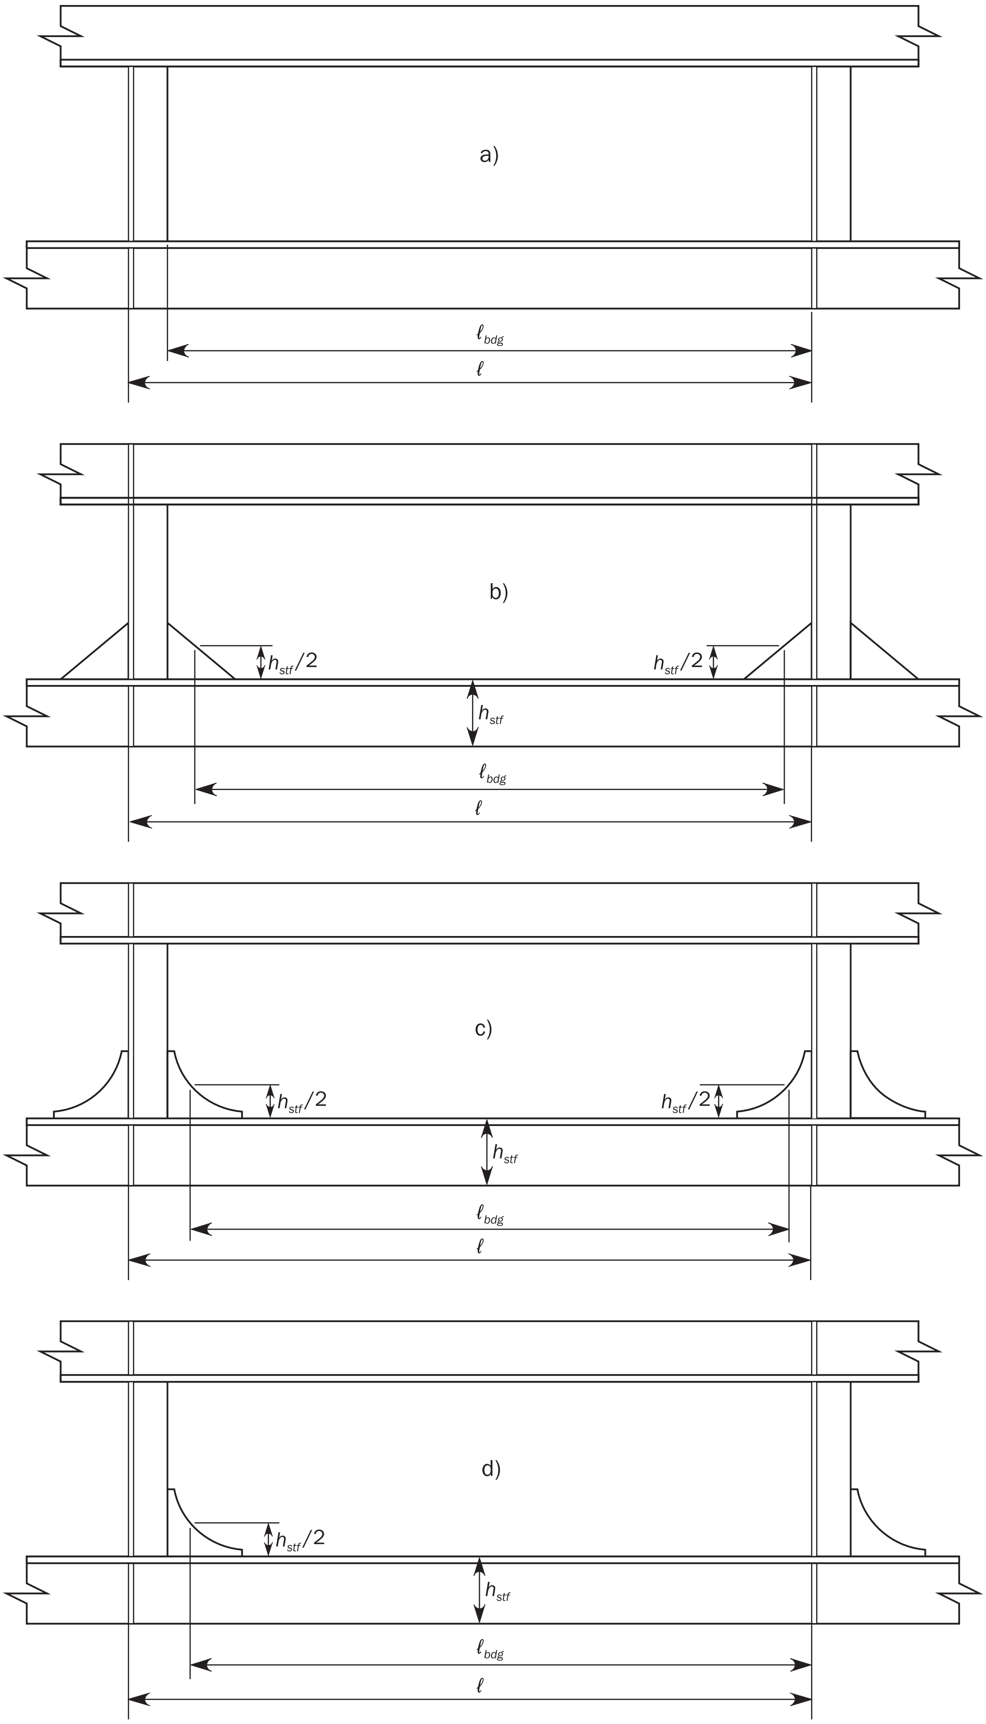
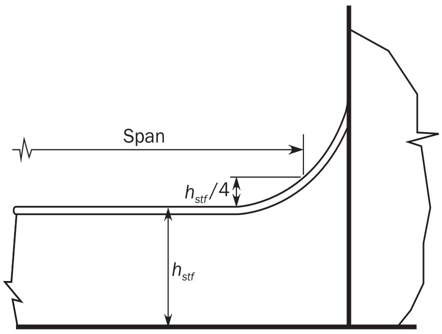


Where the face plate of the stiffener is continuous along the edge of the bracket, the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener, see Figure 3.

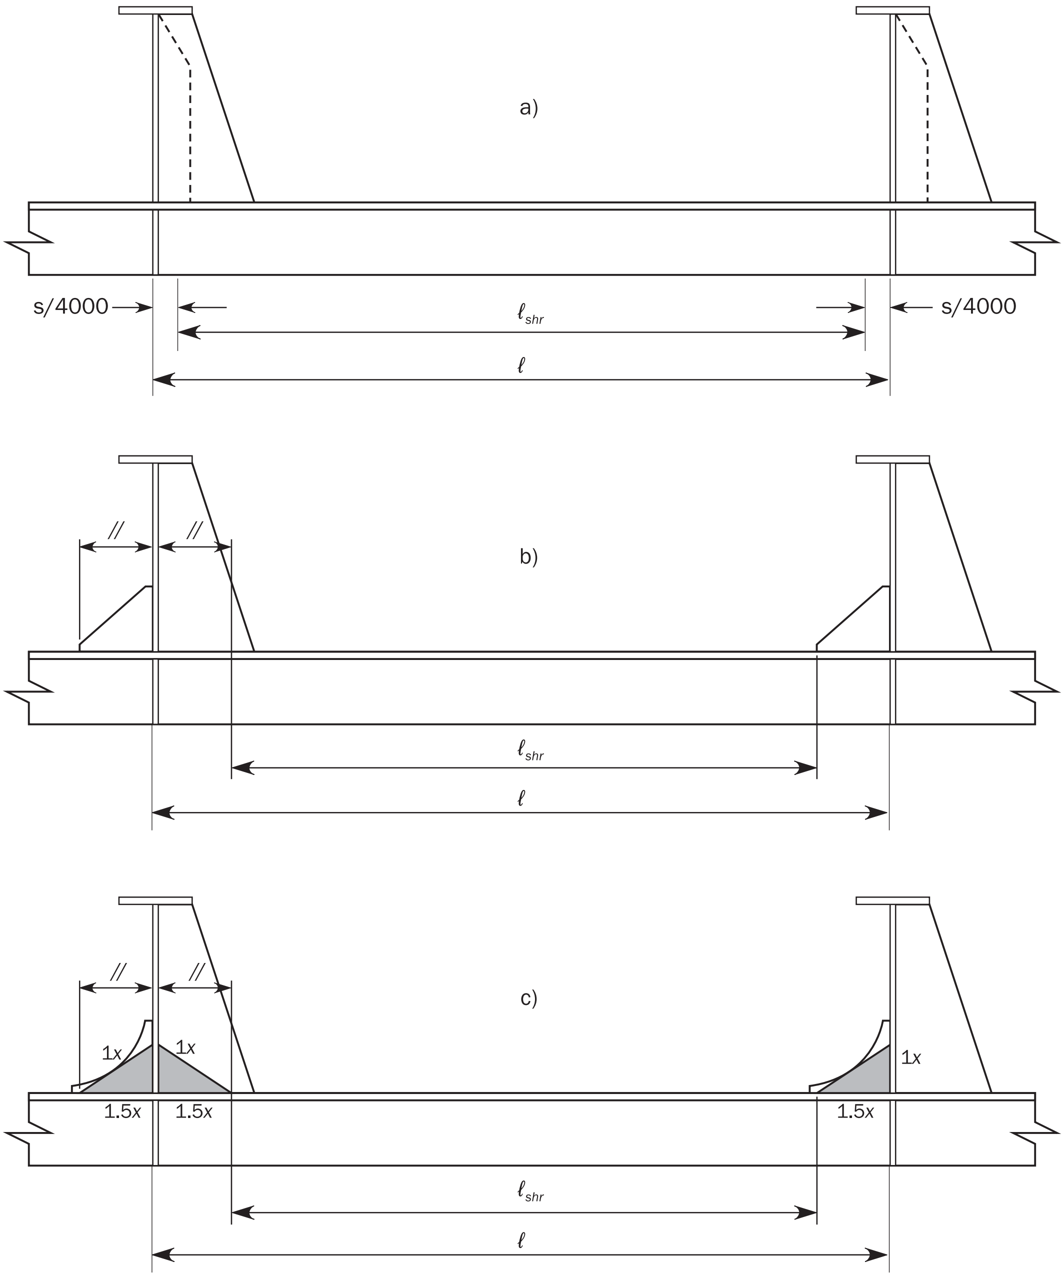
Figure 3 : Effective bending span for local support members with continuous face plate along bracket edge



1.1.3 Effective shear span of stiffeners

The effective shear span, ℓ_{shr} in m, of stiffeners is to be measured as shown in Figure 4 for single skin structures and Figure 5 for double skin structures.

Figure 4 : Effective shear span of stiffeners supported by web stiffeners (single skin construction)



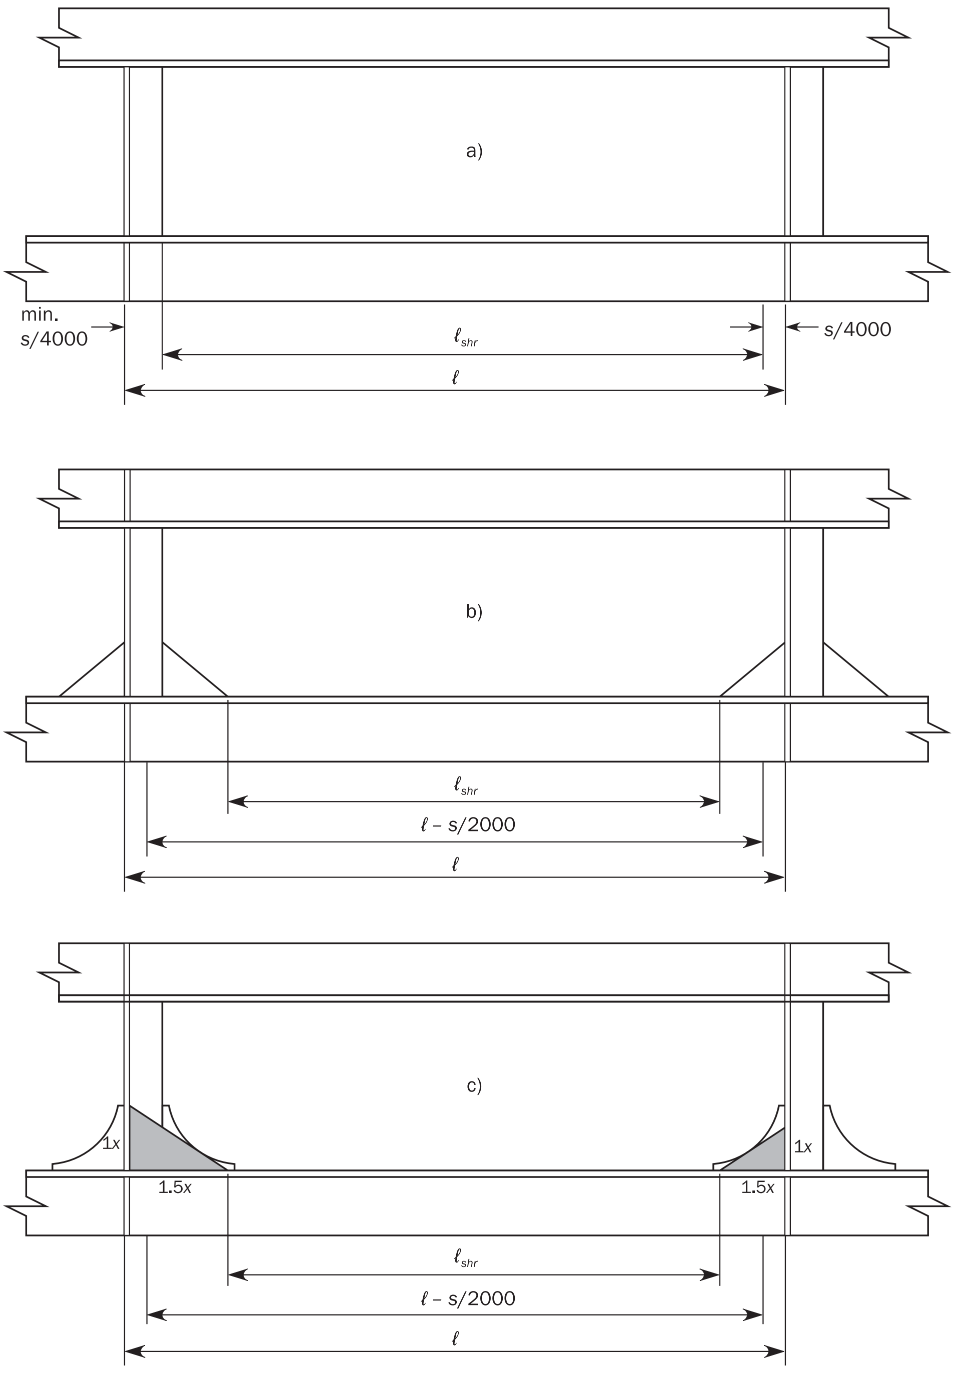
The effective shear span may be reduced for brackets fitted on either the flange or the free edge of the stiffener, or for brackets fitted to the attached plating on the side opposite to that of the stiffener.

If brackets are fitted at both the flange or free edge of the stiffener, and to the attached plating on the side opposite to the stiffener the effective shear span may be reduced using the longer effective bracket arm.

Regardless of support detail, the full length of the stiffener may be reduced by a minimum of s/4000 m at each end of the member, hence the effective shear span ℓ_{shr}, is not to be taken greater than:

$$\ell_{shr} \le \ell - \frac{s}{2000}$$

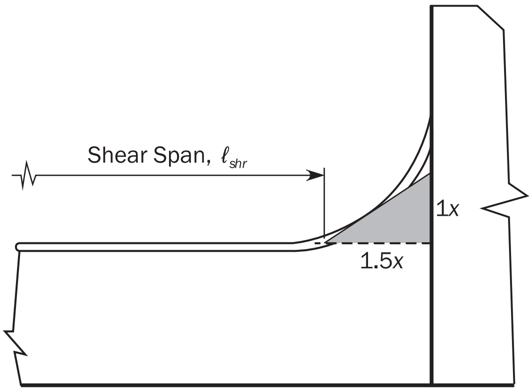
Figure 5 : Effective shear span of stiffeners supported by web stiffeners (double skin construction)



For curved and/or long brackets (high length/height ratio), the effective bracket length is to be taken as the maximum inscribed 1:1.5 triangle as shown in item (c) of both Figure 4 and Figure 5.

Where the face plate of the stiffener is continuous along the curved edge of the bracket, the bracket length to be considered for determination of the span point location is not to be taken greater than 1.5 times the length of the bracket arm as shown in Figure 6.

Figure 6 : Effective shear span for local support members with continuous face plate along bracket edge



1.1.4 Effect of hull form shape on span of stiffeners

For curved stiffeners, the span is defined as the chord length between span points to be measured at the flange for stiffeners with a flange, and at the free edge for flat bar stiffeners. The calculation of the effective span is to be in accordance with requirements given in [1.1.2] and [1.1.3].

1.1.5 Effective span of stiffeners supported by struts

The arrangement of stiffeners supported by struts is not allowed for ships over 120 m in length.

The span, ℓ of stiffeners supported by one strut fitted at mid distance of the primary supporting members is to be taken as $0.7\ell_2$.

In case where two struts are fitted at 1/3 and 2/3 length between primary supporting members, the span, ℓ of stiffeners is to be taken as $0.7\ell_2$.

ℓ_1 and ℓ_2 are the spans defined in Figure 7 and Figure 8.

Figure 7 : Span of stiffeners with one strut

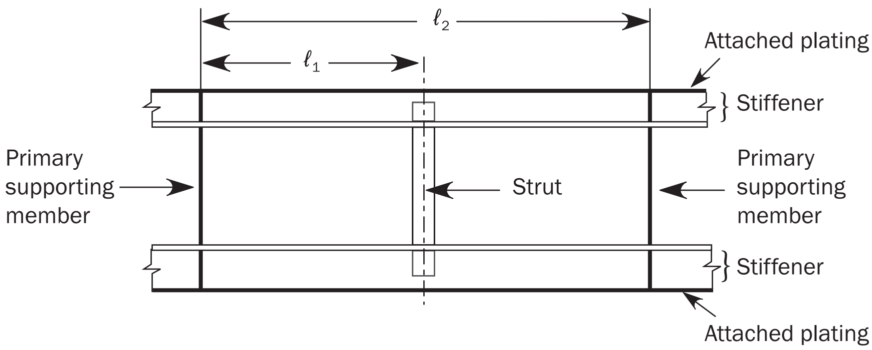


Figure 8 : Span of stiffeners with two struts

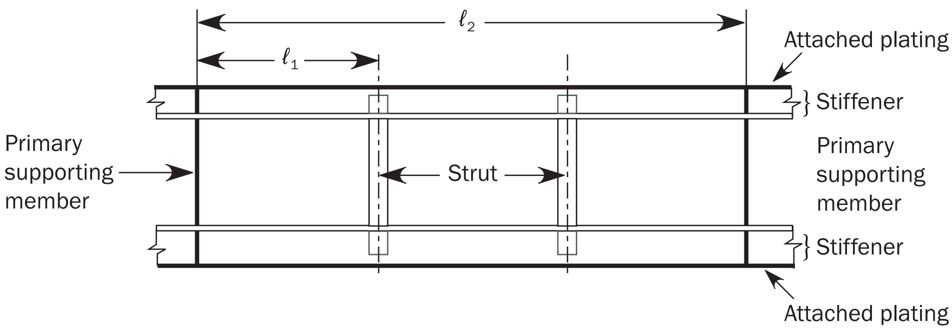

Figure 9 : Effective bending span of primary supporting member

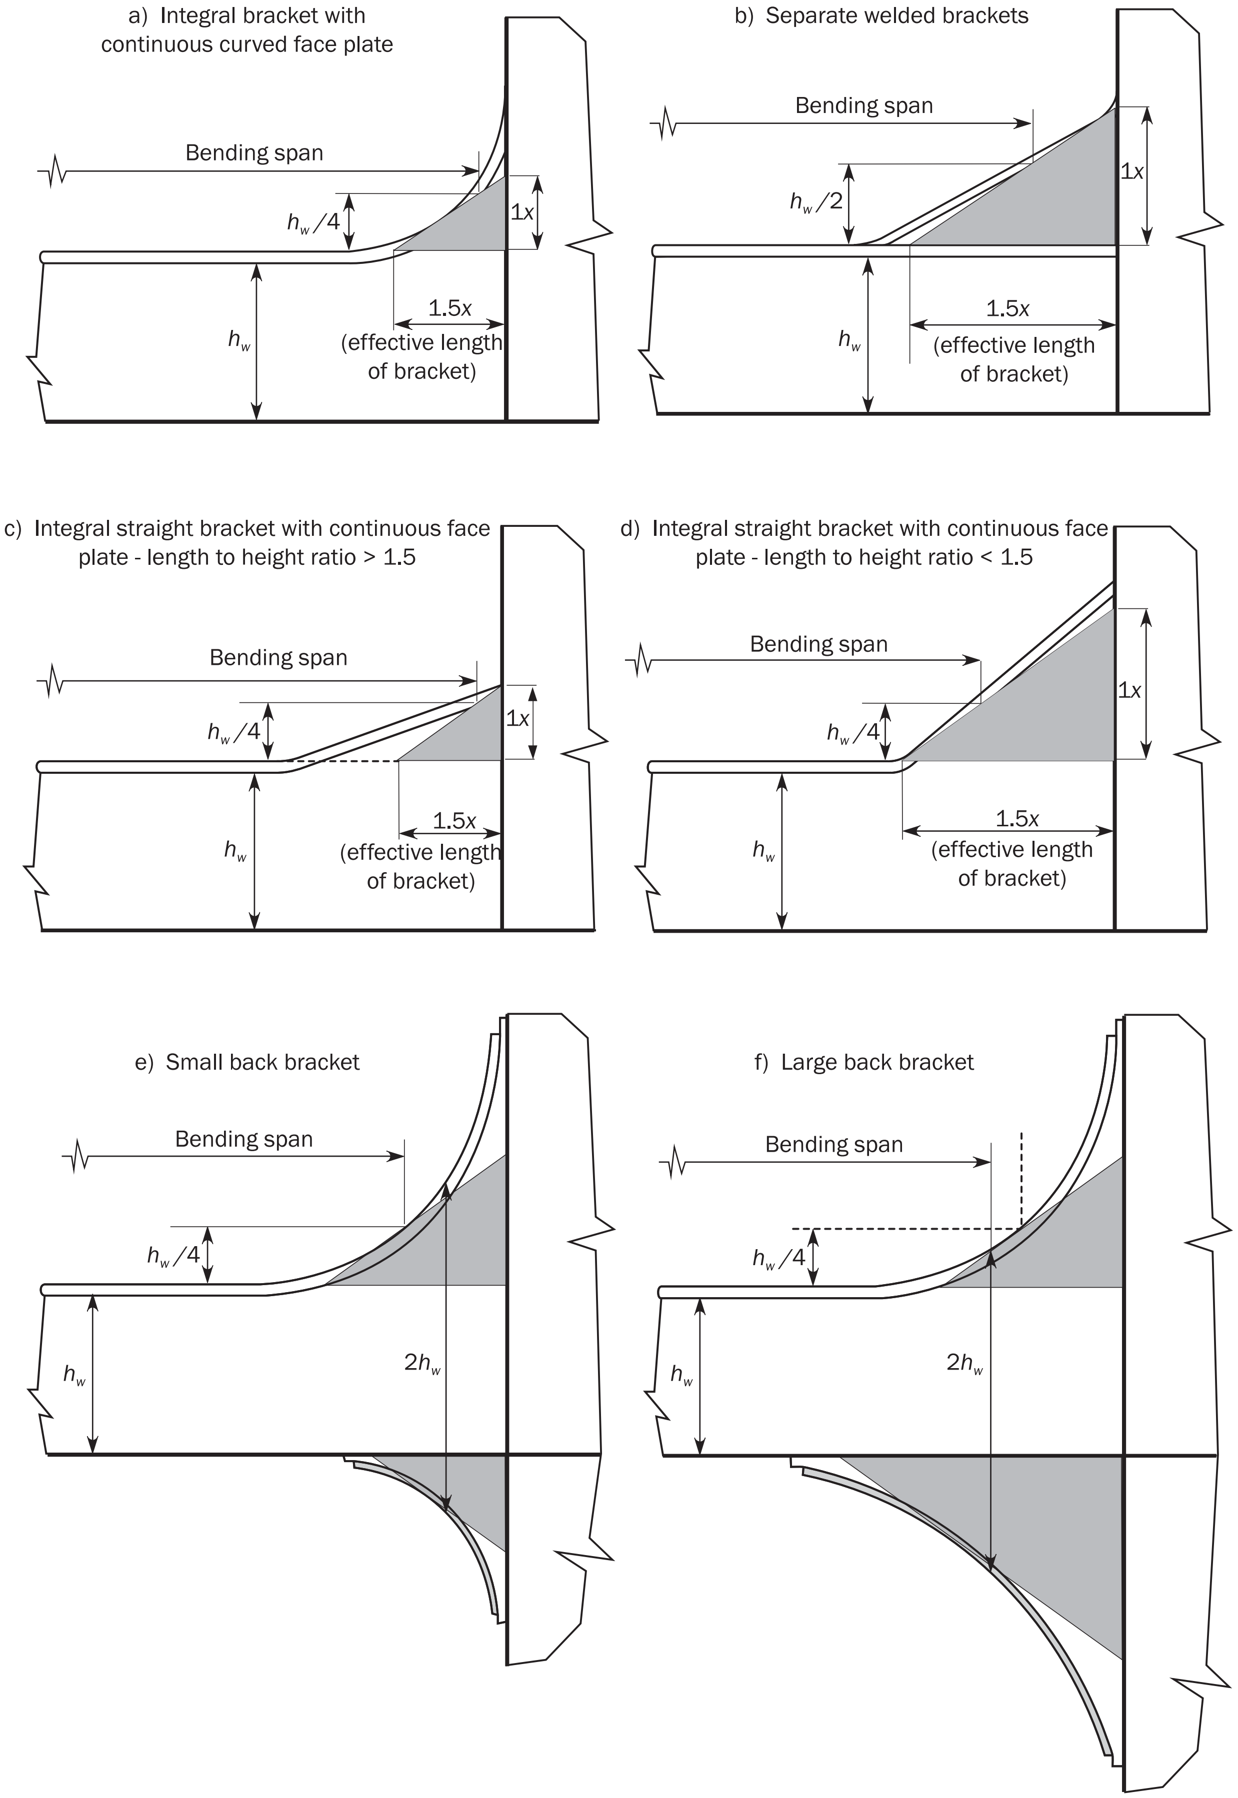

Figure 10 : Effective shear span of primary supporting member

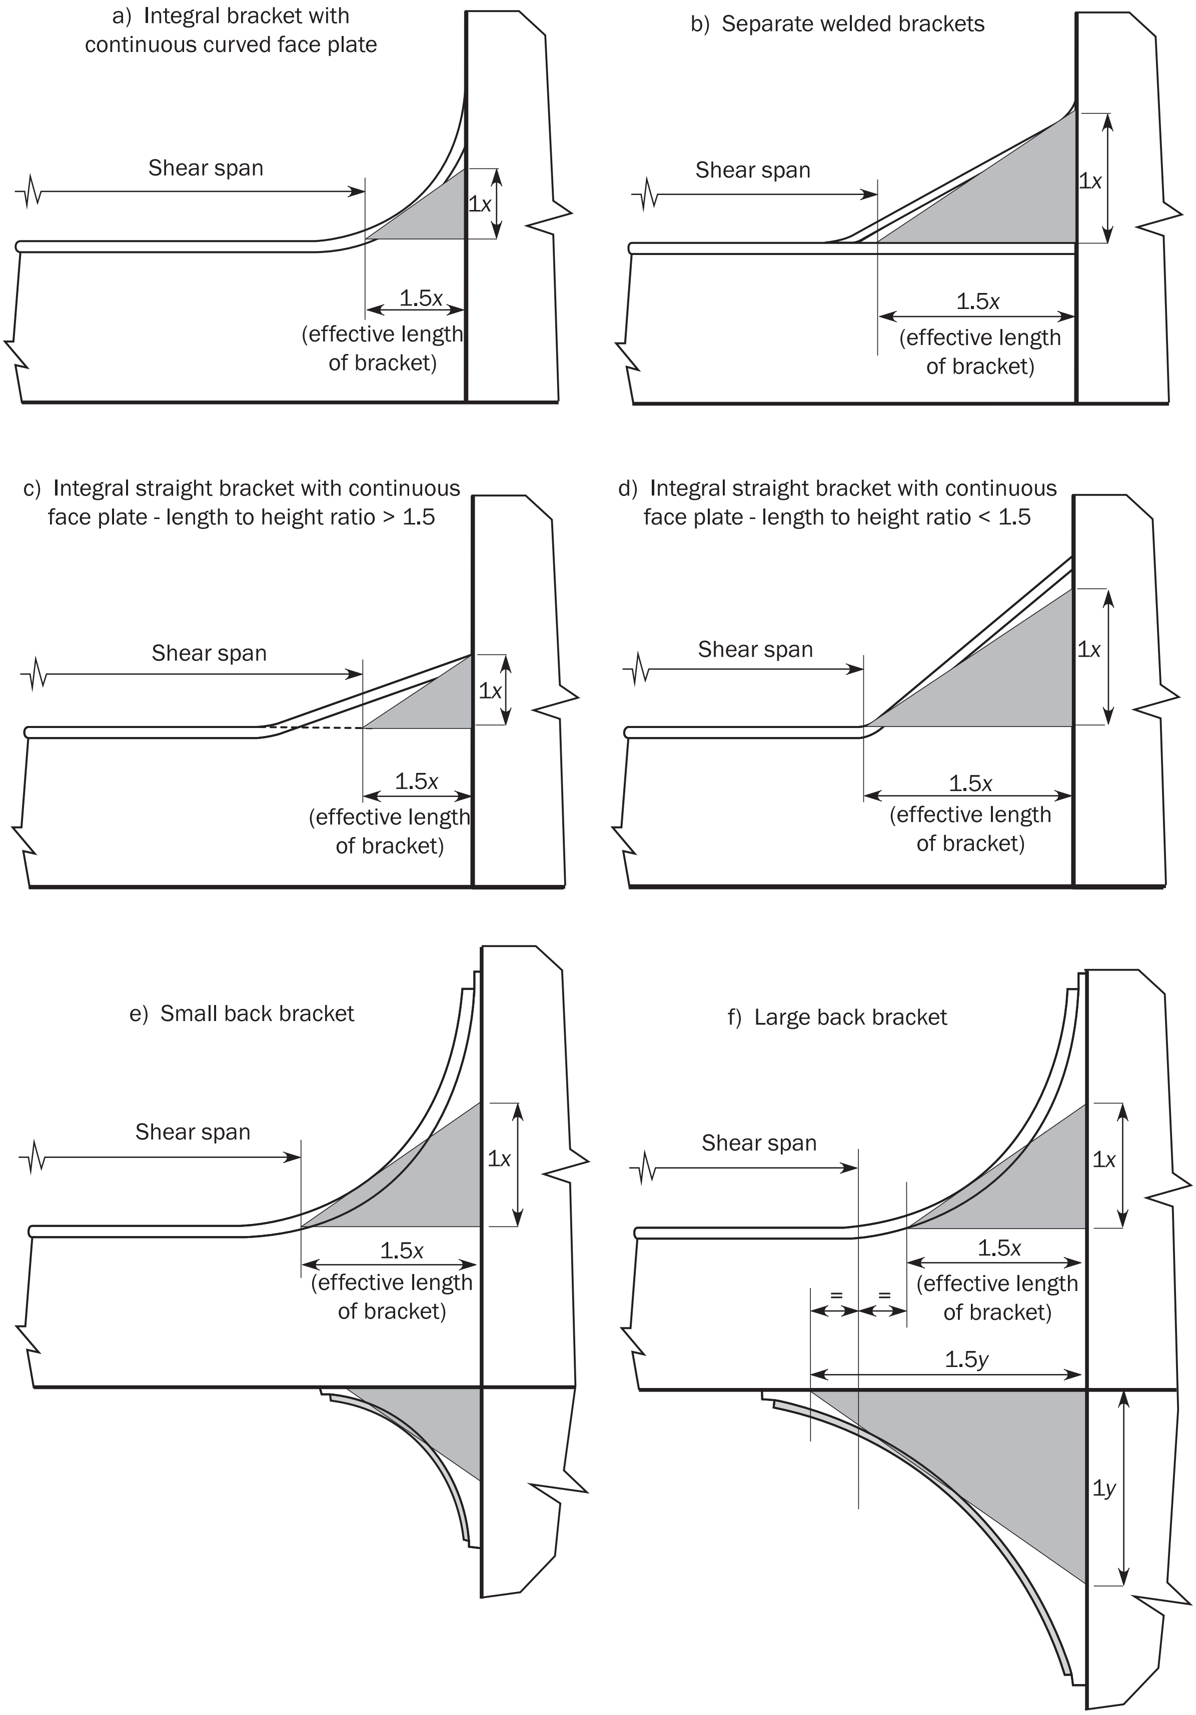


1.1.6 Effective bending span of primary supporting members

The effective bending span, ℓ_{bdg}, in m, of a primary supporting member without end bracket is to be taken as the length of the member between supports.

The effective bending span, ℓ_{bdg}, of a primary supporting member may be taken as less than the full length of the member between supports provided that suitable end brackets are fitted.

The effective bending span ℓ_{bdg}, in m, of a primary supporting member with end brackets is taken between points where the depth of the bracket is equal to half the web height of the primary supporting member as shown in item (b) of Figure 9. The effective bracket used to define these span points is to be taken as given in [1.1.8].

In case of brackets where the face plate of the member is continuous along the face of the bracket, as shown in items (a), (c) and (d) of Figure 9, the effective bending span ℓ_{bdg}, in m, is taken between points where the depth of the bracket is equal to one quarter the web height of the primary supporting member. The effective bracket used to define these span points is to be taken as given in [1.1.8].

For straight brackets with a length to height ratio greater than 1.5, the span point is to be taken to the effective bracket; otherwise the span point is to be taken to the fitted bracket.

For curved brackets, for span positions above the tangent point between fitted bracket and effective bracket, the span point is to be taken to the fitted bracket; otherwise, the span point is to be taken to the effective bracket.

For arrangements where the primary supporting member face plate is carried on to the bracket and backing brackets are fitted; the span point need not be taken greater than to the position where the total depth reaches twice the depth of the primary supporting member. Arrangements with small and large backing brackets are shown in items (e) and (f) of Figure 9.

For arrangements where the height of the primary supporting member is maintained and the face plate width is increased towards the support; the effective bending span may be taken to a position where the face plate breadth reaches twice the nominal breadth.

1.1.7 Effective shear span of primary supporting members

The effective shear span of the primary supporting member may be reduced compared to effective bending span, and taken between the toes of the effective brackets supporting the member, where the toes of effective brackets are as shown in Figure 10. The effective bracket used to define the toe point is given in [1.1.8].

For arrangements where the effective backing bracket is larger than the effective bracket in way of face plate, the shear span is to be taken as the mean distance between toes of the effective brackets as shown in item (f) of Figure 10.

1.1.8 Effective bracket definition

The effective bracket is defined as the maximum size of triangular bracket with a length to height ratio of 1.5 that fits inside the fitted bracket. See Figure 9 for examples.

1.2 Spacing and load supporting breadth

1.2.1 Stiffeners

Stiffeners spacing, s, in mm, for the calculation of the effective attached plating of stiffeners is to be taken as the mean spacing between stiffeners and taken equal to, see Figure 11.

$$s = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

b_1, b_2, b_3, b_4: Spacings between stiffeners at ends, in mm.

In general, the loading breadth supported by stiffener is to be taken equal to s.

1.2.2 Primary supporting member

Primary supporting member spacing, *S*, for the calculation of the effective attached plating of primary supporting members is to be taken as the mean spacing between adjacent primary supporting members, and taken equal to, see Figure 11.

$$S = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

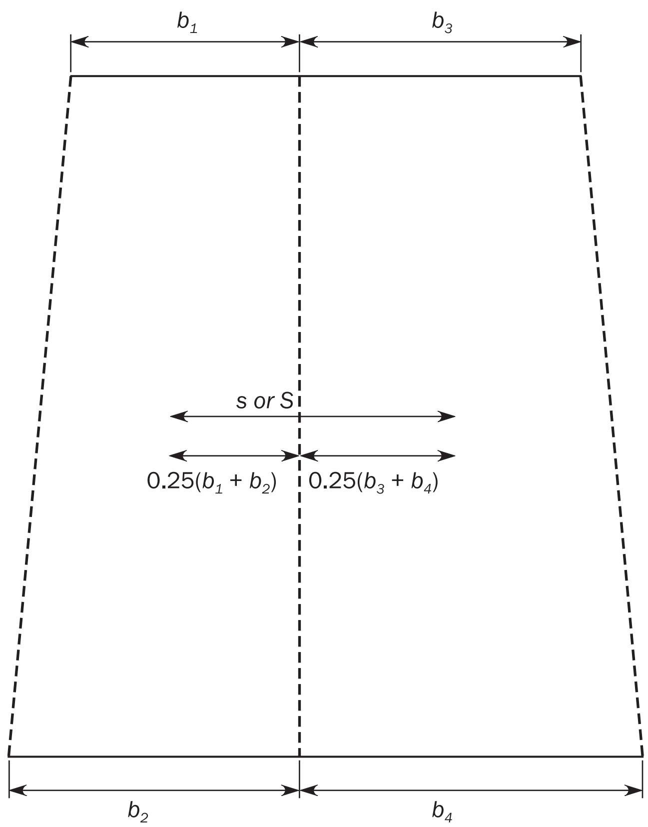
b_1, b_2, b_3, b_4 : Spacings between primary supporting members at ends.

In general, the loading breadth supported by a primary supporting member is to be taken equal to *S*.

1.2.3 Spacing of curved plating

For curved plating, the stiffener spacing, s or the primary supporting member spacing, *S* is to be measured on the mean chord between members.

Figure 11 : Spacing of plating



1.3 Effective breadth

1.3.1 Stiffeners

The effective breadth, b_{eff}, in mm, of the attached plating to be considered in the actual net section modulus for the yielding check of stiffeners is to be obtained from the following formulae:

- Where the plating extends on both sides of the stiffener:

  $b_{eff} = 200\ell$, or

  $b_{eff} = s$

  whichever is lesser.

- Where the plating extends on one side of the stiffener (i.e. stiffeners bounding openings):

  $b_{eff} = 100\ell$, or

  $b_{eff} = 0.5\ s$

  whichever is lesser.

However, where the attached plate net thickness is less than 8 mm, the effective breadth is not to be taken greater than 600 mm.

The effective breadth, b_{eff}, in mm, of the attached plating to be considered for the buckling check of stiffeners is given in Ch 8, Sec 5, [2.3.5].

1.3.2 Primary supporting members

The effective breadth of attached plating, b_{eff}, in m, for calculating the section modulus and/or moment of inertia of a primary supporting member is to be taken as:

$$b_{eff} = S \cdot \min\left[\frac{1.12}{1+\dfrac{1.75}{\left(\dfrac{\ell_{bdg}}{S\sqrt{3}}\right)^{1.6}}};1.0\right] \quad \text{for} \quad \frac{\ell_{bdg}}{S\sqrt{3}} \geq 1$$

$$b_{eff} = 0.407\frac{\ell_{bdg}}{\sqrt{3}} \quad \text{for} \quad \frac{\ell_{bdg}}{S\sqrt{3}} < 1$$

1.3.3 Effective area of curved face plate and attached plating of primary supporting members

The effective net area given in a) and b) is only applicable to curved face plates and curved attached plating of primary supporting members. This is not applicable for the area of web stiffeners parallel to the face plate.

The effective net area is applicable to primary supporting members for the following calculations:

- Actual net section modulus used for comparison with the scantling requirements in Ch 6.
- Actual effective net area of curved face plates, modelled by beam elements, used in Ch 7.

a) The effective net area, $A_{eff\text{-}n50}$, in mm^2, is to be taken as:

$A_{eff\text{-}n50} = C_f\, t_{f\text{-}n50}\, b_f$

where:

C_f : Flange efficiency coefficient taken equal to:

$$C_f = C_{f1}\frac{\sqrt{r_f\, t_{f-n50}}}{b_1} \quad \text{but not to be taken greater than 1.0.}$$

C_{f1} : Coefficient taken equal to:

- For symmetrical and unsymmetrical face plates,

$$C_{f1} = \frac{0.643\ (\sinh\beta\ \cosh\beta + \sin\beta\ \cos\beta)}{(\sinh\beta)^2 + \sin^2\beta}$$

- For attached plating of box girders with two webs,

$$C_{f1} = \frac{0.78\ (\sinh\beta + \sin\beta)\ (\cosh\beta - \cos\beta)}{(\sinh\beta)^2 + \sin^2\beta}$$

- For attached plating of box girders with multiple webs,

$$C_{f1} = \frac{1.56\ (\cosh\beta - \cos\beta)}{\sinh\beta + \sin\beta}$$

β : Coefficient calculated as:

$$\beta = \frac{1.285\ b_1}{\sqrt{r_f\ t_{f-n50}}}\text{, in rad.}$$

b_1 : Breadth, in mm, to be taken equal to:

- For symmetrical face plates, $b_1 = 0.5\ (b_f - t_{w\text{-}n50})$
- For unsymmetrical face plates, $b_1 = b_f$
- For attached plating of box girders, $b_1 = s_w - t_{w\text{-}n50}$

s_w : Spacing of supporting webs for box girders, in mm.

$t_{f\text{-}n50}$: Net flange thickness, in mm. For calculation of C_f and β of unsymmetrical face plates, $t_{f\text{-}n50}$ is not to be taken greater than $t_{w\text{-}n50}$.

$t_{w\text{-}n50}$: Net web plate thickness, in mm.

r_f : Radius of curved face plate or attached plating, in mm, see Figure 12 at mid thickness.

b_f : Breadth of face plate or attached plating, in mm, see Figure 12.

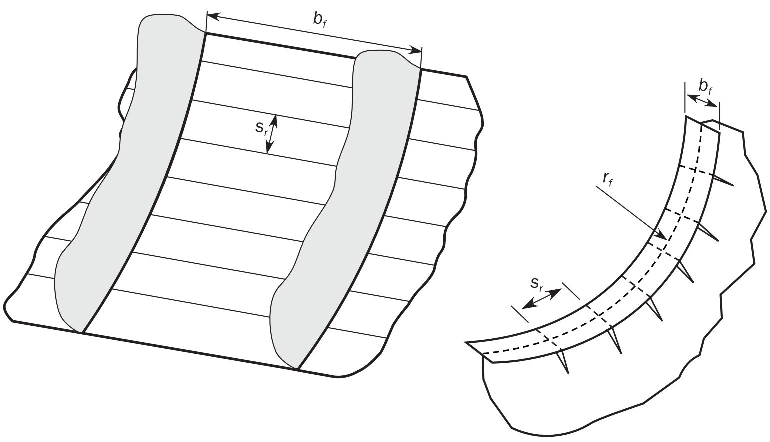
b) The effective net area, in mm², of curved face plates supported by radial brackets, or attached plating supported by cylindrical stiffeners, is given by:

$$A_{eff-n50} = \left(\frac{3r_f\ t_{f-n50} + C_f\ s_r^2}{3r_f\ t_{f-n50} + s_r^2}\right) t_{f-n50}\ b_f$$

where:

s_r : Spacing of tripping brackets or web stiffeners or stiffeners normal to the web plating, in mm, see Figure 12.

Figure 12 : Curved shell panel and face plate



1.4 Geometrical properties of stiffeners and primary supporting members

1.4.1 Stiffener profile with a bulb section

The properties of bulb profile sections are to be determined by direct calculations.

Where direct calculation of properties is not possible, a bulb section may be taken equivalent to a built-up section. The net dimensions of the equivalent built-up section are to be obtained, in mm, from the following formulae.

$$h_w = h'_w - \frac{h'_w}{9.2} + 2$$

$$b_f = \alpha\left(t'_w + \frac{h'_w}{6.7} - 2\right)$$

$$t_f = \frac{h'_w}{9.2} - 2$$

$$t_w = t'_w$$

where:

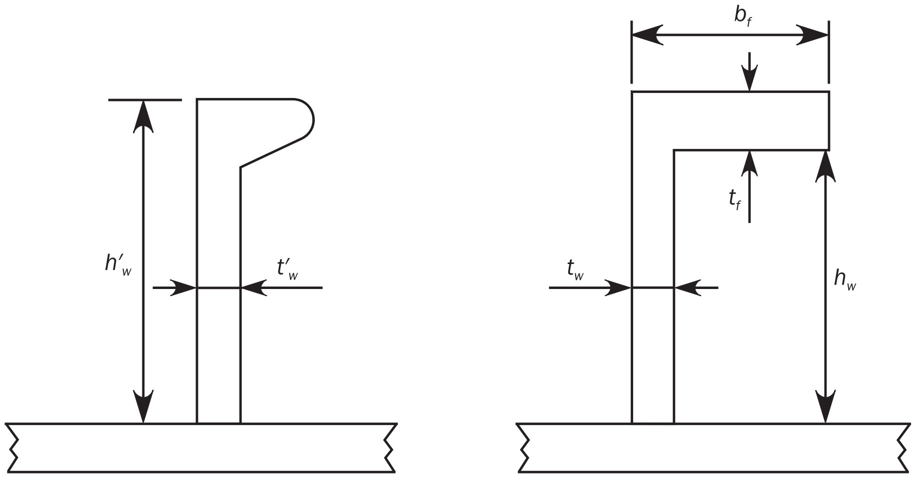
h'_w, t'_w : Net height and thickness of a bulb section, in mm, as shown in Figure 13.

α : Coefficient equal to:

$$\alpha = 1.1 + \frac{(120 - h'_w)^2}{3000} \quad \text{for } h'_w \le 120$$

$$\alpha = 1.0 \quad \text{for } h'_w > 120$$

Figure 13 : Dimensions of stiffeners



1.4.2 Net elastic shear area of stiffeners

The net elastic shear area, A_{shr}, in cm², of stiffeners is to be taken as:

$$A_{shr} = d_{shr}\, t_w\, 10^{-2}$$

d_{shr} : Effective shear depth of stiffener, in mm, as defined in [1.4.3].

t_w : Net web thickness of the stiffener, in mm, as defined in Ch 3, Sec 2, Figure 2.

1.4.3 Effective shear depth of stiffeners

The effective shear depth of stiffeners, d_{shr}, in mm, is to be taken as:

$$d_{shr} = (h_{stf} + t_p)\sin\varphi_w$$

where:

h_{stf} : Height of stiffener, in mm, as defined in Ch 3, Sec 2, Figure 2.

t_p : Net thickness of the stiffener attached plating, in mm, as defined in Ch 3, Sec 2, Figure 2.

φ_w : Angle, in deg, as defined in Figure 14.

1.4.4 Elastic net section modulus of stiffeners

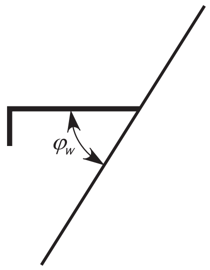
The elastic net section modulus, Z of stiffeners, in cm^3, is to be taken as:

$Z = Z_{stf} \sin \varphi_w$

where:

Z_{stf} : Net section modulus of the stiffener, in cm^3, considered perpendicular to its attached plate, i.e. with φ_w = 90 deg.

Figure 14 : Angle between stiffener web and attached plating



1.4.5 Effective net plastic shear area of stiffeners

The net plastic shear area, $A_{shr\text{-}pl}$, of stiffeners, in cm^2, which is used for assessment against impact loads is to be taken as:

$A_{shr\text{-}pl} = A_{shr}$

where:

A_{shr} : Net elastic shear area, in cm^2, as defined in [1.4.2].

1.4.6 Effective net plastic section modulus of stiffeners

The effective net plastic section modulus, Z_{pl}, of stiffeners, in cm^3, which is used for assessment against impact loads, is to be taken as:

$$Z_{pl} = \frac{f_w\, h_w^2\, t_w}{2000} + \frac{(2\gamma - 1)\, A_f\, h_{f-ctr}}{1000} \quad \text{for} \quad 75° \le \varphi_w \le 90°$$

$$Z_{pl} = \frac{f_w\, h_w^2\, t_w \sin\varphi_w}{2000} + \frac{(2\gamma - 1)\, A_f\, (h_{f-ctr} \sin\varphi_w - b_{f-ctr} \cos\varphi_w)}{1000} \quad \text{for} \quad \varphi_w < 75°$$

where:

f_w : Web shear stress factor, taken equal to:

- For flanged profile cross sections with n = 1 or 2, f_w = 0.75.
- For flanged profile cross sections with n = 0, f_w = 1.0.
- For flat bar stiffeners, f_w = 1.0.

n : Number of plastic hinges at end supports of each member, taken equal to: 0, 1 or 2.

A plastic hinge at end support may be considered where:

- The stiffener is continuous at the support.
- The stiffener passes through the support plate while it is connected at its termination point by a carling (or equivalent) to adjacent stiffeners.
- The stiffener is attached to an abutting stiffener effective in bending (not a buckling stiffener).
- The stiffener is attached to a bracket effective in bending. The bracket is assumed to be effective in bending when it is attached to another stiffener (not a buckling stiffener).

h_w : Depth of stiffener web, in mm, taken equal to:

- For T, L (rolled and built-up) and L2 profiles, as defined in Ch 3, Sec 2, Figure 2, $h_w = h_{stf} - t_{f\text{-}net}$.
- For flat bar and L3 profiles as defined in Ch 3, Sec 2, Figure 2, $h_w = h_{stf}$.
- For bulb profiles, to be taken as given in Table 1 and Table 2.

γ : Coefficient equal to:

$$\gamma = \frac{1 + \sqrt{3 + 12\beta}}{4}$$

β : Coefficient equal to:

- $\beta = \frac{t_w^2\, f_b\, \ell_{shr}^2}{80 b_f^2\, t_f\, h_{f-ctr}} 10^6 + \frac{t_w}{2 b_f}$ for L profiles without a mid-span tripping bracket,

but not to be taken greater than 0.5.

- $\beta = 0.5$ for other cases.

A_f : Net cross sectional area of flange, in mm^2:

- $A_f = 0$ for flat bar stiffeners.
- $A_f = b_f\, t_f$ for other stiffeners.

$b_{f\text{-}ctr}$: Distance from mid thickness of stiffener web to the centre of the flange area:

- $b_{f\text{-}ctr} = 0.5\,(b_f - t_{w\text{-}gr})$ for rolled angle profiles.
- $b_{f\text{-}ctr} = 0$ for T profiles.
- For bulb profiles as given in Table 1 and Table 2.

$h_{f\text{-}ctr}$: Height of stiffener measured to the mid thickness of the flange:

- $h_{f\text{-}ctr} = h_{stf} - 0.5\, t_f$ for profiles with flange of rectangular shape except for L3 profiles.
- $h_{f\text{-}ctr} = h_{stf} - d_e - 0.5\, t_f$ for L3 profiles as defined in Ch 3, Sec 2, Figure 2.
- For bulb profiles as given in Table 1 and Table 2.

d_e : Distance from upper edge of web to the top of the flange, in mm, for L3 profiles, see Ch 3, Sec 2, Figure 2.

f_b : Coefficient taken equal to:

- $f_b = 0.8$ for flanges continuous through the primary supporting member, with end bracket(s).
- $f_b = 0.7$ for flanges sniped at the primary supporting member or terminated at the support without aligned structure on the other side of the support, and with end bracket(s).
- $f_b = 1.0$ for other stiffeners.

t_f : Net flange thickness, in mm.

- $t_f = 0$ for flat bar stiffeners.
- For bulb profiles as given in Table 1 and Table 2.

Table 1 : Characteristic flange data for HP bulb profiles, see Figure 15

h_{stf} (mm)	d_w (mm)	$b_{f\text{-}gr}$ (mm)	$t_{f\text{-}gr}$ (mm)	$b_{f\text{-}ctr}$ (mm)	$h_{f\text{-}ctr}$ (mm)

Note 1: Characteristic flange data converted to net scantlings are given as:

$b_f \approx b_{f\text{-}gr} + 2\ t_w$

$t_f = t_{f\text{-}gr} - t_c$

$t_w = t_{w\text{-}gr} - t_c$

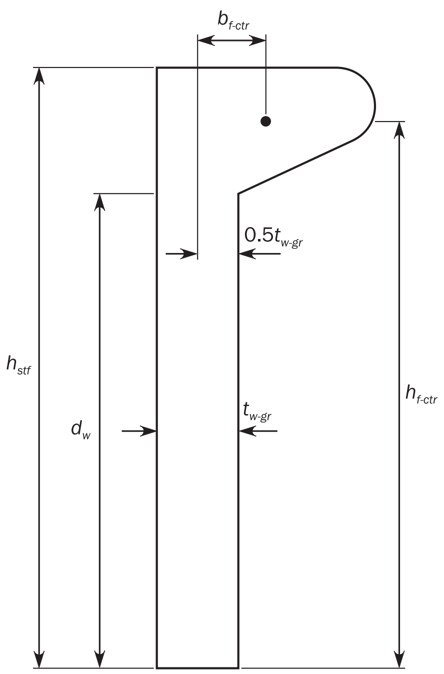
Figure 15 : Characteristic data for bulb profiles



1.4.7 Primary supporting member web not perpendicular to attached plating

Where the primary supporting member web is not perpendicular to the attached plating, the actual net shear area, in cm², and the actual net section modulus, in cm³, can be obtained from the following formulae:

- Actual net shear area:

  $A_{sh-n50} = A_{sh-0-n50} \sin \varphi_w$ for $\varphi_w < 75°$
  $A_{sh-n50} = A_{sh-0-n50}$ for $75° \le \varphi_w \le 90°$

- Actual net section modulus:

  $Z_{n50} = Z_{perp-n50} \sin \varphi_w$ for $\varphi_w < 75°$
  $Z_{n50} = Z_{perp-n50}$ for $75° \le \varphi_w \le 90°$

where:

$A_{sh-0-n50}$: Actual net shear area, in cm², of the primary supporting member assumed to be perpendicular to the attached plating, to be taken equal to:

$$A_{sh-0-n50} = (h_w + t_{f-n50} + t_{p-n50})\, t_{w-n50}\, 10^{-2}$$

$Z_{perp-n50}$: Actual section modulus, in cm³, with its attached plating of the primary supporting member assumed to be perpendicular to the attached plating.

1.4.8 Shear area of primary supporting members with web openings

The effective web height, h_{eff}, in mm, to be considered for calculating the effective net shear area, A_{sh-n50} is to be taken as the lesser of:

$h_{eff} = h_w$

$h_{eff} = h_{w3} + h_{w4}$

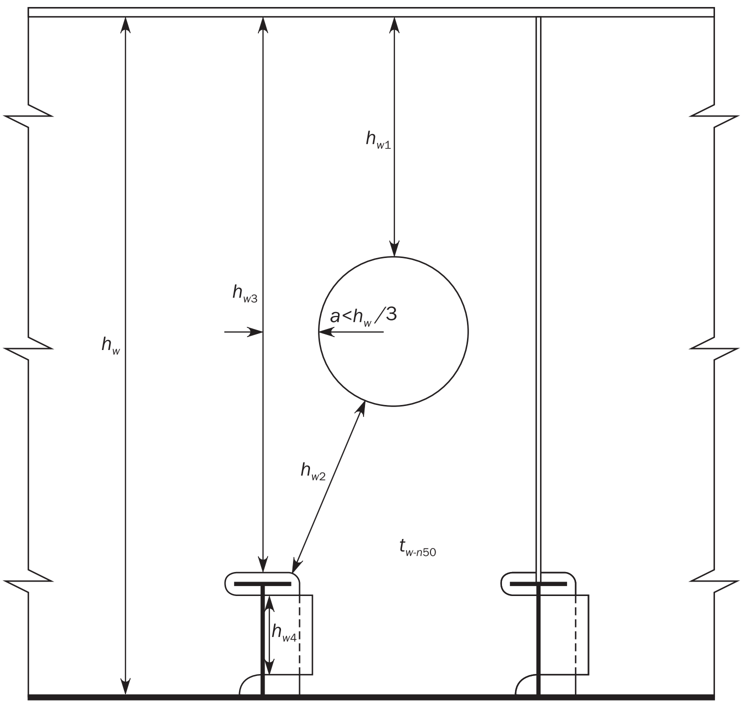
$h_{eff} = h_{w1} + h_{w2} + h_{w4}$

where:

h_w : Web height of primary supporting member, in mm.

h_{w1}, h_{w2}, h_{w3}, h_{w4} : Dimensions as shown in Figure 16.

Figure 16 : Effective shear area in way of web openings



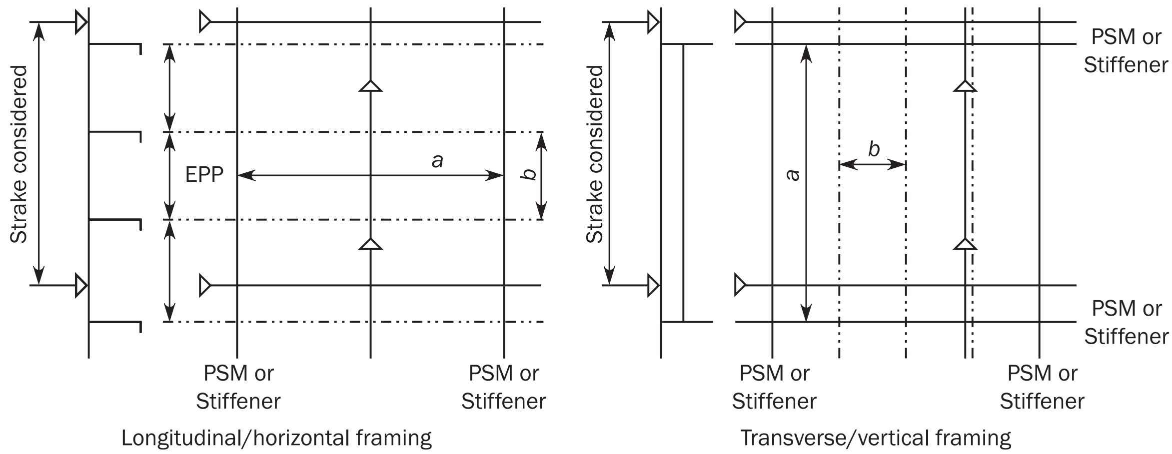
2 PLATES

2.1 Idealisation of EPP

2.1.1 EPP

An elementary plate panel (EPP) is the unstiffened part of the plating between stiffeners and/or primary supporting members. The plate panel length, *a*, and breadth, *b*, of the EPP are defined respectively as the longest and shortest plate edges, as shown in Figure 17.

Figure 17 : Elementary Plate Panel (EPP) definition



2.1.2 Strake required thickness

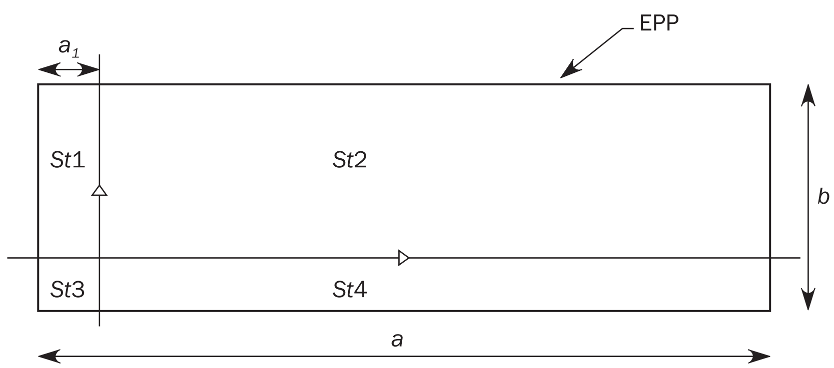
The required thickness of a plate strake is to be taken as the greatest value required for each EPP within that strake. The requirements given in Table 3 are to be applied for the selection of strakes to be considered as shown in Figure 18.

The maximum corrosion addition within a strake is to be applied according to Ch 3, Sec 3, [1.2.4].

Table 3 : Strake considered in a given EPP

	$a/b > 2$	$a/b \leq 2$
$a_1 > b/2$	All strakes (St1, St2, St3, St4)	All strakes (St1, St2, St3, St4)
$a_1 \leq b/2$	Strakes St2 and St4	All strakes (St1, St2, St3, St4)

Figure 18 : Strake considered in a given EPP



where:

a_1 : Distance, in mm, measured inside the considered strake in the direction of the long edge of the EPP, between the strake boundary weld seam and the EPP edge.

2.1.3

For direct strength assessment, the EPP is idealised with the mesh arrangement in the finite element model.

2.2 Load calculation point

2.2.1 Yielding

For the yielding check, the local pressure and hull girder stress, used for the calculation of the local scantling requirements are to be taken at the Load Calculation Point (LCP) having coordinates *x*, *y* and *z* as defined in Table 4.

Table 4 : LCP coordinates for yielding

LCP coordinates	General (1)		Horizontal plating		Vertical transverse structure and transverse stool plating	
	Longitudinal framing (Figure 19)	Transverse framing (Figure 20)	Longitudinal framing	Transverse framing	Horizontal framing (Figure 21)	Vertical framing (Figure 22)
x coordinate	Mid-length of the EPP		Mid-length of the EPP		Corresponding to *y* and *z* values	
y coordinate	Corresponding to *x* and *z* coordinates		Outboard *y* value of the EPP		Outboard *y* value of the EPP, taken at *z* level	
z coordinate	Lower edge of the EPP	The greater of lower edge of the EPP or lower edge of the strake	Corresponding to *x* and *y* values		Lower edge of the EPP	The greater of lower edge of the EPP or lower edge of the strake
(1) All structures other than horizontal platings or vertical transverse structures.						

Figure 19 : Load calculation point (LCP) for longitudinal framing

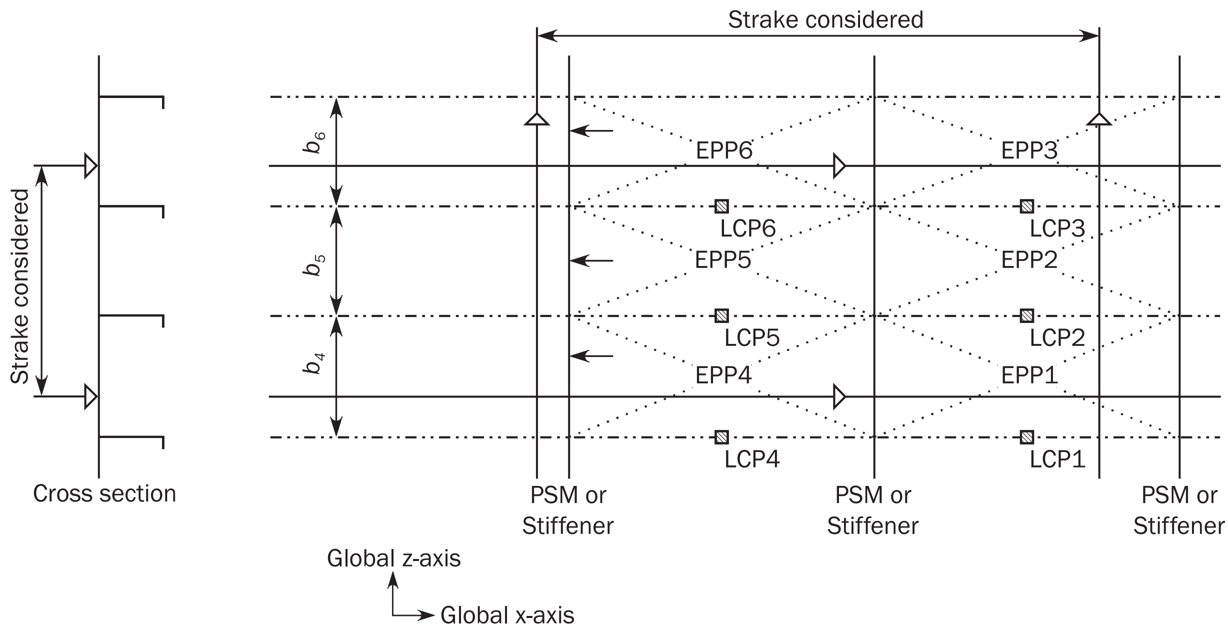


Figure 20 : Load calculation point for transverse framing

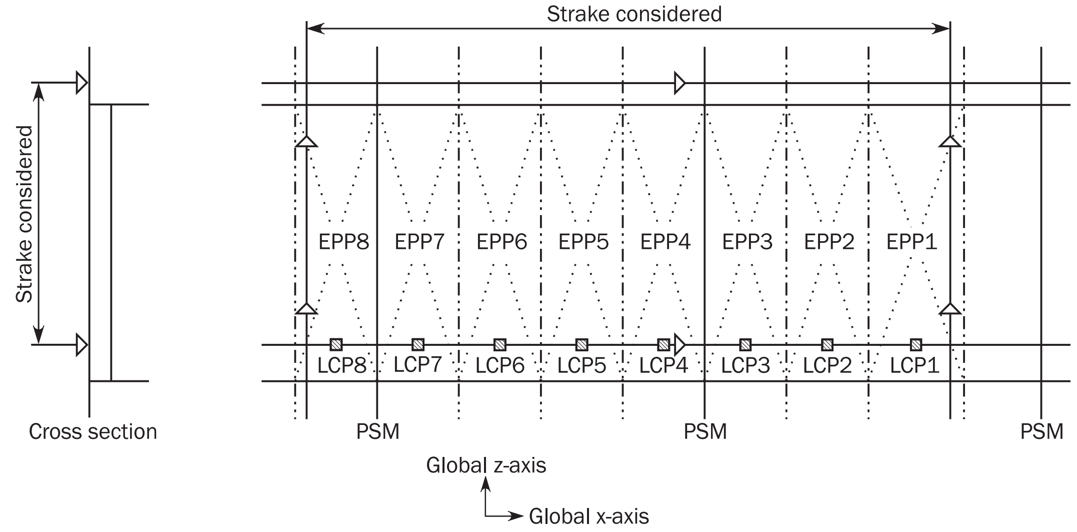

Figure 21 : Load calculation point for horizontal framing on transverse vertical structure

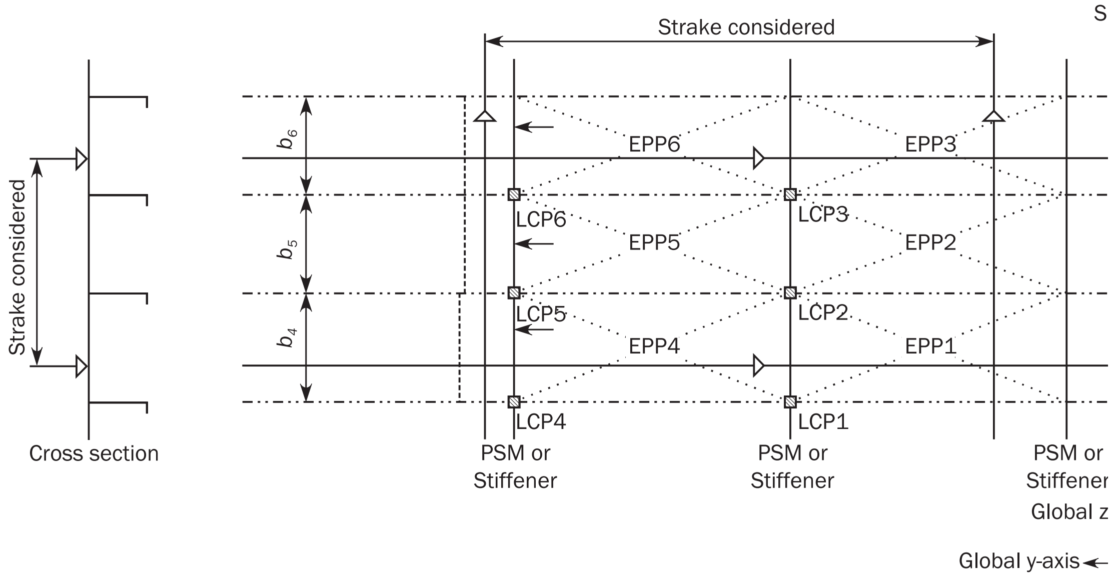

Figure 22 : Load calculation point for vertical framing on transverse vertical structure

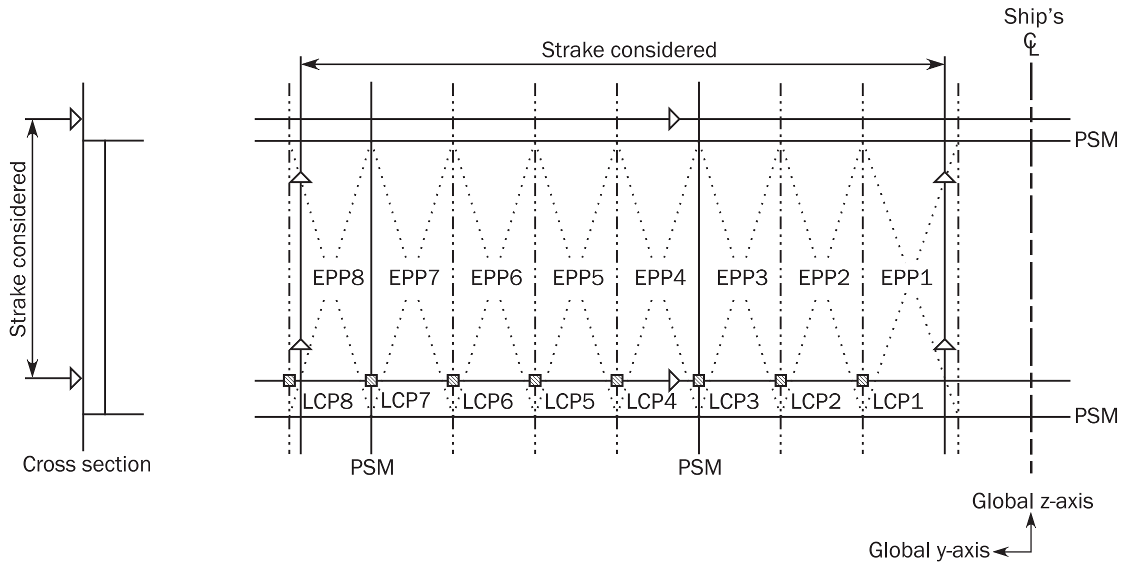


2.2.2 Buckling

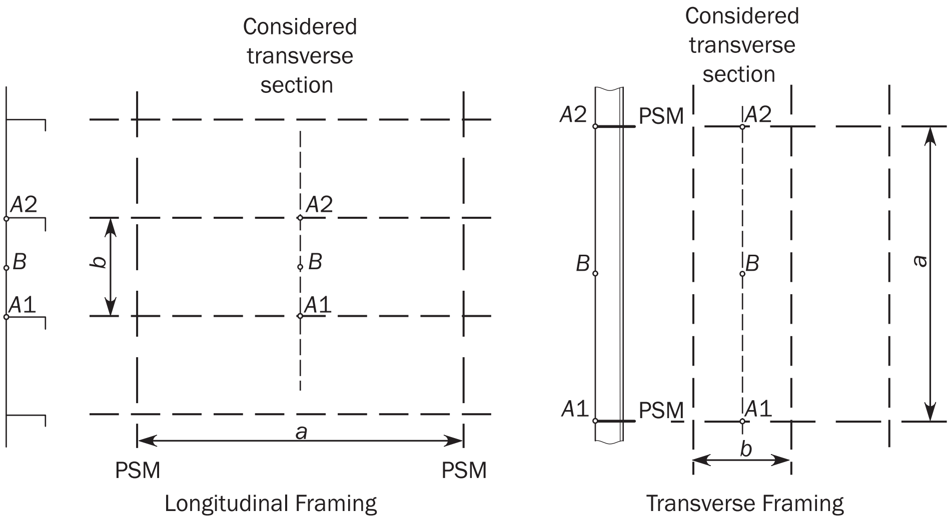
For the prescriptive buckling check of the EPP according to Ch 8, Sec 3, the LCP for the pressure and for the hull girder stresses are defined in Table 5.

For the FE buckling check, Ch 8, Sec 4 is applicable.

Table 5 : LCP coordinates for plate buckling

LCP coordinates	LCP for pressure	LCP for hull girder stresses (Figure 23)		
		Bending stresses		Shear stresses
		Non horizontal plate	Horizontal plate	
x coordinate	Same coordinates as LCP for yielding See Table 4	Mid-length of the EPP		
y coordinate		Both upper and lower ends of the EPP (points A1 and A2)	Outboard and inboard ends of the EPP (points A1 and A2)	Mid-point of EPP (point B)
z coordinate		Corresponding to *x* and *y* values		

Figure 23 : LCP for plate buckling – hull girder stresses



3 STIFFENERS

3.1 Reference point

3.1.1

The requirements of section modulus for stiffeners relate to the reference point giving the minimum section modulus. This reference point is generally located as shown in Figure 24 for typical profiles.

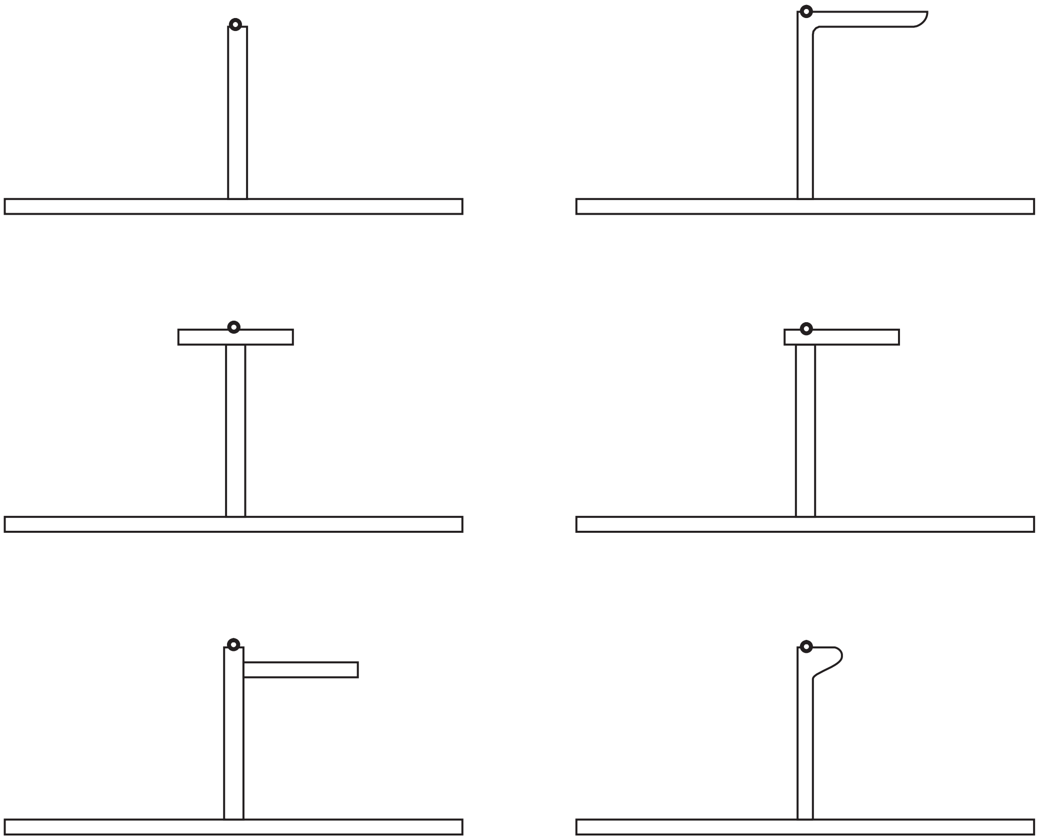
3.2 Load calculation points

3.2.1 LCP for Pressure

The load calculation point for the pressure is located at:

- Middle of the full length, ℓ, of the considered stiffener.
- The intersection point between the stiffener and its attached plate.

Figure 24 : Reference point for calculation of section modulus and hull girder stress for local scantling assessment



3.2.2 LCP for hull girder bending stress

The load calculation point for the hull girder bending stresses is defined as follows:

- For yielding verification according Ch 6:
  - At the middle of the full length, ℓ, of the considered stiffener.
  - At the reference point given in Figure 24.
- For prescriptive buckling requirements according to Ch 8:
  - At the middle of the full length, ℓ, of the considered stiffener.
  - At the intersection point between the stiffener and its attached plate.

3.2.3 Non-horizontal stiffeners

The lateral pressure, P is to be calculated as the maximum between the value obtained at middle of the full length, ℓ, and the value obtained from the following formulae:

$P = \frac{p_U + p_L}{2}$ when the upper end of the vertical stiffener is below the lowest zero pressure level.

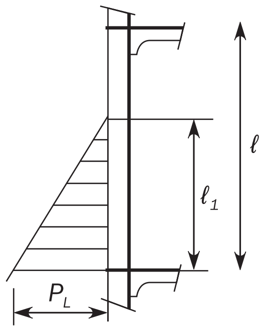
$P = \frac{\ell_1}{\ell}\frac{p_L}{2}$ when the upper end of the vertical stiffener is at or above the lowest zero pressure level, see Figure 25.

where:

ℓ_1 : Distance, in m, between the lower end of vertical stiffener and the lowest zero pressure level.

P_U, P_L : Lateral pressures at the upper and lower end of the vertical stiffener span ℓ, respectively.

Figure 25 : Definition of pressure for vertical stiffeners



4 PRIMARY SUPPORTING MEMBERS

4.1 Load calculation point

4.1.1

The load calculation point is located at the middle of the full length, *S*, at the attachment point of the primary supporting member with its attached plate.

PART 1 CHAPTER 4

LOADS

Table of Contents

SECTION 1
INTRODUCTION

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

S : Static load case.

S+D : Static plus dynamic load case.

1 GENERAL

1.1 Application

1.1.1 Scope

This chapter provides the design load for strength and fatigue assessments.

The load combinations are to be derived for the design load scenarios specified in Ch 4, Sec 7. This section uses the concept of design load scenarios to specify consistent design load sets which cover the appropriate operating modes of a bulk carrier or oil tanker.

1.1.2 Equivalent Design Wave EDW

The dynamic loads associated with each dynamic load case are based on the Equivalent Design Wave (EDW) concept. The EDW concept applies a consistent set of dynamic loads to the ship such that specified dominant load response is equivalent to the required long term response value.

1.1.3 Probability level for strength and fatigue assessments

In this chapter, the assessments are to be understood as follows:

- Strength assessment means the assessment for the strength criteria excluding fatigue, for the loads corresponding to the probability level of 10^{-8}, for the ballast water exchange, for harbour conditions and for flooded conditions.
- Fatigue assessment means the assessment for the fatigue criteria for the loads corresponding to the probability level of 10^{-2}.

1.1.4 Dynamic load components

All dynamic load components are to be concurrent values calculated for each dynamic load case.

1.1.5 Loads for strength assessment

The strength assessment is to be undertaken for all design load scenarios and the final assessment is to be made on the most onerous strength requirement.

Each design load scenario for strength assessment is composed of a Static (S) load case or a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.

The static loads are defined in the following sections:

- Still water hull girder loads in Ch 4, Sec 4.
- External loads in Ch 4, Sec 5.

- Internal loads in Ch 4, Sec 6.

The EDWs for the strength assessment and the dynamic load combination factors for global loads are listed in Ch 4, Sec 2, [2].

The dynamic load components are defined in the following sections:

- Dynamic hull girder load components in Ch 4, Sec 4.
- External loads in Ch 4, Sec 5.
- Internal loads in Ch 4, Sec 6.

1.1.6 Loads for fatigue assessment

Each design load scenario for fatigue assessment is composed of a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.

The static loads are defined in the following sections:

- Still water hull girder loads in Ch 4, Sec 4.
- External loads in Ch 4, Sec 5.
- Internal loads in Ch 4, Sec 6.

The EDWs for the fatigue assessment are listed in Ch 4, Sec 2, [3].

The dynamic load components are defined in the following sections:

- Dynamic hull girder load components in Ch 4, Sec 4.
- External loads in Ch 4, Sec 5.
- Internal loads in Ch 4, Sec 6.

1.2 Definitions

1.2.1 Coordinate system

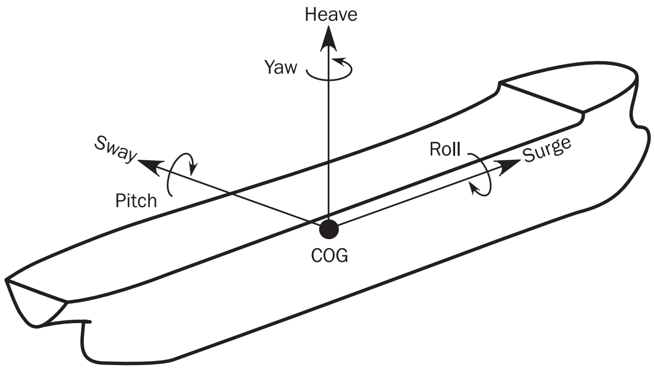
The coordinate system is defined in Ch 1, Sec 4, [3.6.1].

1.2.2 Sign convention for ship motions

The ship motions are defined with respect to the ship's centre of gravity (COG) as shown in Figure 1, where:

- Positive surge is translation in the *X*-axis direction (positive forward).
- Positive sway is translation in the *Y*-axis direction (positive towards port side of ship).
- Positive heave is translation in the *Z*-axis direction (positive upwards).
- Positive roll motion is positive rotation about a longitudinal axis through the COG (starboard down and port up).
- Positive pitch motion is positive rotation about a transverse axis through the COG (bow down and stern up).
- Positive yaw motion is positive rotation about a vertical axis through the COG (bow moving to port and stern to starboard).

Figure 1 : Definition of positive motions

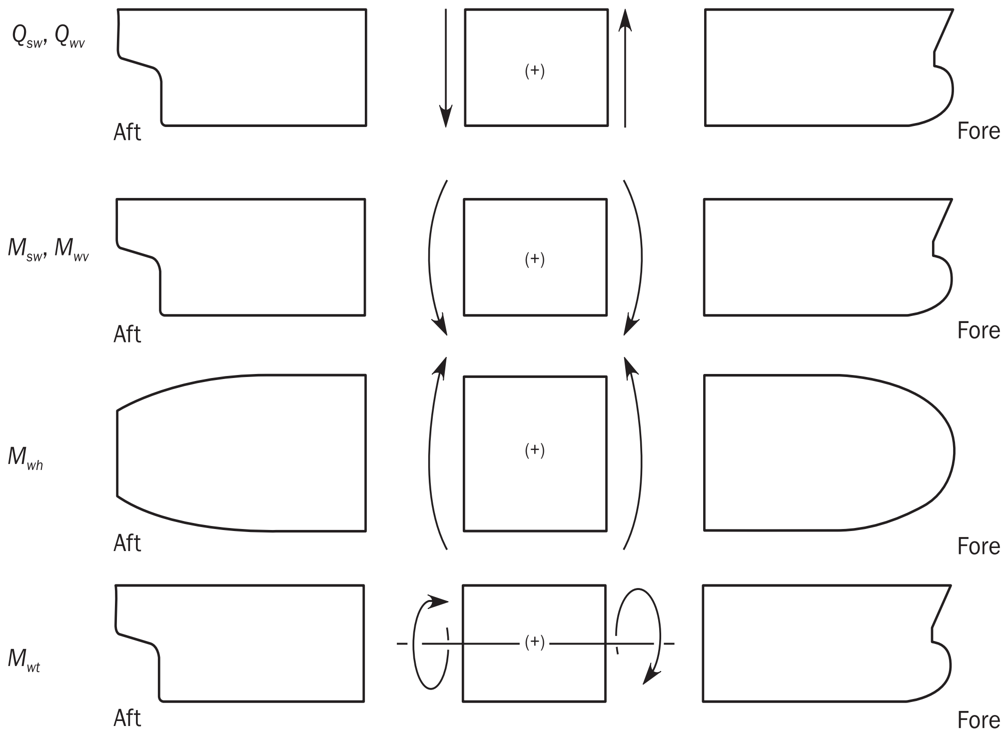


1.2.3 Sign convention for hull girder loads

The sign conventions of vertical bending moments, vertical shear forces, horizontal bending moments and torsional moments at any ship transverse section are as shown in Figure 2, namely:

- The vertical bending moments M_{sw} and M_{wv} are positive when they induce tensile stresses in the strength deck (hogging bending moment) and negative when they induce tensile stresses in the bottom (sagging bending moment).
- The vertical shear forces Q_{sw}, Q_{wv} are positive in the case of downward resulting forces acting aft of the transverse section and upward resulting forces acting forward of the transverse section under consideration.
- The horizontal bending moment M_{wh} is positive when it induces tensile stresses in the starboard side and negative when it induces tensile stresses in the port side.
- The torsional moment M_{wt} is positive in the case of resulting moment acting aft of the transverse section following negative rotation around the *X*-axis, and of resulting moment acting forward of the transverse section following positive rotation around the *X*-axis.

Figure 2 : Sign conventions for shear forces Q_{sw}, Q_{wv} and bending moments M_{sw}, M_{wv}, M_{wh} and M_{wt}



SECTION 2
DYNAMIC LOAD CASES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

a_{surge}, $a_{pitch\text{-}x}$, a_{sway}, $a_{roll\text{-}y}$, a_{heave}, $a_{roll\text{-}z}$, $a_{pitch\text{-}z}$: Acceleration components, as defined in Ch 4, Sec 3.

f_{xL} : Ratio between X-coordinate of the load point and L, to be taken as:

$$f_{xL} = \frac{x}{L}$$, but not to be taken less than 0.0 or greater than 1.0.

f_T : Ratio between draught at a loading condition and scantling draught, as defined in Ch 4, Sec 3.

f_{lp} : Factor depending on longitudinal position along the ship, to be taken as:

$f_{lp} = 1.0$ for $x/L \le 0.5$
$f_{lp} = -1.0$ for $0.5 < x/L$

$f_{lp\text{-}OST}$: Factor for the longitudinal distribution of the torsional moment for the OST load case, to be taken as:

$f_{lp\text{-}OST} = 5\, f_{xL}$ for $x/L < 0.2$
$f_{lp\text{-}OST} = 1.0$ for $0.2 \le x/L < 0.4$
$f_{lp\text{-}OST} = -7.6\, f_{xL} + 4.04$ for $0.4 \le x/L < 0.65$
$f_{lp\text{-}OST} = -0.9$ for $0.65 \le x/L < 0.85$
$f_{lp\text{-}OST} = 6\, f_{xL} - 6$ for $0.85 \le x/L$

$f_{lp\text{-}OSA}$: Factor for the longitudinal distribution of the torsional moment for the OSA load case, to be taken as:

$f_{lp\text{-}OSA} = -(0.2 + 0.3\, f_T)$ for $x/L < 0.4$
$f_{lp\text{-}OSA} = -(0.2 + 0.3\, f_T)(5.6 - 11.5\, f_{xL})$ for $0.4 \le x/L < 0.6$
$f_{lp\text{-}OSA} = 1.3(0.2 + 0.3\, f_T)$ for $0.6 \le x/L$

WS : Weather side, side of the ship exposed to the incoming waves.

LS : Lee side, sheltered side of the ship away from the incoming waves.

M_{WV} : Vertical wave bending moment, in kNm, defined in Ch 4, Sec 4.

Q_{WV} : Vertical wave shear force, in kN, defined in Ch 4, Sec 4.

M_{WH} : Horizontal wave bending moment, in kNm, defined in Ch 4, Sec 4.

M_{WT} : Torsional wave bending moment, in kNm, defined in Ch 4, Sec 4.

C_{WV} : Load combination factor to be applied to the vertical wave bending moment.

C_{QW} : Load combination factor to be applied to the vertical wave shear force.

C_{WH} : Load combination factor to be applied to the horizontal wave bending moment.

C_{WT} : Load combination factor to be applied to the wave torsional moment.

C_{XS} : Load combination factor to be applied to the surge acceleration.

C_{XP} : Load combination factor to be applied to the longitudinal acceleration due to pitch.

C_{XG} : Load combination factor to be applied to the longitudinal acceleration due to pitch motion.

C_{YS} : Load combination factor to be applied to the sway acceleration.

C_{YR} : Load combination factor to be applied to the transverse acceleration due to roll.

C_{YG} : Load combination factor to be applied to the transverse acceleration due to roll motion.

C_{ZH} : Load combination factor to be applied to the heave acceleration.

C_{ZR} : Load combination factor to be applied to the vertical acceleration due to roll.

C_{ZP} : Load combination factor to be applied to the vertical acceleration due to pitch.

θ : Roll angle, in deg, as defined in Ch 4, Sec 3, [2.1.1].

φ : Pitch angle, in deg, as defined in Ch 4, Sec 3, [2.1.2].

1 GENERAL

1.1 Definition of dynamic load cases

1.1.1

The following Equivalent Design Waves (EDW) are to be used to generate the dynamic load cases for structural assessment:

- HSM load cases:

  HSM-1 and HSM-2: Head sea EDWs that minimise and maximise the vertical wave bending moment amidships respectively.

- HSA load cases:

  HSA-1 and HSA-2: Head sea EDWs that maximise and minimise the head sea vertical acceleration at FP respectively.

- FSM load cases:

  FSM-1 and FSM-2: Following sea EDWs that minimise and maximise the vertical wave bending moment amidships respectively.

- BSR load cases:

  BSR-1P and BSR-2P: Beam sea EDWs that minimise and maximise the roll motion downward and upward on the port side respectively with waves from the port side.

  BSR-1S and BSR-2S: Beam sea EDWs that maximise and minimise the roll motion downward and upward on the starboard side respectively with waves from the starboard side.

- BSP load cases:

  BSP-1P and BSP-2P: Beam sea EDWs that maximise and minimise the hydrodynamic pressure at the waterline amidships on the port side respectively.

  BSP-1S and BSP-2S: Beam sea EDWs that maximise and minimise the hydrodynamic pressure at the waterline amidships on the starboard side respectively.

- OST load cases:

  OST-1P and OST-2P: Oblique sea EDWs that minimise and maximise the torsional moment at 0.25*L* from the AE with waves from the port side respectively.

  OST-1S and OST-2S: Oblique sea EDWs that maximise and minimise the torsional moment at 0.25*L* from the AE with waves from the starboard side respectively.

- OSA load cases:

  OSA-1P and OSA-2P: Oblique sea EDWs that maximise and minimise the pitch acceleration with waves from the port side respectively.

  OSA-1S and OSA-2S: Oblique sea EDWs that maximise and minimise the pitch acceleration with waves from the starboard side respectively.

Note 1: 1 and 2 denote the maximum or the minimum dominate load component for each EDW.

Note 2: P and S denote that the weather side is on port side and on starboard side respectively.

HSA and OSA load cases are not to be used for fatigue assessment.

1.2 Application

1.2.1

The dynamic load cases described in this section are to be used for determining the dynamic loads required by the design load scenarios described in Ch 4, Sec 7. These dynamic load cases are to be applied to the following structural assessments:

a) Strength assessment:

- For plating, ordinary stiffeners and primary supporting members by prescriptive methods.
- For the direct strength method (FE analysis) assessment of structural members.

b) Fatigue assessment:

- For structural details covered by simplified stress analysis.
- For structural details covered by FE stress analysis.

2 DYNAMIC LOAD CASES FOR STRENGTH ASSESSMENT

2.1 Description of dynamic load cases

2.1.1

Table 1 to Table 3 describe the ship motions responses and the global loads corresponding to each dynamic load case to be considered for the strength assessment.

Table 1 : Ship responses for HSM, HSA and FSM load cases - Strength assessment

Loadcase	HSM-1	HSM-2	HSA-1	HSA-2	FSM-1	FSM-2
EDW	HSM		HSA		FSM

	$g\sin\theta$	C_{YG}	$0.2 - 0.3f_T$	$-0.2 + 0.3f_T$	$-0.2 + 0.3f_T$	$0.2 - 0.3f_T$
Vertical accelerations	a_{heave}	C_{ZH}	-0.05	0.05	-0.05	0.05
	$a_{roll\text{-}z}$	C_{ZR}	$-0.4 + 0.6f_T$	$0.4 - 0.6f_T$	$0.4 - 0.6f_T$	$-0.4 + 0.6f_T$
	$a_{pitch\text{-}z}$	C_{ZP}	$0.4 - 0.2f_T$	$-0.4 + 0.2f_T$	$0.4 - 0.2f_T$	$-0.4 + 0.2f_T$

SECTION 3
SHIP MOTIONS AND ACCELERATIONS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

a_0 : Acceleration parameter, to be taken as:

$$a_0 = (1.58 - 0.47C_B)\left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right)$$

T_θ : Roll period, in s, as defined in [2.1.1].

θ : Roll angle, in deg, as defined in [2.1.1].

T_φ : Pitch period, in s, as defined in [2.1.2].

φ : Pitch angle, in deg, as defined in [2.1.2].

R : Vertical coordinate, in m, of the ship rotation centre, to be taken as:

$$R = \min\left(\frac{D}{4} + \frac{T_{LC}}{2}, \frac{D}{2}\right)$$

C_{XG}, C_{XS}, C_{XP}, C_{YG}, C_{YS}, C_{YR}, C_{ZH}, C_{ZR}, *and* C_{ZP}: Load combination factors, as defined in Ch 4, Sec 2.

$a_{roll\text{-}y}$: Transverse acceleration due to roll, in m/s^2, as defined in [3.3.2].

$a_{pitch\text{-}x}$: Longitudinal acceleration due to pitch, in m/s^2, as defined in [3.3.1].

$a_{roll\text{-}z}$: Vertical acceleration due to roll, in m/s^2, as defined in [3.3.3].

$a_{pitch\text{-}z}$: Vertical acceleration due to pitch, in m/s^2, as defined in [3.3.3].

f_T : Ratio between draught at a loading condition and scantling draught, to be taken as:

$$f_T = \frac{T_{LC}}{T_{SC}}$$ but is not to be taken less than 0.5.

T_{LC} : Draught, in m, amidships for the considered load case

x, y, z : X, Y and Z coordinates, in m, of the considered point with respect to the coordinate system, as defined in Ch 4, Sec 1, [1.2.1].

f_{ps} : Coefficient for strength assessments which is dependant on the applicable design load scenario specified in Ch 4, Sec 7, and to be taken as:

f_{ps} = 1.0 for extreme sea loads design load scenario.

f_{ps} = 0.8 for the ballast water exchange design load scenario.

f_{ps} = 0.8 for the accidental flooded design load scenario at sea.

f_{ps} = 0.4 for the harbour/sheltered water design load scenario.

f_{fa} : Fatigue coefficient to be taken as:

f_{fa} = 0.9

1 GENERAL

1.1 Definition

1.1.1

The ship motions and accelerations are assumed to be sinusoidal. The motion values defined by the formulae in this section are single amplitudes, i.e. half of the 'crest to trough' height.

2 SHIP MOTIONS AND ACCELERATIONS

2.1 Ship motions

2.1.1 Roll motion

The roll period T_θ, in s, to be taken as:

$$T_\theta = \frac{2.3\pi\ k_r}{\sqrt{g\ GM}}$$

The roll angle θ, in deg, to be taken as:

$$\theta = \frac{9000\,(1.25 - 0.025T_\theta)\ f_p\ f_{BK}}{(B + 75)\pi}$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}(0.23 - 4f_T\ B \times 10^{-4})$ for fatigue assessment.

f_{BK} : To be taken as:

$f_{BK} = 1.2$ for ships without bilge keel.

$f_{BK} = 1.0$ for ships with bilge keel.

k_r : Roll radius of gyration, in m, in the considered loading condition. The values in Table 1 or Table 2 are to be adopted.

GM : Metacentric height, in m, in the considered loading condition. The values in Table 1 or Table 2 are to be adopted.

Table 1 : k_r and GM values for oil tankers

Loading condition (1) (2)	T_{LC}	k_r	GM
Full load condition	T_{SC}	$0.35B$	$0.12B$
Optional conditions that have a draught greater than $0.9T_{SC}$	Actual draught but ≥ $0.9T_{SC}$	$0.35B$	$0.12B$
Partial load condition	$\leq 0.6T_{SC}$	$0.40B$	$0.24B$
Ballast condition	T_{BAL}	$0.45B$	$0.33B$

(1) For optional loading conditions or gale/emergency ballast conditions with draught between $0.6T_{SC}$ and $0.9T_{SC}$, the values of k_r and GM, unless provided in the loading manual, are to be obtained by linear interpolation between the optional condition at $0.9T_{SC}$ and the partial load condition at $0.6T_{SC}$ based on the actual draught.

(2) For flooded loading conditions, the values of k_r and GM, unless provided in the loading manual, are to be taken as those for the full load condition.

Table 2 : k_r and GM values for bulk carriers

Loading condition (1) (2) (4)		Application	T_{LC}	k_r	GM
Full load condition	Homogeneous loading	All bulk carriers	T_{SC}	0.35B	0.12B
	Alternate heavy cargo	BC-A		0.40B	0.20B
	Alternate light cargo	BC-A		0.35B	0.12B
	Homogeneous heavy cargo	BC-B, BC-A		0.42B	0.25B
Steel coil loading (3)		All bulk carriers designated for the carriage of steel products		0.42B	0.25B
Heavy ballast condition		All bulk carriers	T_{BAL-H}	0.40B	0.25B
Normal ballast condition		All bulk carriers	T_{BAL}	0.45B	0.33B

(1) For Multi-port (MP) loading conditions with draught greater than or equal to $0.9T_{SC}$, the values of k_r and GM, unless provided in the loading manual, are to be taken as those from the most appropriate full load condition.
For Multi-port (MP) loading conditions with draught between T_{BAL-H} and $0.9T_{SC}$, the values of k_r and GM, unless provided in the loading manual, are to be obtained by linear interpolation, based on the draught, between the heavy ballast condition and the most appropriate full load condition.
For Multi-port (MP) loading conditions with a draught below T_{BAL-H}, the values of k_r and GM for the heavy ballast condition are to be used.

(2) For flooded loading conditions, the values of k_r and GM, unless provided in the loading manual, are to be taken as those for the full load condition.

(3) When steel coil loading condition is provided by the designer according to Ch 1, Sec 2, [3.6] in the loading manual, this condition is to be assessed with draught, k_r and GM values given in this table.

(4) Block Loading conditions are to be assessed with draught, k_r and GM values given in this table for Homogeneous heavy cargo loading condition.

2.1.2 Pitch motion

The pitch period T_φ, in s, is to be taken as:

$$T_\varphi = \sqrt{\frac{2\pi\lambda_\varphi}{g}}$$

where:

$$\lambda_\varphi = 0.6\,(1 + f_T)\,L$$

The pitch angle φ, in deg, is to be taken as:

$$\varphi = 1350\,f_p\,L^{-0.94}\left\{1.0 + \left(\frac{2.57}{\sqrt{gL}}\right)^{1.2}\right\}$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}[(0.27 - 0.02f_T) - (13 - 5f_T)\,L \times 10^{-5}]$ for fatigue assessment.

2.2 Ship accelerations at the centre of gravity

2.2.1 Surge acceleration

The longitudinal acceleration due to surge, in m/s^2, is to be taken as:

$$a_{surge} = 0.2\,f_p\,a_0\,g$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}[0.27 - (15 + 4f_T)\ L \times 10^{-5}]$ for fatigue assessment.

2.2.2 Sway acceleration

The transverse acceleration due to sway, in m/s^2, is to be taken as:

$$a_{sway} = 0.3\ f_p\ a_0\ g$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}[0.24 - (6 - 2f_T)\ B \times 10^{-4}]$ for fatigue assessment.

2.2.3 Heave acceleration

The vertical acceleration due to heave, in m/s^2, is to be taken as:

$$a_{heave} = f_p\ a_0\ g$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}[(0.27 + 0.02f_T) - 17L \times 10^{-5}]$ for fatigue assessment.

2.2.4 Roll acceleration

The roll acceleration, a_{roll}, in rad/s^2, is to be taken as:

$$a_{roll} = f_p\ \theta\ \frac{\pi}{180}\left(\frac{2\pi}{T_\theta}\right)^2$$

where:

θ : Roll angle using f_p equal to 1.0.

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}[0.23 - 4f_T\ B \times 10^{-4}]$ for fatigue assessment.

2.2.5 Pitch acceleration

The pitch acceleration, a_{pitch}, in rad/s^2, is to be taken as:

$$a_{pitch} = f_p\left(\frac{3.1}{\sqrt{gL}} + 1.0\right)\varphi\ \frac{\pi}{180}\left(\frac{2\pi}{T_\varphi}\right)^2$$

where:

φ : Pitch angle using f_p equal to 1.0.

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}[0.28 - (5 + 6f_T)\ L \times 10^{-5}]$ for fatigue assessment.

3 ACCELERATIONS AT ANY POSITION

3.1 General

3.1.1

The accelerations used to derive the inertial loads at any position are defined with respect to the ship fixed coordinate system. Hence the acceleration values defined in [3.2] and [3.3] include the gravitational acceleration components due to the instantaneous roll and pitch angles.

3.1.2

The accelerations to be applied for the dynamic load cases defined in Ch 4, Sec 2 are given in [3.2].

3.1.3

The envelope accelerations as defined in [3.3] are provided for advisory purposes and may be used for other design purpose when the maximum design acceleration values are required, for example, crane foundations, machinery foundations, etc.

3.2 Accelerations for dynamic load cases

3.2.1 General

The accelerations to be applied for the dynamic load cases defined in Ch 4, Sec 2 are given in [3.2.2] to [3.2.4].

3.2.2 Longitudinal acceleration

The longitudinal acceleration at any position for each dynamic load case, in m/s², is to be taken as:

$$a_X = -C_{XG}\, g\, \sin\varphi + C_{XS}\, a_{surge} + C_{XP}\, a_{pitch}(z-R)$$

3.2.3 Transverse acceleration

The transverse acceleration at any position for each dynamic load case, in m/s², is to be taken as:

$$a_Y = C_{YG}\, g\, \sin\theta + C_{YS}\, a_{sway} - C_{YR}\, a_{roll}(z-R)$$

3.2.4 Vertical acceleration

The vertical acceleration at any position for each dynamic load case, in m/s², is to be taken as:

$$a_Z = C_{ZH}\, a_{heave} + C_{ZR}\, a_{roll}\, y - C_{ZP}\, a_{pitch}\, (x - 0.45L)$$

3.3 Envelope accelerations

3.3.1 Longitudinal acceleration

The envelope longitudinal acceleration, $a_{x\text{-}env}$, in m/s², at any position, is to be taken as:

$$a_{x-env} = 0.7\sqrt{a_{surge}^{\ 2} + \left[\frac{L}{325}\,(g\sin\varphi + a_{pitch-x})\right]^2}$$

where:

$a_{pitch\text{-}x}$: Longitudinal acceleration due to pitch, in m/s²

$$a_{pitch-x} = a_{pitch}\,(z-R)$$

3.3.2 Transverse acceleration

The envelope transverse acceleration, $a_{y\text{-}env}$, in m/s^2, at any position, is to be taken as:

$$a_{y-env} = \sqrt{a_{sway}{}^2 + (g\ \sin\theta + a_{roll-y})^2}$$

where:

$a_{roll\text{-}y}$: Transverse acceleration due to roll, in m/s^2.

$$a_{roll-y} = a_{roll}\ (z - R)$$

3.3.3 Vertical acceleration

The envelope vertical acceleration, $a_{z\text{-}env}$, in m/s^2, at any position, is to be taken as:

$$a_{z-env} = \sqrt{a_{heave}{}^2 + \left(\left(0.3 + \frac{L}{325}\right) a_{pitch-z}\right)^2 + (1.2 a_{roll-z})^2}$$

where:

$a_{picth\text{-}z}$: Vertical acceleration due to pitch, in m/s^2.

$$a_{pitch-z} = a_{pitch}\ (x - 0.45L)$$

$a_{roll\text{-}z}$: Vertical acceleration due to roll, in m/s^2.

$$a_{roll-z} = a_{roll}\ y$$

SECTION 4
HULL GIRDER LOADS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

x : X coordinate, in m, of the calculation point with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

C_w : Wave coefficient, in m, to be taken as:

$$C_w = 10.75 - \left(\frac{300 - L}{100}\right)^{1.5} \quad \text{for } 90 \leq L \leq 300$$

$$C_w = 10.75 \quad \text{for } 300 < L \leq 350$$

$$C_w = 10.75 - \left(\frac{L - 350}{150}\right)^{1.5} \quad \text{for } 350 < L \leq 500$$

f_β : Heading correction factor, to be taken as:

- For strength assessment:

  f_β = 0.8 for BSR and BSP load cases for the extreme sea loads design load scenario.

  f_β = 1.0 for HSM, HSA, FSM, OST and OSA load cases for the extreme sea loads design load scenario.

  f_β = 1.0 for ballast water exchange at sea, harbour/sheltered water and accidental flooded design load scenarios.

- For fatigue assessment:

  f_β = 1.0.

f_{ps} : Coefficient, as defined in Ch 4, Sec 3.

BSR, *BSP*, *HSM*, *HSA*, *FSM*, *OST*, *OSA* : Dynamic load cases, as defined in Ch 4, Sec 2.

1 APPLICATION

1.1 General

1.1.1

The hull girder loads for the static (S) design load scenarios is to be taken as the still water loads defined in [2].

1.1.2

The total hull girder loads for the static plus dynamic (S+D) design load scenarios are to be derived for each dynamic load case and are to be taken as the sum of the still water loads defined in [2] and the dynamic loads defined in [3.5].

2 VERTICAL STILL WATER HULL GIRDER LOADS

2.1 General

2.1.1 Seagoing and harbour/sheltered water conditions

The designer is to provide the permissible still water bending moment and shear force for seagoing and harbour/sheltered water operations.

The permissible still water hull girder loads are to be given at each transverse bulkhead in the cargo hold region, at the middle of cargo compartments, at the collision bulkhead, at the engine room forward bulkhead and at the mid-point between the forward and aft engine room bulkheads. The permissible hull girder bending moments and shear forces at any other position may be obtained by linear interpolation.

Note 1: It is recommended that, for initial design, the permissible hull girder hogging and sagging still water bending moments are at least 5% above the maximum still water bending moment from loading conditions in the loading manual, and the permissible hull girder shear forces are at least 10% above the maximum still water shear force from loading condition in the loading manual, to account for growth and design margins during the design and construction phase of the ship.

2.1.2 Flooded condition

The designer is to provide the envelope of permissible still water bending moment and shear force in flooded condition.

2.1.3 Still water loads for the fatigue assessment

The still water bending moment and shear force values and distribution to be used for the fatigue assessment are to be taken as the most typical values applicable for the loading conditions that the ship will operate in for most of its life. Typically, these conditions will be the normal ballast condition and full homogeneously loaded condition for double hull oil tankers. For bulk carriers, these will be the normal ballast condition, heavy ballast condition, full homogeneously loaded condition and full alternate loaded condition; note the latter is only applicable to BC-A bulk carriers. The definition of loading conditions to use is specified in Ch 9.

2.2 Vertical still water bending moment

2.2.1 Minimum still water bending moment

The minimum still water bending moment, $M_{sw\text{-}h\text{-}min}$ and $M_{sw\text{-}s\text{-}min}$, in kNm, in hogging and sagging condition, respectively is to be taken as:

Hogging conditions:

$$M_{sw-h-min} = f_{sw}\ (171 C_w\ L^2\ B(C_B + 0.7)\ 10^{-3} - M_{wv-h-mid})$$

Sagging conditions:

$$M_{sw-s-min} = -0.85 f_{sw}\ (171 C_w\ L^2\ B(C_B + 0.7)\ 10^{-3} + M_{wv-s-mid})$$

where:

$M_{wv\text{-}h\text{-}mid}$: Vertical wave bending moment for strength assessment in hogging condition, as defined in [3.1.1] using f_p and f_m equal to 1.0.

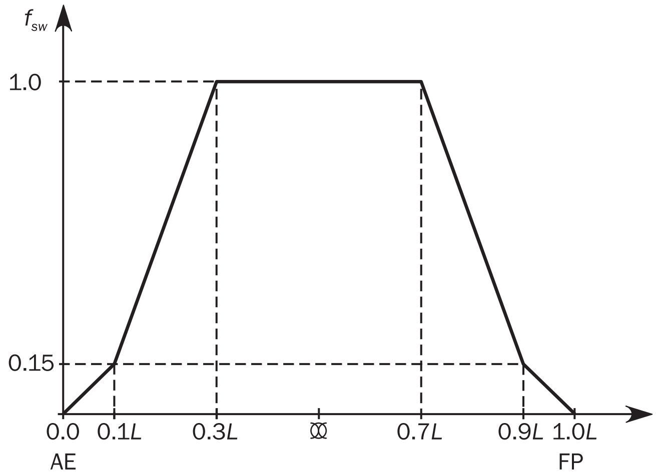
$M_{wv\text{-}s\text{-}mid}$: Vertical wave bending moment for strength assessment in sagging condition, as defined in [3.1.1] using f_p and f_m equal to 1.0.

f_{sw} : Distribution factor along the ship length. To be taken as, see Figure 1:

$f_{sw} = 0.0$ for $x \le 0$
$f_{sw} = 0.15$ at $x = 0.1\,L$
$f_{sw} = 1.0$ for $0.3\,L \le x \le 0.7\,L$
$f_{sw} = 0.15$ at $x = 0.9\,L$
$f_{sw} = 0.0$ for $x \ge L$

Intermediate values of f_{sw} are to be obtained by linear interpolation.

Figure 1 : Distribution factor f_{sw}



2.2.2 Permissible vertical still water bending moment in seagoing condition

The permissible vertical still water bending moments, $M_{sw\text{-}h}$ and $M_{sw\text{-}s}$ in seagoing condition at any longitudinal position are to envelop:

- The most severe still water bending moments calculated, in hogging and sagging conditions, respectively, for the seagoing loading conditions defined in Ch 4, Sec 8.
- The most severe still water bending moments for the seagoing loading conditions defined in the loading manual.
- The minimum still water bending moment defined in [2.2.1]

2.2.3 Permissible vertical still water bending moment in harbour/sheltered water and tank testing condition

The permissible vertical still water bending moments in the harbour/sheltered water and tank testing condition $M_{sw\text{-}p\text{-}h}$ and $M_{sw\text{-}p\text{-}s}$ at any longitudinal position are to envelop:

- The most severe still water bending moments, in hogging and sagging conditions, respectively, for the harbour/sheltered water loading conditions defined in Ch 4, Sec 8.
- The most severe still water bending moments for the harbour/sheltered water loading conditions defined in the loading manual.
- The permissible still water bending moment defined in [2.2.2].
- The minimum still water bending moment defined in [2.2.1] increased by 25%.

2.2.4 Permissible vertical still water bending moment in flooded condition at sea

The permissible vertical still water bending moments in flooded condition $M_{sw\text{-}f}$ at any longitudinal position are to envelop:

- The most severe still water bending moments, in hogging and sagging conditions, respectively, for the intact and flooded seagoing loading conditions defined in Ch 4, Sec 8.
- The most severe still water bending moments for the intact and flooded seagoing loading conditions defined in the loading manual.
- The permissible still water bending moment defined in [2.2.2] increased by 10%.

2.3 Vertical still water shear force

2.3.1 Minimum still water shear force in seagoing conditions for oil tankers

The minimum hull girder positive and negative vertical still water shear force, Q_{sw-min} in kN, in way of transverse bulkheads between cargo tanks in the seagoing condition is to be taken as:

a) For oil tankers with three cargo tanks across the breadth of the ship:

$$Q_{sw-min} = \pm max \begin{cases} 0.225\rho g\ B_{local}\ \ell_{tk}\ T_{SC} \\ 0.5\rho g\ [0.98\ (V_{CT} + 2V_{ST}) - 0.7B_{local}\ \ell_{tk}\ T_{SC}] \end{cases}$$

and is to be taken as the maximum value of Q_{sw-min} calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

b) For oil tankers with two cargo tanks across the breadth of the ship:

$$Q_{sw-min} = \pm 0.4\rho g\ B_{local}\ \ell_{tk}\ T_{SC}$$

and is to be taken as maximum value of Q_{sw-min} calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

where:

B_{local} : Local breadth, in m, at T_{SC} at the middle length of the tank under consideration.

ℓ_{tk} : Length of cargo tank under consideration, in m, taken at the forward or aft side of the transverse bulkhead under consideration, in m.

V_{CT} : Volume of centre cargo tank, in m^3, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration.

V_{ST} : Volume of side cargo tank, in m^3, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration.

2.3.2 Minimum still water shear force in harbour/sheltered water conditions for oil tankers

The minimum hull girder positive and negative vertical still water shear force, $Q_{sw-p-min}$ in kN in the harbour/sheltered water condition in way of transverse bulkheads between cargo tanks are to be taken as:

a) For oil tankers with three cargo tanks across the breadth of the ship:

$$Q_{sw-p-min} = \pm max \begin{cases} 0.275\rho g\ B_{local}\ \ell_{tk}\ T_{SC} \\ 0.5\rho g\ [0.98\ (V_{CT} + 2V_{ST}) - 0.6B_{local}\ \ell_{tk}\ T_{SC}] \end{cases}$$

and is to be taken as the maximum value of $Q_{sw-p-min}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

b) For oil tankers with two cargo tanks across the breadth of the ship:

$$Q_{sw-min} = \pm 0.45\rho g\ B_{local}\ \ell_{tk}\ T_{SC}$$

and is to be taken as maximum value of $Q_{sw-p-min}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

2.3.3 Permissible still water shear force in seagoing condition

The permissible vertical still water shear forces, Q_{sw} for oil tankers and bulk carriers, in seagoing condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the seagoing loading conditions defined in Ch 4, Sec 8 after shear force correction in case of bulk carrier.
- The most severe still water shear forces for the seagoing loading conditions defined in the loading manual after shear force correction in case of bulk carrier.
- For oil tankers, the minimum still water shear forces for seagoing conditions defined in [2.3.1].

2.3.4 Permissible still water shear force in harbour/sheltered water and tank testing condition

The permissible vertical still water shear forces, Q_{sw-p} for oil tankers and bulk carriers, in the harbour/sheltered water and tank testing condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the harbour/sheltered water loading conditions defined in Ch 4, Sec 8 after shear force correction in case of bulk carrier.
- The most severe still water shear forces for the harbour/sheltered water loading conditions defined in the loading manual after shear force correction in case of bulk carrier.
- For oil tankers, the minimum still water shear forced for harbour/sheltered water conditions defined in [2.3.2].

The following value may be used as guidance at preliminary design stage:

$$Q_{sw-p} = Q_{sw} + 0.6Q_{wv}$$

where:

Q_{sw} : Permissible still water shear force Q_{sw}, as defined in [2.3.3].

Q_{wv} : Vertical wave shear force for strength assessment Q_{wv-pos} and Q_{wv-neg}, as defined in [2.3.1] using f_p equal to 1.0.

2.3.5 Permissible still water shear force in flooded condition at sea

The permissible vertical still water shear forces, Q_{sw-f} for oil tankers and bulk carriers, in flooded condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the flooded seagoing loading conditions defined in Ch 4, Sec 8 after shear force correction in case of bulk carrier.
- The most severe still water shear forces for the flooded seagoing loading conditions defined in the loading manual after shear force correction in case of bulk carrier.
- The permissible still water shear force is defined in [2.3.3].

3 DYNAMIC HULL GIRDER LOADS

3.1 Vertical wave bending moment

3.1.1

The vertical wave bending moments at any longitudinal position, in kNm, are to be taken as:

Hogging condition:

$$M_{wv-h} = 0.19 f_{nl-vh} f_m f_p C_w L^2 BC_B$$

Sagging condition:

$$M_{wv-s} = -0.19 f_{nl-vs} f_m f_p C_w L^2 BC_B$$

where:

$f_{nl\text{-}vh}$: Coefficient considering nonlinear effects applied to hogging, to be taken as:

$f_{nl\text{-}vh} = 1.0$ for strength and fatigue assessment.

$f_{nl\text{-}vs}$: Coefficient considering nonlinear effects applied to sagging, to be taken as:

$f_{nl\text{-}vs} = 0.58\left(\frac{C_B + 0.7}{C_B}\right)$ for strength assessment.

$f_{nl\text{-}vs} = 1.0$ for fatigue assessment.

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = 0.9[0.27 - (6 + 4f_T)\ L \times 10^{-5}]$ for fatigue assessment.

f_m : Distribution factor for vertical wave bending moment along the ship's length, to be taken as:

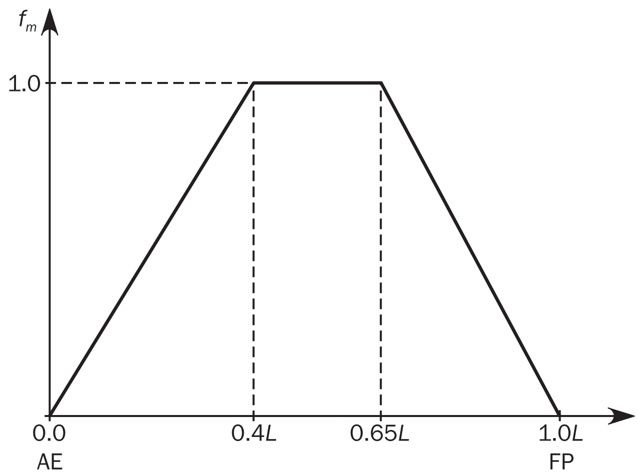
$f_m = 0.0$ for $x \le 0$

$f_m = 1.0$ for $0.4\ L \le x \le 0.65\ L$

$f_m = 0.0$ for $x \ge L$

Intermediate values of f_m are to be obtained by linear interpolation (see Figure 2).

Figure 2 : Distribution factor f_{mm}



3.2 Vertical wave shear force

3.2.1

The vertical wave shear forces at any longitudinal position, in kN, are to be taken as:

$$Q_{wv-pos} = 0.52 f_{q-pos}\ f_p\ C_w\ LBC_B$$

$$Q_{wv-neg} = -0.52 f_{q-neg}\ f_p\ C_w\ LBC_B$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = 0.9[0.27 - (17 - 8f_T)\ L \times 10^{-5}]$ for fatigue assessment.

$f_{q\text{-}pos}$: Distribution factor along the ship length for positive wave shear force, to be taken as:

$f_{q\text{-}pos}$ = 0.0 for $x \le 0$
$f_{q\text{-}pos}$ = 0.92 f_{nl-vh} for 0.2 $L \le x \le 0.3$ L
$f_{q\text{-}pos}$ = 0.7 for 0.4 $L \le x \le 0.6$ L
$f_{q\text{-}pos}$ = 1.0 f_{nl-vs} for 0.7 $L \le x \le 0.85$ L
$f_{q\text{-}pos}$ = 0.0 for $x \ge L$

Intermediate values of $f_{q\text{-}pos}$ are to be obtained by linear interpolation (see Figure 3).

$f_{q\text{-}neg}$: Distribution factor along the ship length for negative wave shear force, to be taken as:

$f_{q\text{-}neg}$ = 0.0 for $x \le 0$
$f_{q\text{-}neg}$ = 0.92 f_{nl-vs} for $0.2L \le x \le 0.3$ L
$f_{q\text{-}neg}$ = 0.7 for $0.4L \le x \le 0.6$ L
$f_{q\text{-}neg}$ = 1.0 f_{nl-vh} for $0.7L \le x \le 0.85$ L
$f_{q\text{-}neg}$ = 0.0 for $x \ge L$

Intermediate values of $f_{q\text{-}neg}$ are to be obtained by linear interpolation, see Figure 4.

$f_{nl\text{-}vh}$, $f_{nl\text{-}vs}$: Coefficient considering nonlinear effects defined in [3.1.1].

Figure 3 : Distribution factor of positive vertical shear force $f_{q\text{-}pos}$

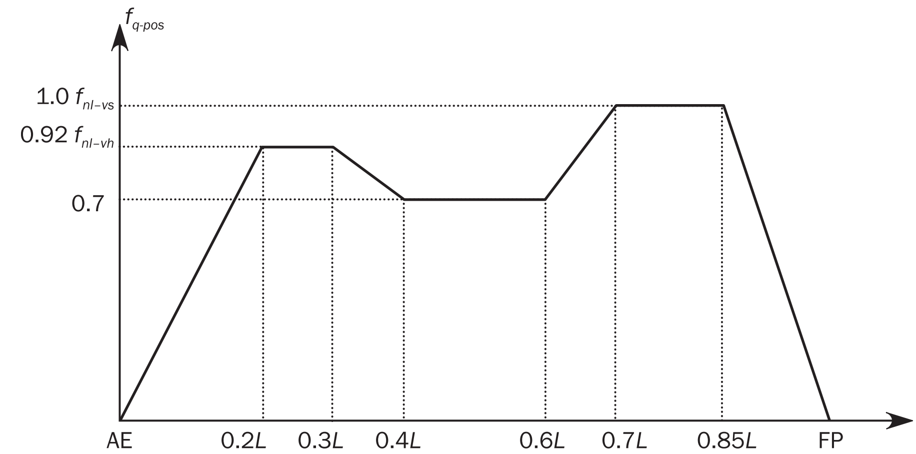


Figure 4 : Distribution factor of negative vertical shear force $f_{q\text{-}neg}$

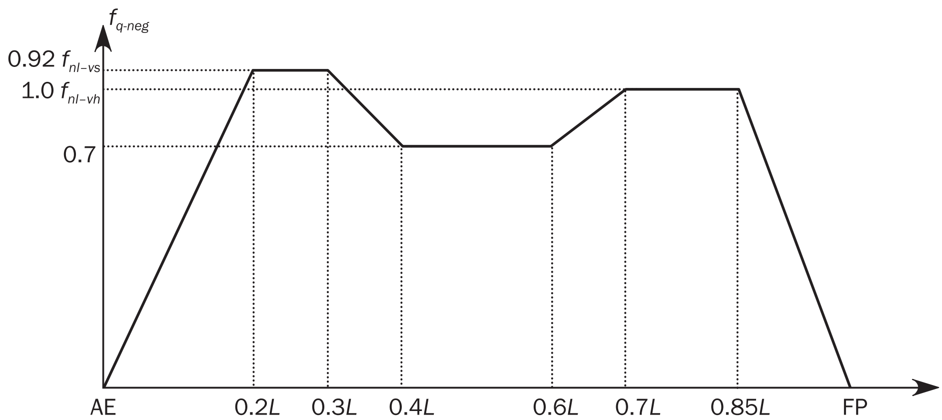


3.3 Horizontal wave bending moment

3.3.1

The horizontal wave bending moment at any longitudinal position, in kNm, is to be taken as:

$$M_{wh} = f_{nlh} f_p \left(0.31 + \frac{L}{2800}\right) f_m \, C_w \, L^2 \, T_{LC} \, C_B$$

where:

f_{nlh} : Coefficient considering nonlinear effect to be taken as:

f_{nlh} = 0.9 for strength assessment

f_{nlh} = 1.0 for fatigue assessment

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = 0.9 \cdot [(0.2 + 0.04 f_T) + (11 - 8 f_T) \, L \times 10^{-5}]$ for fatigue assessment.

f_m : Distribution factor defined in [3.1.1].

3.4 Wave torsional moment

3.4.1

The wave torsional moment at any longitudinal position with respect to the ship baseline, in kNm, is to be taken as:

$$M_{wt} = f_p (M_{wt1} + M_{wt2})$$

where:

$$M_{wt1} = 0.4 f_{t1} \, C_w \sqrt{\frac{L}{T_{LC}}} \, B^2 \, D C_B$$

$$M_{wt2} = 0.22 f_{t2} \, C_w \, L B^2 \, C_B$$

f_{t1}, f_{t2} : Distribution factors, taken as:

$f_{t1} = 0$ for $x < 0$

$f_{t1} = \left|\sin\left(\frac{2\pi x}{L}\right)\right|$ for $0 \le x \le L$

$f_{t1} = 0$ for $x > L$

$f_{t2} = 0$ for $x < 0$

$f_{t2} = sin^2\left(\frac{\pi x}{L}\right)$ for $0 \le x \le L$

$f_{t2} = 0$ for $x > L$

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = 0.9[0.24 + (6 f_T - 5) \, B \times 10^{-4}]$ for fatigue assessment.

3.5 Hull girder loads for dynamic load cases

3.5.1 General

The dynamic hull girder loads to be applied for the dynamic load cases defined in Ch 4, Sec 2, are given in [3.5.2] to [3.5.5].

3.5.2 Vertical wave bending moment

The vertical wave bending moment, $M_{wv\text{-}LC}$, in kNm, to be used for each dynamic load case in Ch 4, Sec 2, is defined in Table 1.

Table 1 : Vertical wave bending moment for dynamic load cases

Load combination factor	M_{wv-LC}
$C_{WV} \geq 0$	$f_\beta \; C_{WV} \; M_{wv-h}$
$C_{WV} < 0$	$f_\beta \; C_{WV} \; \lvert M_{wv-s} \rvert$

where:

C_{WV} : Load combination factor for vertical wave bending moment, to be taken as specified in Ch 4, Sec 2.

M_{wv-h}, M_{wv-s}: Hogging and sagging vertical wave bending moment taking account of the considered design load scenario, as defined in [3.1.1].

3.5.3 Vertical wave shear force

The vertical wave shear force, Q_{wv-LC}, in kN, to be used for each dynamic load case in Ch 4, Sec 2, is defined in Table 2.

Table 2 : Vertical wave shear force for dynamic load cases

Load combination factor	Q_{wv-LC}
$C_{QW} \geq 0$	$f_\beta \; C_{QW} \; Q_{wv-pos}$
$C_{QW} < 0$	$f_\beta \; C_{QW} \; \lvert Q_{wv-neg} \rvert$

where:

C_{QW} : Load combination factor for vertical wave shear force, to be taken as specified in Ch 4, Sec 2.

Q_{wv-pos}, Q_{wv-neg} : Positive and negative vertical wave shear force taking account of the considered design load scenario, as defined in [3.2.1].

3.5.4 Horizontal wave bending moment

The horizontal wave bending moment, M_{wh-LC}, in kNm, to be used for each dynamic load case defined in Ch 4, Sec 2, is to be taken as:

$$M_{wh-LC} = f_\beta \; C_{WH} \; M_{wh}$$

where:

C_{WH} : Load combination factor for horizontal wave bending moment, to be taken as specified in Ch 4, Sec 2.

M_{wh} : Horizontal wave bending moment taking account of the appropriate design load scenario, as defined in [3.3.1].

3.5.5 Wave torsional moment

The wave torsional moment, M_{wt-LC}, in kNm, to be used for each dynamic load case defined in Ch 4, Sec 2, is to be taken as:

$$M_{wt-LC} = f_\beta \; C_{WT} \; M_{wt}$$

where:

C_{WT} : Load combination factor for wave torsional moment, to be taken as specified in Ch 4, Sec 2.

M_{wt} : Wave torsional moment taking account of the appropriate design load scenario, as defined in [3.4.1].

SECTION 5

EXTERNAL LOADS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

λ : Wave length, in m.

B_x : Moulded breadth at the waterline, in m, at the considered cross section.

x, y, z : X, Y and Z coordinates, in m, of the load point with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

f_{xL} : Ratio as defined in Ch 4, Sec 2.

f_{yB} : Ratio between Y-coordinate of the load point and B_x, to be taken as:

$$f_{yB} = \frac{|2y|}{B_x} \text{, but not greater than 1.0.}$$

$f_{yB} = 0$ when $B_x = 0$.

f_{yB1} : Ratio between Y-coordinate of the load point and B, to be taken as:

$$f_{yB1} = \frac{|2y|}{B} \text{, but not greater than 1.0}$$

C_w : Wave coefficient defined in Ch 4, Sec 4.

f_T : Ratio as defined in Ch 4, Sec 3.

$P_{W,WL}$: Wave pressure at the waterline, kN/m^2, for the considered dynamic load case.

$$P_{W,WL} = P_W \text{ for } z = T_{LC}$$

h_W : Water head equivalent to the pressure at waterline, in m, to be taken as:

$$h_W = \frac{P_{W,WL}}{\rho g}$$

f_{ps} : Coefficient for strength assessment, as defined in Ch 4, Sec 3.

θ : Roll angle, in deg, as defined in Ch 4, Sec 3, [2.1.1].

T_θ : Roll period, in s, as defined in Ch 4, Sec 3, [2.1.1].

f_{fa} : Coefficient defined in Ch 4, Sec 3.

f_β : Coefficient defined in Ch 4, Sec 4.

1 SEA PRESSURE

1.1 Total pressure

1.1.1

The external pressure P_{ex} at any load point of the hull, in kN/m^2, for the static (S) design load scenarios, is to be taken as:

$P_{ex} = P_S$ but not less than 0.

The total pressure P_{ex} at any load point of the hull for the static plus dynamic (S+D) design load scenarios, is to be derived from each dynamic load case and is to be taken as:

$P_{ex} = P_S + P_W$ but not less than 0.

where:

P_S : Hydrostatic pressure, in kN/m^2, defined in [1.2].

P_W : Wave pressure, in kN/m^2, is defined in [1.3].

1.2 Hydrostatic pressure

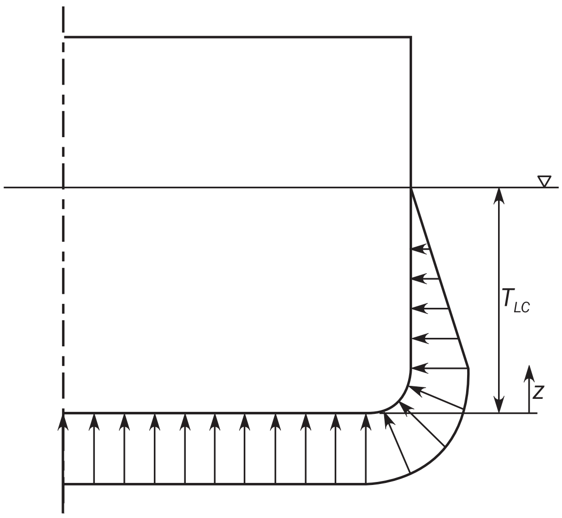
1.2.1

The hydrostatic pressure, P_S at any load point, in kN/m^2, is obtained from Table 1. See also Figure 1.

Table 1 : Hydrostatic pressure, P_S

Location	Hydrostatic Pressure, P_S, in kN/m^2
$z \le T_{LC}$	$\rho\, g\, (T_{LC} - z)$
$z > T_{LC}$	0

Figure 1 : Hydrostatic pressure, P_S



1.3 External dynamic pressures for strength assessment

1.3.1 General

The hydrodynamic pressures for each dynamic load case defined in Ch 4, Sec 2, [2] are defined in [1.3.2] to [1.3.8].

1.3.2 Hydrodynamic pressures for HSM load cases

The hydrodynamic pressures, P_W, for HSM-1 and HSM-2 load cases, at any load point, in kN/m², are to be obtained from Table 2. See also Figure 2 and Figure 3.

Table 2 : Hydrodynamic pressures for HSM load cases

	Wave pressure, in kN/m²		
Load case	$z \le T_{LC}$	$T_{LC} < z \le h_W + T_{LC}$	$z > h_W + T_{LC}$
HSM-1	$P_W = max\ (-P_{HS}, \rho g\ (z - T_{LC}))$	$P_W = P_{W,WL} - \rho g(z - T_{LC})$	$P_W = 0.0$
HSM-2	$P_W = max\ (P_{HS}, \rho g\ (z - T_{LC}))$		

where:

$$P_{HS} = f_{ps}\ f_{nl}\ f_h\ k_a\ k_p\ f_{yz}\ C_W \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} : Coefficient considering non-linear effects, to be taken as:

- For extreme sea loads design load scenario:

  $f_{nl} = 0.7$ at $f_{xL} = 0$

  $f_{nl} = 0.9$ at $f_{xL} = 0.3$

  $f_{nl} = 0.9$ at $f_{xL} = 0.7$

  $f_{nl} = 0.6$ at $f_{xL} = 1$

- For ballast water exchange design load scenario:

  $f_{nl} = 0.85$ at $f_{xL} = 0$

  $f_{nl} = 0.95$ at $f_{xL} = 0.3$

  $f_{nl} = 0.95$ at $f_{xL} = 0.7$

  $f_{nl} = 0.80$ at $f_{xL} = 1$

Intermediate values are obtained by linear interpolation.

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

$$f_h = 3.0(1.21 - 0.66\ f_T)$$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = (0.5 + f_T)\left\{(3 - 2\sqrt{f_{yB}}) - \frac{20}{9}f_{xL}(7 - 6\sqrt{f_{yB}})\right\} + \frac{2}{3}(1 - f_T) \quad \text{for } f_{xL} < 0.15$$

$$k_a = 1.0 \quad \text{for } 0.15 \le f_{xL} < 0.7$$

$$k_a = 1 + (f_{xL} - 0.7)\left\{\left(\frac{40}{3}f_T - 5\right) + 2(1 - f_{yB})\left[\frac{18}{C_B}f_T(f_{xL} - 0.7) - 0.25(2 - f_T)\right]\right\} \quad \text{for } f_{xL} \ge 0.7$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.6(1 + f_T)L$$

k_p : Phase coefficient to be obtained from Table 3. Intermediate values are to be interpolated.

Table 3 : k_p values for HSM load cases

f_{xL}	0	$0.3 - 0.1\ f_T$	$0.35 - 0.1\ f_T$	$0.8 - 0.2\ f_T$	$0.9 - 0.2\ f_T$	1.0
k_p	$-0.25\ f_T\ (1 + f_{yB})$	-1	1	1	-1	-1

Figure 2 : Transverse distribution amidships of dynamic pressure for HSM-1, HSA-1 and FSM-1 load cases

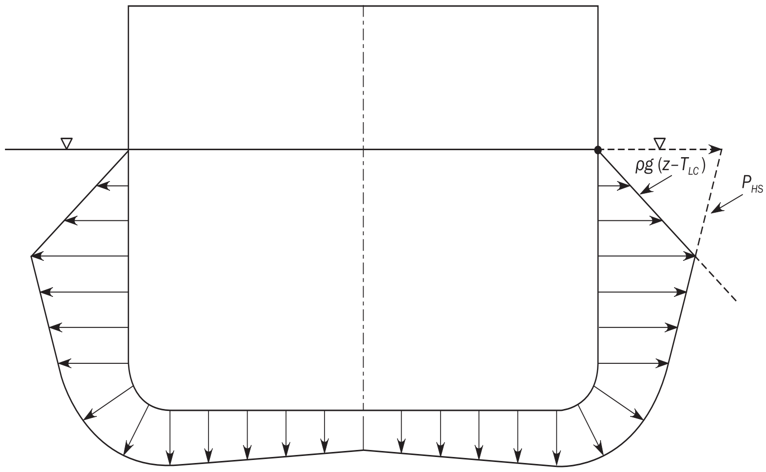


Figure 3 : Transverse distribution amidships of dynamic pressure for HSM-2, HSA-2 and FSM-2 load cases

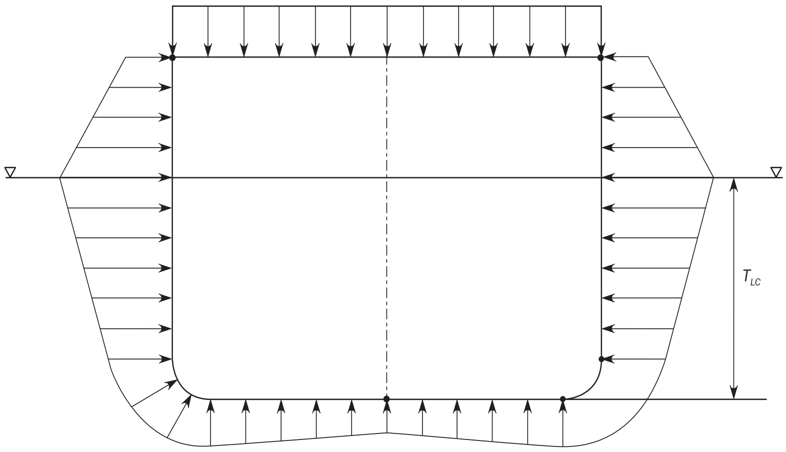

1.3.3 Hydrodynamic pressures for HSA load cases

The hydrodynamic pressures, P_W, for HSA-1 and HSA-2 load cases at any load point, in kN/m², are to be obtained from Table 4. See also Figure 2 and Figure 3.

Table 4 : Hydrodynamic pressures for HSA load cases

	Wave pressure, in kN/m²		
Load case	$z \le T_{LC}$	$T_{LC} < z \le h_W + T_{LC}$	$z > h_W + T_{LC}$
HSA-1	$P_W = max(-P_{HS},\ \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho g(z - T_{LC})$	$P_W = 0.0$
HSA-2	$P_W = max(P_{HS},\ \rho g(z - T_{LC}))$		

where:

$$P_{HS} = f_{ps}\ f_{nl}\ f_h\ k_a\ k_p\ f_{yz}\ C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} : Coefficient considering non-linear effects, to be taken as defined in [1.3.2].

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

$$f_h = 2.4(1.21 - 0.66\ f_T)$$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as defined in [1.3.2].

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.6(1 + f_T)L$$

k_p : Phase coefficient to be obtained from Table 5. Intermediate values are to be interpolated.

Table 5 : k_p values for HSA load cases

f_{xL}	0	$0.3 - 0.1\ f_T$	$0.5 - 0.2\ f_T$	$0.8 - 0.2\ f_T$	$0.9 - 0.2\ f_T$	1.0
k_p	$1.5 - f_T - 0.5\ f_{yB}$	-1	1	1	-1	-1

1.3.4 Hydrodynamic pressures for FSM load cases

The hydrodynamic pressures, P_W, for FSM-1 and FSM-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 6. See also Figure 2 and Figure 3.

Table 6 : Hydrodynamic pressures for FSM load cases

	Wave pressure, in kN/m^2		
Load case	$z \le T_{LC}$	$T_{LC} < z \le h_W + T_{LC}$	$z > h_W + T_{LC}$
FSM-1	$P_W = max(-P_{FS},\ \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho g(z - T_{LC})$	$P_W = 0.0$
FSM-2	$P_W = max(P_{FS},\ \rho g(z - T_{LC}))$		

where:

$$P_{FS} = f_{ps}\ f_{nl}\ f_h\ k_a\ k_p\ f_{yz}\ C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} : Coefficient considering non-linear effects, to be taken as:

$f_{nl} = 0.9$ for extreme sea loads design load scenario.

$f_{nl} = 0.95$ for ballast water exchange design load scenarios.

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

$f_h = 2.6$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = 1 + (3.75 - 2\ f_T)(1 - 5\ f_{xL})(1 - f_{yB}) \quad \text{for} \quad f_{xL} < 0.2$$
$$k_a = 1.0 \quad \text{for} \quad 0.2 \le f_{xL} < 0.9$$
$$k_a = 1 + 20(1 - f_{yB})\ (f_{xL} - 0.9) \quad \text{for} \quad f_{xL} \ge 0.9$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.6(1 + 2/3\ f_T)L$$

k_p : Phase coefficient to be obtained from Table 7. Intermediate values are to be interpolated.

Table 7 : k_p values for FSM load cases

f_{xL}	0	$0.35 - 0.1\ f_T$	$0.5 - 0.2\ f_T$	0.75	0.8	1.0
k_p	$-0.75 - 0.25\ f_{yB}$	-1	1	1	-1	$-0.75 - 0.25\ f_{yB}$

1.3.5 Hydrodynamic pressures for BSR load cases

The wave pressures, P_W, for BSR-1 and BSR-2 load cases, at any load point, in kN/m², are to be obtained from Table 8. See also Figure 4 and Figure 5.

Table 8 : Hydrodynamic pressures for BSR load cases

<table>
<tr><th></th><th colspan="3">Wave pressure, in kN/m²</th></tr>
<tr><th>Load case</th><th>$z \le T_{LC}$</th><th>$T_{LC} < z \le h_W + T_{LC}$</th><th>$z > h_W + T_{LC}$</th></tr>
<tr><td>BSR-1P</td><td>$P_W = \max(P_{BSR}, \rho g\ (z - T_{LC}))$</td><td rowspan="4">$P_W = P_{W,WL} - \rho g\ (z - T_{LC})$</td><td rowspan="4">$P_W = 0.0$</td></tr>
<tr><td>BSR-2P</td><td>$P_W = \max(-P_{BSR}, \rho g\ (z - T_{LC}))$</td></tr>
<tr><td>BSR-1S</td><td>$P_W = \max(P_{BSR}, \rho g\ (z - T_{LC}))$</td></tr>
<tr><td>BSR-2S</td><td>$P_W = \max(-P_{BSR}, \rho g\ (z - T_{LC}))$</td></tr>
</table>

where:

- For BSR-1P and BSR-2P load cases.

$$P_{BSR} = f_\beta\, f_{nl}\left(10 y \sin\theta + 0.88\, f_{ps}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}\,(f_{yB1} + 1)\right)$$

- For BSR-1S and BSR-2S load cases.

$$P_{BSR} = f_\beta\, f_{nl}\left(-10 y \sin\theta + 0.88\, f_{ps}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}\,(f_{yB1} + 1)\right)$$

f_{nl} : Coefficient considering non-linear effect, to be taken as:

$f_{nl} = 1$ for extreme sea loads design load scenario.

$f_{nl} = 1$ for ballast water exchange design load scenarios.

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = \frac{g}{2\pi}\,T_\theta^2$$

Figure 4 : Transverse distribution of dynamic pressure for BSR-1P (left) and BSR-1S (right) load cases

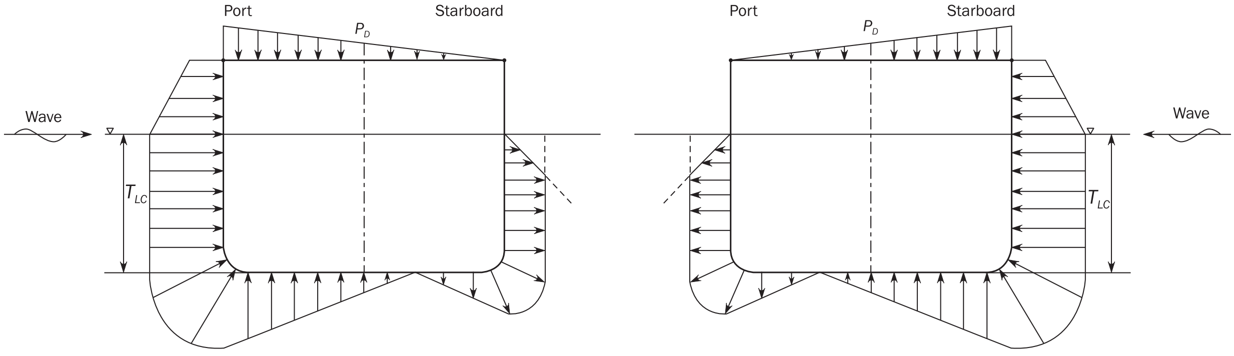

Figure 5 : Transverse distribution of dynamic pressure for BSR-2P (left) and BSR-2S (right) load cases

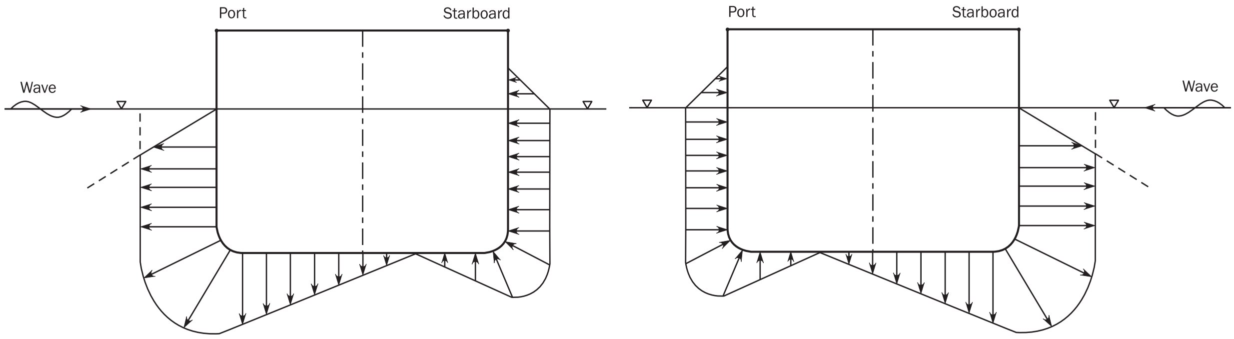

1.3.6 Hydrodynamic pressures for BSP load cases

The wave pressures, P_W, for BSP-1 and BSP-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 9. See also Figure 6 and Figure 7.

Table 9 : Hydrodynamic pressures for BSP load cases

	Wave pressure, in kN/m²		
Load case	$z \le T_{LC}$	$T_{LC} < z \le h_W + T_{LC}$	$z > h_W + T_{LC}$
BSP-1P	$P_W = \max(P_{BSP}, \rho g\,(z - T_{LC}))$	$P_W = P_{W,WL} - \rho g\,(z - T_{LC})$	$P_W = 0.0$
BSP-2P	$P_W = \max(-P_{BSP}, \rho g\,(z - T_{LC}))$		
BSP-1S	$P_W = \max(P_{BSP}, \rho g\,(z - T_{LC}))$		
BSP-2S	$P_W = \max(-P_{BSP}, \rho g\,(z - T_{LC}))$		

where:

$$P_{BSP} = 4.5\, f_\beta\, f_{ps}\, f_{nl}\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.2(1 + 2\, f_T)L$$

f_{yz} : Girth distribution coefficient, to be obtained from Table 10.

Table 10 : Girth distribution coefficient, f_{yz} for BSP load cases

Transverse position	BSP-1P - BSP-2P	BSP-1S - BSP-2S
$y \ge 0$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5\, f_{yB1} + 0.5$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB1} + 0.5$
$y < 0$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB1} + 0.5$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5\, f_{yB1} + 0.5$

f_{nl} : Coefficient considering non-linear effect, to be taken as:

- For extreme sea loads design load scenario:

  $f_{nl} = 0.6$ at $f_{xL} = 0$

  $f_{nl} = 0.8$ at $f_{xL} = 0.3$

  $f_{nl} = 0.8$ at $f_{xL} = 0.7$

  $f_{nl} = 0.6$ at $f_{xL} = 1$

- For ballast water exchange design load scenario:

  f_{nl} = 0.6 at f_{xL} = 0

  f_{nl} = 0.8 at f_{xL} = 0.3

  f_{nl} = 0.8 at f_{xL} = 0.7

  f_{nl} = 0.6 at f_{xL} = 1

Intermediate values are obtained by linear interpolation.

Figure 6 : Transverse distribution of dynamic pressure for BSP-1P (left) and BSP-1S (right) load cases

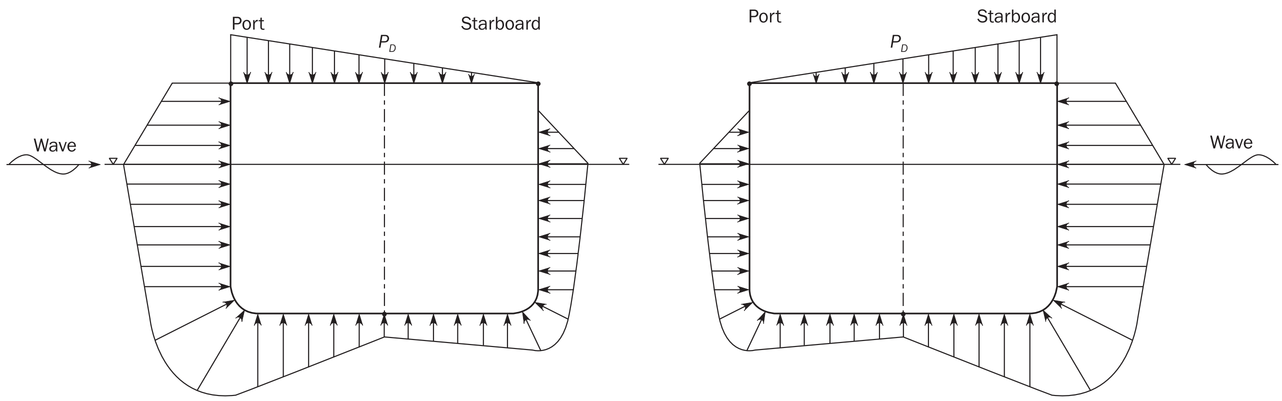

Figure 7 : Transverse distribution of dynamic pressure for BSP-2P (left) and BSP-2S (right) load cases

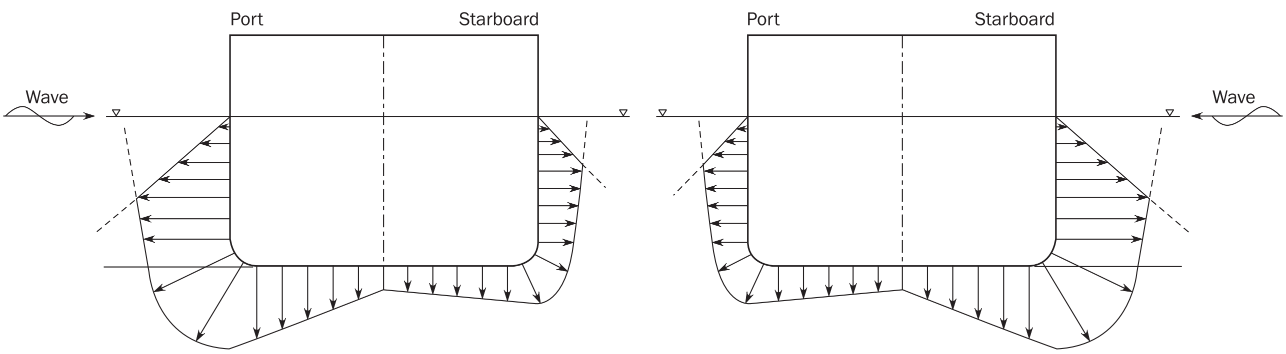

1.3.7 Hydrodynamic pressures for OST load cases

The wave pressures, P_W, for OST-1 and OST-2 load cases, at any load point are to be obtained, in kN/m^2, from Table 11. See also Figure 8 and Figure 9.

Figure 8 : Transverse distribution of dynamic pressure amidships for OST-1P (left) and OST-1S (right) load cases

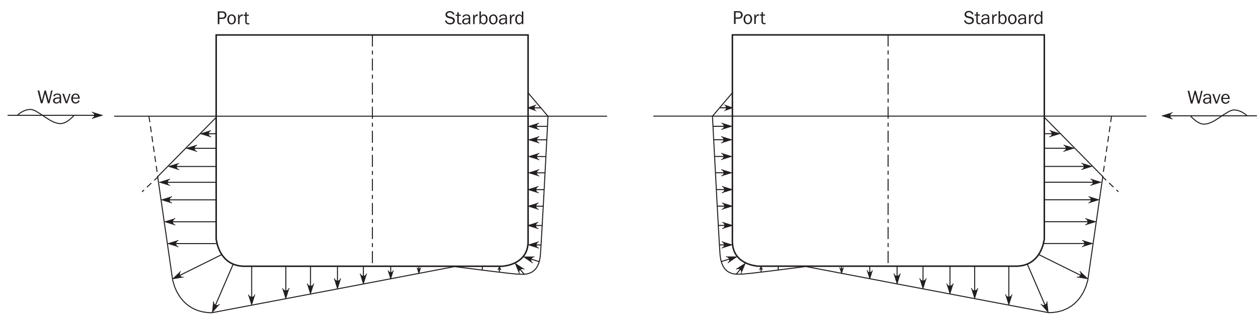

Figure 9 : Transverse distribution of dynamic pressure amidships for OST-2P (left) and OST-2S (right) load cases

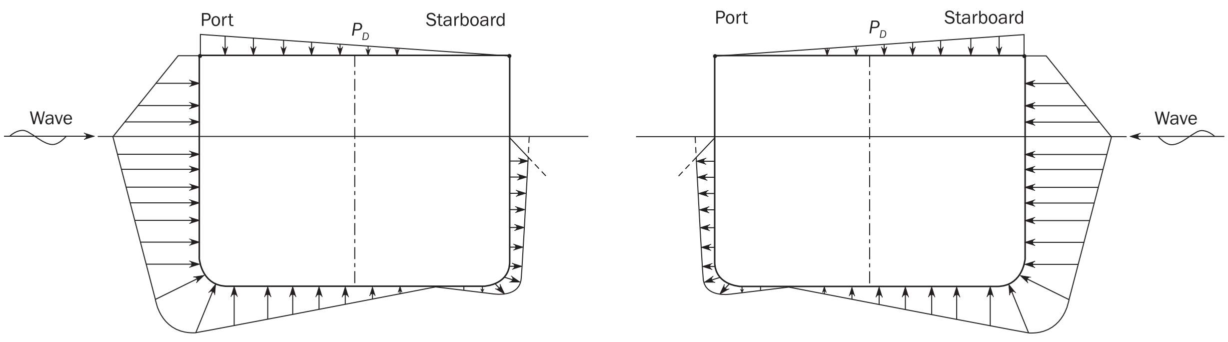

Table 11 : Hydrodynamic pressures for OST load cases

	Wave pressure, in kN/m²		
Load case	$z \le T_{LC}$	$T_{LC} < z \le h_W + T_{LC}$	$z > h_W + T_{LC}$
OST-1P	$P_W = \max\,(P_{OST}, \rho g\,(z - T_{LC}))$	$P_W = P_{W,WL} - \rho g(z - T_{LC})$	$P_W = 0.0$
OST-2P	$P_W = \max\,(-P_{OST}, \rho g\,(z - T_{LC}))$		
OST-1S	$P_W = \max\,(P_{OST}, \rho g\,(z - T_{LC}))$		
OST-2S	$P_W = \max\,(-P_{OST}, \rho g\,(z - T_{LC}))$		

where:

$$P_{OST} = 1.38\, f_{ps}\, f_{nl}\, k_a\, k_p\, f_{yz}\, C_W \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} : Girth distribution coefficient, to be obtained from Table 12.

f_{nl} : Coefficient considering non-linear effect, to be taken as:

$f_{nl} = 0.8$ for extreme sea loads design load scenario.

$f_{nl} = 0.9$ for ballast water exchange design load scenarios.

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.45\, L$$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 13.

k_p : Phase coefficient to be obtained from Table 14. Intermediate values are to be interpolated.

Table 12 : Girth distribution coefficient, f_{yz} for OST load cases

Transverse position	OST-1P - OST-2P	OST-1S - OST-2S
$y \ge 0$	$5\,\dfrac{z}{T_{LC}} + 3.5\, f_{yB} + 1.5$	$1.5\,\dfrac{z}{T_{LC}} + 1.5$
$y < 0$	$1.5\,\dfrac{z}{T_{LC}} + 1.5$	$5\,\dfrac{z}{T_{LC}} + 3.5\, f_{yB} + 1.5$

Table 13 : k_a values for OST load cases

Transverse position	Longitudinal Position	OST-1P - OST-2P	OST-1S - OST-2S

1.3.8 Hydrodynamic pressures for OSA load cases

The wave pressures, P_W, for OSA-1 and OSA-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 15. See also Figure 10 and Figure 11.

Table 15 : Hydrodynamic pressures for OSA load cases

	Wave pressure, in kN/m^2		
Load case	$z \leq T_{LC}$	$T_{LC} < z \leq h_W + T_{LC}$	$z > h_W + T_{LC}$
OSA-1P	$P_W = \max\ (P_{OSA}, \rho g\ (z - T_{LC}))$	$P_W = P_{W,WL} - \rho g\ (z - T_{LC})$	$P_W = 0.0$
OSA-2P	$P_W = \max\ (- P_{OSA}, \rho g\ (z - T_{LC}))$		
OSA-1S	$P_W = \max\ (P_{OSA}, \rho g\ (z - T_{LC}))$		
OSA-2S	$P_W = \max\ (- P_{OSA}, \rho g\ (z - T_{LC}))$		

where:

$$P_{OSA} = 0.81\ f_{ps}\ f_{nl}\ k_a\ k_p\ f_{yz}\ C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}\ (1 + 0.5\ f_T)$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.70\ L$$

f_{nl} : Coefficient considering non-linear effect, to be taken as:

- For extreme sea loads design load scenario:

  $f_{nl} = 0.5$ at $f_{xL} = 0$

  $f_{nl} = 0.8$ at $f_{xL} = 0.3$

  $f_{nl} = 0.8$ at $f_{xL} = 0.7$

  $f_{nl} = 0.6$ at $f_{xL} = 1$

- For ballast water exchange design load scenario:

  $f_{nl} = 0.75$ at $f_{xL} = 0$

  $f_{nl} = 0.9$ at $f_{xL} = 0.3$

  $f_{nl} = 0.9$ at $f_{xL} = 0.7$

  $f_{nl} = 0.8$ at $f_{xL} = 1$

Intermediate values are obtained by linear interpolation.

f_{yz} : Girth distribution coefficient, to be obtained from Table 16.

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 17.

k_p : Phase coefficient to be obtained from Table 18. Intermediate values are to be interpolated.

Table 16 : Girth distribution coefficient, f_{yz} for OSA load cases

Transverse position	OSA-1P - OSA-2P	OSA-1S - OSA-2S
$y \geq 0$	$5.5\ \frac{z}{T_{LC}} + 5.3\ f_{yB} + 2.2$	$0.9\ \frac{z}{T_{LC}} + 0.4\ f_{yB} + 2.2$
$y < 0$	$0.9\ \frac{z}{T_{LC}} + 0.4\ f_{yB} + 2.2$	$5.5\frac{z}{T_{LC}} + 5.3\ f_{yB} + 2.2$

Table 17 : k_a values for OSA load cases

	0.85	$0.5\ f_T - 1.25 + (0.2 - 0.1\ f_T)\ f_{yB}$	$0.5\ f_T - 1.25 + (0.25 - 0.5\ f_T)\ f_{yB}$
	1.0	$0.5\ f_T - 1.25 + (0.2 - 0.1\ f_T)\ f_{yB}$	$0.5\ f_T - 1.25 + (0.25 - 0.5\ f_T)\ f_{yB}$

1.3.9 Envelope of dynamic pressure

The envelope of dynamic pressure at any point, $P_{ex\text{-}max}$, is to be taken as the greatest pressure obtained from any of the load cases determined by [1.3.2] to [1.3.8].

1.4 External dynamic pressures for fatigue assessments

1.4.1 General

The external pressure P_{ex} at any load point of the hull for the fatigue static plus dynamic (F:S+D) design load scenario, is to be derived for each fatigue dynamic load case and is to be taken as:

$P_{ex} = P_S + P_W$ but not less than 0.

where:

P_S : Hydrostatic pressure, in kN/m^2, defined in[1.2].

P_W : Hydrodynamic pressure, in kN/m^2, is defined in [1.4.2] to [1.4.6].

1.4.2 Hydrodynamic pressures for HSM load cases

The hydrodynamic pressures, P_W, for load cases HSM-1 and HSM-2, at any load point, in kN/m^2, are to be obtained from Table 19.

Table 19 : Hydrodynamic pressures for HSM load cases

	Wave pressure, in kN/m^2		
Load case	$z \leq T_{LC}$	$T_{LC} < z \leq 2h_w + T_{LC}$	$z > 2h_w + T_{LC}$
HSM-1	$P_w = max\ (-P_{HS}, \rho g(z - T_{LC}))$	$P_w = P_{w,wL} - \frac{1}{2}\rho g\ (z - T_{LC})$	$P_W = 0.0$
HSM-2	$P_w = max\ (P_{HS}, \rho g(z - T_{LC}))$		

where:

$$P_{HS} = f_p\, f_h\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

$$f_h = 2.75\,(1.21 - 0.66\, f_T)$$

f_p : Coefficient to be taken as:

$$f_p = f_{fa}[(0.21 + 0.02\, f_T) + (6 - 4\, f_T)\, L \times 10^{-5}]$$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = 1 + 3\, f_T - (1 + f_T)\, f_{yB} + [5\,(1 + f_T)\, f_{yB} - 15\, f_T]\, f_{xL} \quad \text{for} \quad f_{xL} < 0.2$$

$$k_a = 1.0 \quad \text{for} \quad 0.2 \le f_{xL} < 0.6$$

$$k_a = 1 + (f_{xL} - 0.6)\,[(13.5 - 3.5\, f_T)\, f_{yB} + (14.5\, f_T - 17) + 40(1 - f_{yB})\,(f_{xL} - 0.6)] \quad \text{for} \quad f_{xL} \ge 0.6$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.6\,(1 + f_T)\, L$$

k_p : Phase coefficient to be obtained from Table 20. Intermediate values are to be interpolated.

Table 20 : k_p values for HSM load cases

f_{xL}	k_P
0	$(1.0 - f_T) + (0.5 - f_T)\, f_{yB}$
$0.3 - 0.1\, f_T$	-1
$0.5 - 0.2\, f_T$	1
$0.9 - 0.4\, f_T$	1
$0.9 - 0.2\, f_T$	-1
1.0	-1

1.4.3 Hydrodynamic pressures for FSM load cases

The hydrodynamic pressures, P_W, for FSM-1 and FSM-2 load cases, at any load point, in kN/m², are to be obtained from Table 21.

Table 21 : Hydrodynamic pressures for FSM load cases

	Wave pressure, in kN/m²		
Load case	$z \le T_{LC}$	$T_{LC} < z \le 2\, h_W + T_{LC}$	$z > 2\, h_W + T_{LC}$
FSM-1	$P_w = max(-P_{FS},\, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\, \rho g\,(z - T_{LC})$	$P_W = 0.0$
FSM-2	$P_W = max(P_{FS},\, \rho g(z - T_{LC}))$		

where:

$$P_{FS} = f_p\, f_h\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:
$f_h = 2.6$

f_p : Coefficient to be taken as:

$$f_p = f_{fa}[(0.21 + 0.02\,f_T) + (6 - 4\,f_T)\,L \times 10^{-5}]$$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$k_a = 1 + (3.5 - 2\,f_T)(1 - 5\,f_{xL})(1 - f_{yB})$ for $f_{xL} < 0.2$

$k_a = 1.0$ for $0.2 \le f_{xL} < 0.9$

$k_a = 1 + 15(1 - f_{yB})(f_{xL} - 0.9)$ for $f_{xL} \ge 0.9$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.6\left(1 + \frac{2}{3}\,f_T\right)L$$

k_p : Phase coefficient to be obtained from Table 22. Intermediate values are to be interpolated.

Table 22 : k_p values for HSM load cases

f_{xL}	k_P
0	$-0.75 - 0.25\,f_{yB}$
$0.35 - 0.1\,f_T$	-1
$0.5 - 0.2\,f_T$	1
0.75	1
$0.9 - 0.1\,f_T$	-1
1.0	$-0.5 - 0.5\,f_{yB}$

1.4.4 Hydrodynamic pressures for BSR load cases

The hydrodynamic pressures, P_W, for BSR-1 and BSR-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 23.

Table 23 : Hydrodynamic pressures for BSR load cases

	Wave pressure, in kN/m^2		
Load case	$z \le T_{LC}$	$T_{LC} < z \le 2\,h_W + T_{LC}$	$z > 2\,h_W + T_{LC}$
BSR-1P	$P_W = \max\,(P_{BSR}, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g\,(z - T_{LC})$	$P_W = 0.0$
BSR-2P	$P_W = \max\,(-P_{BSR}, \rho g(z - T_{LC}))$		
BSR-1S	$P_W = \max\,(P_{BSR}, \rho g(z - T_{LC}))$		
BSR-2S	$P_W = \max\,(-P_{BSR}, \rho g(z - T_{LC}))$		

where:

- For BSR-1P and BSR-2P load cases.

$$P_{BSR} = 10y\sin\theta + 0.88 f_p\,C_w\sqrt{\frac{L_0 + \lambda - 125}{L}}(f_{yB1} + 1)$$

- For BSR-1S and BSR-2S load cases.

$$P_{BSR} = -10y\sin\theta + 0.88 f_p\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}(f_{yB1} + 1)$$

f_p : Coefficient to be taken as:

$$f_p = f_{fa}[(0.21 + 0.04\, f_T) - (12\, f_T - 2)\, B \times 10^{-4}]$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = \frac{g}{2\pi} T_\theta^2$$

1.4.5 Hydrodynamic pressures for BSP load cases

The wave pressures, P_W, for BSP-1 and BSP-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 24.

Table 24 : Hydrodynamic pressures for BSP load cases

	Wave pressure, in kN/m^2		
Load case	$z \le T_{LC}$	$T_{LC} < z \le 2\, h_w + T_{LC}$	$z > 2\, h_w + T_{LC}$
BSP-1P	$P_W = \max(P_{BSP}, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g(z - T_{LC})$	$P_W = 0.0$
BSP-2P	$P_W = \max(-P_{BSP}, \rho g(z - T_{LC}))$		
BSP-1S	$P_W = \max(P_{BSP}, \rho g(z - T_{LC}))$		
BSP-2S	$P_W = \max(-P_{BSP}, \rho g(z - T_{LC}))$		

where:

$$P_{BSP} = 4.5\, f_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.2(1 + 2\, f_T)L$$

f_p : Coefficient to be taken as:

$$f_p = f_{fa}[0.2 + (8 + 16\, f_T) \times 10^{-3}]$$

f_{yz} : Girth distribution coefficient, to be obtained from Table 25.

Table 25 : Girth distribution coefficient, f_{yz} for BSP load cases

Transverse position	BSP-1P - BSP-2P	BSP-1S - BSP-2S
$y \ge 0$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5\, f_{yB1} + 0.5$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB1} + 0.5$
$y < 0$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB1} + 0.5$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5\, f_{yB1} + 0.5$

1.4.6 Hydrodynamic pressures for OST load cases

The wave pressures, P_W, for OST-1 and OST-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 26.

Table 26 : Hydrodynamic pressures for OST load cases

	Wave pressure, in kN/m²		
Load case	$z \leq T_{LC}$	$T_{LC} < z \leq 2\ h_W + T_{LC}$	$z > 2h_W + T_{LC}$
OST-1P	$P_W = \max(P_{OST}, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g(z - T_{LC})$	$P_W = 0.0$
OST-2P	$P_W = \max(-P_{OST}, \rho g(z - T_{LC}))$		
OST-1S	$P_W = \max(P_{OST}, \rho g(z - T_{LC}))$		
OST-2S	$P_W = \max(-P_{OST}, \rho g(z - T_{LC}))$		

where:

$$P_{OST} = 1.38\ f_p\ k_a\ k_p\ f_{yz}\ C_w\ \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} : Girth distribution coefficient, to be obtained from Table 27.

Table 27 : Girth distribution coefficient, f_{yz} for OST load cases

Transverse position	OST-1P - OST-2P	OST-1S - OST-2S
$y \geq 0$	$5\frac{z}{T_{LC}} + 3.3\ f_{yB} + 1.7$	$\frac{z}{T_{LC}} + 0.3\ f_{yB} + 1.7$
$y < 0$	$\frac{z}{T_{LC}} + 0.3\ f_{yB} + 1.7$	$5\frac{z}{T_{LC}} + 3.3\ f_{yB} + 1.7$

f_p : Coefficient to be taken as:

$$f_p = f_{fa}[(0.25 - 0.02\ f_T) + (12\ f_T - 9)\ B \times 10^{-4}]$$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = 0.45\ L$$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 28.

k_p : Phase coefficient to be obtained from Table 29. Intermediate values are to be interpolated.

Table 28 : k_a values for OST load cases

Transverse position	Longitudinal Position	OST-1P - OST-2P	OST-1S - OST-2S
$y \geq 0$	$f_{xL} \leq 0.2$	$1.0 + \{(3.5 - 2\ f_T) + (10\ f_T - 17.5)f_{xL}\}(1 - f_{yB})$	$1.0 + (3.5 - 2\ f_T - 1.5\ f_{yB}) + (10\ f_T - 17.5 + 7.5\ f_{yB})f_{xL}$

	0.9	$0.24 - (0.24 + f_T)\ f_{yB}$	$0.24 + 0.76\ f_{yB}$
	1.0	-1.0	$-1.0 + 0.5\ f_{yB}$

2 EXTERNAL PRESSURES ON EXPOSED DECKS

2.1 Application

2.1.1

The external pressures and forces on exposed decks are only to be applied for strength assessment.

2.1.2

The green sea pressures defined in [2.2] for exposed decks are to be considered independently of the pressures due to distributed cargo or other equipment loads and any concentrated forces due to cargo or other unit equipment loads, defined in [2.3.1] and [2.3.2] respectively.

2.2 Green sea loads

2.2.1 Pressure on exposed deck

The external dynamic pressure due to green sea loading, P_D, at any point of an exposed deck, in kN/m^2, for the static plus dynamic (S+D) design load scenarios is to be derived for each dynamic load case and is to be taken as defined in [2.2.3] to [2.2.4]

The external dynamic pressure due to green sea loading, P_D, at any point of an exposed deck for the static (S) design load scenarios is zero.

2.2.2

If a breakwater is fitted on the exposed deck, no reduction in the green sea pressure is allowed for the area of the exposed deck located aft of the breakwater.

2.2.3 HSM, HSA and FSM load cases

The external pressure, P_D, for HSM, HSA and FSM load cases, at any load point of an exposed deck is to be obtained, in kN/m^2, from the following formula, see Figure 2 and Figure 3:

$$P_D = \chi \, P_W$$

where:

$P_W = P_{W,D}$, but not to be taken less than $P_{D\text{-}min}$.

$P_{W,D}$: Pressure, in kN/m^2, obtained at side of the exposed deck for HSM, HSA and FSM load cases as defined in [1.3].

$P_{D\text{-}min}$: Minimum exposed deck pressure, in kN/m^2, to be taken as:

- For cargo hold analysis according to Ch 7: $P_{D\text{-}min} = 0$.
- For other cases: $P_{D\text{-}min}$ as defined in Table 30.

χ : Coefficient defined in Table 31.

Table 30 : Minimum pressures on exposed decks for HSM, HSA, FSM load cases

Location	Minimum pressure on exposed deck, $P_{D\text{-}min}$, in kN/m^2	
	$L_{LL} \geq 100$m	$L_{LL} < 100$m
$x_{LL}/L_{LL} \leq 0.75$	34.3	$14.9 + 0.195\, L_{LL}$
$x_{LL}/L_{LL} > 0.75$	$34.3 + (14.8 + a(L_{LL} - 100))\left(4\dfrac{x_{LL}}{L_{LL}} - 3\right)$	$12.2 + \dfrac{L_{LL}}{9}\left(5\dfrac{x_{LL}}{L_{LL}} - 2\right) + 3.6\dfrac{x_{LL}}{L_{LL}}$

a : Coefficient taken equal to:
$a = 0.356$ for Type A, Type B-60 and Type B-100 freeboard ships
$a = 0.0726$ for Type B freeboard ships.

x_{LL} : *X*-coordinate of the load point measured from the aft end of the freeboard length L_{LL}.

Table 31 : Coefficient for pressure on exposed decks

Exposed deck location	χ
Freeboard deck	1.00
Superstructure deck including forecastle deck	0.75
1st tier of deckhouse	0.56
2nd tier of deckhouse	0.42
3rd tier of deckhouse	0.32
4th tier of deckhouse	0.25
5th tier of deckhouse	0.20
6th tier of deckhouse	0.15
7th tier of deckhouse and above	0.10

2.2.4 BSR, BSP, OST and OSA load cases

The external pressure, P_D, for BSR, BSP, OST and OSA load cases at any load point of an exposed deck is to be obtained, in kN/m^2, by linear interpolation between the pressures at the port and starboard deck edges (see also Figure 4, Figure 6, Figure 9 and Figure 10):

$$P_{D,stb} = \chi \, P_{W,D-stb}$$

$$P_{D,pt} = \chi \, P_{W,D-pt}$$

where:

$P_{W,D\text{-}stb}$: Pressure obtained at starboard deck edge for BSR, BSP, OST or OSA load cases as defined in [1.3], as appropriate.

$P_{W,D\text{-}pt}$: Pressure obtained at port deck edge for BSR, BSP, OST and OSA load cases as defined in [1.3], as appropriate.

χ : Coefficient defined in Table 31.

2.2.5 Envelope of dynamic pressures on exposed deck

The envelope of dynamic pressure at any point of an exposed deck, $P_{D\text{-}max}$, is to be taken as the greatest pressure obtained from any of the load cases determined by [2.2.3] and [2.2.4].

2.3 Load carried on exposed deck

2.3.1 Pressure due to distributed load

If a distributed load is carried on an exposed deck, for example deck cargo or other equipment, the static and dynamic pressures due to this distributed load are to be considered.

The total pressure, P_{dl}, in kN/m^2, due to this distributed load for the static (S) design load scenario is to be taken as:

$$P_{dl} = P_{dl-s}$$

The pressure P_{dl}, in kN/m^2, due to this distributed load for the static plus dynamic (S+D) design load scenario is to be derived for each dynamic load case and is to be taken as:

$$P_{dl} = P_{dl-s} + P_{dl-d}$$

where:

$P_{dl\text{-}s}$: Static pressure, in kN/m^2, due to the distributed load, to be defined by the Designer and, in general, but not less than 10 kN/m^2.

$P_{dl\text{-}d}$: Dynamic pressure, in kN/m^2, due to the distributed load, in kN/m^2, to be taken as:

$$P_{dl-d} = f_\beta \frac{a_Z}{g} P_{dl-s}$$

a_Z : Vertical acceleration, in m/s^2, at the centre of gravity of the distributed load, for the considered load case, to be obtained according to Ch 4, Sec 3, [3.2.4].

2.3.2 Concentrated force due to unit load

If a unit load, for example deck cargo, is carried on an exposed deck, the static and dynamic forces due to the unit load carried are to be considered.

The force F_U, in kN, due to this concentrated load for the static (S) design load scenarios, is to be taken as:

$$F_U = F_{U-s}$$

The force F_U, in kN, due to this concentrated load for the static plus dynamic (S+D) design load scenarios is to be derived for each dynamic load case and is to be taken as:

$$F_U = F_{U-s} + F_{U-d}$$

where:

$F_{U\text{-}s}$: Static force, in kN, due to the unit load to be taken equal to:

$$F_{U-s} = m_U\, g$$

$F_{U\text{-}d}$: Dynamic force, in kN, due to unit load to be taken equal to:

$$F_{U-d} = m_U\, f_\beta\, a_Z$$

m_U : Mass of the unit load carried, in t.

a_Z : Vertical acceleration, in m/s^2, at the centre of gravity of the unit load carried for the considered load case, to be obtained according to Ch 4, Sec 3, [3.2.4].

3 EXTERNAL IMPACT PRESSURES FOR THE BOW AREA

3.1 Application

3.1.1

The impact pressures for the bow area are only to be applied for strength assessment.

3.2 Bottom slamming pressure

3.2.1

The bottom slamming pressure P_{SL}, in kN/m^2, for the bottom slamming design load scenario is to be evaluated for the following two cases:

Case 1: An empty ballast tank or a void space in way of the bottom shell.

$$P_{SL} = 10\, g\sqrt{L}\, f_{SL}\, c_{SL-et} \quad \text{for } L < 170 \text{ m}$$

$$P_{SL} = 130\, g\, f_{SL}\, c_{SL-et}\, e^{c_1} \quad \text{for } L \geq 170 \text{ m}$$

Case 2: A full ballast tank in way of the bottom shell.

$$P_{SL} = 10\, g\sqrt{L}\, f_{SL}\, c_{SL-ft} - 1.25\, \rho g(z_{top} - z) \quad \text{for } L < 170 \text{ m}$$

$$P_{SL} = 130\, g\, f_{SL}\, c_{SL-ft}\, e^{c_1} - 1.25\, \rho g(z_{top} - z) \quad \text{for } L \geq 170 \text{ m}$$

where:

c_1 : Coefficient to be taken as:

$$c_1 = 0 \quad \text{for } L \leq 180 \text{ m}$$

$$c_1 = -0.0125(L - 180)^{0.705} \quad \text{for } L > 180 \text{ m}$$

$c_{SL\text{-}et}$: Slamming coefficient for case with an empty ballast tank or void space:

$$c_{SL-et} = 5.95 - 10.5\left(\frac{T_{F-e}}{L}\right)^{0.2}$$

$c_{SL\text{-}ft}$: Slamming coefficient for case with a full ballast tank:

$$c_{SL-ft} = 5.95 - 10.5\left(\frac{T_{F-f}}{L}\right)^{0.2}$$

f_{SL} : Longitudinal slamming distribution factor, to be taken as:

$$f_{SL} = 0 \quad \text{for } x/L \leq 0.5$$

$$f_{SL} = 1.0 \quad \text{for } x/L = 0.5 + c_2$$

$$f_{SL} = 1.0 \quad \text{for } x/L = 0.65 + c_2$$

$$f_{SL} = 0.5 \quad \text{for } x/L \geq 1$$

Intermediate values of f_{SL} are to be obtained by linear interpolation.

c_2 : Coefficient to be taken as:

$$c_2 = 0.33\, C_B + \frac{L}{2500} \quad \text{but not to be taken greater than 0.35.}$$

$T_{F\text{-}e}$: Design slamming draught at the FP to be provided by the Designer. $T_{F\text{-}e}$ is not to be greater than the minimum draught at the FP indicated in the loading manual for all seagoing conditions where any of the ballast tanks within the bottom slamming region are empty. This includes all loading conditions with tanks inside the bottom slamming region that use the 'sequential' ballast water exchange method.

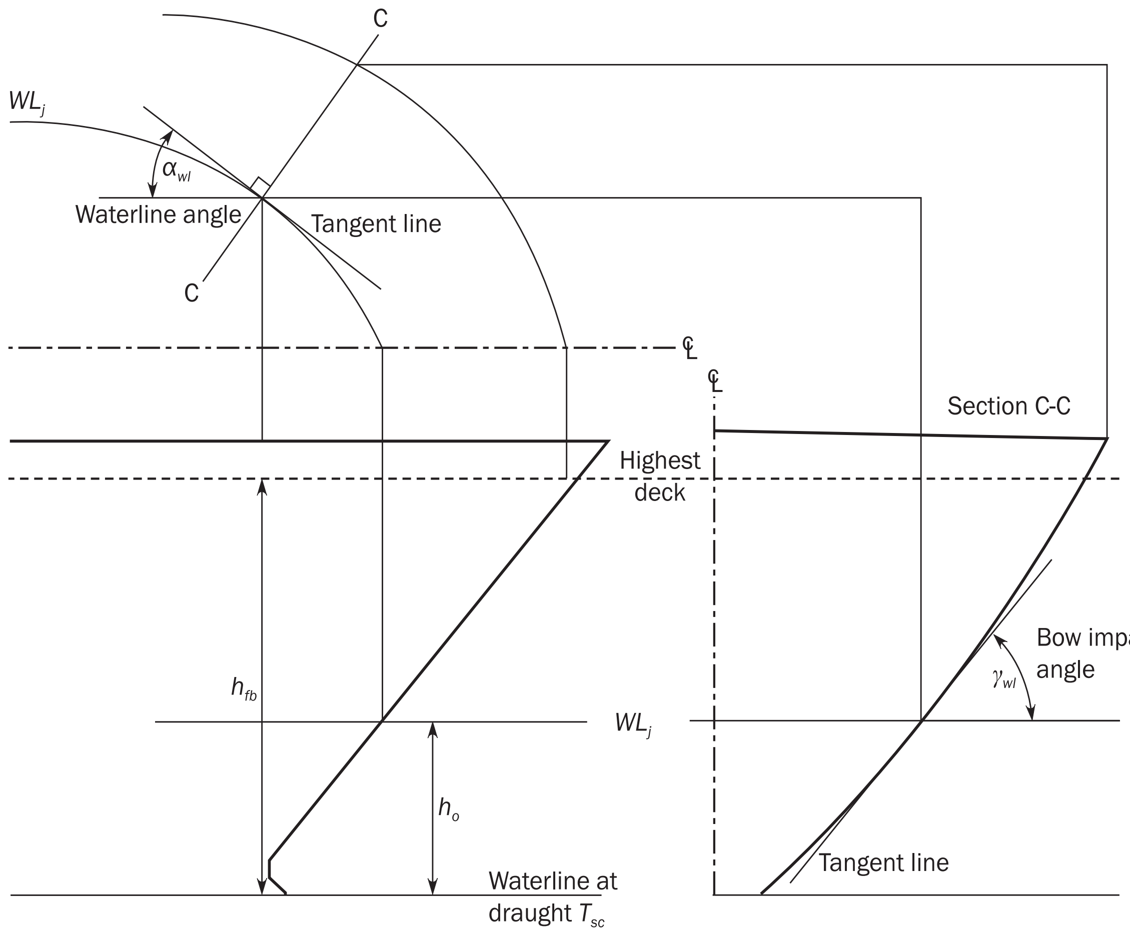
$T_{F\text{-}f}$: Design slamming draught at the FP to be provided by the Designer. $T_{F\text{-}f}$ is not to be greater than the minimum draught at the FP indicated in the loading manual for all seagoing conditions where all ballast tanks within the bottom slamming region are full. This includes all loading conditions with tanks inside the bottom slamming region that use the 'flow-through' ballast water exchange method.

z_{top} : Z-coordinate of the highest point of the tank, excluding small hatchways, in m.
For strength assessment of double bottom floors and girders, z_{top} is not to be taken greater than the double bottom height.

3.2.2 Loading manual information

The loading guidance information is to clearly state the design slamming draughts and the ballast water exchange method used for each ballast tank.

Figure 12 : Definition of bow geometry



3.3 Bow impact pressure

3.3.1 Design pressures

The bow impact pressure P_{FB}, in kN/m^2, to be considered for the bow impact design load scenario is to be taken as:

$$P_{FB} = 1.025\ f_{FB}\ c_{FB}\ V_{im}^2\ \sin\gamma_{wl}$$

where:

f_{FB} : Longitudinal bow flare impact pressure distribution factor. To be taken as:

$$f_{FB} = 0.55 \quad \text{for } x/L \le 0.9$$
$$f_{FB} = 4\,(x/L - 0.9) + 0.55 \quad \text{for } 0.9 < x/L \le 0.9875$$
$$f_{FB} = 8(x/L - 0.9875) + 0.9 \quad \text{for } 0.9875 < x/L \le 1.0$$
$$f_{FB} = 1.0 \quad \text{for } x/L > 1.0$$

V_{im} : Impact speed, in knots, to be taken as:

$$V_{im} = 0.514\ V_{ref}\ \sin\alpha_{wl} + \sqrt{L}$$

V_{ref} : Forward speed, in knots, to be taken as:

$$V_{ref} = 0.75\ V \quad \text{but not less than 10.}$$

α_{wl} : Local waterline angle, in deg, at the considered position, but not less than 35 deg. See Figure 12.

γ_{wl} : Local bow impact angle, in deg, measured in a vertical plane containing the normal to the shell, from the horizontal to the tangent line at the considered position but not less than 50 deg, as shown in Figure 12. Where this value is not available, it may be taken as:

$$\gamma_{wl} = \tan^{-1}\left(\frac{\tan\beta_{pl}}{\cos\alpha_{wl}}\right)$$

β_{pl} : Local body plan angle, in deg, at the considered position from the horizontal to the tangent line, but not less than 35 deg.

c_{FB} : Coefficient to be taken as:

$$c_{FB} = 1.0 \quad \text{for positions between draughts } T_{BAL} \text{ and } T_{SC}.$$
$$c_{FB} = \sqrt{1.0 + \cos^2\left[90\ \frac{(h_{fb} - 2h_0)}{h_{fb}}\right]} \quad \text{for positions above draught } T_{SC}.$$

h_{fb} : Vertical distance, in m, from the waterline at the draught T_{SC} to the highest deck at side. See Figure 12.

h_0 : Vertical distance, in m, from the waterline at the draught T_{SC} to the considered position. See Figure 12.

4 EXTERNAL PRESSURES ON SUPERSTRUCTURE AND DECKHOUSES

4.1 Application

4.1.1

The external pressures on superstructure and deckhouses are only to be applied for strength assessment.

These pressures are to be considered as dynamic pressures and are to be applied to the appropriate structure without any static pressure load component.

4.1.2

The dynamic load case concept is not to be applied for external pressures on superstructures and deckhouses.

4.2 Exposed wheel house tops

4.2.1

The lateral pressure for exposed wheel house tops, P_D, in kN/m^2, is to be taken as:

$$P_D = 12.5$$

4.3 Sides of superstructures

4.3.1

The design pressure for the external sides of superstructures, P_{SI}, in kN/m^2, is to be taken as:

where:

$$P_{SI} = 2.1\ C_W\ c_F\ (C_B + 0.7)\ \frac{20}{10 + z - T_{LC}}$$

c_F : Distribution factor according to Table 32.

Table 32 : Distribution factor c_F

Location	c_F
$x/L < 0.2$	$1.0 + \frac{5}{C_B}\left(0.2 - \frac{x}{L}\right)$ without taking x/L less than 0.1
$x/L \geq 0.2$	1.0

4.4 End bulkheads of superstructures and deckhouse walls

4.4.1

The external pressure for the aft and forward external bulkheads of superstructures and deckhouse walls, in kN/m^2, is to be taken as:

$$P_A = f_n\ f_c\ [f_b\ f_d - (z - T_{SC})]$$

but is not to be less than $P_{A\text{-}min}$.

where:

f_n : Coefficient defined in Table 33.

f_c : Coefficient, to be taken as:

$$f_c = 0.3 + 0.7\ \frac{b_1}{B_1} \quad \text{but not less than 0.475.}$$

For exposed parts of machinery casings, f_c is not to be taken less than 1.0.

f_d : Coefficient, to be taken as:

$$f_d = \frac{L}{10}\ e^{-(L/300)} - \left(1 - \left(\frac{L}{150}\right)^2\right) \quad \text{for } L < 150 \text{ m}$$

$$f_d = \frac{L}{10}\ e^{-(L/300)} \quad \text{for } 150 \text{ m} \leq L < 300 \text{ m}$$

$$f_d = 11.03 \quad \text{for } L \geq 300 \text{ m}$$

b_1 : Breadth of deckhouse at the position considered.

B_1 : Actual breadth of ship on the exposed weather deck at the position considered.

f_b : Coefficient defined in Table 34.

$P_{A\text{-}min}$: Minimum lateral pressure, in kN/m^2, as defined in Table 35.

5 EXTERNAL PRESSURES ON HATCH COVERS

5.1 Application

5.1.1

The external pressures on hatch covers are only to be applied for strength assessment.

5.2 Green sea loads

5.2.1

The green sea loads at any load point of a hatch cover, P_{HC}, in kN/mm^2, is to be taken as follows:

- For cargo hold analysis according to Ch 7:

  $P_{HC} = P_D - \rho\ g\ (z_{HC} - D)$ without being less than 0.

- For other cases: $P_{HC} = P_{D,min}$ as defined in Table 30.

P_D : Green sea pressure, in kN/mm^2, on the deck in way of the hatch cover obtained according to [2.2], considering χ equal to 1.0.

z_{HC} : z coordinate of the top of the hatch cover, in m.

5.3 Load carried on hatch covers

5.3.1

If a distributed load or a unit load is carried on a hatch cover, the pressure is to be obtained according to [2.3].

Table 33 : Coefficient f_n

Type of bulkhead	Location	f_n
Unprotected front bulkhead (1)	Lowest tier (2)	$20 + \frac{L_2}{12}$
	Second tier	$10 + \frac{L_2}{12}$
	Third tier and above	$5 + \frac{L_2}{15}$
Protected front bulkhead (1)	All tiers	$5 + \frac{L_2}{15}$
Side bulkheads	All tiers	$5 + \frac{L_2}{15}$
Aft end bulkheads	Abaft amidships	$7 + \frac{L_2}{100} - 8\frac{x}{L_2}$
	Forward of amidships	$5 + \frac{L_2}{100} - 4\frac{x}{L_2}$

(1) The front bulkhead of a superstructure or deckhouse may be considered as protected when it is located less than B_x behind another superstructure or deckhouse, and the width of the front bulkhead being considered is less than the width of the aft bulkhead of the superstructure or deckhouse forward of it. B_x is the local breadth of the ship at the front bulkhead.

(2) The lowest tier is normally that tier which is directly situated above the uppermost continuous deck to which the moulded depth D is measured. However, when (D - T_{SC}) exceeds the minimum non-corrected tabular freeboard (according to ICLL as amended) by at least one standard superstructure height (as defined in Ch 1, Sec 4, [3.3]), then this tier may be defined as the 2nd tier and the tier above as the 3rd tier.

Table 34 : Coefficient f_b

Location of bulkhead (1)	f_b
$\frac{x}{L} < 0.45$	$1.0 + \left(\frac{x/L - 0.45}{C_{B1} + 0.2}\right)^2$
$\frac{x}{L} \geq 0.45$	$1.0 + 1.5\left(\frac{x/L - 0.45}{C_{B1} + 0.2}\right)^2$

where:

C_{B1} : Block coefficient, but not less than 0.60 nor greater than 0.80. For aft deckhouse bulkheads located forward of amidships, C_{B1} may be taken as 0.80.

(1) For deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding 0.15*L* each, and *x* is to be taken as the *X*-coordinate of the centre of each part considered.

Table 35 : Minimum lateral pressure, P_{A-min}

	P_{A-min}, in kN/m²	
L	Lowest tier of unprotected fronts	Elsewhere (1)
$90 < L \leq 250$	$25 + \frac{L}{10}$	$12.5 + \frac{L}{20}$
$L > 250$	50	25

(1) For the 4th tier and above, P_{A-min} is to be taken equal to 12.5 kN/m².

SECTION 6
INTERNAL LOADS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4

a_X, a_Y, a_Z: Longitudinal, transverse and vertical accelerations, in m/s^2, at x_G, y_G, z_G, as defined in Ch 4, Sec 3, [3.2].

B_H : Breadth of the cargo hold, in m, measured at mid-length of the cargo hold and at the mid height between the top of hopper tank and the bottom of topside tank, see Figure 1.

B_{IB} : Breadth of inner bottom, in m, measured at mid-length of the cargo hold, see Figure 1.

D_1 : Distance, in m, from the baseline to the freeboard deck at side amidships.

d_{sc} : Diameter, in m, of a steel coil.

f_{cd} : Factor for joint probability of occurrence of liquid cargo density and maximum sea state in 25 years design life, to be taken as:

- For strength assessment with FE analysis of cargo tanks filled with liquid cargo:

  $f_{cd} = 1.0$ for $\rho_L > 1.025$ t/m^3.

  $f_{cd} = 0.88$ for $\rho_L = 1.025$ t/m^3.

- For other cases:

  $f_{cd} = 1.0$.

f_{dc} : Dry cargo factor taken as:

- $f_{dc} = 1.0$ for strength assessment,
- $f_{dc} = 0.5$ for fatigue assessment.

f_β : Coefficient defined in Ch 4, Sec 4.

h_{air} : Height of air pipe or overflow pipe above the top of the tank, in m.

h_C : Height of bulk cargo, in m, from the inner bottom to the upper surface of bulk cargo, as defined in [2.3.1] or [2.3.2].

h_{DB} : Height, in m, of the double bottom at the centreline, measured at mid-length of the cargo hold, see Figure 1.

h_{HPL} : Vertical distance, in m, from the inner bottom at centreline to the upper intersection of hopper tank and side shell or inner side for double side bulk carriers, determined at mid length of the considered cargo hold, as shown in Figure 1.

$h_{HPL} = 0$ if there is no hopper tank.

h_{HPU} : Vertical distance, in m, from the inner bottom at centreline to the lower intersection of topside tank and side shell or inner side for double side bulk carriers, determined at mid length of the cargo hold at midship, as shown in Figure 1.

h_{LS} : Mean height, in m, of the lower stool, measured from the inner bottom.

h_{max} : Maximum permissible filling level, in m, taken as:

- For ballast tanks: maximum tank height,
- For cargo tanks with cargo density equal to ρ_L: maximum tank height

- For cargo tanks with heavy liquid cargo density equal to ρ_{part} associated with a partially filled cargo tank: h_{part} as defined in Ch 10, Sec 4, [1.2.1].

K_C : Coefficient taken equal to:

$K_C = \cos^2\alpha + (1 - \sin\Psi)\sin^2\alpha$ for inner bottom, hopper tank, transverse and longitudinal bulkheads, lower stool, vertical upper stool, inner side and side shell.

$K_C = 0$ for topside tank, main deck and sloped upper stool.

$K_{C\text{-}f}$: Coefficient taken equal to:

$$K_{C-f} = \tan^2\left(45 - \frac{\Psi}{2}\right)$$

ℓ : Distance, in m, between floors.

ℓ_H : Length of the cargo hold, in m, at the centreline between the transverse bulkheads. This is to be measured to the mid-depth of the corrugated bulkhead(s) if fitted.

ℓ_{lp} : Distance, in m, between outermost dunnage per EPP in the ship X direction, see Figure 10.

ℓ_{st} : Length, in m, of a steel coil.

M : Mass, in t, of the bulk cargo being considered.

M_{Full} : Cargo mass, in t, in a cargo hold corresponding to the volume up to the top of the hatch coaming with a density of the greater of M_H/V_{Full} or 1.0 t/m^3.

$M_{Full} = 1.0\ V_{Full}$ but not less than M_H.

M_H : Cargo mass, in t, in a cargo hold that corresponds to the homogeneously loaded condition at maximum draught with 50% consumables.

M_{HD} : Maximum allowable cargo mass, in t, in a cargo hold according to design loading conditions with specified holds empty at maximum draught with 50% consumables.

$M_{sc\text{-}ib}$: Equivalent mass of a steel coil, in t, on inner bottom, as defined in [4.3.1]

$M_{sc\text{-}hs}$: Equivalent mass of a steel coil, in t, on hopper side, as defined in [4.3.2].

n_1 : Number of tiers of steel coils.

n_2 : Number of load points per EPP of the inner bottom, see [4.1.3].

n_3 : Number of dunnages supporting one row of steel coils.

P_{drop} : Overpressure, in kN/m^2, due to sustained liquid flow through air pipe or overflow pipe in case of overfilling or filling during flow through ballast water exchange. It is to be defined by the designer, but not to be less than 25 kN/m^2.

P_{PV} : Setting of pressure relief valve, in kN/m^2, if fitted, but not less than 25 kN/m^2.

perm : Permeability of cargo, to be taken as:

perm = 0.3 for iron ore, coal cargoes and cement.

perm = 0 for steel coils.

R : Vertical coordinate of the ship rotation centre, defined in Ch 4, Sec 3.

s_C : Spacing of corrugations, in m, as defined in Ch 3, Sec 6, [10.4.2].

T_θ : Roll period, in s, as defined in Ch 4, Sec 3, [2.1.1].

V_{Full} : Volume, in m^3, of cargo hold up to top of the hatch coaming, taken as:

$V_{Full} = V_H + V_{HC}$.

V_H : Volume, in m^3, of cargo hold up to level of the intersection of the main deck with the hatch coaming excluding the volume enclosed by hatch coaming, see Figure 1.

V_{HC} : Volume, in m^3, of the hatch coaming, from the level of the intersection of the main deck with the hatch side coaming to the top of the hatch coaming, determined for the cargo hold at midship, as shown in Figure 1.

V_{TS} : Total volume, in m^3, of the portion of the lower bulkhead stools within the cargo hold length ℓ_H and inboard of the hopper tanks.

W : Mass, in t, of a steel coil.

x, y, z : X, Y and Z coordinates, in m, of the load point with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

x_G, y_G, z_G: X, Y and Z coordinates, in m, of the volumetric centre of gravity of the tank or fully filled cargo hold, i.e. V_{Full}, considered with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2].

In case of partially filled cargo hold, x_G, y_G, z_G to be taken as follows:

x_G, y_G: Volumetric centre of gravity of the cargo hold.

$z_G = h_{DB} + h_{C\text{-}cl} / 2$

z_{top} : Z coordinate of the highest point of tank, excluding small hatchways, in m.

z_C : Height of the upper surface of the cargo above the baseline in way of the load point, in m, to be taken as:

$z_C = h_{DB} + h_C$.

α : Angle, in deg, between panel considered and the horizontal plane.

φ : Pitch angle, in deg, defined in Ch 4, Sec 3, [2.1.2].

ψ : Assumed angle of repose, in deg, of bulk cargo (considered drained and removed); to be taken as:

$\psi = 30°$ in general.
$\psi = 35°$ for iron ore.
$\psi = 25°$ for cement.

ρ_c : Density of bulk cargo, in t/m^3, as defined in [2.3.3].

ρ_L : Density of liquid in the tank and ballast hold, in t/m^3, but not less than:

- For strength assessment:

  $\rho_L = 1.025$ for all liquids including oil cargoes. If a tank filled at 98% is intended to carry heavier liquid cargoes than 1.025 (i.e. $\rho_{max\text{-}LM} > 1.025$), then $\rho_L = \rho_{max\text{-}LM}$.

- For fatigue assessment:

  $\rho_L = 0.9$ for liquid cargoes.

  $\rho_L = 1.025$ for all other liquids.

$\rho_{max\text{-}LM}$: Maximum liquid cargo density in t/m^3, associated with a full tank at 98%, from any loading condition in the ship's loading manual or value specified by the designer.

ρ_{part} : Maximum permissible high liquid cargo density, in t/m^3, associated with a partially filled cargo tank but not taken less than ρ_L considered for strength assessment.

ρ_{slh} : Liquid density, in t/m^3, to be used for sloshing assessment, taken as:

$\rho_{slh} = \rho_{part}$ for heavy liquid cargo density associated with partial filling of cargo tank
$\rho_{slh} = \rho_L$ for all other cases

ρ_{ST} : Density of steel, in t/m^3, to be taken as 7.8.

θ : Roll angle, in deg, defined in Ch 4, Sec 3, [2.1.1].

θ_h : Angle, in deg, between inner bottom plate and hopper sloping plate. in general θ_h is such that:

$$\tan\theta_h = \frac{2h_{HPL}}{B_H - B_{IB}}$$

1 PRESSURES DUE TO LIQUIDS

1.1 Application

1.1.1 Pressures for the strength and fatigue assessments of intact conditions

The internal pressure due to liquid acting on any load point of a tank and ballast hold boundary, in kN/m^2, for the static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:

$P_{in} = P_{ls}$ but not less than 0.

The internal pressure due to liquid acting on any load point of a tank and ballast hold boundary, in kN/m^2, for the static plus dynamic (S+D) design load scenarios is to be derived for each dynamic load case and is to be taken as:

$P_{in} = P_{ls} + P_{ld}$ but not less than 0.

where:

P_{ls} : Static pressure due to liquid in tanks and ballast holds, in kN/m^2, as defined in [1.2].

P_{ld} : Dynamic inertial pressure due to liquid in tanks and ballast holds, in kN/m^2, as defined in [1.3].

1.1.2 Pressures for the strength assessments of flooded conditions

The internal pressure in flooded condition, in kN/m^2, acting on any load point of the watertight boundary of a hold, tank or other space for the flooded static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:

$P_{in} = P_{fs}$ but not less than $\rho g d_0$

The internal pressure in flooded condition, in kN/m^2, acting on any load point of the watertight boundary of a hold, tank or other space for the flooded static plus dynamic (S+D) design load scenarios, is to be derived for each dynamic load case and is to be taken as:

$P_{in} = P_{fs} + P_{fd}$ but not less than $\rho g d_0$

where:

P_{fs} : Static pressure of seawater in flooded condition in the compartment, in kN/m^2, as defined in [1.4].

P_{fd} : Dynamic inertial pressure of seawater in flooded condition in the compartment, in kN/m^2, as defined in [1.5].

d_0 : Distance, in m, to be taken as:

$d_0 = 0.02 L$ for $L < 120$ m.

$d_0 = 2.4$ for $L \geq 120$ m.

For corrugations of vertically corrugated bulkheads of bulk carrier cargo holds, the flooded pressures and forces specified in [3] for bulk cargoes are to be applied.

For cargo holds carrying steel products, the requirements for pressures and forces in [4] are to be applied.

1.2 Static liquid pressure

1.2.1 Normal operations at sea

The static pressure due to liquid in tanks and ballast holds, P_{ls} during normal operations at sea, in kN/m^2, is to be taken as:

$P_{ls} = f_{cd}\, \rho_L\, g\, (Z_{top} - Z) + P_{PV}$ for cargo tanks filled with liquid cargo.

$P_{ls} = \rho_L\, g\, (z_{top} - z + 0.5\, h_{air})$ for other cases.

1.2.2 Harbour/sheltered water operations

The static pressure, P_{ls} due to liquid in tanks and ballast holds for harbour/sheltered water operations, in kN/m^2, is to be taken as:

$P_{ls} = \rho_L\ g\ (z_{top} - z + h_{air}) + P_{drop}$ for ballast tanks

$P_{ls} = \rho_L\ g\ (z_{top} - z) + P_{PV}$ for cargo tanks filled with liquid cargo

$P_{ls} = \rho_L\ g\ (z_{top} - z + 0.5\ h_{air})$ for other cases

1.2.3 Sequential ballast water exchange

The static pressure, P_{ls} due to liquid in ballast tanks associated with sequential ballast water exchange operations, in kN/m^2, is to be taken as:

$P_{ls} = \rho_L\ g\ (z_{top} - z + 0.5\ h_{air})$

1.2.4 Flow through ballast water exchange

The static pressure, P_{ls} due to liquid in ballast tanks associated with flow through ballast water exchange operations, in kN/m^2, is to be taken as:

$P_{ls} = \rho_L\ g\ (z_{top} - z + h_{air}) + P_{drop}$

1.2.5 Ballasting using ballast water treatment system

The static pressure, P_{ls} due to liquid in tanks and ballast holds associated with ballasting operations using a ballast water treatment system is to be taken as defined for sequential ballast exchange in [1.2.3]. The ship designer has to inform the Society if the ballast water treatment system implies additional pressure to be considered as P_{drop}, etc in addition to the pressure defined in [1.2.3].

1.2.6 Static liquid pressure for the fatigue assessment

The static pressure due to liquid in tanks and ballast holds, P_{ls} to be used for the fatigue assessment, in kN/m^2, is to be taken as:

$P_{ls} = \rho_L\ g\ (z_{top} - z)$ for all tanks (cargo and water ballast tanks, ballast hold and other tanks).

1.3 Dynamic liquid pressure

1.3.1

The dynamic pressure, P_{ld} due to liquid in tanks and ballast holds, in kN/m^2 is to be taken as:

$P_{ld} = f_\beta f_{cd} \rho_L [a_Z (z_0 - z) + f_{ull-l}\, a_X (x_0 - x) + f_{ull-t}\, a_Y (y_0 - y)]$

where:

f_{ull-l} : Longitudinal acceleration correction factor for the ullage space above the liquid in tanks and ballast holds, taken as:

- For strength assessment:

  f_{ull-l} = 0.62 for cargo tanks filled with any liquids including water ballast.

  f_{ull-l} = 1.0 for other cases.

- For fatigue assessment:

  $f_{ull-l} = 0.5 + \dfrac{|z_0 - z|}{\ell_{fs}} \dfrac{180}{\varphi\pi}$ for cargo tanks and ballast holds.

  f_{ull-l} = 1.0 for other cases.

  f_{ull-l} is not to be less than 0.0 nor greater than 1.0

ℓ_{fs} : Cargo tank length at the top of the tank or length of the ballast hold hatch coaming, in m.

f_{ull-t} : Transverse acceleration correction factor to account for the ullage space above the liquid in tanks and ballast holds, taken as:

- For strength assessment:

  f_{ull-t} = 0.67 for cargo tanks filled with any liquids including water ballast.

  f_{ull-t} = 1.0 for other cases.

- For fatigue assessment:

  $$f_{ull-t} = 0.5 + \frac{|z_0 - z|}{b_{top}} \frac{180}{\theta\pi} \quad \text{for cargo tanks and ballast holds.}$$

  f_{ull-t} = 1.0 for other cases.

  f_{ull-t} is not to be less than 0.0 nor greater than 1.0

b_{top} : Cargo tank breadth at the top of the tank or breadth of the ballast hold hatch coaming, in m, determined at mid length of the tank or ballast hold hatch coaming.

x_0 : X coordinate, in m, of the reference point.

y_0 : Y coordinate, in m, of the reference point.

z_0 : Z coordinate, in m, of the reference point.

The reference point is to be taken as the point with the highest value of V_j, calculated for all points that define the upper boundary of the tank or ballast hold as follows:

$$V_j = a_X (x_j - x_G) + a_Y (y_j - y_G) + (a_Z + g)(z_j - z_G)$$

where:

x_j : X coordinate, in m, of the point j on the upper boundary of the tank or ballast hold.

y_j : Y coordinate, in m, of the point j on the upper boundary of the tank or ballast hold.

z_j : Z coordinate, in m, of the point j on the upper boundary of the tank or ballast hold.

1.4 Static pressure in flooded conditions

1.4.1 Static pressure in flooded compartments

The static pressure, P_{fs} in kN/m², for watertight boundaries of flooded compartments is to be taken as:

$$P_{fs} = \rho g (z_{FD} - z) \quad \text{but not less than 0.}$$

where:

z_{FD} : Z coordinate, in m, of the freeboard deck at side in way of the transverse section considered or the deepest equilibrium waterline in the damaged condition whichever is the greater.

1.5 Dynamic pressure in flooded conditions

1.5.1 Dynamic pressure in flooded compartments

The dynamic pressure, P_{fd}, in kN/m², for watertight boundaries of flooded compartments is to be taken as:

$$P_{fd} = f_\beta\ \rho\, [a_Z (z_{0FD} - z) + f_{ull-l}\, a_X (x_0 - x) + f_{ull-t}\, a_Y (y_0 - y)]$$

where:

z_{0FD} : Z coordinate of the effective reference point, in m, for a flooded compartment taken as:

When $z_{FD} > z_0,\ z_{0FD} = z_0$

When $z_{FD} \le z_0,\ z_{0FD} = z_{FD}$

f_{ull-l}, f_{ull-t} : Longitudinal and transverse acceleration correction factors:

When $z_{FD} > z_0$, f_{ull-l} and f_{ull-t} are to be taken as defined in [1.3.1].

When $z_{FD} \leq z_0$, f_{ull-l} = 1.0 and f_{ull-t} = 1.0.

2 PRESSURES AND FORCES DUE TO DRY BULK CARGO

2.1 Application

2.1.1

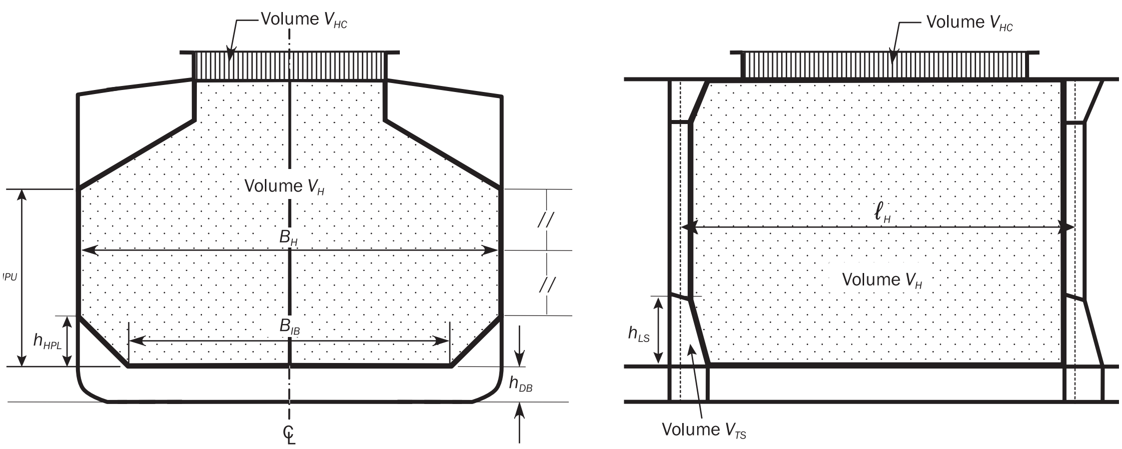
The pressures and forces due to dry cargo in bulk in a cargo hold are to be determined both for fully and partially filled cargo holds according to [2.4] and [2.5].

2.2 Hold definitions

2.2.1 Geometrical characteristics

Figure 1 gives the main geometrical elements of a bulk carrier cargo hold.

Figure 1 : Definition of cargo hold parameters for bulk carrier



2.2.2 Fully and partially filled cargo holds

The definitions of a fully and partially filled dry bulk cargo holds are as follow:

a) Fully filled hold:
The dry bulk cargo density is such that the cargo hold is filled up to the top of the hatch coaming, as shown in Figure 2.

The upper surface of the cargo and its effective height in the hold h_C are to be determined in accordance with [2.3.1].

b) Partially filled hold:
The cargo density is such that the cargo hold is not filled up to the top of the hatch coaming, as shown in Figure 3 or Figure 4.

The upper surface of the cargo and its effective height in the hold h_C are to be determined in accordance with [2.3.2].

2.3 Dry cargo characteristics

2.3.1 Definition of the upper surface of dry bulk cargo for full cargo holds

For a fully filled cargo hold as defined in [2.2.2], including non-prismatic holds, the effective upper surface of the cargo is an equivalent horizontal surface at h_C, in m, above inner bottom at centreline as shown in Figure 2.

The value of h_C is to be calculated at mid length of the cargo hold at the midship, is to be kept constant over the cargo hold region area and is determined as follows:

$$h_C = h_{HPU} + h_0$$

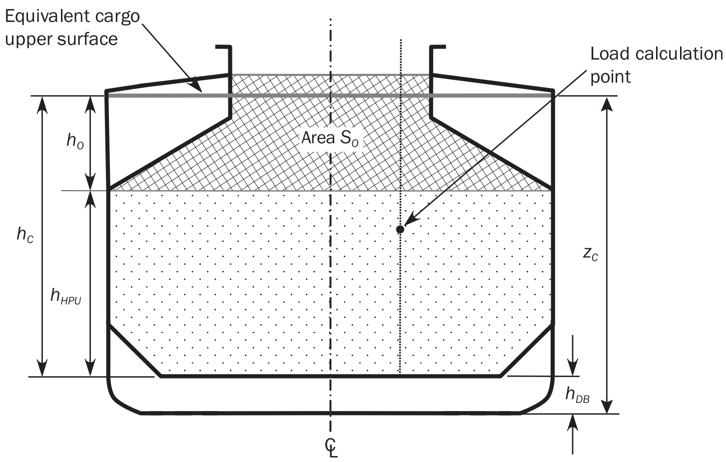
where:

$$h_0 = \frac{S_A}{B_H}$$

$$S_A = S_0 + \frac{V_{HC}}{\ell_H}$$

S_0 : Shaded area, in m^2, above the lower intersection of topside tank and side shell or inner side, as the case may be, and up to the level of the intersection of the main deck with the hatch coaming, determined for the cargo hold at the midship as shown in Figure 2.

Figure 2 : Definition of effective upper surface of cargo for a full cargo hold



2.3.2 Definition of upper surface of dry bulk cargo for partially filled cargo holds

For any partially filled cargo hold, as defined in [2.2.2], including non-prismatic holds, the effective upper surface of the cargo is to be made of three parts:

- One central horizontal surface of breadth $B_H/2$, in m, at a height $h_{C\text{-}CL}$, in m, above the inner bottom
- A sloped surface at each side with an angle $\psi/2$, in degrees, between the central horizontal surface, and the side shell or inner hull, as shown in Figure 3, or the hopper plating, as shown in Figure 4, as the case may be.

The height of cargo surface h_C, in m, is to be calculated at mid length of the considered cargo hold and is to be taken as constant over the length of the hold as follows:

For $|y| \le \frac{B_H}{4}$: $h_C = h_{C\text{-}CL}$

For $\frac{B_H}{4} < |y| \le \frac{B_2}{2}$: $h_C = h_{C-CL} - \left(|y| - \frac{B_H}{4}\right) \tan\frac{\Psi}{2}$

For $|y| > \frac{B_2}{2}$: $h_C = 0$

where:

h_1 : Height, in m, to be taken as:

$$h_1 = \frac{M}{\rho_C \cdot B_H\ \ell_H} - \left(\frac{B_H + B_{IB}}{2B_H}\right) h_{HPL} - \frac{3}{16} B_H \tan\frac{\psi}{2} + \frac{V_{TS}}{B_H\ \ell_H}$$

- For $h_1 \geq 0$ as shown in Figure 3:

$$h_{C-CL} = h_{HPL} + h_1 + h_2$$

$$h_2 = \frac{B_H}{4} \tan\frac{\psi}{2}$$

$$B_2 = B_H$$

- For $h_1 < 0$ as shown in Figure 4

$$h_{C-CL} = h_{11} + h_{22}$$

$$h_{11} = h_{HPL}\left(\frac{B_2 - B_{IB}}{B_H - B_{IB}}\right)$$

$$h_{22} = \left(\frac{B_2}{2} - \frac{B_H}{4}\right) \tan\frac{\psi}{2}$$

$$B_2 = \sqrt{\frac{\frac{1}{\ell_H}\left(\frac{M}{\rho_C} + V_{TS}\right) + \frac{1}{2}\left(\frac{h_{HPL} \cdot B_{IB}^2}{B_H - B_{IB}}\right) + \frac{B_H^2}{16}\tan\frac{\psi}{2}}{\frac{1}{2}\left[\left(\frac{h_{HPL}}{B_H - B_{IB}}\right) + \frac{1}{2}\tan\frac{\psi}{2}\right]}}$$

h_{C-CL} : Height, in m, of the cargo surface at the centreline, as shown in Figure 3 and Figure 4

B_2 : Maximum breadth of the cargo, in m, as shown in Figure 3 and Figure 4

Figure 3 : Definition of the effective upper surface of cargo for a partially filled cargo hold when $h_1 \geq 0$

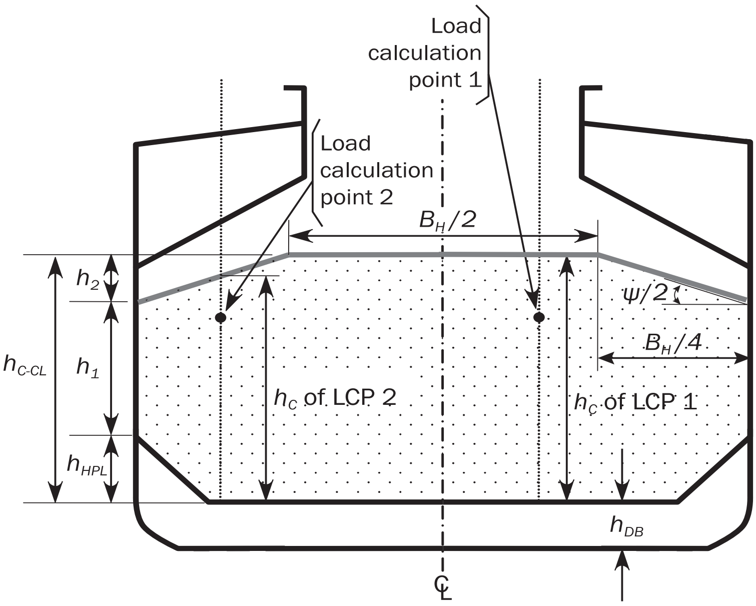


Figure 4 : Definition of the effective upper surface of cargo for a partially filled cargo hold when $h_1 < 0$

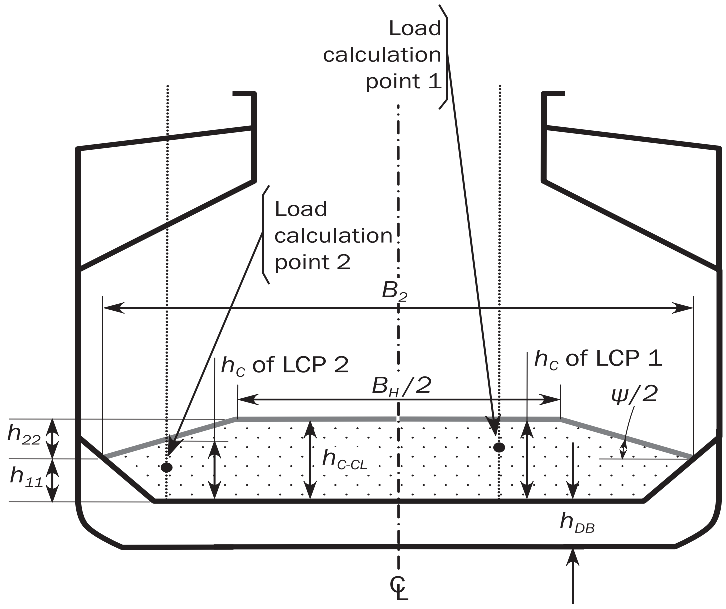

2.3.3 Mass and density

The dry cargo mass and the density of the cargo are to be taken as follows:

- For strength assessment in intact condition: the values defined in Table 1
- For fatigue assessment: the values defined in Table 2
- For strength assessment in flooded condition: the values defined in Table 3

Table 1 : Dry bulk cargo mass and density for strength assessment in intact condition

Ship type	Cargo mass Cargo density	Homogeneous loading condition		Alternate loading condition	
		Fully filled hold	Partially filled hold	Fully filled hold	Partially filled hold
No BC notation	M	$M = M_{Full}$	N/A	N/A	
	ρ_C	Maximum value specified in the loading manual			
BC-C	M	$M = M_{Full}$	N/A	N/A	
	ρ_C	$\rho_C = \dfrac{M_{Full}}{V_{Full}}$ but not less than 1.0			
BC-B	M	$M = M_{Full}$	$M = M_H$	N/A	
	ρ_C	$\rho_C = \dfrac{M_{Full}}{V_{Full}}$ but not less than 1.0	$\rho_C = 3.0$ (1)		
BC-A	M	$M = M_{Full}$	$M = M_H$	$M = M_{HD} + 0.1M_H$	$M = M_{HD} + 0.1M_H$
	ρ_C	$\rho_C = \dfrac{M_{Full}}{V_{Full}}$ but not less than 1.0	$\rho_C = 3.0$ (1)	$\rho_C = \dfrac{M_{HD} + 0.1\,M_H}{V_{Full}}$	$\rho_C = 3.0$ (1)

(1) To be taken as 3.0 unless an alternative maximum cargo density is specified in the loading manual.

Table 2 : Dry bulk cargo mass and density for fatigue assessment

Ship type	Cargo mass Cargo density	Homogeneous loading condition (Fully filled hold)	Alternate loading condition (Partially filled hold)
No BC notation	M	$M = M_H$	N/A
	ρ_C	ρ_C = maximum value specified in the loading manual	
BC-C	M	$M = M_H$	
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	
BC-B	M	$M = M_H$	
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	
BC-A	M	$M = M_H$	$M = M_{HD}$
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	$\rho_C = 3.0$ **(1)**

(1) To be taken as 3.0 unless an alternative maximum cargo density is specified in the loading manual.

Table 3 : Dry bulk cargo mass and density for strength assessment in flooded condition

Ship type	Cargo mass Cargo density	Homogeneous loading condition		Alternate loading condition		
		Fully filled hold	Partially filled hold	Fully filled hold	Partially filled hold	Hold loaded with $\rho_C \leq 1.78$ t/m^3 **(2)**
No BC notation	M	$M = M_H$	N/A	N/A		
	ρ_C	ρ_C = maximum value specified in the loading manual				
BC-C	M	$M = M_H$	N/A	N/A		
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$				
BC-B	M	$M = M_H$	$M = M_H$	N/A		
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	$\rho_C = 3.0$ **(1)**			
BC-A	M	$M = M_H$	$M = M_H$	$M = M_{HD}$	$M = M_{HD}$	$M = M_{HD}$
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	$\rho_C = 3.0$ **(1)**	$\rho_C = \left(\frac{M_{HD}}{V_{Full}}\right)$	$\rho_C = 3.0$ **(1)**	$\rho_C = 1.78$

(1) To be taken as 3.0 unless an alternative maximum cargo density is specified in the loading manual.

(2) To be applied for bulk carriers that are required to carry cargoes with a density less than or equal to 1.78 t/m^3.

2.3.4 FE application

The following process is to be applied for the bulk cargo pressure loads used in FE analysis:

a) Determine h_c according to [2.3.1] for fully filled cargo hold or [2.3.2] for partially filled cargo hold.

b) Determine the corresponding static pressure as defined in [2.4.2] and static shear pressure as defined in [2.5.2] using ρ_c and apply them in the FE model.

c) Calculate the actual mass of cargo, M_{actual}, in t.

d) Determine the effective cargo density, in t/m^3:

$$\rho_{eff} = \frac{M}{M_{actual}} \rho_c$$

e) Calculate the final pressure distribution and shear load using ρ_{eff} instead of ρ_c.

2.4 Dry bulk cargo pressures

2.4.1 Total pressure

The total pressure due to dry bulk cargo acting on any load point of a cargo hold boundary, in kN/m^2, is to be taken as:

$P_{in} = P_{bs}$	For strength assessment of intact conditions for static (S) design load scenarios, given in Ch 4, Sec 7
$P_{in} = P_{bs} + P_{bd}$	For strength assessment of intact conditions and fatigue assessment for static plus dynamic (S+D) design load scenarios, given in Ch 4, Sec 7

but not less than 0.

where:

P_{bs} : Static pressure due to dry bulk cargo, in kN/m^2, as defined in [2.4.2].

P_{bd} : Dynamic inertial pressure due to dry bulk cargo in cargo holds, in kN/m^2, as defined in [2.4.3].

Static and dynamic pressures as defined in [2.4.2] and [2.4.3] for FE analysis are to be determined using ρ_{eff} instead of ρ_c.

2.4.2 Static pressure

The dry bulk cargo static pressure P_{bs}, in kN/m^2, is to be taken as:

$$P_{bs} = \rho_C \, g K_C \, (z_C - z) \quad \text{but not less than 0.}$$

2.4.3 Dynamic pressure

The dry bulk cargo dynamic pressure P_{bd}, in kN/m^2, for each load case is to be taken as:

$$P_{bd} = f_\beta \, \rho_C \, [0.25 \, a_X \, (x_G - x) + 0.25 \, a_Y \, (y_G - y) + f_{dc} K_C \, a_Z \, (z_C - z)] \quad \text{for } z \le z_c$$

$$P_{bd} = 0 \quad \text{for } z > z_c$$

2.5 Shear load

2.5.1 Application

For FE strength assessment, the following shear load pressures are to be considered in addition to the dry bulk cargo pressures defined in [2.4] when the load point elevation, z, is lower or equal to z_c:

- For static (S) design load scenarios, given in Ch 4, Sec 7: Static shear load, $P_{bs\text{-}s}$, due to gravitational forces acting on hopper tanks and lower stools plating, as defined in [2.5.2].

- For static plus dynamic (S+D) design load scenarios, given in Ch 4, Sec 7: The following dynamic shear load pressures:

  $P_{bs\text{-}s}$ + $P_{bs\text{-}d}$ for the hopper tank and the lower stool plating, as defined in [2.5.3].

  $P_{bs\text{-}dx}$ for the inner bottom plating in the longitudinal direction, as defined in [2.5.4].

  $P_{bs\text{-}dy}$ for the inner bottom plating in the transverse direction, as defined in [2.5.4].

Shear loads as defined in [2.5.2] to [2.5.4] for FE analysis are to be determined using ρ_{eff} instead of ρ_c.

2.5.2 Static shear load on the hopper tank and lower stool plating

The static shear load pressure, $P_{bs\text{-}s}$ (positive downward to the plating) due to dry bulk cargo gravitational forces acting on hopper tank and lower stool plating, in kN/m^2, is to be taken as:

$$P_{bs-s} = \rho_C\, g\, \frac{(1-K_C)\,(z_C - z)}{\tan\alpha}$$

2.5.3 Dynamic shear load on the hopper tank and lower stool plating

The dynamic shear load pressure, $P_{bs\text{-}d}$ (positive downward to the plating) due to dry bulk cargo forces on the hopper tank and lower stool plating, in kN/m^2, for each dynamic load case is to be taken as:

$$P_{bs-d} = f_\beta\, \rho_C\, a_z\, \frac{(1-K_C)\,(z_C - z)}{\tan\alpha}$$

2.5.4 Dynamic shear load along the inner bottom plating for FE analyses

The dynamic shear load pressures, $P_{bs\text{-}dx}$ in the longitudinal direction (positive to bow) due to dry bulk cargo forces acting along the inner bottom plating, in kN/m^2, for each dynamic load case is to be taken respectively as:

$$P_{bs-dx} = -0.75\, f_\beta\, \rho_C\, a_X\, h_C$$

The dynamic shear load pressures, $P_{bs\text{-}dy}$ in the transverse direction (positive to port) due to dry bulk cargo forces acting along the inner bottom plating, in kN/m^2, for each dynamic load case is to be taken respectively as

$$P_{bs-dy} = -0.75\, f_\beta\, \rho_C\, a_y\, h_C$$

The dynamic shear load pressures $P_{bs\text{-}dx}$ and $P_{bs\text{-}dy}$ are only used for FE strength assessment.

3 PRESSURES AND FORCES DUE TO DRY CARGOES IN FLOODED CONDITIONS

3.1 Vertically corrugated transverse watertight bulkheads

3.1.1 Application

The pressure defined in this sub-article applies to vertically corrugated transverse watertight bulkheads of the cargo holds of bulk carriers for the assessment in flooded conditions.

Each cargo hold is to be considered individually flooded, see Figure 5, Figure 6 and Figure 7.

3.1.2 General

The loads to be considered as acting on each bulkhead are those given by the combination of loads induced by cargo loads with those induced by the flooded loads of one hold adjacent to the bulkhead under examination. In any case, the pressure due to the flooded loads without cargo is also to be considered.

The most severe combinations of cargo induced loads and flooded loads are to be used for the check of the scantlings of each bulkhead, depending on the loading conditions included in the loading manual considering the individual flooded condition of both loaded and empty holds:

- Homogeneous loading conditions;
- Non-homogeneous loading conditions;

For the purpose of this article, the following items are defined as:

- Design load limits:

  The specified design load limits for the cargo holds are to be represented by loading conditions defined by the designer in the loading manual.

- Maximum cargo mass to consider:

  Unless the ship is intended to carry, in non-homogeneous conditions, only iron ore or cargo having bulk density equal to or greater than 1.78 t/m^3, the maximum mass of cargo which may be carried in the hold is also to be considered to fill that hold up to the top of the hatch coaming.

- Homogeneous loading conditions:

  Homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling level, evaluated for each hold, does not exceed 1.20, to be corrected for different cargo densities.

- Packed cargoes:

  Holds carrying packed cargoes (such as steel mill products) are to be considered as empty.

- Unconsidered loading conditions:

  Non-homogeneous part loading conditions associated with multi-port loading and unloading operations for homogeneous loading conditions do not need to be considered for the verification of these requirements.

3.1.3 Flooded level

The flooded level z_F is the distance, in m, measured vertically from the baseline with the ship in the upright position, and obtained from Table 4.

Table 4 : Flooded level z_F, in m, for vertically corrugated transverse bulkheads

Bulk carrier type	Vertically corrugated transverse bulkhead position	
	Foremost	Others
Bulk carriers less than 50,000 t deadweight with Type B freeboard	$z_F = 0.95\ D_1$	$z_F = 0.85\ D_1$
	$z_F = 0.9\ D_1$ **(1)**	$z_F = 0.8\ D_1$ **(1)**
Other bulk carriers	$z_F = D_1$	$z_F = 0.9\ D_1$
	$z_F = 0.95\ D_1$ **(1)**	$z_F = 0.85\ D_1$ **(1)**
(1) For ships carrying cargoes having bulk density less than 1.78 t/m^3 in non-homogeneous loading conditions.		

3.1.4 Flooded patterns

Three different flooded patterns are to be considered:

- The flooded level is below the upper surface of the cargo, (see Figure 5: $z_C > z_F$)
- The flooded level is above the upper surface of the cargo, (see Figure 6: $z_C \le z_F$)
- The flooded hold is empty, (see Figure 7: $z_C = h_{DB}$)

Figure 5 : Flooded level below upper surface of bulk cargo

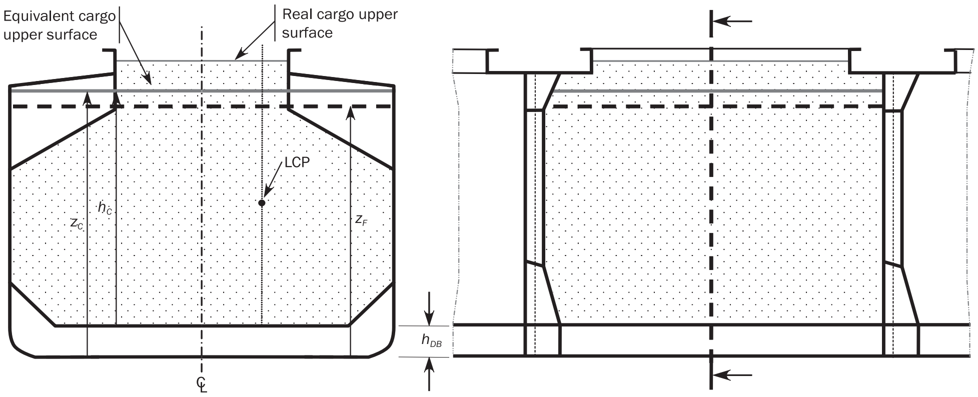

Figure 6 : Flooded level above upper surface of bulk cargo

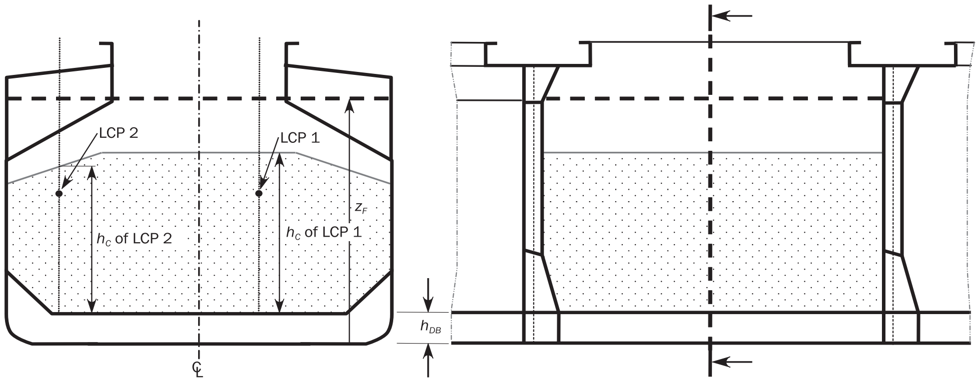

Figure 7 : Flooded cargo hold without cargo

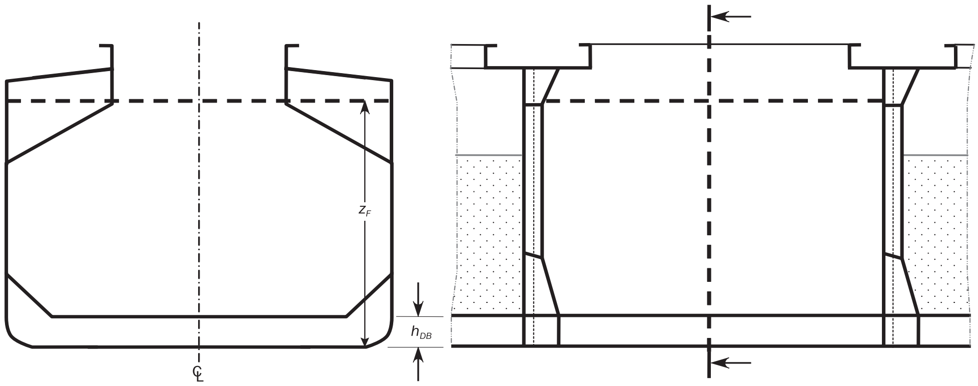


3.1.5 Pressures and forces on vertically corrugated transverse bulkheads of flooded cargo holds

The static pressure $P_{bf\text{-}s}$, in kN/m^2, at any point of the vertically corrugated transverse bulkhead located at a level z from the baseline is given in Table 5 for each flooded pattern defined in [3.1.4].

The force $F_{bf\text{-}s}$, in kN, acting on a corrugation of a transverse bulkhead is given by Table 6 for each flooded pattern defined in [3.1.4].

where:

$P_{bf\text{-}s\text{-}LE}$: Static pressure calculated according to Table 5 for $z = h_{LS} + h_{DB}$.

Table 5 : Static pressure on vertically corrugated transverse bulkhead of a flooded cargo hold P_{bf-s}

Flooded case	Load point position	Pressure P_{bf-s}, in kN/m²
$z_C > z_F$	$z > z_C$	$P_{bf-s} = 0$
	$z_C \geq z \geq z_F$	$P_{bf-s} = \rho_C\, g\, (z_C - z)\, K_{C-f}$
	$z_F > z \geq h_{DB}$	$P_{bf-s} = \rho g\, (z_F - z) + [\rho_C\, (z_C - z) - \rho\, (1 - perm)\, (z_F - z)]\, g K_{C-f}$
$h_{DB} \leq z_C \leq z_F$	$z > z_F$	$P_{bf-s} = 0$
	$z_F \geq z \geq z_C$	$P_{bf-s} = \rho g\, (z_F - z)$
	$z_C > z \geq h_{DB}$	$P_{bf-s} = \rho g\, (z_F - z) + [\rho_C - \rho\, (1 - perm)]\, g\, (z_C - z)\, K_{C-f}$

Table 6 : Force acting on a corrugation in the flooded cargo holds F_{bf-s}

Flooded case	Force F_{bf-s}, in kN
$z_C > z_F$	$F_{bf-s} = s_C \left\{ \rho_C\, g\, \dfrac{(z_C - z_F)^2}{2}\, K_{C-f} + \left[\dfrac{\rho_C\, g\, (z_C - z_F)\, K_{C-f} + P_{bf-s-LE}}{2}\right] (z_F - h_{DB} - h_{LS}) \right\}$
$z_F \geq z_C$	$F_{bf-s} = s_C \left\{ \rho g\, \dfrac{(z_F - z_C)^2}{2} + \left[\dfrac{\rho g\, (z_F - z_C) + P_{bf-s-LE}}{2}\right] (z_C - h_{DB} - h_{LS}) \right\}$

3.1.6 Pressures and forces on vertically corrugated transverse bulkheads of non-flooded cargo holds

The static pressure P_{bs}, in kN/m², at a point of the vertically corrugated transverse bulkhead located, located at the level z from the baseline, due to dry bulk cargo of a non-flooded cargo hold acting on the intact side of the transverse bulkhead which is flooded on the other side is to be taken as:

$P_{bs} = \rho_C\, g\, K_{C-f}\, (z_C - z)$ but not less than 0.

The resultant force F_{bs}, in kN, acting on a corrugation is to be taken as:

$$F_{bs} = \rho_C\, g s_C\, \frac{(z_C - h_{DB} - h_{LS})^2}{2}\, K_{C-f}$$

3.1.7 Resultant pressures and forces on vertically corrugated transverse bulkheads of flooded cargo holds

The resultant pressure P_R, in kN/m², at each point of the bulkhead, and the resultant force F_R, in kN, acting on a corrugation, given in Table 7, are to be considered for the assessment in flooded conditions of vertically corrugated transverse bulkhead structures, where:

P_{bf-s} : Pressure in the flooded cargo holds, in kN/m², as defined in [3.1.5].

P_{bs} : Pressure in the non-flooded cargo holds, in kN/m², as defined in [3.1.6].

F_{bf-s} : Force acting on a corrugation in the flooded cargo holds, in kN, as defined in [3.1.5].

F_{bs} : Force acting on a corrugation in the non-flooded cargo holds, in kN, as defined in [3.1.6].

Table 7 : Resultant pressure P_R and resultant force F_R on vertically corrugated transverse bulkhead in flooded condition

Loading condition	Resultant pressure P_R, in kN/m^2	Resultant force F_R, in kN	Application
Homogeneous	$P_R = P_{bf\text{-}s} - 0.8\ P_{bs}$	$F_R = F_{bf\text{-}s} - 0.8\ F_{bs}$	All bulk carriers
Alternate	$P_R = P_{bf\text{-}s}$	$F_R = F_{bf\text{-}s}$	BC-A bulk carriers

3.2 Double bottom in cargo hold region of bulk carrier in flooded conditions

3.2.1 Application

Each cargo hold is to be considered individually flooded.

3.2.2 General

The loads to be considered as acting on the double bottom are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of the hold to which the double bottom belongs.

The most severe combinations of cargo induced loads and flooded loads are to be used, depending on the loading conditions included in the loading manual:

- Homogeneous loading conditions.
- Non-homogeneous loading conditions.
- Packed cargo conditions (such as in the case of steel mill products).

For each loading condition, the maximum dry bulk cargo density to be carried is to be considered in calculating the allowable hold loading.

3.2.3 Flooded level

The flooded level z_F is the distance, in m, measured vertically from the baseline with the ship in the upright position, and obtained from Table 8.

Table 8 : Flooded level z_F, for double bottom in cargo hold region of bulk carrier

Bulk carrier type	Cargo hold	
	Foremost	Others
Bulk carriers less than 50,000 t deadweight with Type-B freeboard	$z_F = 0.95\ D_1$	$z_F = 0.85\ D_1$
Other bulk carriers	$z_F = D_1$	$z_F = 0.9\ D_1$

4 STEEL COIL LOADS IN CARGO HOLDS OF BULK CARRIERS

4.1 General

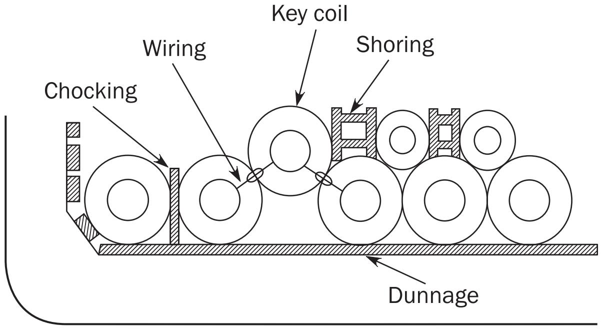
4.1.1 Application

The provision is determined by assuming Figure 8 as the standard means of securing steel coils loaded on wooden dunnage.

It is assumed that all the steel coils have the same characteristics.

In cases where steel coils are lined up in two or more tiers, formulae in [4.1.3] and [4.2] can be applied assuming that only the lowest tier of steel coils is in contact with hopper sloping plate or inner side plate. In other cases, scantling requirements are to be determined on a case-by-case basis.

Figure 8 : Inner bottom loaded by steel coils



4.1.2 Arrangement of steel coils on inner bottom

The two following arrangements of steel coils on the inner bottom are considered:

- The steel coils are positioned without respect to the location of the inner bottom floors, as shown in Figure 9.
- The steel coils are positioned with respect to the location of the inner bottom floors, as shown in Figure 10.

Figure 9 : Steel coils loaded independently of inner bottom floors locations

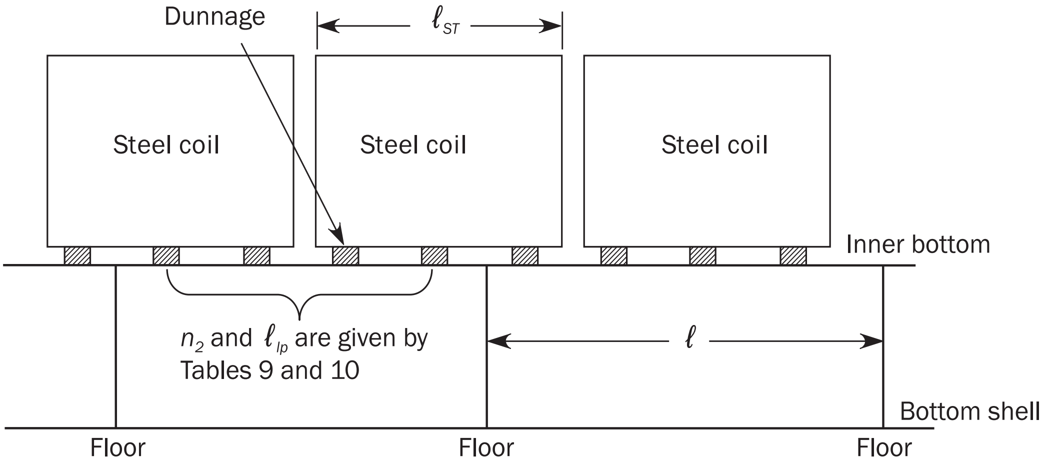


Figure 10 : Steel coils loaded between inner bottom floors

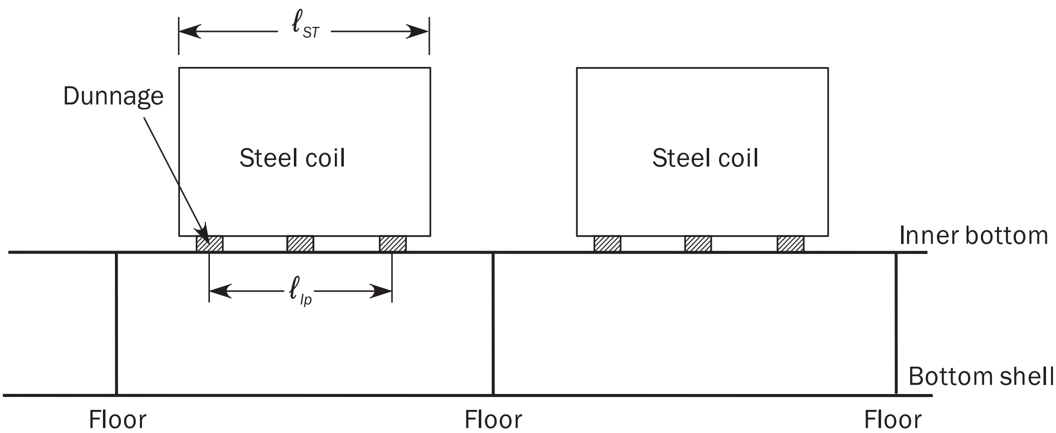

4.1.3 Arrangement of steel coils independently of the floor locations

For steel coils loaded without respect to the location of floors in the inner bottom, see Figure 9:

The number n_2 of load point dunnages per elementary plate panels is to be found in comply with Table 9.

The distance ℓ_{lp}, in m, between outermost load point dunnages per elementary plate panel is to be found in comply with Table 10.

Table 9 : Number n_2 of load point dunnages per elementary plate panel

n_2	n_3			
	2	3	4	5
1	$0 < \frac{\ell}{\ell_{st}} \le 0.5$	$0 < \frac{\ell}{\ell_{st}} \le 0.33$	$0 < \frac{\ell}{\ell_{st}} \le 0.25$	$0 < \frac{\ell}{\ell_{st}} \le 0.2$
2	$0.5 < \frac{\ell}{\ell_{st}} \le 1.2$	$0.33 < \frac{\ell}{\ell_{st}} \le 0.67$	$0.25 < \frac{\ell}{\ell_{st}} \le 0.5$	$0.2 < \frac{\ell}{\ell_{st}} \le 0.4$
3	$1.2 < \frac{\ell}{\ell_{st}} \le 1.7$	$0.67 < \frac{\ell}{\ell_{st}} \le 1.2$	$0.5 < \frac{\ell}{\ell_{st}} \le 0.75$	$0.4 < \frac{\ell}{\ell_{st}} \le 0.6$
4	$1.7 < \frac{\ell}{\ell_{st}} \le 2.4$	$1.2 < \frac{\ell}{\ell_{st}} \le 1.53$	$0.75 < \frac{\ell}{\ell_{st}} \le 1.2$	$0.6 < \frac{\ell}{\ell_{st}} \le 0.8$
5	$2.4 < \frac{\ell}{\ell_{st}} \le 2.9$	$1.53 < \frac{\ell}{\ell_{st}} \le 1.87$	$1.2 < \frac{\ell}{\ell_{st}} \le 1.45$	$0.8 < \frac{\ell}{\ell_{st}} \le 1.2$
6	$2.9 < \frac{\ell}{\ell_{st}} \le 3.6$	$1.87 < \frac{\ell}{\ell_{st}} \le 2.4$	$1.45 < \frac{\ell}{\ell_{st}} \le 1.7$	$1.2 < \frac{\ell}{\ell_{st}} \le 1.4$
7	$3.6 < \frac{\ell}{\ell_{st}} \le 4.1$	$2.4 < \frac{\ell}{\ell_{st}} \le 2.73$	$1.7 < \frac{\ell}{\ell_{st}} \le 1.95$	$1.4 < \frac{\ell}{\ell_{st}} \le 1.6$
8	$4.1 < \frac{\ell}{\ell_{st}} \le 4.8$	$2.73 < \frac{\ell}{\ell_{st}} \le 3.07$	$1.95 < \frac{\ell}{\ell_{st}} \le 2.4$	$1.6 < \frac{\ell}{\ell_{st}} \le 1.8$
9	$4.8 < \frac{\ell}{\ell_{st}} \le 5.3$	$3.07 < \frac{\ell}{\ell_{st}} \le 3.6$	$2.4 < \frac{\ell}{\ell_{st}} \le 2.65$	$1.8 < \frac{\ell}{\ell_{st}} \le 2.0$
10	$5.3 < \frac{\ell}{\ell_{st}} \le 6.0$	$3.6 < \frac{\ell}{\ell_{st}} \le 3.93$	$2.65 < \frac{\ell}{\ell_{st}} \le 2.9$	$2.0 < \frac{\ell}{\ell_{st}} \le 2.4$

Table 10 : Distance between outermost load point dunnages per elementary plate panel, ℓ_{lp}, in m

n_2	n_3			
	2	3	4	5
1	Actual breadth of dunnages			
2	$0.5\ell_{st}$	$0.33\ell_{st}$	$0.25\ell_{st}$	$0.2\ell_{st}$
3	$1.2\ell_{st}$	$0.67\ell_{st}$	$0.50\ell_{st}$	$0.4\ell_{st}$
4	$1.7\ell_{st}$	$1.20\ell_{st}$	$0.75\ell_{st}$	$0.6\ell_{st}$

9	$4.8\ell_{st}$	$3.07\ell_{st}$	$2.40\ell_{st}$	$1.8\ell_{st}$
10	$5.3\ell_{st}$	$3.60\ell_{st}$	$2.65\ell_{st}$	$2.0\ell_{st}$

4.1.4 Arrangement of steel coils between floors

For steel coils loaded with respect to the locations of floors in the inner bottom, see Figure 10:

- The number n_2 of load point dunnages per elementary plate panels is to be taken as: $n_2 = n_3$
- The distance ℓ_{lp} between outermost load point dunnages per elementary plate panel is to be taken as the distance between the outermost dunnage supporting one row of steel coils.

4.1.5 Centre of gravity of steel coil cargo

The centre of gravity of the steel coil cargo of the considered cargo hold is to be taken at the following position:

a) Longitudinal position

x_{Gsc} is the X coordinate, in m, of the volumetric centre of gravity of the considered cargo hold with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

b) Transverse position

$$y_{Gsc} = \varepsilon \frac{B_H}{4}$$

c) Vertical position

$$z_{Gsc} = h_{DB} + \left[1 + (n_1 - 1)\frac{\sqrt{3}}{2}\right]\frac{d_{sc}}{2}$$

where:

ε : Coefficient to be taken as:

ε = 1.0 when a port side structural member is assessed.

ε = -1.0 when a starboard side structural member is assessed.

4.2 Total loads

4.2.1 Total load on the inner bottom

The total load F_{sc-ib}, in kN, due to steel coil cargoes on the inner bottom is to be taken as:

$$F_{sc-ib} = \cos(C_{XG}\,\varphi)\,\cos(C_{YG}\,\theta)\,F_{sc-ib-s} + F_{sc-ib-d} \text{ but not less than 0}$$

where:

$F_{sc-ib-s}$: Static load, in kN, on the inner bottom, given in [4.3.1].

$F_{sc-ib-d}$: Dynamic load, in kN, on the inner bottom, given in [4.4.2].

C_{XG}, C_{YG} : Load combination factors, as defined in Ch 4, Sec 2, [2.2].

4.2.2 Total load on the hopper side

The total load F_{sc-hs}, in kN, due to steel coil cargoes on the hopper side is to be taken as:

$$F_{sc-hs} = \frac{\cos(\theta_h + \varepsilon\,C_{YG}\,\theta)\,\cos(C_{XG}\,\varphi)}{\cos\theta_h}F_{sc-hs-s} + F_{sc-hs-d} \text{ but not less than 0}$$

where:

$F_{sc-hs-s}$: Static load, in kN, on the hopper side, given in [4.3.2].

$F_{sc-hs-d}$: Dynamic load, in kN, on the hopper, given in [4.4.3].

C_{XG}, C_{YG} : Load combination factors, as defined in Ch 4, Sec 2, [2.2].

4.3 Static loads

4.3.1 Static loads on the inner bottom

The static load $F_{sc-ib-s}$, in kN, on the inner bottom due to steel coils is to be taken as:

$$F_{sc-ib-s} = M_{sc-ib} g$$

where:

M_{sc-ib} : Equivalent mass of steel coils, in t, to be taken as:

$$M_{sc-ib} = K_S\, W \frac{n_1\, n_2}{n_3} \quad \text{for} \quad n_2 \le 10 \quad \text{and} \quad n_3 \le 5$$

$$M_{sc-ib} = K_S\, W n_1 \frac{\ell}{\ell_{st}} \quad \text{for} \quad n_2 > 10 \quad \text{or} \quad n_3 > 5$$

K_S : Coefficient to be taken as:

K_S = 1.4 when steel coils are lined up in one tier with a key coil.

K_S= 1.0 in other cases.

4.3.2 Static load on the hopper side

The static load $F_{sc-hs-s}$, in kN, on the hopper side due to steel coils is to be taken as:

$$F_{sc-hs-s} = \cos\theta_h M_{sc-hs} \cdot g$$

where:

M_{sc-hs} : Equivalent mass of steel coils, in t, to be taken as:

$$M_{sc-hs} = C_k\, W \frac{n_2}{n_3} \quad \text{for} \quad n_2 \le 10 \quad \text{and} \quad n_3 \le 5$$

$$M_{sc-hs} = C_k\, W \frac{\ell}{\ell_{st}} \quad \text{for} \quad n_2 > 10 \quad \text{or} \quad n_3 > 5$$

C_k : Coefficient to be taken as:

C_k = 3.2 when steel coils are lined up two or more tiers, or when steel coils are lined up one tier and key coil is located second or 3rd from hopper sloping plate or inner hull plate.

C_k = 2.0 for other cases.

4.4 Dynamic loads

4.4.1 Tangential roll acceleration

The tangential roll acceleration a_R, in m/s^2, is to be taken as:

$$a_R = \theta \frac{\pi}{180} \left(\frac{2\pi}{T_\theta}\right)^2 \sqrt{y_{Gsc}^2 + (R - z_{Gsc})^2}$$

where:

y_{Gsc} : Y coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

z_{Gsc} : Z coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

4.4.2 Dynamic load on the inner bottom

The dynamic load $F_{sc\text{-}ib\text{-}d}$, in kN, on the inner bottom due to steel coils is to be taken as:

$$F_{sc-ib-d} = M_{sc-ib}\, a_z$$

where:

a_z : Vertical acceleration, in m/s^2, as defined in Ch 4, Sec 3, [3.2.4], calculated at the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

4.4.3 Dynamic load on the hopper side

The dynamic load $F_{sc\text{-}hs\text{-}d}$, in kN, on the hopper side due to steel coils is to be taken as:

$$F_{sc-hs-d} = \varepsilon M_{sc-hs}\left[C_{YR}\, a_R\, \sin\left(\tan^{-1}\left|\frac{y_{Gsc}}{R - z_{Gsc}}\right| - \theta_h\right) - C_{YS}\, a_{sway}\, \sin\theta_h\right]$$

where:

C_{YS}, C_{YR} : Load combination factors, defined in Ch 4, Sec 2, [2.2].

a_{sway} : Sway acceleration, in m/s^2, as defined in Ch 4, Sec 3, [2.2.2].

a_R : Tangential acceleration, in m/s^2, as defined in [4.4.1].

y_{Gsc} : Y coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

z_{Gsc} : Z coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

5 LOADS ON NON-EXPOSED DECKS AND PLATFORMS

5.1 Application

5.1.1 General

The loads defined in [5.2] and [5.3] are applicable to non-exposed decks, accommodation decks and platforms.

5.2 Pressure due to distributed load

5.2.1

If a distributed load is carried on a deck, the static and dynamic pressures due to this distributed load are to be considered.

The static distributed load is to be defined by the designer without being less than 3 kN/m^2 for accommodation decks and 10 kN/m^2 for other decks and platforms.

The pressure P_{dl}, in kN/m^2, due to this distributed load for the static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:

$$P_{dl} = P_{dl-s}$$

The pressure P_{dl}, in kN/m^2, due to this distributed load for the static plus dynamic (S+D) design load scenarios, is to be derived for the envelope of dynamic load cases and is to be taken as:

$$P_{dl} = P_{dl-s} + P_{dl-d} \quad \text{but not less than 0.}$$

where:

$P_{dl\text{-}s}$: Static pressure, in kN/m^2, due to the distributed load.

P_{dl-d} : Dynamic pressure, in kN/m^2, due to the distributed load, in kN/m^2, to be taken as:

$$P_{dl-d} = f_\beta \frac{a_{Z-env}}{g} P_{dl-s}$$

a_{z-env} : Envelope of vertical acceleration, in m/s^2, at the load position being considered, for the dynamic load cases, given in Ch 4, Sec 3, [3.3.3].

5.3 Concentrated force due to unit load

5.3.1

If a unit load is carried on an internal deck, the static and dynamic forces due to the unit load carried are to be considered.

The force F_U, in kN, due to this concentrated load for the static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:

$$F_U = F_{U-s}$$

The force F_U, in kN, due to this concentrated load for the static plus dynamic (S+D) design load scenarios, is to be derived for the envelope of dynamic load cases and is to be taken as:

$F_U = F_{U-s} + F_{U-d}$ but not less than 0.

where:

F_{U-s} : Static force, in kN, due to the unit load to be taken as:

$$F_{U-s} = m_U g$$

F_{U-d} : Dynamic force, in kN, due to unit load to be taken as:

$$F_{U-d} = m_U f_\beta a_{z-env}$$

m_U : Mass of the unit load carried, in t.

a_{z-env} : Envelope of vertical acceleration, in m/s^2, at the centre of gravity of the unit load carried for the dynamic load cases, given in Ch 4, Sec 3, [3.3.3].

6 SLOSHING PRESSURES IN TANKS

6.1 General

6.1.1 Application

This article applies to all liquid cargo, ballast tanks and other tanks with volume exceeding 100 m^3, but does not apply to the water ballast cargo hold of bulk carriers.

6.1.2

The sloshing pressures defined in this article do not include the effect of impact pressures due to high velocity impacts with tank boundaries or internal structures. For tanks with a maximum effective sloshing breadth, b_{slh}, see [6.4.2], greater than 0.56 B or a maximum effective sloshing length, ℓ_{slh}, see [6.3.2], greater than 0.13 L at any filling level from 0.05 h_{max} to 0.95 h_{max}, see [6.3.3], a separate impact assessment is to be carried out in accordance with the Society procedures.

6.1.3 Sloshing pressure on tank boundaries and internal divisions

The sloshing pressure due to liquid motions in a tank P_{slh} acting on any load point of a tank boundary or internal divisions, in kN/m^2, for the sloshing design load scenario, given in Ch 4, Sec 7, is to be taken as follows, without being less than $P_{slh\text{-}min}$, as given in [6.2]:

- $P_{slh} = P_{slh\text{-}lng}$ for transverse bulkheads, as defined in [6.3.3].
- $P_{slh} = P_{slh\text{-}wf}$ for web frames and transverse stringers, as defined in [6.3.4].
- $P_{slh} = P_{slh\text{-}t}$ for longitudinal bulkheads, as defined in [6.4.3].
- $P_{slh} = P_{slh\text{-}grd}$ for longitudinal girders and stringers, see [6.4.4].

6.2 Minimum sloshing pressure

6.2.1

The minimum sloshing pressure, $P_{slh\text{-}min}$, for tanks of cellular construction, i.e. double hull construction with internal structures restricting the fluid motion, is to be taken as 12 kN/m^2.

The minimum sloshing pressure, $P_{slh\text{-}min}$, for cargo and all other tanks is to be taken as 20 kN/m^2.

6.3 Sloshing pressure due to longitudinal liquid motion

6.3.1 Application

The sloshing pressure due to longitudinal liquid motion, $P_{slh\text{-}lng}$, is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 h_{max} to 0.95 h_{max}, in 0.05 h_{max} increments.

6.3.2 Effective sloshing length

The effective sloshing length, ℓ_{slh}, in m, is to be taken as defined in Table 11.

Table 11 : Effective sloshing length ℓ_{slh}

Type of transverse bulkhead	ℓ_{slh}
Transverse tight bulkheads	$\ell_{slh} = \dfrac{(1 + n_{WT}\,\alpha_{WT})\,(1 + f_{wf}\,\alpha_{wf})\ell_{tk-h}}{(1 + n_{WT})\,(1 + f_{wf})}$
Transverse wash bulkheads	$\ell_{slh} = \dfrac{[1 + (n_{WT} - 1)\,\alpha_{WT}]\,(1 + f_{wf}\,\alpha_{wf})\ell_{tk-h}}{(1 + n_{WT})\,(1 + f_{wf})}$

where:

n_{WT} : Number of transverse wash bulkheads in the tank.

α_{WT} : Transverse wash bulkhead coefficient, to be taken as (see Figure 11):

$$\alpha_{WT} = \frac{A_{OWT}}{A_{tk-t-h}}$$

α_{wf} : Transverse web frame coefficient, to be taken as (see Figure 12):

$$\alpha_{wf} = \frac{A_{O-wf-h}}{A_{tk-t-h}}$$

For tanks with changing shape along the length and/or with web frames of different shape the transverse web frame coefficient, α_{wf}, may be taken as the weighted average of all web frame locations in the tank given as:

$$\alpha_{wf} = \frac{\sum_{i=1}^{n_{wf}} \frac{A_{O-wf-h_i}}{A_{tk-t-h_i}}}{n_{wf}}$$

A_{OWT} : Total area of openings, in m^2, in the transverse section in way of the wash bulkhead below the considered filling height.

$A_{tk\text{-}t\text{-}h}$: Total transverse cross sectional area, in m^2, of the tank below the considered filling height.

$A_{O\text{-}wf\text{-}h}$: Total area of openings, in m^2, in the transverse section in way of the web frame below the considered filling height.

f_{wf} : Factor to account for number of transverse web frames and transverse wash bulkheads in the tank, to be taken as:

$$f_{wf} = \frac{n_{wf}}{1 + n_{WT}}$$

n_{wf} : Number of transverse web frames, excluding wash bulkheads, in the tank.

$\ell_{tk\text{-}h}$: Length of cargo tank, in m, at considered filling height.

Figure 11 : Transverse wash bulkhead coefficient

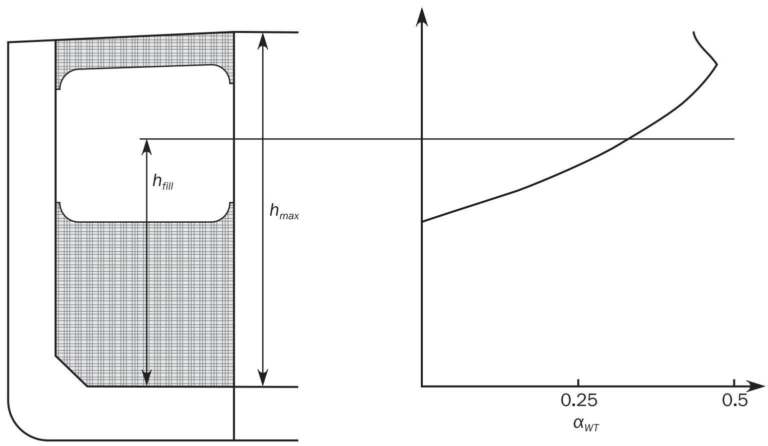

Figure 12 : Transverse web frame coefficient

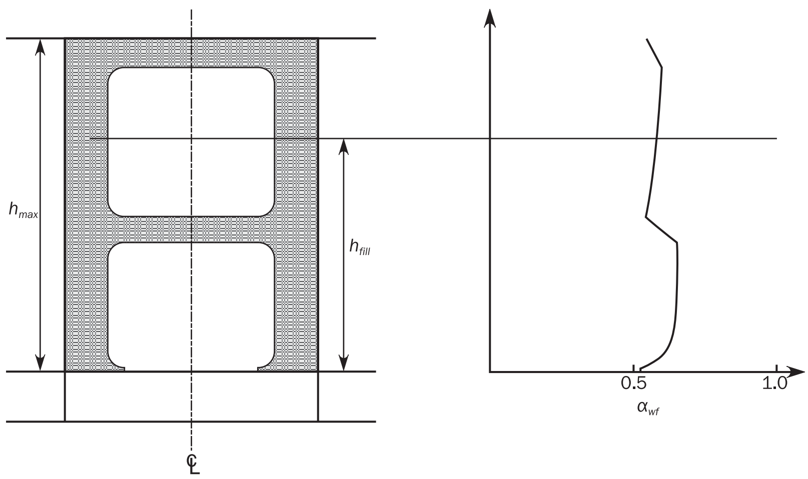


6.3.3 Sloshing pressure in way of transverse bulkheads

The sloshing pressure in way of transverse bulkheads including wash bulkheads due to longitudinal liquid motion, $P_{slh-lng}$, in kN/m², for a particular filling level, is to be taken as:

$$P_{slh-\ln g} = \rho_{slh}\, g\ell_{slh}\, f_{slh}\left[0.4 - \left(0.39 - \frac{1.7\ \ell_{slh}}{L}\right)\frac{L}{350}\right]$$

where:

ℓ_{slh} : Effective sloshing length, in m, as defined in [6.3.2].

f_{slh} : Coefficient taken as:

$$f_{slh} = 1 - 2\left(0.7 - \frac{h_{fill}}{h_{max}}\right)^2$$

h_{fill} : Filling height, measured from tank bottom, in m, see Figure 11.

6.3.4 Sloshing pressure on internal web frames or transverse stringers adjacent to a transverse bulkhead

For tanks with internal web frames the sloshing pressure acting on a web frame or transverse stringer adjacent to transverse bulkheads or transverse wash bulkheads due to longitudinal liquid motion, P_{slh-wf}, in kN/m², provided it is located within 0.25 ℓ_{slh} from the bulkhead, is to be taken as:

$$P_{slh-wf} = P_{slh-\ln g}\left(1 - \frac{s_{wf}}{\ell_{slh}}\right)^2$$

where:

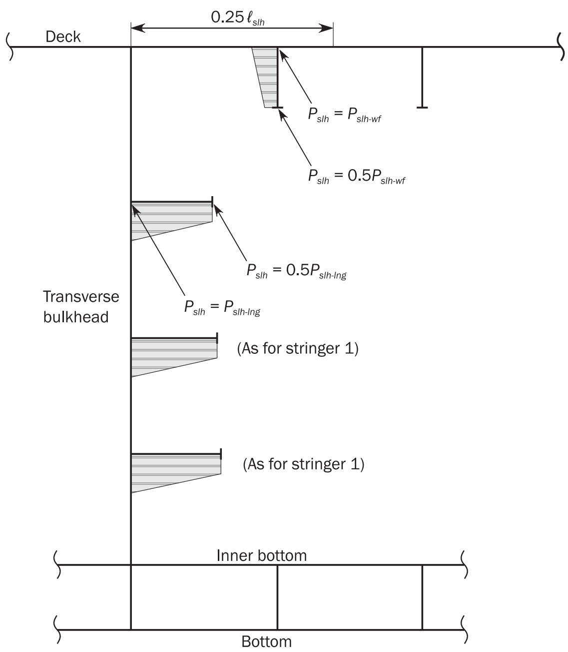
ℓ_{slh} : Effective sloshing length, in m, as defined in [6.3.2].

$P_{slh-lng}$: Sloshing pressure due to longitudinal liquid motion acting on transverse bulkhead, as defined in [6.3.3].

s_{wf} : Distance from transverse bulkhead to web frame under consideration, in m.

The distribution of pressure across web frames and transverse stringers is given in Figure 13.

Figure 13 : Sloshing pressure distribution on transverse stringers and web frames



6.4 Sloshing pressure due to transverse liquid motion

6.4.1 Application

The sloshing pressure due to transverse liquid motion, $P_{slh\text{-}t}$, is to be taken constant as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 h_{max} to 0.95 h_{max}, in 0.05 h_{max} increments.

6.4.2 Effective sloshing breadth

The effective sloshing breadth, b_{slh}, in m, is to be taken as in Table 12, but not less than 0.3B.

Table 12 : Effective sloshing breadth b_{slh}

Type of longitudinal bulkhead	b_{slh}
Longitudinal tight bulkheads	$b_{slh} = \dfrac{(1 + n_{WL}\ \alpha_{WL})\ (1 + f_{grd}\ \alpha_{grd})\ b_{tk-h}}{(1 + n_{WL})\ (1 + f_{grd})}$
Longitudinal wash bulkheads	$b_{slh} = \dfrac{[1 + (n_{WL} - 1)\ \alpha_{WL}]\ (1 + f_{grd}\ \alpha_{grd})\ b_{tk-h}}{(1 + n_{WL})\ (1 + f_{grd})}$

where:

n_{WL} : Number of longitudinal wash bulkheads in the tank.

α_{WL} : Longitudinal wash bulkhead coefficient:

$$\alpha_{WL} = \frac{A_{OWL}}{A_{tk-L-h}}$$

α_{grd} : Girder coefficient, to be taken as:

$$\alpha_{grd} = \frac{A_{O-grd-h}}{A_{tk-L-h}}$$

A_{OWL} : Total area of openings, in m^2, in the longitudinal section in way of the wash bulkhead below the considered filling height.

$A_{tk\text{-}L\text{-}h}$: Total longitudinal cross sectional area, in m^2, of the tank below the considered filling height.

$A_{O\text{-}grd\text{-}h}$: Total area of openings, in m^2, in the longitudinal section in way of the web frame below the considered filling height.

f_{grd} : Factor to account for number of longitudinal girders and longitudinal wash bulkheads in the tank, to be taken as:

$$f_{grd} = \frac{n_{grd}}{1 + n_{WL}}$$

n_{grd} : Number of longitudinal girders, excluding longitudinal wash bulkheads, in the tank.

$b_{tk\text{-}h}$: Breadth of cargo tank, in m, at considered filling height.

6.4.3 Sloshing pressure in way of longitudinal bulkheads

The sloshing pressure in way of longitudinal bulkheads including wash bulkheads due to transverse liquid motion, $P_{slh\text{-}t}$, in kN/m^2, for a particular filling level, is to be taken as:

$$P_{slh-t} = 7\ \rho_{slh}\ g f_{slh} \left(\frac{b_{slh}}{B} - 0.3\right)\ GM^{0.75}$$

where:

b_{slh} : Effective sloshing breadth defined in [6.4.2].

GM : Metacentric height, given in Ch 4, Sec 3, [2.1.1].

For the calculation of sloshing pressure in ballast tanks the 'ballast condition' is to be used for oil tankers and the 'normal ballast condition' for bulk carriers.

For the calculations of sloshing pressure in cargo tanks of oil tankers, the 'partial load condition' is to be used.

6.4.4 Sloshing pressure on internal girders or longitudinal stringers adjacent to longitudinal bulkheads

For tanks with internal girders or stringers, the sloshing pressure acting on the girder/web frame adjacent to longitudinal bulkheads and longitudinal wash bulkhead, $P_{slh\text{-}grd}$, in kN/m², provided it is located within 0.25 b_{slh} from the bulkhead, is to be taken as:

$$P_{slh-grd} = P_{slh-t}\left(1 - \frac{s_{grd}}{b_{slh}}\right)^2$$

where:

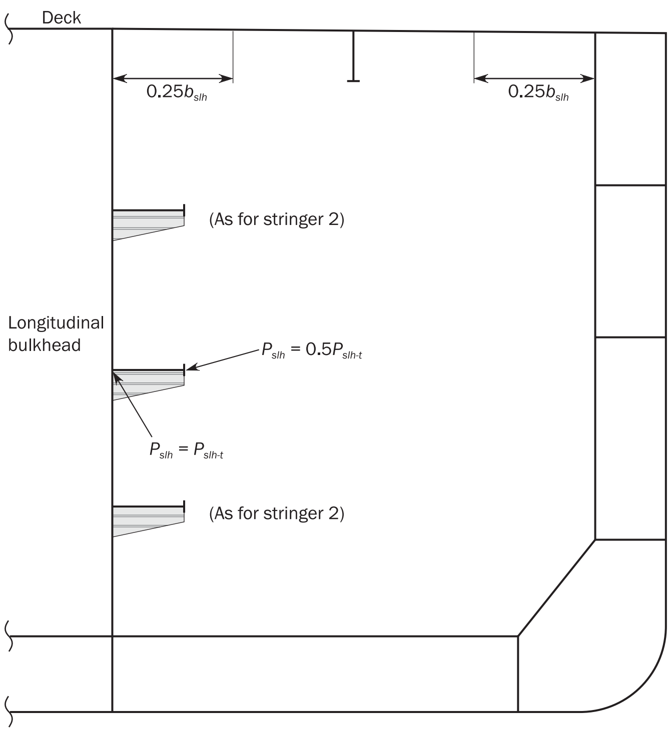
b_{slh} : Effective sloshing breadth defined in [6.4.2].

$P_{slh\text{-}t}$: Sloshing pressure due to transverse liquid motion acting on longitudinal bulkhead, as defined in [6.4.3].

s_{grd} : Distance from longitudinal bulkhead to girder under consideration, in m.

The distribution of pressure across stringers is given in Figure 14. The distribution of pressure across longitudinal girders is similar to the deck web frame shown in Figure 13.

Figure 14 : Sloshing pressure distribution on longitudinal stringers and girders



7 DESIGN PRESSURE FOR TANK TESTING

7.1 Definition

7.1.1

The actual strength testing is to be carried out in accordance with Ch 1, Sec 2, [3.8.4]. In order to assess the structure, static design pressures are to be applied.

The design pressure for tank testing, P_{ST}, in kN/m^2, is to be taken as:

$$P_{ST} = 10\ (z_{ST} - z)$$

where:

z_{ST} : Design testing load height, in m, as defined in Table 13.

Table 13 : Design testing load height z_{ST}

Compartment	z_{ST}
Double bottom tanks (1)	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{bd}$
Hopper side tanks, topside tanks, double side tanks, fore and aft peaks used as tank, cofferdams	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{top} + 2.4$
Tank bulkheads, deep tanks, fuel oil bunkers	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{top} + 2.4$ $z_{ST} = z_{top} + 0.1\ P_{PV}$
Ballast hold	$z_{ST} = z_h + 0.9$
Chain locker (if aft of collision bulkhead)	$z_{ST} = z_{top}$
Independent tanks	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{top} + 0.9$
Ballast ducts	Testing load height corresponding to ballast pump maximum pressure

where:

z_{bd} : Z coordinate, in m, of the bulkhead deck.

z_h : Z coordinate, in m, of the top of hatch coaming.

(1) For double bottom tanks connected with hopper side tanks, topside tanks or double side tanks, z_{ST} corresponding to "Hopper side tanks, topside tanks, double side tanks, fore and aft peaks used as tank, cofferdams" is applicable.

SECTION 7
DESIGN LOAD SCENARIOS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

VBM : Design vertical bending moment, in kNm.

M_{sw} : Permissible hull girder hogging and sagging still water bending moment for seagoing operation, in kNm, as defined in Ch 4, Sec 4, [2.2.2].

M_{sw-p} : Permissible hull girder hogging and sagging still water bending moment for harbour/sheltered water operation, in kNm, as defined in Ch 4, Sec 4, [2.2.3].

M_{sw-f} : Permissible hull girder hogging or sagging still water bending moment M_{sw-f} for seagoing operation in the flooded condition, in kNm, as defined in Ch 4, Sec 4, [2.2.4].

M_{wv-LC} : Vertical wave bending moment for a considered dynamic load case, in kNm, as defined in Ch 4, Sec 4, [3.5.2].

HBM : Design horizontal bending moment, in kNm.

M_{wh-LC} : Horizontal wave bending moment for a considered dynamic load case, in kNm, as defined in Ch 4, Sec 4, [3.5.4].

TM : Design torsional moment, in kNm.

M_{wt-LC} : Wave torsional moment for a considered dynamic load case, in kNm, as defined in Ch 4, Sec 4, [3.5.5].

VSF : Design vertical shear force, in kN.

Q_{sw} : Permissible hull girder positive and negative still water shear force limits for seagoing operation, in kN, as defined in Ch 4, Sec 4, [2.3.1] or Ch 4, Sec 4, [2.3.3].

Q_{sw-p} : Permissible hull girder positive and negative still water shear force limits for harbour/sheltered water operation, in kN, as defined in Ch 4, Sec 4, [2.3.2] or Ch 4, Sec 4, [2.3.4].

Q_{sw-f} : Permissible hull girder positive and negative still water shear force for seagoing operation in the flooded condition, in kN, as defined in Ch 4, Sec 4, [2.3.5].

Q_{wv-LC} : Vertical wave shear force for a considered dynamic load case, in kN, as defined in Ch 4, Sec 4, [3.5.3].

P_{ex} : Design external pressure, in kN/m^2.

P_S : Static sea pressure at considered draught, in kN/m^2, as defined in Ch 4, Sec 5, [1.2.1].

P_W : Dynamic pressure for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 5, [1.3.2] to Ch 4, Sec 5, [1.3.8].

P_D : Green sea load for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 5, [2.2.3] and Ch 4, Sec 5, [2.2.4].

P_{in} : Design internal pressure, in kN/m^2.

P_{ST} : Tank testing pressure, in kN/m^2, see Ch 4, Sec 6, [7.1.1].

P_{ls} : Static liquid pressure in tank, in kN/m^2, as defined in Ch 4, Sec 6, [1.2].

P_{ld} : Dynamic liquid pressure in tank for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 6, [1.3].

P_{bs} : Dry bulk cargo static pressure, in kN/m^2, as defined in Ch 4, Sec 6, [2.5.2].

P_{bd} : Dry bulk cargo dynamic pressure for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 6, [2.5.3].

P_{fs} : Static pressure in compartments and tanks in flooded condition, in kN/m^2, as defined in Ch 4, Sec 6, [1.4.1].

P_{fd} : Dynamic pressure in compartments and tanks in flooded condition, in kN/m^2, as defined in Ch 4, Sec 6, [1.5.1]

$P_{dl\text{-}s}$: Static pressure on non-exposed decks and platforms, in kN/m^2, as defined in Ch 4, Sec 6, [5.2.1].

$P_{dl\text{-}d}$: Dynamic pressure on non-exposed decks and platforms for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 6, [5.2.1]

$F_{U\text{-}s}$: Static load acting on supporting structures and securing systems for heavy units or cargo, equipment or structural components, in kN, as defined in Ch 4, Sec 5, [2.3.2].

$F_{U\text{-}d}$: Dynamic load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, in kN, as defined in Ch 4, Sec 5, [2.3.2].

P_{SL} : Bottom slamming pressure, in kN/m^2, as defined in Ch 4, Sec 5, [3.2].

P_{FB} : Bow impact pressure, in kN/m^2, as defined in Ch 4, Sec 5, [3.3].

P_{slh} : Sloshing pressure, in kN/m^2, as defined in Ch 4, Sec 6, [6].

1 GENERAL

1.1 Application

1.1.1

This section gives the design load scenarios that are to be used for:

- Strength assessment by prescriptive and direct analysis (Finite Element Method, FEM) methods, as given in [2].
- Fatigue assessment by prescriptive and direct analysis (FEM) methods, as given in [3].

1.1.2

For the strength assessment, the principal design load scenarios consist of either S (Static) loads or S+D (Static + Dynamic) loads. In some cases, the letter 'A' prefixes the S or S+D to denote that this is an accidental design load scenario. There are some additional design load scenarios to be considered which relate to impact (I) loads, sloshing (SL) loads and fatigue (F) load.

2 DESIGN LOAD SCENARIOS FOR STRENGTH ASSESSMENT

2.1 Principal design load scenarios

2.1.1

The principal design load scenarios are given in Table 1.

Table 1 : Principal design load scenarios

Design load scenario			Harbour and sheltered water and testing	Seagoing conditions with extreme sea loads	Ballast water exchange (4)	Accidental flooded conditions (4)	
Load components			Static (S)	Static + Dynamic (S+D)	Static + dynamic (S+D)	Static (A: S)	Static + dynamic (A: S+D)
Hull Girder	VBM		M_{sw-p}	$M_{sw} + M_{wv-LC}$	$M_{sw} + M_{wv-LC}$	M_{sw-f} (2)	$M_{sw-f} + M_{wv-LC}$ (3)
	HBM		-	M_{wh-LC}	M_{wh-LC}	-	M_{wh-LC} (3)
	VSF		Q_{sw-p}	$Q_{sw} + Q_{wv-LC}$	$Q_{sw} + Q_{wv-LC}$	-	$Q_{sw-f} + Q_{wv-LC}$ (3)
	TM		-	M_{wt-LC}	M_{wt-LC}	-	-
Local Loads	P_{ex}	External deck for green sea	-	P_D	-	-	-
		Hull envelope	P_S	$P_S + P_W$	$P_S + P_W$	-	-
	P_{in}	Ballast tanks (1)	Max (P_{ls}, P_{ST})	$P_{ls} + P_{ld}$	$P_{ls} + P_{ld}$	-	-
		Liquid cargo tanks			-	-	
		Other tanks			-	-	
		Watertight boundaries	-	-	-	P_{fs}	$P_{fs} + P_{fd}$
		Cargo holds	P_{bs}	$P_{bs} + P_{bd}$	-		
	P_{dk}	Internal decks for dry spaces	P_{dl-s}	$P_{dl-s} + P_{dl-d}$	-	-	-
		External deck for distributed loads	P_{dl-s}	$P_{dl-s} + P_{dl-d}$	-	-	-
		External deck for heavy units	F_{U-s}	$F_{U-s} + F_{U-d}$	-	-	-

(1) WB cargo hold is considered as ballast tank except for design load scenario 'ballast water exchange'.
(2) M_{swf} used for hull local scantling of watertight bulkhead
(3) Hull girder strength check is performed according to Ch 5, Sec 1 for bulk carriers having a length L of 150 m or above
(4) Applicable to prescriptive assessment only

2.2 Additional design load scenarios

2.2.1

The design load scenarios to be considered for sloshing, bottom slamming and bow impact are given in Table 2.

Table 2 : Design load scenarios for impact and sloshing conditions

Design load scenario / Load components			Bow impact Impact (I)	Bottom slamming Impact (I)	Sloshing Sloshing (SL)
Hull Girder	VBM		-	-	M_{sw}
	HBM		-	-	-
	VSF		-	-	-
	TM		-	-	-
Local Loads	P_{ex}	External deck for green sea	-	-	-
		Hull envelope	P_{FB}	P_{SL}	-
	P_{in}	Ballast tanks	-	-	P_{slh}
		Liquid cargo tanks			
		Other tanks			
		Watertight boundaries		-	-
		Cargo holds (1)	-	-	-
	P_{dk}	Internal decks for dry spaces	-	-	-
		External deck for distributed loads	-	-	-
		External deck for heavy units	-	-	-

(1) Sloshing assessment is not to be considered for water ballast cargo holds of bulk carriers.

3 DESIGN LOAD SCENARIOS FOR FATIGUE ASSESSMENT

3.1 Design load scenarios

3.1.1

The design load scenarios for fatigue assessment are given in Table 3.

Table 3 : Design load scenarios for fatigue assessment

Design load scenario / Load components			Fatigue: Static + Dynamic (F: S+D)
Hull Girder	VBM		$M_{sw} + M_{wv\text{-}LC}$
	HBM		$M_{wh\text{-}LC}$
	VSF		$Q_{sw} + Q_{wv\text{-}LC}$
	TM		$M_{wt\text{-}LC}$
Local Loads	P_{ex}	External deck for green sea	-
		Hull envelope	$P_S + P_W$
	P_{in}	Ballast tanks (1)	$P_{ls} + P_{ld}$
		Liquid cargo tanks	
		Other tanks designed for liquid filling	
		Watertight boundaries	-
		Cargo holds	$P_{bs} + P_{bd}$
	P_{dk}	Internal decks for dry spaces	-
		External deck for distributed loads	-
		External deck for heavy units	-

(1) WB cargo hold is considered as ballast tank except for design load scenario ‘ballast water exchange’.

SECTION 8
LOADING CONDITIONS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

ℓ : Distance from propeller centreline to the waterline, in m.

D_p : Propeller diameter, in m.

M_{Full} : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_H : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{HD} : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{BLK} : Maximum cargo mass in cargo holds in block loading conditions, in t, as defined in Ch 4, App 1.

$C_{BM\text{-}LC}$: Coefficient taken as the percentage of permissible SWBM, defined in Table 2 to Table 9 and Table 12 to Table 21.

$C_{SF\text{-}LC}$: Coefficient taken as the percentage of permissible SWSF, defined in Table 2 to Table 9 and Table 12 to Table 21.

$x_{b\text{-}aft}$, $x_{b\text{-}fwd}$: Longitudinal position, in m, of respectively the aft and forward bulkhead of the mid-hold of the FE model.

EA : Empty hold in alternate loading condition.

FA : Full hold in alternate loading condition.

T_{H1}, T_{H2}, T_{H3}, T_{H4}: Minimum permissible draught, in m, in harbour condition as defined in Ch 4, App 1.

1 APPLICATION

1.1 Ships having a length *L* of 150m or above

1.1.1

The requirements in [2] to [5] are applicable to ships having a length *L* of 150 m or above.

1.1.2 Design loading conditions for strength assessment

Design loading conditions for strength assessment are given in [2] to [4]. The design loading conditions common to both oil tankers and bulk carriers are given in [2]. Specific design loading conditions for oil tankers and bulk carriers are given in [3] and [4] respectively.

Unless otherwise specified, each of the design seagoing conditions is to be investigated for the arrival and departure conditions.

1.1.3

These requirements are not intended to prevent conditions to be included in the loading manual for which calculations are to be submitted. It is not intended to replace in any way the required loading manual/instrument.

1.1.4

Loading conditions from the loading manual, which are not covered in [2] to [4], if any, are to be considered.

1.1.5 Standard design load conditions for fatigue assessment

The standard design loading conditions for fatigue assessment are given in [5].

1.2 Bulk carriers having a length *L* less than 150 m

1.2.1

The severest loading condition from the loading manual, midship section drawing or otherwise specified by the Designer are to be considered for the longitudinal strength given in Ch 5 and for local strength check of plating, ordinary stiffeners and primary supporting members given in Ch 6 and Pt 2, Ch 1, Sec 3 and Pt 2, Ch 1, Sec 4.

The requirements in [2] are applicable to ships having a length *L* less than 150 m.

1.3 Dynamic load cases

1.3.1 Seagoing conditions

Unless otherwise specified, each of the design seagoing conditions are to be investigated for all dynamic load cases.

1.3.2 Beam and oblique sea dynamic load cases

For FE load analysis, the beam sea and oblique sea dynamic load cases calculated for port and starboard sides are to be applied on the model to obtain the results for both model sides.

For ship with structure symmetrical about the centreline, the beam sea and oblique sea dynamic load cases calculated for portside may be applied only to the model (i.e. dynamic load cases on starboard side may be omitted) provided the results (yield and buckling) are mirrored.

2 COMMON DESIGN LOADING CONDITIONS

2.1 Definitions

2.1.1

In general, the design cargo and ballast loading conditions, based on the amount of bunker, fresh water and stores at departure and arrival, are to be considered for the still water bending moment and shear force calculations. Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting are to be submitted and included in the loading manual.

2.1.2 Departure conditions

The departure conditions are to be based on bunker tanks not taken less than 95% full and other consumables taken at 100% capacity.

2.1.3 Arrival conditions

The arrival conditions are to be based on 10% of the maximum capacity of bunker, fresh water and stores.

2.2 Partially filled ballast tanks

2.2.1 Partially filled ballast tanks in ballast loading conditions

Ballast loading conditions involving partially filled peak and/or other ballast tanks in any departure, arrival or intermediate condition are not permitted to be used as design loading conditions unless:

- Stress levels are within the Rule acceptance criteria for loading conditions with the considered tanks full, empty and partially filled at intended level in any departure, arrival or intermediate condition.
- For bulk carriers having a length L of 150 m or above, longitudinal strength of hull girder in flooded condition given in Ch 5, Sec 1 is to comply with loading conditions with the considered tanks full, empty and partially filled at intended level in any departure, arrival or intermediate condition.

The corresponding full, empty and partially filled tank conditions are to be considered as design conditions for calculation of the still water bending moment and shear force, but these do not need to comply with propeller immersion and trim requirements as specified in [2.3.1], [3.1.1] or [4.1.1].

Where multiple tanks are intended to be partially filled, all combinations of empty, full and partially filled at intended levels for those tanks are to be investigated. These requirements are not applicable to ballast water exchange using the sequential method.

2.2.2 Partially filled ballast tanks in cargo loading conditions

In cargo loading conditions, the requirement in [2.2] applies to peak ballast tanks only.

2.3 Seagoing conditions

2.3.1

The following seagoing loading conditions are to be included, as a minimum, in the loading manual:

a) Homogeneous cargo loading condition including a condition at the scantling draught. Homogeneous loading conditions are to not include filling of ballast tanks in departure conditions.

b) Ballast condition where the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in [2.2.1] are to be complied with. All cargo tanks/holds are to be empty including cargo tanks/holds suitable for the carriage of water ballast at sea. The propeller is to be fully immersed. The trim is to be by the stern and is not to exceed 0.015 L_{LL}.

c) Conditions covering ballast water exchange procedures with the calculations of intermediate conditions just before and just after ballasting and/or deballasting any ballast tank.

2.4 Harbour and sheltered water conditions

2.4.1

The following harbour and sheltered water conditions are to be included in the loading manual:

a) Conditions representing typical complete loading and unloading operations.

b) Docking condition afloat.

c) Propellers inspection afloat condition, in which the propeller shaft centreline is at least $D_p/4$ above the waterline in way of the propeller.

2.5 Loading conditions

2.5.1 Alternative design

For structural arrangement not covered by this section, the loading conditions, including loading pattern, corresponding draught, still water bending moment and shear forces are to be agreed by the Society.

3 OIL TANKERS

3.1 Specific design loading conditions

3.1.1 Seagoing conditions

The following seagoing loading conditions are to be included, as a minimum, in the loading manual:

a) Heavy ballast condition where the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in [2.2.1] are to be complied with. The fore peak water ballast tank is to be full, if fitted. If upper and lower fore peak tanks are fitted, the lower is required to be full and the upper tank may be full, partially full or empty. All the cargo tanks are to be empty including cargo tanks suitable for the carriage of water ballast at sea. The draught at the forward perpendicular is not to be less than that for the normal ballast condition. The propeller is to be fully immersed. The trim is to be by the stern and is not to exceed 0.015 L.

b) Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions.

c) Any specified non-uniform distribution of loading.

d) Conditions with high density cargo including the maximum design cargo density, when applicable.

e) Design ballast condition in which all segregated ballast tanks in the cargo tank region are full and all other tanks are empty including fuel oil and fresh water tanks. This design condition is for assessment of hull strength and is not intended for ship operation. This condition will also be covered by the IMO 73/78 SBT condition provided the corresponding condition in the loading manual only includes ballast in segregated ballast tanks in the cargo tank region.

3.1.2 Additional loading conditions

The following additional loading conditions are to be included in the loading manual if the ship is specifically approved and intended to be operated in such conditions:

a) Seagoing ballast conditions including water ballast carried in one or more cargo tanks which are intended for use in emergency situations as allowed by MARPOL Reg. 18.
b) Seagoing loading conditions where the net static upward load on the double bottom exceeds that given with the combination of an empty cargo tank and a mean ship's draught of 0.9 T_{SC}.
c) Seagoing loading conditions with cargo tanks less than 25% full with the combination of mean ship's draught greater than 0.9 T_{SC}.
d) Seagoing loading conditions where the net static downward load on the double bottom exceeds that given with the combination of a full cargo tank at a cargo density of 1.025 t/m^3 or greater and a mean ship's draught of 0.6 T_{SC}.
e) For ships arranged with cross ties in the centre cargo tank, seagoing loading conditions showing a non-symmetric loading pattern where the difference in filling level between corresponding port and starboard wing cargo tanks exceeds 25% of the filling height in the wing cargo tank.

3.2 Design load combinations for direct strength analysis

3.2.1

The design load combinations for FE analysis are given in Table 1 as follows:

Table 1 : Design load combination for oil tankers

	Midship cargo hold region	Outside midship cargo hold region	Foremost cargo tanks	Aftmost cargo tanks
Tankers with two oil-tight bulkheads	Table 2	Table 4	Table 6	Table 8
Tankers with one centreline oil-tight bulkhead	Table 3	Table 5	Table 7	Table 9
Note 1: **Outside midship cargo hold region means the forward or aft cargo hold region except the foremost and aftmost cargo holds**				

3.2.2

For tankers with two oil-tight longitudinal bulkheads, where the cargo tank length is less than 0.15 L, the draughts given in Table 2, Table 4, Table 6 and Table 8 are subject to special consideration by the Society.

3.2.3

For tankers with one centreline oil-tight longitudinal bulkhead, where the cargo tank length is less than 0.11 L, the draughts given in Table 3, Table 5, Table 7 and Table 9 are subject to special consideration by the Society.

3.2.4

For seagoing conditions, the dynamic load cases required to be investigated for each loading pattern are indicated in Table 2 to Table 9. Dynamic load cases are defined in Ch 4, Sec 2.

3.2.5 Ships with structure symmetrical about centreline

For ships with structure symmetrical about the centreline, the loading pattern mirrored about centreline of another pattern may be omitted provided the results (yield and buckling) are mirrored, e.g. Table 2 A7b, A12b.

3.2.6 Tankers with two oil-tight longitudinal bulkheads except with a cross tie arrangement in the wing cargo tanks

For tankers with two oil-tight longitudinal bulkheads except with a cross tie arrangement in the wing cargo tanks, loading patterns A7 and A12 in Table 2, Table 4, Table 6 and Table 8 are to be examined for the possibility that unequal filling levels in transversely paired wing cargo tanks would result in a more onerous stress response. Loading pattern A7 is required to be analysed only if such a non-symmetric seagoing loading condition is included in the ship loading manual. The actual loading pattern, draught, GM and k_r from the loading manual are to be used in the FE analysis. Where the GM and k_r are not given in the ship's loading manual, GM and k_r are to be determined in accordance with Ch 4, Sec 3.

If loading patterns A7 and A12 are not considered, an operational restriction describing that the difference in filling level between corresponding port and starboard wing cargo tanks is not to exceed 25% of the filling height in the wing cargo tank, is to be added in the loading manual.

Loading patterns A7 and A12 need not be examined for tankers with a cross tie arrangement in the wing cargo tanks.

3.2.7

For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A3 and harbour loading pattern A13, with all cargo tanks abreast empty, in Table 2, Table 4, Table 6 and Table 8 are to be analysed with a ship draught of 0.65 T_{SC} and 0.7 T_{SC} respectively. If conditions in the ship loading manual specify greater draughts for loading pattern A3 or A13, then the maximum specified draught in the ship's loading manual for the loading pattern is to be used.

3.2.8

For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A5 and harbour loading pattern A11, with all cargo tanks abreast fully loaded, in Table 2, Table 4, Table 6 and Table 8 are to be analysed with a ship draught of 0.65 T_{SC} and 0.6 T_{SC} respectively. If conditions in the ship loading manual specify lesser draughts for loading pattern A5 or A11, then the minimum specified draught in the ship's loading manual for the loading pattern is to be used.

3.2.9

For loading patterns A1, A2, B1, B2 and B3, with cargo tank(s) empty, in Table 2 to Table 9, a minimum ship draught of 0.9 T_{SC} is to be used in the analysis. If conditions in the ship loading manual specify greater draughts for loading patterns with empty cargo tank(s), then the maximum specified draught for the actual condition is to be used.

3.2.10 Ballast conditions

Where a ballast condition is specified in the ship loading manual with ballast water filled in one or more cargo tanks, loading patterns A8 or B7 in Table 2 or Table 3 are to be examined.

If the actual loading pattern as specified in the loading manual is different from load pattern A8 or B7 then:

a) The actual loading patterns are to be substituted for the loading pattern A8 or B7 with the following calculation conditions:
   - Draught to be taken as T_{BAL-E},
   - C_{BM-LC} = 100% (sag.),
   - C_{SF-LC} = 100%,
   - 100% filling of the considered tanks carrying ballast water.

b) The strength assessment is to be carried out for all the dynamic load cases as defined in Ch 4, Sec 2.

c) An operational restriction corresponding to the analysed condition is to be added in the loading manual.

The actual loading pattern, draught, GM and k_r from the loading manual are to be used in the FE analysis. Where the GM and k_r are not given in the ship's loading manual, GM and k_r are to be determined in accordance with Ch 4, Sec 3.

(1) The actual shear force and bending moment that results from the application of local loads to the FE model are to be used. Adjusting vertical loads and bending moments are not applied.

(2) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.

(3) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(4) For the mid-hold where $x_{b-aft} \leq 0.5L$ and $x_{b-fwd} \geq 0.5L$, the shear force is to be adjusted to target value at aft bulkhead of the mid-hold.

(5) For the mid-hold where $x_{b-aft} \leq 0.5L$ and $x_{b-fwd} \geq 0.5L$, the shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(6) This load combination is to be considered only for the mid-hold where $x_{b-aft} > 0.5L$ or $x_{b-fwd} < 0.5L$.

(5) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

4 BULK CARRIERS

4.1 Specific design loading condition

4.1.1 Seagoing conditions

The following seagoing loading conditions are to be included, as a minimum, in the loading manual:

a) Cargo loading conditions as defined in [4.1.2] to [4.1.4].

b) Heavy ballast condition where the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in [2.2.1] are to be complied with. The propeller immersion ℓ/D_p is to be at least 60%. The trim is to be by the stern and is not to exceed 0.015 L. The moulded forward draught is not to be taken less than the smaller of 0.03 L or 8 m.

4.1.2 Cargo loading condition for BC-C

Homogeneous cargo loaded condition is to be included in the loading manual where the cargo density corresponds to all cargo holds, including hatchways, being 100% full at scantling draught with all ballast tanks empty.

4.1.3 Cargo loading condition for BC-B

As required for BC-C, plus:

Homogeneous cargo loaded condition is to be included in the loading manual where the cargo density is taken equal to 3.0 t/m^3, and all cargo holds are taken with the same filling ratio (cargo mass/hold cubic capacity) in all cargo holds at scantling draught with all ballast tanks empty.

In cases where the cargo density applied for this design loading condition is different from 3.0 t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated in the loading manual. If the maximum density is less than 3.0 t/m^3 then the additional service feature {maximum cargo density *x.y* t/m^3} is to be indicated as defined in Ch 1, Sec 1, [3.2.1].

4.1.4 Cargo loading condition for BC-A

As required for BC-B, plus:

At least one cargo loaded condition with specified holds empty, with cargo density 3.0 t/m^3, and the same filling ratio (cargo mass/hold cubic capacity) in all loaded cargo holds at scantling draught with all ballast tanks empty.

The combination of specified empty holds is to be indicated with the additional service feature {holds *a*, *b*, ... may be empty}.

In such cases where the design cargo density applied is different from 3.0 t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated in the loading manual. If the maximum density is less than 3.0 t/m^3 then the additional service feature {holds *a*, *b*, ... may be empty with maximum cargo density *x.y* t/m^3} is to be indicated as defined in Ch 1, Sec 1, [3.2.1].

4.1.5 Additional ballast conditions

The following ballast conditions are to be included in the loading manual for longitudinal strength assessment:

- Ballast conditions with all ballast tanks 100% full,
- Heavy ballast conditions with all ballast tanks 100% full and one cargo hold adapted and designated for the carriage of water ballast at sea, where provided, 100% full.
  Where more than one hold is adapted and designated for the carriage of water ballast at sea, it is not required that two or more holds be assumed 100% full simultaneously in the longitudinal strength assessment, unless such conditions are expected in the heavy ballast condition. Unless each hold is individually investigated, the designated heavy ballast hold and any/all restrictions for the use of other ballast hold(s) are to be indicated in the loading manual.

4.1.6 Steel coils or heavy cargoes

The following note is to be included in the loading manual:

"Where the ship engages in a service carrying such cargoes as steel coils or heavy cargoes that may have an adverse effect on the local strength of the double bottom and which is not described as cargo in the loading manual, the maximum permissible and the minimum required mass of cargo are to be considered specially."

4.2 Design load combinations for direct strength analysis

4.2.1 Applicable general loading patterns

The following loading patterns are to be applied:

a) Any cargo hold carrying M_{Full} with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at scantling draught.

b) Any cargo hold carrying minimum 50% of M_H, with all double bottom tanks in way of the cargo hold being empty, at scantling draught.

c) Any cargo hold taken empty, with all double bottom tanks in way of the cargo hold being empty, at the deepest ballast draught.

4.2.2 Multiport conditions

The following multiport conditions are applicable to all types of bulk carriers except when the service feature {no MP} is assigned:

a) Any cargo hold carrying M_{Full} with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of scantling draught.

b) Any cargo hold taken empty with all double bottom tanks in way of the cargo hold being empty, at 83% of scantling draught.

c) Any two adjacent cargo holds carrying M_{Full} with the next holds being empty, with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of the scantling draught. This requirement to the mass of the cargo and fuel oil in double bottom tanks in way of the cargo hold applies also to the condition where the adjacent hold is filled with ballast.

d) Any two adjacent cargo holds being empty with the next holds being full, with all double bottom tanks in way of the cargo hold being empty, at 75% of scantling draught.

4.2.3 Alternate conditions

The following alternate conditions are applicable to BC-A only:

a) Cargo holds which are intended to be empty at scantling draught, being empty with all double bottom tanks in way of the cargo hold also being empty.

b) Cargo holds which are intended to be loaded with high density cargo, carrying M_{HD} plus 10% of M_H, in the partially filled condition with highest density according to Ch 4, Sec 6, Table 1. The fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty in way of the cargo hold, at scantling draught.

c) Cargo holds which are intended to be loaded with high density cargo, carrying M_{HD} plus 10% of M_H in the full condition with lowest density according to Ch 4, Sec 6, Table 1. The fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty in way of the cargo hold, at scantling draught.

d) If the ship is intended to operate in alternate block load condition, any two adjacent cargo holds are to be loaded with the next holds being empty, carrying 10% of M_H in each hold in addition to the maximum cargo load according to that design loading condition, with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at

scantling draught. In operation the maximum allowable mass is to be limited to the maximum cargo load according to the design loading conditions.

4.2.4 Heavy ballast condition

The following condition applies to ballast holds only:

- Cargo holds which are designed as ballast water holds, being 100% full of ballast water including hatchways, with all double bottom tanks in way of the cargo hold being 100% full, at any heavy ballast draught. For ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty except if this loading condition is explicitly prohibited in the loading manual.

4.2.5 Additional harbour condition for all bulk carriers

The following additional harbour conditions apply to all bulk carriers:

a) At reduced draught during loading and unloading in harbour, the maximum allowable mass in a cargo hold may be increased by 15% of the maximum mass allowed at the scantling draught in seagoing condition, but is not to exceed the mass allowed at scantling draught in the seagoing condition. The minimum required mass may be reduced by the same amount.

b) Any single cargo hold holding the maximum allowable seagoing mass at 67% of scantling draught, in harbour condition.

c) Any two adjacent cargo holds carrying M_{Full} with the next holds being empty, with fuel oil tanks in the double bottom in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of scantling draught, in harbour condition.

4.2.6 Design load combinations for direct strength analysis

The loading patterns to be considered in the direct strength analysis of bulk carriers are summarised in Table 10. Load combinations providing the calculations details for each loading pattern are given in Table 12 to Table 21.

Table 10 : Applicable loading patterns according to additional service features

Loading pattern	Requirement	BC-			BC- {no MP}		
		A	B	C	A	B	C

Harbour condition	[4.2.5]	×	×	×	×	×	×

4.2.7

The design load combinations for FE analysis are given as follows:

Table 11 : Design load combinations for Bulk Carriers

	Midship cargo hold region	Outside midship cargo hold region	Aftmost cargo hold	Foremost cargo hold
BC-A – EA	Table 12	Table 15	N/A	N/A
BC-A – FA	Table 13	Table 16	Table 18	Table 20
BC- B & BC-C	Table 14	Table 17	Table 19	Table 21
Note 1: **Outside midship cargo hold region means the forward or aft cargo hold region except the foremost and aftmost cargo holds**				

4.3 Hold mass curves

4.3.1

Based on the design loading criteria, as given in [4.2.1] to [4.2.5] except [4.2.4], hold mass curves for each single hold, as well as for any two adjacent holds are to be included in the loading manual and the loading instrument. The maximum allowable or minimum required cargo mass in a cargo hold, or in two adjacent loaded holds is related to the net load on the double bottom. The net load on the double bottom is a function of draught, cargo mass in the cargo hold, as well as the mass of fuel oil and ballast water contained in double bottom tanks.

4.3.2

Hold mass curves are to be calculated according to Ch 4, App 1 showing maximum allowable and minimum required masses as a function of draught in seagoing condition as well as during loading and unloading in harbour.

(1) Loading pattern No. 1 with the cargo mass M_{Full} and the maximum cargo density as defined in [4.1.4] can be analysed in lieu of this loading pattern.
(2) Maximum cargo density as defined in [4.1.4] is to be used for calculation of dry cargo pressure.
(3) In case of no ballast hold, normal ballast condition with assuming M_{SW} = 100% (hog.) is to be analysed.
(4) Position of ballast hold is to be adjusted as appropriate.
(5) This condition is only required when this loading condition is included in the loading manual.
(6) Actual still water vertical bending moment, as given in the loading manual, may be used instead of design value.
(7) This condition is to be considered for the empty hold which is assigned as ballast hold, if any.
(8) This condition is not required when this loading condition is explicitly prohibited in the loading manual.
(9) For the mid-hold where $x_{b\text{-}aft}$<0.5L and $x_{b\text{-}fwd}$>0.5L, the shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(10) For the mid-hold where $x_{b\text{-}aft}$<0.5L and $x_{b\text{-}fwd}$>0.5L, the shear force is to be adjusted to target value at forward bulkhead of the mid-hold.
(11) This load combination is to be considered only for the mid-hold where $x_{b\text{-}aft}$>0.5L or $x_{b\text{-}fwd}$<0.5L.
(12) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(13) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.
(14) This condition is only required when block loading condition is included in the loading manual.

(1) Loading pattern no. 1 with the cargo mass M_{Full} and the maximum cargo density as defined in [4.1.4] can be analysed in lieu of this loading pattern.

(2) Maximum cargo density as defined in [4.1.4] is to be used for calculation of dry cargo pressure.

(3) In case of no ballast hold, normal ballast condition with assuming M_{SW} = 100% (hog.) is to be analysed.

(4) Position of ballast hold is to be adjusted as appropriate.

(5) This condition is only required when block loading condition is included in the loading manual.

(6) Actual still water vertical bending moment, as given in the loading manual, may be used instead of design value.

(7) This condition is to be considered for the heavy cargo hold which is assigned as ballast hold, if any.

(8) This condition is not required when this loading condition is explicitly prohibited in the loading manual.

(9) For the mid-hold where x_{b-aft}<0.5L and x_{b-fwd}>0.5L, the shear force is to be adjusted to target value at aft bulkhead of the mid-hold.

(10) For the mid-hold, where x_{b-aft}<0.5L and x_{b-fwd}>0.5L, the shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(11) This load combination is to be considered only for the mid-hold, where x_{b-aft}>0.5L or x_{b-fwd}<0.5L.

(12) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.

(13) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(14) This condition is only required when block loading condition is included in the loading manual.

(3) In case of no ballast hold, normal ballast condition with assuming M_{SW} = 100% (hog.) is to be analysed.

(4) Position of ballast hold is to be adjusted as appropriate.

(5) This condition is only required when this loading condition is included in the loading manual.

(6) Actual still water vertical bending moment, as given in the loading manual, may be used instead of design value.

(7) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.

(8) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(9) This condition is only required when block loading condition is included in the loading manual.

5 STANDARD LOADING CONDITIONS FOR FATIGUE ASSESSMENT

5.1 Oil tanker

5.1.1

The standard loading conditions to be applied to oil tankers for fatigue assessment as required in Ch 9, Sec 1, [6.2], are defined in Table 22 to Table 24.

Table 22 : Standard design FE loading conditions for fatigue assessment of oil tankers except for foremost and aftmost cargo holds

No.	Description	Loading pattern	Still water loads			Dynamic load cases
			Draught	C_{BM-LC} : % of perm. SWBM	C_{SF-LC} : % of perm. SWSF (1)	
Oil tankers with two oil-tight bulkheads						
A1-F	Full load		T_{SC}	60% (sag.)		All
A2-F	Normal ballast		T_{BAL}	80% (hog.)		All
Oil tankers with centreline oil-tight bulkhead						
B1-F	Full load		T_{SC}	60% (sag.)		All
B2-F	Normal ballast		T_{BAL}	80% (hog.)		All

(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.

Table 23 : Standard design FE loading conditions for fatigue assessment of oil tankers for aftmost cargo hold

No.	Description	Loading pattern	Still water loads: Draught	Still water loads: C_{BM-LC} : % of perm. SWBM	Still water loads: C_{SF-LC} : % of perm. SWSF (1)	Dynamic load cases
Oil tankers with two oil-tight bulkheads						
A1-F	Full load		T_{SC}	60% (sag.)		All
A2-F	Normal ballast		T_{BAL}	80% (hog.)		All
Oil tankers with centreline oil-tight bulkhead						
B1-F	Full load		T_{SC}	60% (sag.)		All
B2-F	Normal ballast		T_{BAL}	80% (hog.)		All

(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.

Table 24 : Standard design FE loading conditions for fatigue assessment of oil tankers for foremost cargo hold

No.	Description	Loading pattern	Still water loads: Draught	Still water loads: C_{BM-LC} : % of perm. SWBM	Still water loads: C_{SF-LC} : % of perm. SWSF (1)	Dynamic load cases
Oil tankers with two oil-tight bulkheads						
A1-F	Full load		T_{SC}	60% (sag.)		All
A2-F	Normal ballast		T_{BAL}	80% (hog.)		All
Oil tankers with centreline oil-tight bulkhead						
B1-F	Full load		T_{SC}	60% (sag.)		All
B2-F	Normal ballast		T_{BAL}	80% (hog.)		All

(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.

5.2 Bulk carriers

5.2.1

The standard loading conditions to be applied to bulk carriers for fatigue assessment as required in Ch 9, Sec 1, [6.3] are defined in Table 25, to Table 31 according to their additional service feature notations and the location of the assessed details.

Table 25 : Standard design FE Load combinations for fatigue assessment applicable to empty hold of BC-A in alternate condition (EA) - cargo hold region except aftmost and foremost cargo holds

No.	Description	Loading pattern Aft Mid Fore	Draught	C_{BM-LC} : % of perm. SWBM	C_{SF-LC} : % of perm. SWSF	Dynamic load case
1-F (1)	Full load homogeneous		T_{SC}	40% (sag.)		All
2-F (2)	Full load alternate		T_{SC}	75% (hog.)	100%	All
3-F (1)	Normal ballast		T_{BAL}	80% (hog.)		All
4-F (2) (3)	Heavy ballast		T_{BAL-H}	75% (sag.)	100%	All
5-F (2) (4)			T_{BAL-H}	45% (hog.)	100%	All
6-F (1) (5)			T_{BAL-H}	45% (hog.)		All

(1) The actual shear force curve that results from the application of static and dynamic local loads to the FE model are to be used.

(2) The actual shear force curve that results from the application of static and dynamic local loads to the FE model are to be used. Where this shear force exceeds the target value, the correction of vertical loads is to be applied to adjust the shear force down to the target value.

(3) This condition is to be considered for empty cargo hold which is assigned as ballast hold, if any

(4) This condition is applicable when the WB hold corresponds to the forward or aft hold of the 3 hold model.

(5) This condition is applicable when the WB hold is located outside the 3 cargo hold model

Table 26 : Standard design FE Load combinations for fatigue assessment applicable to loaded hold of BC-A in alternate condition (FA) - cargo hold region except aftmost and foremost cargo holds

No.	Description	Loading pattern Aft Mid Fore	Draught	C_{BM-LC} : % of perm. SWBM	C_{SF-LC} : % of perm. SWSF	Dynamic load case
1-F (1)	Full load homogeneous		T_{SC}	40% (sag.)		All
2-F (2)	Full load alternate		T_{SC}	75% (hog.)	100%	All
3-F (1)	Normal ballast		T_{BAL}	80% (hog.)		All
4-F (2) (3)	Heavy ballast		T_{BAL-H}	75% (sag.)	100%	All
5-F (2) (4)			T_{BAL-H}	45% (hog.)	100%	All
6-F (1) (5)			T_{BAL-H}	45% (hog.)		All

(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.

(2) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used. Where this shear force exceeds the target value, the correction of vertical loads is to be applied to adjust the shear force down to the target value.

(3) This condition is to be considered for loaded cargo hold which is assigned as ballast hold, if any

(4) This condition is applicable when the WB hold corresponds to the forward or aft hold of the 3 hold model.

(5) This condition is applicable when the WB hold is located outside the 3 cargo hold model.

Table 27 : Standard design FE Load combinations for fatigue assessment applicable to loaded hold of BC-A in alternate condition (FA) - Aftmost cargo hold

No.	Description	Loading pattern Aft Mid Fore	Draught	C_{BM-LC} : % of perm. SWBM	C_{SF-LC} : % of perm. SWSF	Dynamic load case

APPENDIX 1
HOLD MASS CURVES

SYMBOLS

Symbols

h : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline, in m.

h_a : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the aft cargo hold of two adjacent cargo holds, in m.

h_f : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the fore cargo hold of two adjacent cargo holds, in m.

M_H : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{Full} : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{HD} : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{BLK} : The maximum cargo mass in a cargo hold of two adjacent cargo holds according to the block loading condition in the loading manual, in t.

T_i : In loading condition No. *i*, draught, in m, at mid-hold position of single cargo hold length or at mid-length of the two adjacent cargo holds considered.

T_{min} : 0.75 T_{SC} or draught in ballast conditions with the two adjacent cargo holds empty, whichever is greater, in m.

T_{H1} : Minimum permissible draught, in m, in harbour condition with M_{Full} in each of the two adjacent holds to be taken as:

- For ships having {No MP} notation assigned:

$$T_{H1} = min\begin{cases} 0.67T_{SC} \\ T_{SC} - \dfrac{0.15\sum M_{Full}}{1.025\left(\dfrac{V_f}{h_f} + \dfrac{V_a}{h_a}\right)} \end{cases}$$

- For ships not having {No MP} notation assigned:

$$T_{H1} = 0.67T_{SC} - \frac{0.15\sum M_{Full}}{1.025\left(\dfrac{V_f}{h_f} + \dfrac{V_a}{h_a}\right)}$$

T_{H2} : Minimum permissible draught, in m, in harbour condition with M_{Full} in EA holds of BC-A ships or with M_{Full} in any holds of BC-B and BC-C ships to be taken as:

- For ships having {No MP} notation assigned:

$$T_{H2} = min\begin{cases} 0.67T_{SC} \\ T_{SC} - \dfrac{0.15M_{Full}}{1.025\dfrac{V_H}{h}} \end{cases}$$

- For ships not having {No MP} notation assigned:

$$T_{H2} = 0.67T_{SC} - \frac{0.15M_{Full}}{1.025\frac{V_H}{h}}$$

T_{H3} : Minimum permissible draught, in m, in harbour condition in case of block loading with M_{BLK} in each of the two adjacent holds of BC-A ships to be taken as:

$$T_{H3} = T_{SC} - \frac{\sum(0.15M_{BLK} + 0.1M_H)}{1.025\left(\frac{V_f}{h_f} + \frac{V_a}{h_a}\right)}$$

T_{H4} : Minimum permissible draught, in m, in harbour condition with M_{HD} in FA holds of BC-A ships to be taken as:

$$T_{H4} = min\begin{cases} 0.67T_{SC} \\ T_{SC} - \frac{0.15M_{HD} + 0.1M_H}{1.025\frac{V_H}{h}} \end{cases}$$

V_H : Volume in m^3, as defined in Ch 4, Sec 6.

V_a : Volume of the after cargo hold of two adjacent cargo holds excluding volume of the hatchway part, in m^3.

V_f : Volume of the forward cargo hold of two adjacent cargo holds excluding volume of the hatchway part, in m^3

Σ : The sum of masses of two adjacent cargo holds.

EA : Empty hold in alternate loading condition.

FA : Full hold in alternate loading condition.

1 GENERAL

1.1 Application

1.1.1

The requirements of this appendix apply to bulk carriers of 150 m in length *L* and above.

1.1.2

This appendix describes the procedure to be used for determination of:

- The maximum and minimum mass of cargo in each cargo hold as a function of the draught at mid-hold position of cargo hold.
- The maximum and minimum mass of cargo in any two adjacent holds as a function of the draught at mid-length of these two adjacent cargo holds.

1.1.3 General

The cargo mass curves of single cargo hold or of two adjacent cargo holds in seagoing and harbour conditions as defined in [2] and [3] are based on the loading conditions considered in Ch 4, Sec 8, [4.2]. However if the ship structure is checked for more severe loading conditions than the ones considered in Ch 4, Sec 8, [4.2.7], the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

1.1.4 Loading/unloading conditions in harbour

For any bulk carrier, the maximum permissible cargo mass and the minimum required cargo mass of single cargo hold or of two adjacent cargo holds, corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15% of the maximum permissible mass at the maximum draught for the cargo hold in seagoing condition. However, maximum permissible mass is in no case to be greater than the maximum permissible cargo mass at designed maximum load draught for each cargo hold.

1.1.5 Maximum and minimum permissible mass expression

The maximum and minimum permissible mass in seagoing conditions, ($W_{maxS}(T_i)$, $W_{minS}(T_i)$) and in harbour condition (($W_{maxH}(T_i)$, $W_{minH}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae given in tables of [2] and [3] for the followings.:

- BC-A ship not having {No MP} notation assigned,
- BC-A ship having {No MP} notation assigned,
- BC-B and BC-C ships not having {No MP} notation assigned,
- BC-B and BC-C ships having {No MP} notation assigned,

Examples for mass curve of loaded cargo holds and cargo hold which can be empty at the maximum draught for BC-A ships not having {No MP} assigned are shown in figures of the above mentioned tables.

2 MAXIMUM AND MINIMUM MASSES OF CARGO IN EACH HOLD

2.1 Maximum permissible mass and minimum required mass of single cargo hold

2.1.1 BC-A ship not having {No MP} notation assigned

Table 1 : BC-A ship not having {No MP} notation assigned

Hold	Loading conditions	Max / Min curves	Curve Ref	Ref
FA	Seagoing	Maximum: $W_{maxS}\ (T_i) = M_{HD} + 0.1\ M_H - 1.025\ V_H \dfrac{(T_{SC} - T_i)}{h} \le M_{HD}$	I	Ch 4, Sec 8, [4.2.3] b & c
		Minimum: $W_{minS}\ (T_i) = 1.025\ V_H \dfrac{(T_i - 0.83 T_{SC})}{h} \ge 0$	II	Ch 4, Sec 8, [4.2.2] b
	Harbour	Maximum: $W_{maxH}(T_i) = max \begin{cases} M_{HD} - 1.025\ V_H \dfrac{(0.67 T_{SC} - T_i)}{h} \le M_{HD} \\ W_{maxS}\ (T_i) + 0.15 M_{HD} \le M_{HD} \end{cases}$	III-1 III-2	Ch 4, Sec 8, [4.2.6] a Ch 4, Sec 8, [4.2.5]
		Minimum: $W_{minH}(T_i) = W_{minS}(T_i) - 0.15 M_{HD} \ge 0$	IV	Ch 4, Sec 8, [4.2.5]

For symbols not defined in this section, refer to Ch 1, Sec 4.

M_{sw} : Permissible hogging and sagging vertical still water bending moment in intact seagoing condition, in kNm, at the hull transverse section considered, defined in Ch 4, Sec 4, [2.2.2].

M_{sw-p} : Permissible hogging and sagging vertical still water bending moment for harbour/sheltered water operation, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.3].

M_{sw-f} : Permissible hogging and sagging vertical still water bending moment in flooded condition at sea, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.4].

M_{wv} : Vertical wave bending moment in seagoing condition, in kNm, in intact or flooded conditions at the hull transverse section considered, defined in Ch 4, Sec 4, [3.1.1].

M_{wh} : Horizontal wave bending moment, in kNm, at the hull transverse section considered, defined in Ch 4, Sec 4, [3.3.1].

Q_{sw} : Permissible positive or negative still water shear force for seagoing operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.3].

Q_{sw-p} : Permissible positive or negative still water shear force for harbour/sheltered operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.4].

Q_{sw-f} : Permissible positive or negative still water shear force for in flooded condition at sea, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.5].

Q_{wv} : Vertical wave shear force in seagoing condition, in kN, in intact or flooded conditions at the hull transverse section considered, defined in Ch 4, Sec 4, [3.2.1].

Q_{sw-Lcd} : Vertical still water shear force for the considered loading condition in seagoing operation, in kN, at the hull transverse section considered.

$Q_{sw-Lcd-p}$: Vertical still water shear force for the considered loading condition in harbour/sheltered operation, in kN, at the hull transverse section considered.

$Q_{sw-Lcd-f}$: Vertical still water shear force for the considered flooded condition in seagoing operation, in kN, at the hull transverse section considered.

x : X coordinate, in m, of the calculation point with respect to the reference coordinate system defined in Ch 1, Sec 4, [3.6].

V_D : Vertical distance to the equivalent deck line, in m, as defined in [1.4.3].

z : Z coordinate, in m, of the calculation point with respect to the reference coordinate system defined in Ch 1, Sec 4, [3.6].

z_n : Z coordinate, in m, of horizontal neutral axis of the hull transverse section with net scantling defined in [1.2], with respect to the reference coordinate system defined in Ch 1, Sec 4, [3.6].

I_{y-n50} : Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to [1.5].

I_{z-n50} : Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to [1.5].

Z_{A-n50} : Net section modulus, in m^3, at any point of the hull transverse section, to be calculated according [1.4.1].

Z_{B-n50}, Z_{D-n50}: Net section moduli, in m^3, at bottom and deck, respectively, to be calculated according to [1.4.2] and [1.4.3].

z_{VD} : Z coordinate, in m, taken equal to $V_D + z_n$.

C_w : Wave parameter defined in Ch 4, Sec 4.

ρ : Seawater density, taken equal to 1.025 t/m^3.

1 STRENGTH CHARACTERISTICS OF HULL GIRDER TRANSVERSE SECTIONS

1.1 General

1.1.1

This section specifies the criteria for calculating the hull girder strength characteristics to be used for the checks in [2] to [3], in association with the hull girder loads specified in Ch 4, Sec 4.

1.2 Hull girder transverse sections

1.2.1 General

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder longitudinal strength, i.e. all continuous longitudinal members below and including the strength deck defined in [1.3], taking into account the requirements in [1.2.2] to [1.2.13].

1.2.2 Net scantling

The members contributing to the hull girder longitudinal strength are to be considered using the net offered scantlings based on gross offered thickness reduced by 0.5 t_c, as defined in Ch 3, Sec 3, when the hull girder strength characteristics are used for the hull girder yielding check according to [2] to [3].

1.2.3 Structural members not contributing to hull girder sectional area

The following members are not to be considered in the calculation as they are considered not contributing to the hull girder sectional area:

- Superstructures which do not form a strength deck.
- Deckhouses.
- Vertically corrugated bulkheads, according to [1.2.7].
- Bulwarks and gutter plates.
- Bilge keels.
- Sniped or non-continuous longitudinal stiffeners.
- Non-continuous hatch coaming.

1.2.4 Continuous trunks and longitudinal continuous hatch coamings

Continuous trunks and longitudinal continuous hatch coamings may be included in the hull girder transverse sections, provided that they are effectively supported by longitudinal bulkheads or primary supporting members.

1.2.5 Longitudinal stiffeners or girders welded above the strength deck

Longitudinal stiffeners or girders welded above the strength deck, including the deck of any trunk fitted as specified in [1.2.4], are to be included in the hull girder transverse sections.

1.2.6 Longitudinal girders between hatchways, supported by longitudinal bulkheads

Where longitudinal girders, effectively supported by longitudinal bulkheads, are fitted between hatchways, the sectional area of these longitudinal girders are to be included in the hull girder transverse section.

1.2.7 Longitudinal bulkheads with vertical corrugations

For longitudinal bulkheads with vertical corrugations, the vertical corrugations are not to be included in the hull girder transverse section. Longitudinal bulkheads with vertical corrugations are not effective for hull girder bending, but they are effective for hull girder shear force.

1.2.8 Members in materials other than steel

Where a member contributing to the longitudinal strength is made in material other than steel with a Young's modulus, E equal to 2.06×10^5 N/mm^2, the steel equivalent sectional area that may be included in hull girder transverse section is obtained, in m^2, from the following formula:

$$A_{SE-n50} = \frac{E}{2.06 \times 10^5} A_{M-n50}$$

where:

$A_{M\text{-}n50}$: Sectional area, in m^2, of the member under consideration.

1.2.9 Definitions of openings

The following definitions of opening are to be applied:

a) Large openings are:
   - Elliptical openings exceeding 2.5 m in length or 1.2 m in breadth.
   - Circular openings exceeding 0.9 m in diameter.

b) Small openings (i.e. manholes, lightening holes, etc) are openings that are not large ones.

c) Isolated openings are openings spaced not less than 1 m apart in the ship's transverse/vertical direction.

1.2.10 Large openings and nearby small openings

Large openings are to be deducted from the sectional area used in hull girder moment of inertia and section modulus. When small openings are spaced less than 1 m apart in the ship's transverse/vertical direction to large openings, the total breadth of them is to be deducted from the sectional area.

Additionally, isolated small openings which do not comply with the arrangement requirements given in Ch 3, Sec 6, [6.3.2] are to be deducted from the sectional areas included in the hull girder transverse sections.

1.2.11 Isolated small openings

Isolated small openings in one transverse section in the strength deck or bottom area need not be deducted from the sectional areas included in the hull girder transverse sections, provided that:

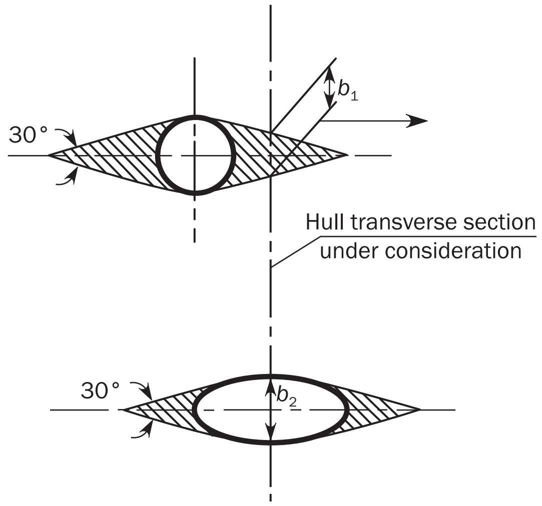
$$\Sigma b_S \le 0.06(B - \Sigma b)$$

Σb_S : Total breadth of isolated small openings, in m, in the strength deck or bottom area at the transverse section considered, determined as indicated in Figure 1, not deducted from the section area as per [1.2.10].

Σb : Total breadth of large openings, in m, at the transverse section considered, determined as indicated in Figure 1, deducted from the section area as defined in [1.2.10].

Where the total breadth of isolated small openings Σb_s does not fulfil the above criteria, only the excess of breadth is to be deducted from the sectional areas included in the hull girder transverse sections.

Figure 1 : Calculation of Σb and Σb_s



b_1 and b_2 included in Σb and Σb_s

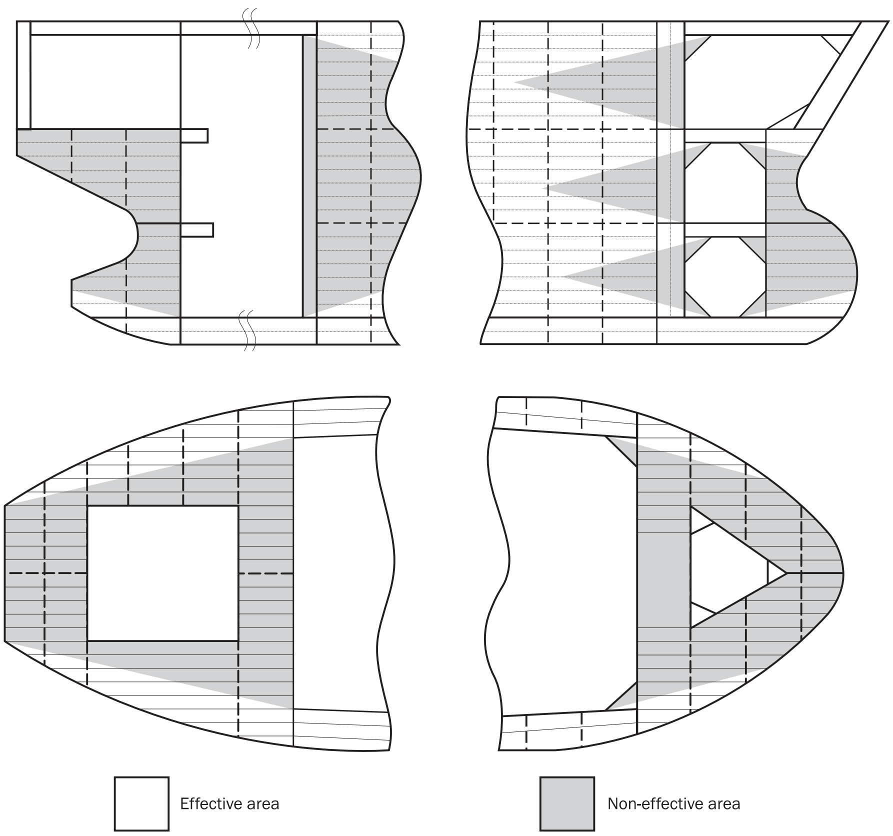
1.2.12 Lightening holes, draining holes and single scallops

Lightening holes, draining holes and single scallops in longitudinals need not be deducted if their height is less than 0.25 h_w, where h_w is the web height of the longitudinals, in mm. Otherwise, the excess is to be deducted from the sectional area or compensated.

1.2.13 Non-continuous decks and longitudinal bulkheads

When calculating the effective area in way of non-continuous decks and longitudinal bulkheads, the effective area is to be taken as shown in Figure 2. The shadow area, which indicates the ineffective area, is obtained by drawing two tangent lines with an angle of 15 deg to the longitudinal axis of the ship.

Figure 2 : Effective area in way of non-continuous decks and bulkheads



1.3 Strength deck

1.3.1

The strength deck is, in general, the uppermost continuous deck. In the case of a superstructure or deckhouses contributing to the longitudinal strength, the strength deck is the deck of the superstructure or the deck of the uppermost deckhouse.

1.4 Section modulus

1.4.1 Section modulus at any point

The section modulus at any point of a hull transverse section is obtained, in m^3, from the following formula:

$$Z_{A-n50} = \frac{I_{y-n50}}{|z - z_n|}$$

1.4.2 Section modulus at bottom

The section modulus at bottom is obtained, in m^3, from the following formula:

$$Z_{B-n50} = \frac{I_{y-n50}}{z_n}$$

1.4.3 Section modulus at deck

The section modulus at equivalent deck line is obtained, in m^3, from the following formula:

$$Z_{D-n50} = \frac{I_{y-n50}}{V_D}$$

where:

V_D : Vertical distance of the equivalent deck line, in m, taken equal to:

When no effective longitudinal members specified in [1.2.4] and [1.2.5] are positioned above a line extending from strength deck at side to a position $(z_D - z_n)/0.9$ from the neutral axis at the centreline

$$V_D = z_D - z_n$$

When effective longitudinal members as specified in [1.2.4] and [1.2.5] are positioned above a line extending from strength deck at side to a position $(z_D - z_n)/0.9$ from the neutral axis at the centreline

$$V_D = (z_T - z_n)\left(0.9 + 0.2\frac{y_T}{B}\right) \geq z_D - z_n$$

z_D : Z coordinate, in m, of strength deck at side, defined in [1.3].

y_T, z_T : Y and Z coordinates, in m, of the top of continuous trunk, hatch coaming, longitudinal stiffeners or girders, to be measured for the point which maximises the value of V_D.

1.5 Moments of inertia

1.5.1

The net moment of inertia, I_{y-n50} and I_{z-n50}, in m^4, are those, calculated about the horizontal and vertical neutral axes, respectively, of the hull transverse sections defined in [1.2].

2 HULL GIRDER BENDING ASSESSMENT

2.1 General

2.1.1

Scantlings of all continuous longitudinal members of the hull girder based on moment of inertia and section modulus requirement in [2.3] are to be maintained within 0.4 *L* amidships.

2.1.2

The *k* material factors are to be defined with respect to the materials used for the bottom and deck members contributing to the longitudinal strength according to [1]. When material factors for higher strength steels are used, the requirements in [2.4] apply.

2.2 Normal stresses

2.2.1

The normal stress, σ_L induced by vertical bending moments, is to be assessed for both hogging and sagging conditions, along the full length of the hull girder, from AE to FE.

The normal stress, σ_L at any point of the hull transverse section located below z_{VD} is to comply with the following formula:

$\sigma_L \le \sigma_{perm}$

where:

σ_L : Normal stress, in N/mm^2, as defined in [2.2.2].

σ_{perm} : Permissible hull girder bending stress, in N/mm^2, as given in Table 1.

2.2.2

The normal stresses, σ_L in N/mm^2, induced by vertical bending moments are given in Table 2:

2.2.3

The normal stresses in a member made in material other than steel with a Young's modulus, *E* equal to 2.06×10^5 N/mm^2, included in the hull girder transverse sections as specified in [1.2.8], are obtained from the following formula:

$$\sigma_L = \frac{E}{2.06 \times 10^5} \sigma_{Ls}$$

where:

σ_{LS} : Normal stress, in N/mm^2, in the member under consideration, calculated according to [2.2.2] considering this member as having the steel equivalent sectional area A_{SE} defined in [1.2.8].

2.3 Minimum net moment of inertia and net section modulus at midship section

2.3.1

At the transverse section in the midship part, the net moment of inertia about the horizontal axis, $I_{y\text{-}n50}$ is to be not less than the value obtained, in m^4, from the following formula:

$$I_{yR} = 2.7\ C_w\ L^3\ B\,(C_B + 0.7)\ 10^{-8}$$

Table 1 : Permissible hull girder bending stress

Operation	Design load	Permissible hull girder bending stress, σ_{perm}				
		$\frac{x}{L} \le 0.1$	$0.1 < \frac{x}{L} < 0.3$	$0.3 \le \frac{x}{L} \le 0.7$	$0.7 < \frac{x}{L} < 0.9$	$\frac{x}{L} \ge 0.9$
Seagoing	(S+D)	$140/k$	Linear interpolation	$190/k$	Linear interpolation	$140/k$
Harbour/sheltered water	(S)	$105/k$	Linear interpolation	$143/k$	Linear interpolation	$105/k$
Flooded condition at sea for bulk carriers having a length L of 150 m or above	(A:S+D)	$140/k$	Linear interpolation	$190/k$	Linear interpolation	$140/k$

Table 2 : Normal stress, σ_L

Operation	Normal stress, σ_L		
	At any point located below Z_{VD}	At bottom (1)	At deck (1)
Seagoing	$\sigma_L = \frac{M_{sw} + M_{wv}}{Z_{A-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw} + M_{wv}}{Z_{B-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw} + M_{wv}}{Z_{D-n50}} 10^{-3}$
Harbour/sheltered water	$\sigma_L = \frac{M_{sw-p}}{Z_{A-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-p}}{Z_{B-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-p}}{Z_{D-n50}} 10^{-3}$
Flooded condition at sea for bulk carriers having a length L of 150 m or above	$\sigma_L = \frac{M_{sw-f} + M_{wv}}{Z_{A-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-f} + M_{wv}}{Z_{B-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-f} + M_{wv}}{Z_{D-n50}} 10^{-3}$
(1) The σ_L values at bottom and deck, correspond to the application of formula given for any point, calculated at equivalent deck line and at baseline.			

2.3.2

At the transverse section in the midship part, the vertical hull girder net section modulus at the deck and the bottom, $Z_{D\text{-}n50}$ and $Z_{B\text{-}n50}$, are not to be less than the value obtained, in m^3, from the following formula:

$$Z_R = 0.9k\ C_w\ L^2\ B\,(C_B + 0.7)\,10^{-6}$$

2.4 Extent of high tensile steel

2.4.1 Vertical extent

The vertical extent of higher strength steel, $z_{hts,i}$, in m, used in the deck zone or bottom zone and measured respectively from the moulded deck line at side or baseline is not to be taken less the value obtained from the following formula, see Figure 3:

$$z_{hts,\,i} = z_1\left(1 - \frac{\sigma_{perm,\,i}}{\sigma_L}\right)$$

where:

z_1 : Distance from horizontal neutral axis to moulded deck line or baseline respectively, in m.

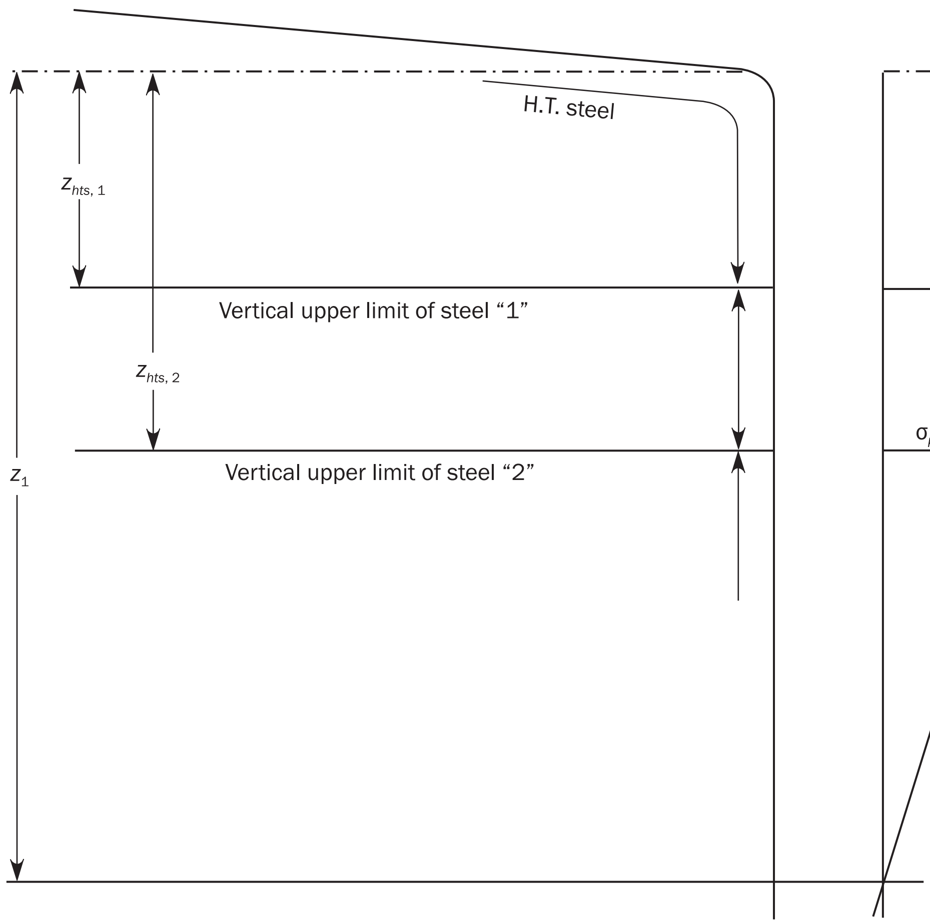
$\sigma_{perm,i}$: Permissible hull girder bending stress of the considered steel, in N/mm², as given in Table 1 and Figure 3.

σ_L : Hull girder bending stress, σ_{dk} at moulded deck line or σ_{bl} at baseline respectively, in N/mm² given in Table 3.

Table 3 : Hull girder stresses at baseline and moulded deck line

Operation	At baseline	At moulded deck line
Seagoing	$\sigma_{bl} = \dfrac{\lvert M_{sw} + M_{wv}\rvert}{I_{y-n50}} z_n 10^{-3}$	$\sigma_{dk} = \dfrac{\lvert M_{sw} + M_{wv}\rvert}{I_{y-n50}} (z_{dk-s} - z_n) 10^{-3}$
Harbour/sheltered water	$\sigma_{bl} = \dfrac{\lvert M_{sw-p}\rvert}{I_{y-n50}} z_n 10^{-3}$	$\sigma_{dk} = \dfrac{\lvert M_{sw-p}\rvert}{I_{y-n50}} (z_{dk-s} - z_n) 10^{-3}$
Flooded condition at sea for bulk carriers having a length L of 150 m or above	$\sigma_{bl} = \dfrac{\lvert M_{sw-f} + M_{wv}\rvert}{I_{y-n50}} z_n 10^{-3}$	$\sigma_{dk} = \dfrac{\lvert M_{sw-f} + M_{wv}\rvert}{I_{y-n50}} (z_{dk-s} - z_n) 10^{-3}$
$z_{dk\text{-}s}$: Distance from baseline to moulded deck line at side, in m.		

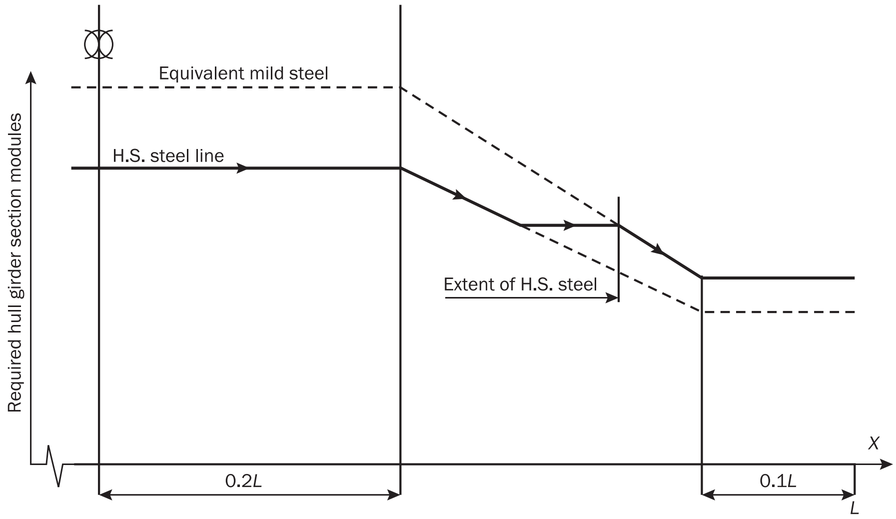
Figure 3 : Vertical extent of higher strength steel



2.4.2 Longitudinal extent

Where used, the application of higher strength steel is to be continuous over the length of the ship to the location where the longitudinal stress levels are within the allowable range for mild steel structure, as shown in Figure 4.

Figure 4 : Longitudinal extent of higher strength steel



3 HULL GIRDER SHEAR STRENGTH ASSESSMENT

3.1 General

3.1.1

The hull girder shear strength requirements apply along the full length of the hull girder, from AE to FE.

3.2 Hull girder shear capacity

3.2.1

The total vertical hull girder shear capacity, Q_R in kN, is the minimum of the calculated values for all plates *i* contributing to the hull girder shear of the considered transverse section and is to be taken as:

$$Q_R = \min_i\left(\frac{\tau_{i-perm} \cdot t_{i-n50}}{q_{vi}} \cdot 10^{-3}\right)$$

where:

$t_{i\text{-}n50}$: Net thickness of plate *i*, in mm. For longitudinal bulkheads between cargo tanks of oil tankers, $t_{i\text{-}n50}$ is to be taken as $t_{sfi\text{-}n50}$ (see [3.4.1]) and $t_{sti\text{-}k\text{-}n50}$ (see [3.5.1]) as appropriate.

q_{vi} : Contribution ratio for hull girder shear force per mm, in mm^{-1}, for the plate *i* based on net scantlings with deduction of 0.5 t_c, which is equal to the unit shear flow per mm, in N/mm, obtained from a numerical calculation based on thin-walled beam theory according to Ch 5, App 1.

$\tau_{i\text{-}perm}$: Permissible shear stress, in N/mm^2, as given in Table 4, for plate *i*.

Table 4 : Permissible hull girder shear stress

Operation	Design load	Permissible hull girder shear, $\tau_{i\text{-}perm}$
Seagoing	(S+D)	120/*k*
Harbour/sheltered water	(S)	105/*k*
Flooded condition at sea of bulk carriers having a length *L* of 150 m or above	(A:S+D)	120/*k*

3.3 Acceptance criteria

3.3.1 Permissible vertical shear force

The positive and negative permissible vertical shear forces are to comply with the following criteria:

- For seagoing operation:

  $|Q_{sw}| \le Q_R - |Q_{wv}|$

- For harbour/sheltered water operation:

  $|Q_{sw-p}| \le Q_R$

- For flooded condition at sea of bulk carriers having a length L of 150 m or above:

  $|Q_{sw-f}| \le Q_R - |Q_{wv}|$

where:

Q_R : Total vertical hull girder shear capacity, in kN, as defined in [3.2.1].

The shear force Q_{wv}, used in 2 above criteria is to be taken with the same sign as the considered shear forces Q_{sw}, and Q_{sw-f} respectively.

3.3.2 Vertical still water shear force

The vertical still water shear forces, in kN, for all loading conditions are to comply with the following criteria:

- For seagoing operation:

  $|Q_{sw-Lcd} - \Delta Q_{mdf}| \le |Q_{sw}|$

- For harbour/sheltered water operation:

  $|Q_{sw-Lcd-p} - \Delta Q_{mdf}| \le |Q_{sw-p}|$

- For flooded condition at sea of bulk carriers having a length L of 150 m or above:

  $|Q_{sw-Lcd-f} - \Delta Q_{mdf}| \le |Q_{sw-f}|$

where:

ΔQ_{mdf} : Shear force correction at the transverse section considered, in kN, taken as:

- For bulk carriers, the value defined in [3.6.1].
- For oil tankers, $\Delta Q_{mdf} = 0$.

The permissible shear forces Q_{sw}, Q_{sw-p} and Q_{sw-f} are to be taken with the same sign as the considered shear forces Q_{sw-Lcd}, $Q_{sw-Lcd-p}$ and $Q_{sw-Lcd-f}$ respectively.

3.4 Effective net thickness for longitudinal bulkheads between cargo tanks of oil tankers

3.4.1

For longitudinal bulkheads between cargo tanks, the net thickness of the plating above the inner bottom, $t_{sfi-n50}$ for plate i, in mm, is given by:

$$t_{sfi-n50} = t_{i-n50} - t_{\Delta i}$$

where:

$t_{\Delta i}$: Thickness deduction for plate i, in mm, as defined in [3.4.2].

3.4.2

The vertical distribution of thickness reduction for shear force correction is to be triangular as indicated in Figure 5. The thickness deduction, $t_{\Delta i}$ in mm, to account for shear force correction on the plate i, is to be taken as:

$$t_{\Delta i} = \frac{\delta Q_3}{h_{blk}\ \tau_{i-perm}}\left(1 - \frac{x_{blk}}{0.5\ell_{tk}}\right)\left(2 - \frac{2(z_p - h_{db})}{h_{blk}}\right)$$

where:

δQ_3 : Shear force correction for longitudinal bulkhead as defined in [3.4.3] and [3.4.4] for ships with one or two longitudinal bulkheads respectively, in kN.

ℓ_{tk} : Length of cargo tank, in m.

h_{blk} : Height of longitudinal bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead, as shown in Figure 5.

x_{blk} : Minimum longitudinal distance from section considered to the nearest cargo tank transverse bulkhead, in m. To be taken positive and not greater than 0.5 ℓ_{tk}.

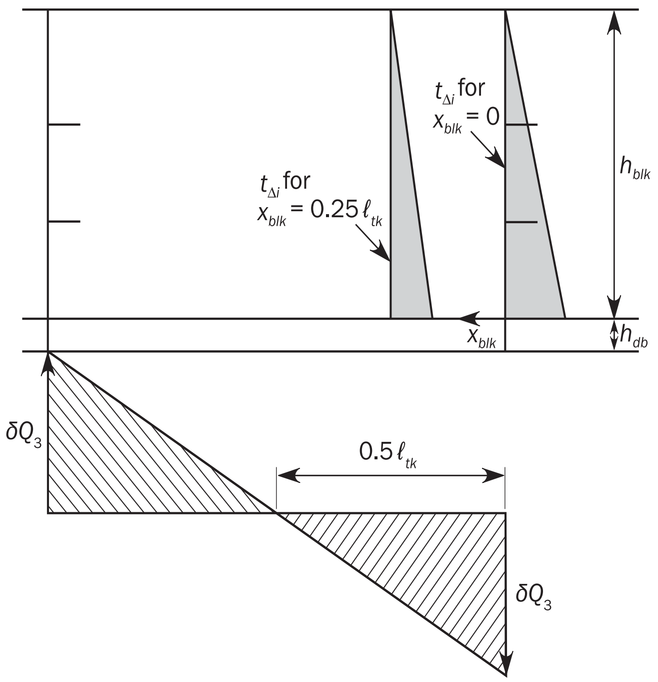
z_p : Vertical distance from the lower edge of plate i to the base line, in m, but not taken less than h_{db}.

h_{db} : Height of double bottom, in m, as shown in Figure 5.

$\tau_{i\text{-}perm}$: Permissible hull girder shear stress, in N/mm^2, for plate i:

$\tau_{i\text{-}perm}$ = 120/k.

Figure 5 : Shear force correction for longitudinal bulkheads



3.4.3 Shear force correction for a ship with a centreline longitudinal bulkhead

For ships with a centreline longitudinal bulkhead, the shear force correction in way of transverse bulkhead, δQ_3, in kN, is to be obtained from the following formula:

$$\delta Q_3 = 0.5\ K_3\ F_{db}$$

where:

F_{db} : Maximum resulting force on the double bottom in a tank, in kN, as defined in [3.4.5].

K_3 : Correction factor, to be taken equal to:

$$K_3 = 0.4 \cdot \left(1 - \frac{1}{1+n}\right) - f_3$$

n : Number of floors between transverse bulkheads.

f_3 : Shear force distribution factor, as defined in Table 5.

3.4.4 Shear force correction for a ship with two longitudinal bulkheads between the cargo tanks

For ships with two longitudinal bulkheads between the cargo tanks, the shear force correction, δQ_3 in kN, is to be obtained from the following formula:

$$\delta Q_3 = 0.5\ K_3\ F_{db}$$

where:

F_{db} : Maximum resulting force on the double bottom in a tank, in kN, as defined in [3.4.5].

K_3 : Correction factor, to be taken equal to:

$$K_3 = 0.5 \cdot \left(1 - \frac{1}{1+n}\right)\left(\frac{1}{r+1}\right) - f_3$$

Table 5 : Shear force distribution factor for oil tanker

Hull configuration	f_3 factor
One centreline bulkhead 	$f_3 = 0.504 - 0.076\dfrac{A_{1-n50}}{A_{2-n50}} - 0.156\dfrac{A_{2-n50}}{A_{3-n50}}$
Two longitudinal bulkheads 	$f_3 = 0.353 - 0.049\dfrac{A_{1-n50}}{A_{2-n50}} - 0.095\dfrac{A_{2-n50}}{A_{3-n50}}$

where:

$A_{1\text{-}n50}$, $A_{2\text{-}n50}$, $A_{3\text{-}n50}$: Net projected area onto the vertical plane based on net thickness, t_{n50}, of the side shell, inner hull or the longitudinal bulkhead respectively, at one side of the section under consideration.

The area $A_{1\text{-}n50}$ includes the net plating area of the side shell, including the bilge.

The area $A_{2\text{-}n50}$ includes the net plating area of the inner hull, including the hopper side and the outboard girder under.

The Area $A_{3\text{-}n50}$ includes the net plating area of the longitudinal bulkheads, including the double bottom girders in line. The area $A_{3\text{-}n50}$ for the centreline bulkhead is not to be reduced for symmetry around the centreline. When the longitudinal bulkhead is made with corrugation, $A_{3\text{-}n50}$ is to consider the equivalent net thickness of the corrugation as defined in [3.4.6].

where:

n : Number of floors between transverse bulkheads.

r : Ratio of the part load carried by the wash bulkheads and floors from longitudinal bulkhead to the double side taken as:

$$r = \frac{1}{\left[\dfrac{A_{3-n50}}{A_{1-n50} + A_{2-n50}} + \dfrac{2 \times 10^4 \, b_{80} (n_s + 1) A_{3-n50}}{\ell_{tk} (n_s \, A_{T-n50} + R)}\right]}$$

ℓ_{tk} : Length of cargo tank, between transverse bulkheads in the side cargo tank, in m.

b_{80} : 80% of the distance from longitudinal bulkhead to the inner hull longitudinal bulkhead, in m, at tank mid length.

$A_{T\text{-}n50}$: Net shear area of the transverse wash bulkhead, including the double bottom floor directly below, in the side cargo tank, in cm^2, taken as the smallest area in a vertical section.

$A_{1\text{-}n50}$, $A_{2\text{-}n50}$, $A_{3\text{-}n50}$:Net areas, as defined in Table 5, in m^2.

f_3 : Shear force distribution factor, as defined in Table 5.

n_S : Number of wash bulkheads in the side cargo tank.

R : Total efficiency of the transverse primary supporting members in the side tank in cm^2.

$$R = \left(\frac{n - n_s}{2} - 1\right) \frac{A_{Q-n50}}{\gamma}$$

$$\gamma = 1 + \frac{300 \;\, {b_{80}}^2 \; A_{Q-n50}}{I_{psm-n50}}$$

$A_{Q\text{-}n50}$: Net shear area, in cm^2, of a transverse primary supporting member in the wing cargo tank, taken as the sum of the net shear areas of floor, cross ties and deck transverse webs. The net shear area is to be calculated at the mid span of the members.

$I_{psm\text{-}n50}$: Net moment of inertia for transverse primary supporting members, in cm^4, in the wing cargo tank, taken as the sum of the moments of inertia of transverses and cross ties. The net moment of inertia is to be calculated at the mid span of the member including an attached plate width equal to the primary supporting member spacing.

3.4.5 Vertical force on double bottom

The maximum vertical resulting force on the double bottom in a tank, F_{db} is in no case to be less than that given by the minimum conditions given in Table 6.

The maximum resulting force on the double bottom in a tank, F_{db} in kN, is to be taken as:

$$F_{db} = g \left| W_{CT} + W_{CWBT} - \rho \;\, b_2 \;\, \ell_{tk} \; T_{mean} \right|$$

where:

W_{CT} : Weight of cargo, in tonnes, as defined in Table 7.

W_{CWBT} : Weight of ballast, in tonnes, as defined in Table 7.

b_2 : Breadth, in m, as defined in Table 7.

ℓ_{tk} : Length of cargo tank, between watertight transverse bulkheads in the wing cargo tank, in m.

T_{mean} : Draught at the mid length of the tank for the loading condition considered, in m.

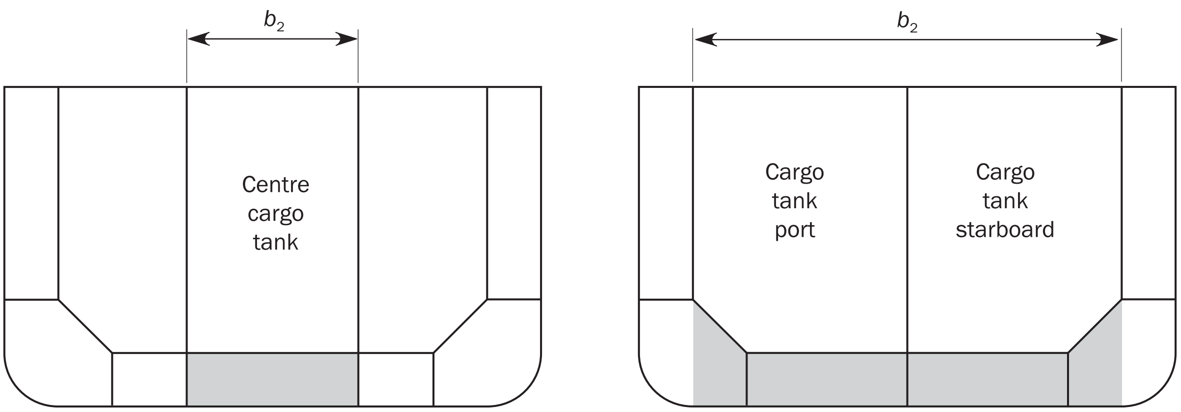
Table 6 : Minimum conditions for double bottom

Structural configuration	Positive/negative force, F_{db}	Minimum condition
Ships with centreline bulkhead	Max positive net vertical force, F_{db+}	0.9 T_{sc} and empty cargo tanks and ballast tanks
	Max negative net vertical force, F_{db-}	0.6 T_{sc} and full cargo tanks and empty ballast tanks
Ships with two longitudinal bulkheads	Max positive net vertical force, F_{db+}	0.9 T_{sc} and empty cargo tanks and ballast tanks
	Max negative net vertical force, F_{db-}	0.6 T_{sc} and full centre cargo tank and empty ballast tanks

Table 7 : Design conditions for double bottom

Structural configuration	W_{CT}	W_{CWBT}	b_2
Ships with centreline bulkhead	Weight of cargo in cargo tanks, in tonnes, using a minimum density of 1.025 t/m^3.	Weight of ballast between port and starboard inner sides, in t.	Maximum breadth between port and starboard inner sides at mid length of tank, in m, as shown in Figure 6.
Ships with two longitudinal bulkheads	Weight of cargo in the centre tank, in tonnes, using a minimum density of 1.025 t/m^3.	Weight of ballast below the centre cargo tank, in t.	Maximum breadth of the centre cargo tank at mid length of tank, in m, as shown in Figure 6.

Figure 6 : Tank breadth b_2



3.4.6 Equivalent net thickness of corrugation

The equivalent net thickness, in mm, of the corrugation of vertical and horizontal corrugated bulkheads, $t_{cor\text{-}n50}$, to be used for the calculation of the effective net shear area and for the unit shear flow, is given as follows:

$$t_{cor-n50} = \frac{t_{w-gr} + t_{f-gr}}{2} \cdot \frac{s_c}{c+a} - 0.5t_c$$

where:

$t_{w\text{-}gr}$: Gross corrugation web thickness, in mm.

$t_{f\text{-}gr}$: Gross corrugation flange thickness, in mm.

s_c : Projected length of one corrugation, in mm, as defined in Ch 3, Sec 6, Figure 21.

c : Breadth of corrugation web, in mm, as defined in Ch 3, Sec 6, Figure 21.

a : Breadth of corrugation flange, in mm, as defined in Ch 3, Sec 6, Figure 21.

3.5 Effective net thickness for longitudinal bulkheads between cargo tanks of oil tankers - Correction due to loads from transverse bulkhead stringers

3.5.1

In way of transverse bulkhead stringer connections, within areas as specified in Figure 7, the equivalent net thickness of plate, $t_{sti\text{-}k\text{-}n50}$ in mm, where the index k refers to the identification number of the stringer, is not to be taken greater than:

$$t_{sti-k-n50} = t_{sfi-n50}\left(1 - \frac{\tau_{sti-k}}{\tau_{i-perm}}\right)$$

where:

$\tau_{sti\text{-}k}$: Shear stress in plate i, in N/mm^2, in the longitudinal bulkhead due to the stringer force in way of stringer k, taken as:

$$\tau_{sti-k} = \frac{Q_{st-k}}{\ell_{st-k}\ t_{sfi-n50}}$$

$t_{sfi\text{-}n50}$: Effective net plating thickness, in mm, calculated at the transverse bulkhead for the height corresponding to the level of the stringer.

$\tau_{i\text{-}perm}$: permissible hull girder shear stress, in N/mm^2, as defined in Table 4 for the plate i.

$\ell_{st\text{-}k}$: Connection length of stringer k, in m, as defined in Figure 7.

$Q_{st\text{-}k}$: Shear force on the longitudinal bulkhead from the stringer in loaded condition with tanks abreast full in kN, taken as:

$$Q_{st-k} = 0.8\ F_{st-k}\left(1 - \frac{z_{st-k} - h_{db}}{h_{blk}}\right)$$

$F_{st\text{-}k}$: Total stringer supporting force in way of a longitudinal bulkhead, in kN, taken as:

$$F_{st-k} = \frac{P_{st-k}\ b_{st-k}(h_k + h_{k-1})}{2}$$

h_{db} : Double bottom height, in m.

h_{blk} : Height of bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead.

$z_{st\text{-}k}$: Z coordinate of the stringer k, in m.

$P_{st\text{-}k}$: Pressure on stringer k, in kN/m^2, taken as:.

$$P_{st-k} = g\ \rho_L\ h_{tt-k}$$

ρ_L : Density of the liquid in cargo tank, in t/m^3, ad defined in Ch 4, Sec 6.

$h_{tt\text{-}k}$: Height from the top of the tank to the midpoint of the load area between $h_k/2$ below and $h_{k-1}/2$ above the stringer k, in m.

h_k : Vertical distance from the considered stringer k to the stringer k+1 below. For the lowermost stringer, it is to be taken as 80% of the average vertical distance to the inner bottom, in m.

$h_{k\text{-}1}$: Vertical distance from the considered stringer k to the stringer k-1 above. For the uppermost stringer, it is to be taken as 80% of the average vertical distance to the upper deck, in m.

$b_{st\text{-}k}$: Load breadth acting on stringer k, in m, as defined in Figure 9 and Figure 10.

Figure 7 : Effective connection length of stringer

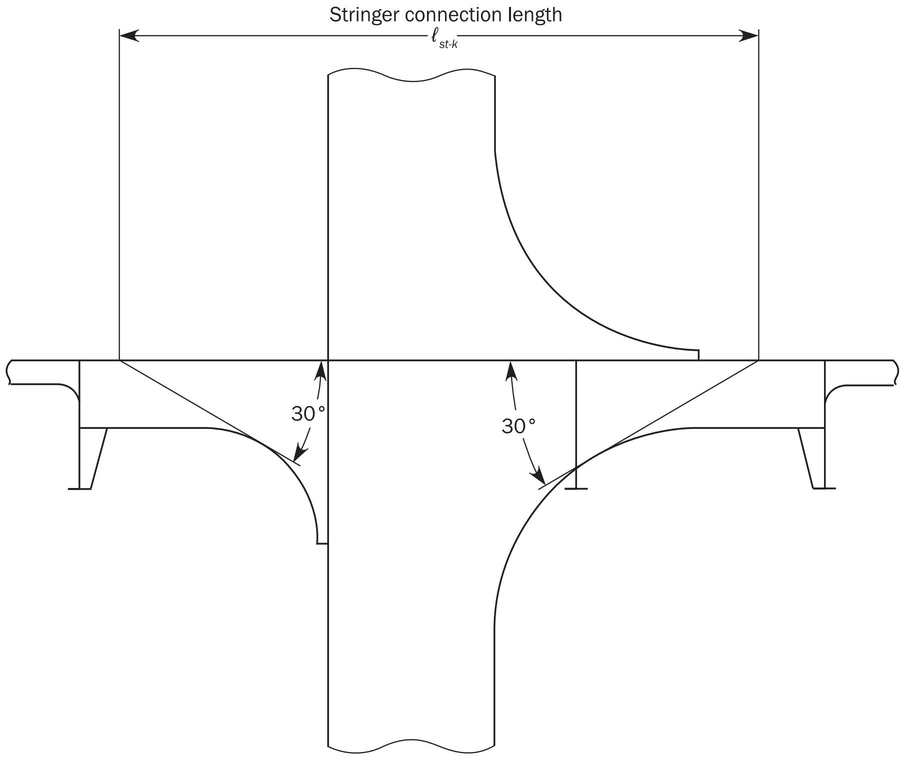


Figure 8 : Region for stringer correction, t_i, for ships with 3 stringers

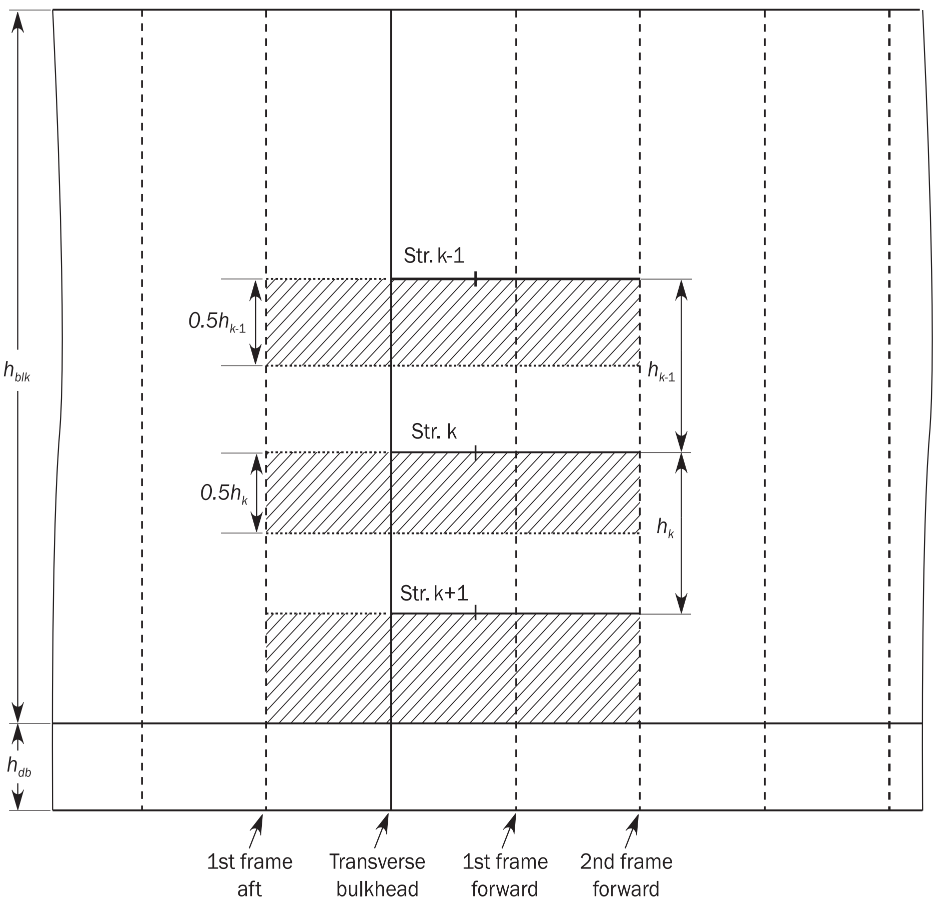

Figure 9 : Load breadth of stringers for ships with a centreline bulkhead

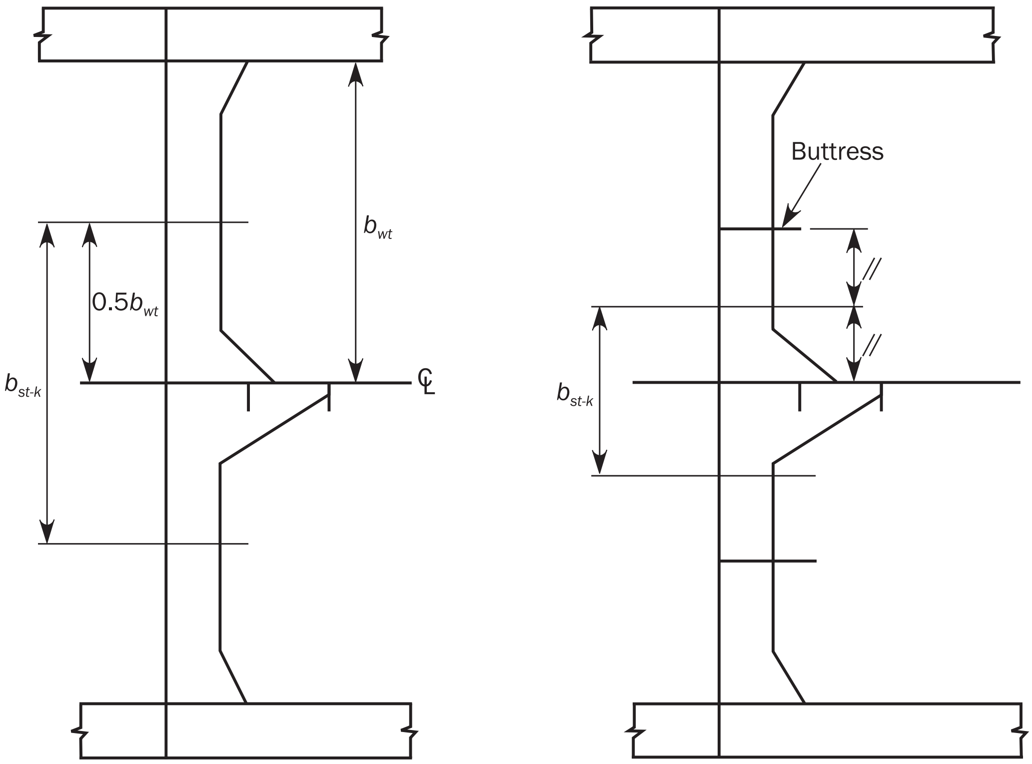

Figure 10 : Load breadth of stringers for ships with 2 inner longitudinal bulkheads

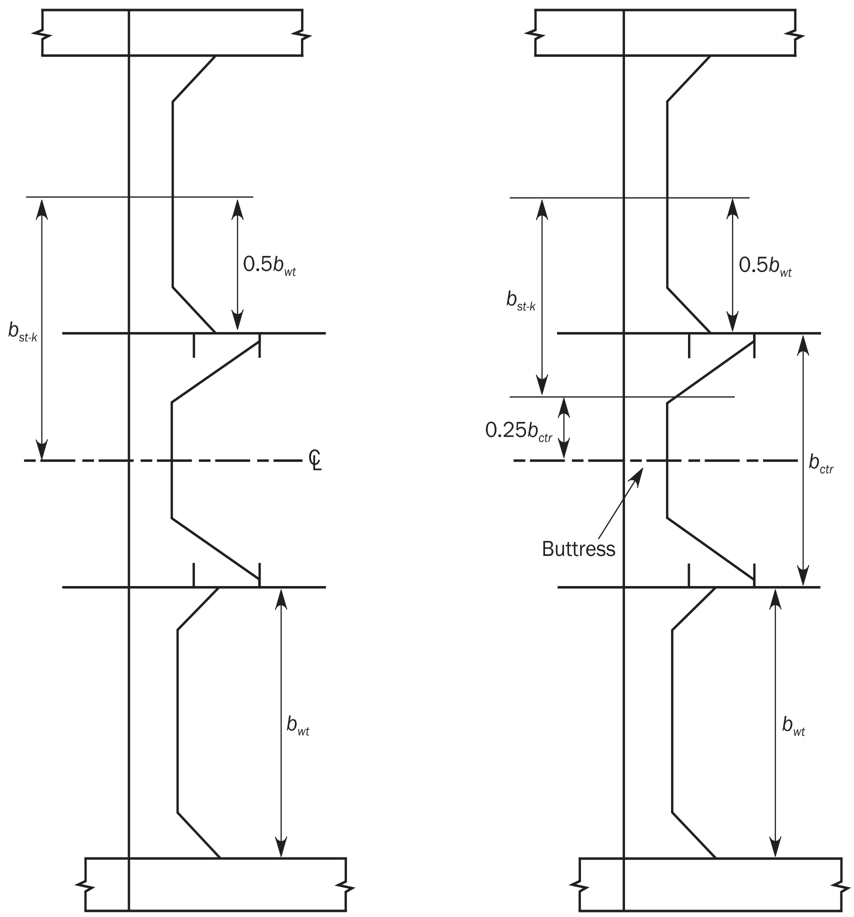


In this figure:

b_{wt} is the breadth of wing cargo tank, in m.

b_{ctr} is the breadth of centre cargo tank, in m.

3.5.2

Where reinforcement is provided to meet the above requirement, the reinforced area based on the maximum value of $t_{sti-k-n50}$ is to extend longitudinally for the full length of the stringer connection and a minimum of one frame spacing forward and aft of the bulkhead. The reinforced area is to extend vertically from above the stringer level and down to 0.5 h_k below the stringer, where h_k, the vertical distance from the considered stringer to the stringer below is as defined in [3.5.1]. For the lowermost stringer the maximum plate thickness requirement, $t_{sti-k-n50}$ is to extend down to the inner bottom, see Figure 8.

3.6 Shear force correction for bulk carriers

3.6.1

When hull girder shear strength assessment is performed in accordance with [3], shear force correction, which takes into account the portion of loads transmitted by the double bottom longitudinal girders to the transverse bulkheads, is to be considered.

For the considered cargo hold, the shear force correction at the considered transverse section is to be obtained, in kN, from the following formula:

$$\Delta Q_{mdf} = C_d \alpha \left(\frac{M}{B_H \ \ell_H} - \rho T_{LC,mh} \right)$$

where:

C_d : Distribution coefficient taken as:

- C_d = -1 at the aft end of the considered cargo hold except for aftmost cargo hold.
- C_d = 1 at the fore end of the considered cargo hold except for foremost cargo hold.
- C_d = 0 at mid-length of the cargo hold.
- C_d = 0 at the aft bulkhead of the aftmost cargo hold.
- C_d = 0 at the fore bulkhead of the foremost cargo hold.
- C_d : Linearly distributed at other locations.

α : Coefficient taken as:

$$\alpha = g \frac{\ell_0 \ b_0}{2 + \varphi \frac{\ell_0}{b_0}}$$

M : Mass, in t, in the hold in way of the considered transverse section for the considered loading condition. M is to include the mass of ballast water and fuel oil located directly below the flat portion of the inner bottom, if any, excluding the portion under the bulkhead stool.

B_H : Breadth of the cargo hold, in m, as defined in Ch 4, Sec 6.

ℓ_H : Length of the cargo hold, in m, as defined in Ch 4, Sec 6.

ℓ_0, b_0 : Length and breadth, respectively, in m, of the flat portion of the double bottom in way of the hold considered; b_0 is to be measured on the hull transverse section at the middle of the hold.

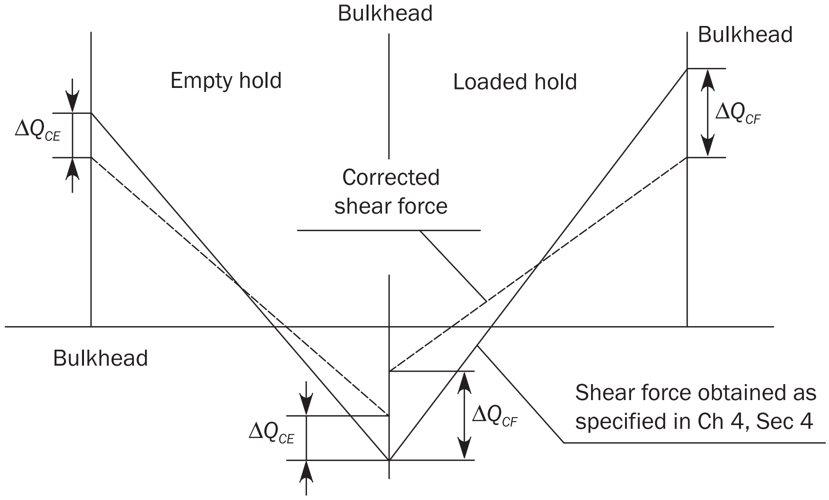
$$\varphi = 1.38 + 1.55 \frac{\ell_0}{b_0}$$, but not greater than 3.7.

$T_{LC,mh}$: Draught, in m, measured vertically on the hull transverse section at the middle of the hold considered, from the moulded baseline to the waterline in the loading condition considered.

ΔQ_{CF} : Shear force correction for the full hold.

ΔQ_{CE} : Shear force correction for the empty hold.

Figure 11 : Shear force correction, ΔQ_C



SECTION 2
HULL GIRDER ULTIMATE STRENGTH

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4

$M_{sw\text{-}h}$,$M_{sw\text{-}s}$: Permissible hogging and sagging vertical still water bending moment in intact seagoing condition, in kNm, at the hull transverse section considered, defined in Ch 4, Sec 4, [2.2.2].

$M_{sw\text{-}p\text{-}h}$, $M_{sw\text{-}p\text{-}s}$: Permissible hogging and sagging vertical still water bending moment for harbour/sheltered water operation, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.3].

$M_{sw\text{-}f}$: Permissible hogging and sagging vertical still water bending moment in flooded condition at sea, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.4].

1 APPLICATION

1.1 General

1.1.1

The requirements of this section apply to ships equal to or greater than 150 m in length *L*.

1.1.2

The hull girder ultimate strength is to be assessed through the cargo hold region and machinery space.

1.1.3

The hull girder ultimate bending capacity is to be checked to ensure that it satisfies the checking criteria given in [2]. Such checking criteria are applicable to intact ship structures in the following conditions:

- For bulk carriers: seagoing, harbour/sheltered water and flooded conditions.
- For oil tankers: seagoing and harbour/sheltered water conditions.

2 CHECKING CRITERIA

2.1 General

2.1.1

The vertical hull girder ultimate bending capacity is to be checked for hogging and sagging conditions, for the following design load scenarios, as defined in Table 1:

- For bulk carriers: design load scenario A, for seagoing, harbour/sheltered water and flooded conditions.
- For oil tankers: design load scenario A, for seagoing and harbour/sheltered water conditions; and design load scenario B, for the operational seagoing homogeneous full load condition.

Table 1 : Design load scenarios

Design load scenarios		Permissible still water bending moment, M_{sw-U}
A	S+D	M_{sw-h} or M_{sw-s}
	S	M_{sw-p-h} or M_{sw-p-s}
	A: S+D	M_{sw-f}
B	S+D	Maximum sagging still water bending moment for operational seagoing homogeneous full load condition (1)
(1) The maximum still water bending moment is to be taken from the departure condition with the ship homogeneously loaded at maximum draught and corresponding arrival and any mid-voyage conditions.		

2.1.2

The vertical hull girder ultimate bending capacity at any hull transverse section is to satisfy the following criteria:

$$M \le \frac{M_U}{\gamma_R}$$

where:

M : Vertical bending moment, in kNm, to be obtained as specified in [2.2.1].

M_U : Vertical hull girder ultimate bending capacity, in kNm, to be obtained as specified in [2.3].

γ_R : Partial safety factor for the vertical hull girder ultimate bending capacity to be taken equal to:

$\gamma_R = \gamma_M \gamma_{DB}$

γ_M : Partial safety factor for the vertical hull girder ultimate bending capacity, covering material, geometric and strength prediction uncertainties; in general, to be taken equal to:

$\gamma_M = 1.1$

γ_{DB} : Partial safety factor for the vertical hull girder ultimate bending capacity, covering the effect of double bottom bending, to be taken equal to:

- For hogging condition:
  - $\gamma_{DB} = 1.25$ for empty cargo holds in alternate condition of BC-A bulk carriers,
  - $\gamma_{DB} = 1.10$ for oil tankers, for BC-B and BC-C bulk carriers and loaded cargo holds in alternate condition of BC-A bulk carriers,
- For sagging condition: $\gamma_{DB} = 1.0$

2.2 Hull girder ultimate bending loads

2.2.1

The vertical hull girder bending moment, M in hogging and sagging conditions, to be considered in the ultimate strength check is to be taken as:

$$M = \gamma_S M_{sw-U} + \gamma_W M_{wv}$$

where:

M_{sw-U} : Permissible still water bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered as defined in Table 1.

M_{wv} : Vertical wave bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered as defined in Ch 4, Sec 4, [3.1].

γ_S : Partial safety factor for the still water bending moment, as defined in Table 2.

γ_W : Partial safety factor for the vertical wave bending moment, as defined in Table 2.

Table 2 : Partial safety factors

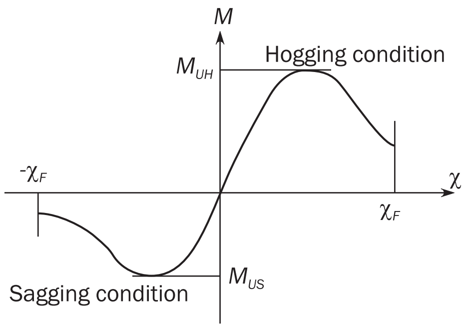
Design load scenarios	γ_S	γ_W
A	1.0	1.2
B	1.0	1.3

2.3 Hull girder ultimate bending capacity

2.3.1

The ultimate bending moment capacities of a hull girder transverse section, in hogging and sagging conditions, are defined as the maximum values of the curve of bending moment capacity versus the curvature χ of the transverse section considered (see Figure 1). The curvature χ is positive for hogging condition and negative for sagging condition.

Figure 1 : Bending moment capacity versus curvature χ



The hull girder ultimate bending capacity, M_U, is to be calculated according to Ch 5, App 2.

2.3.2

The effective area for the hull girder ultimate strength capacity assessment is specified in Ch 5, App 2.

SECTION 3
HULL GIRDER RESIDUAL STRENGTH

1 APPLICATION

1.1 General

1.1.1

The requirements of this section apply to ships equal to or greater than 150 m in length *L*.

1.1.2

The hull girder ultimate bending capacity in the damaged condition is to be checked for the seagoing condition to ensure that it satisfies the residual strength checking criteria given in [2].

1.1.3

The hull girder residual strength is to be assessed through the cargo hold region and the machinery space.

2 CHECKING CRITERIA

2.1 General

2.1.1

The vertical hull girder ultimate bending capacity in the damaged condition is to be checked for the damage conditions specified in [2.2] in hogging and sagging conditions. For the damage conditions specified in [2.2], for the design load scenario A, as defined in Table 1:

Table 1 : Design load scenarios

	Design load scenario	Permissible still water bending moment in damage, $M_{sw\text{-}D}$
Collision	A: S+D	$M_{sw\text{-}h}$ or $M_{sw\text{-}s}$
Grounding	A: S+D	$M_{sw\text{-}h}$ or $M_{sw\text{-}s}$

2.1.2

The vertical hull girder ultimate bending capacity in the damaged condition at any hull transverse section is to satisfy the following criteria:

$$M_D \le \frac{M_{UD}}{\gamma_{RD} \cdot C_{NA}}$$

where:

M_D : Vertical bending moment in the damaged condition, in kNm, to be obtained as specified in [2.3].

M_{UD} : Vertical hull girder ultimate bending capacity in the damaged condition, in kNm, to be obtained as specified in [2.4].

γ_{RD} : Partial safety factor for the vertical hull girder ultimate bending capacity in the damaged condition, to be taken equal to:
$\gamma_{RD} = 1.0$

C_{NA} : Neutral axis coefficient taken as:

- C_{NA} = 1.0 for grounding,
- C_{NA} = 1.1 for collision.

2.2 Damage conditions

2.2.1 General

The damage conditions specified for collision in [2.2.2] and for grounding in [2.2.3] are to be considered. The damage extents specified in [2.2.2] and [2.2.3] are to be measured from the moulded lines of the ship.

Plates of inner bottom and inner hull longitudinal bulkhead are to be considered intact unless the damage extent exceeds the distance from inner bottom and inner hull longitudinal bulkhead plate respectively, to the hull envelope plate.

Stiffener element is to be considered intact unless the connection of stiffener with attached plate is included in the damaged extent.

Plates and stiffeners of inner bottom and inner hull longitudinal bulkhead are to be considered intact unless the damage extent exceeds the moulded distance from inner bottom and inner hull longitudinal bulkhead plate respectively, to the hull envelope plate.

2.2.2 Collision

For the collision assessment of the considered transverse damage cross section, the damage is to be considered on one side and inclusive of the freeboard deck.

The damage for collision extends from the point of intersection of the moulded lines of deck and side:

- vertically downward for a distance h and upward without limit,
- transversally inboard for a distance d and outward without limit,

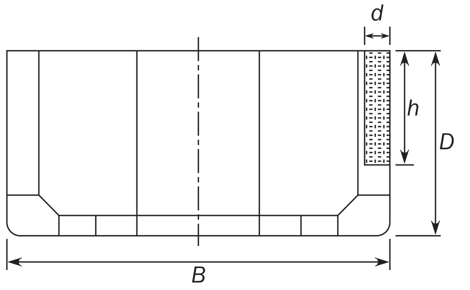
where h and d are given in Table 2 according to the side shell arrangement in the considered damage transverse section.

On ships with a rounded gunwale, the point of intersection is to be taken from the continuation of the moulded lines of deck and side.

Table 2 : Damage extent for collision

Damage penetration, in m	Side shell arrangement	
	Single side	Double side
Height, h	0.75 D	0.60 D
Depth, d	B /16	B /16

Figure 1 : Damage extent for collision



The capacity of the damaged transverse cross section is calculated with the damage extent on one side, the ship kept in upright position.

2.2.3 Grounding

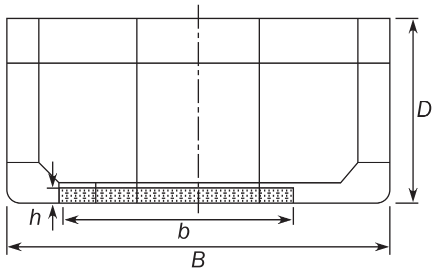
For the grounding assessment of the considered transverse damage cross section, the damage is to be considered on the bottom in the most unfavourable transversal position as regard to the structure considered by the damage.

The damage extent for grounding is given in Table 3.

Table 3 : Damage extent for grounding

Damage penetration, in m	Bulk carriers	Oil tankers
Height, h	Min (B /20, 2)	Min (B /15, 2)
Breadth, b	0.60 B	0.60 B

Figure 2 : Damage extent for grounding



2.3 Hull girder ultimate bending loads in the damaged condition

2.3.1

The vertical bending moment, M_D in hogging and sagging conditions, to be considered in the ultimate strength check of the hull girder in the damaged condition, is to be obtained from the following formula:

$$M_D = \gamma_{SD} M_{sw-D} + \gamma_{WD} M_{wv}$$

where:

M_{sw-D} : Permissible still water bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered, as defined in Table 1.

M_{wv} : Vertical wave bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered, as defined in Ch 4, Sec 4, [3.1].

γ_{SD} : Partial safety factor for the still water bending moment in the damaged condition, to be taken equal to:
$\gamma_{SD} = 1.1$

γ_{WD} : Partial safety factor for the vertical wave bending moment in the damaged condition, to be taken equal to:
$\gamma_{WD} = 0.67$

2.4 Hull girder ultimate bending capacity in the damaged condition

2.4.1

The hull girder ultimate bending capacity in the damaged condition is to be calculated according to Ch 5, App 2, with the damaged parts assumed not to contribute to the hull girder strength. When assessing the ultimate bending capacity, M_{UD} of the damaged hull sections, damaged area as defined in [2.2] carries no loads and is to be removed in the capacity model.

2.4.2

The effective area of the intact parts for the hull girder ultimate strength capacity assessment is specified in Ch 5, App 2.

APPENDIX 1
DIRECT CALCULATION OF SHEAR FLOW

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 CALCULATION FORMULA

1.1 General

1.1.1

This appendix describes the procedures of direct calculation of shear flow which is working along a ship cross section due to hull girder vertical shear force. Shear flow q_v, at each location in the cross section, is calculated where considering the cross section is subjected to a unit vertical shear force, 1 N, in the direction of z coordinate.

The unit shear flow per mm, q_v in N/mm, can be considered equal to:

$$q_v = q_D + q_I$$

where:

q_D : Determinate shear flow, as defined in [1.2].

q_I : Indeterminate shear flow which circulates around the closed cells, as defined in [1.3].

In the calculation of the unit shear flow, q_v, the longitudinal stiffeners are to be taken into account.

1.2 Determinate shear flow

1.2.1

The determinate shear flow, q_D in N/mm, at each location in the cross section can be obtained from the following line integration:

$$q_D\,(S) = -\frac{1}{10^6\ I_{y-n50}}\int_0^s (z - z_n)\ t_{n50}ds$$

where:

s : Coordinate value of running coordinate along the cross section, in m.

I_{y-n50} : Moment inertia of the cross section, in m^4.

t_{n50} : Net thickness of plating, in mm, or equivalent net thickness of corrugated plate as defined in Ch 5, Sec 1, [3.4.6].

1.2.2

Assuming the cross section is composed of line segments as shown in Figure 1, the determinate shear flow can be calculated by the following equation.

$$q_{Dk} = q_D(\ell) = -\frac{t_{n50}\ell}{2\times10^6\ I_{y-n50}}(z_k + z_i - 2z_n) + q_{Di}$$

where:

q_{Dk}, q_{Di} : Determinate shear flow at node k and node i respectively, in N/mm.

ℓ : Length of line segments, in m.

z_k, z_i : Z coordinate of the end point of line segment, in m, as defined in Figure 1.

1.2.3

Where the cross section includes closed cells, the closed cell are to be cut with virtual slits, as shown in Figure 2 in order to obtain the determinate shear flow.

However, the virtual slits must not be located at the walls by which the other closed cell is also bounded.

1.2.4

Calculations of the determinate shear flow at bifurcation points can be calculated such as water flow calculations as shown in Figure 3.

Figure 1 : Definition of line segment

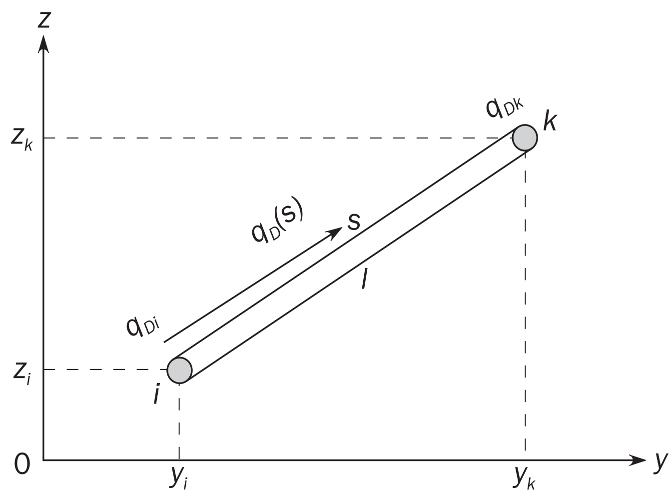


Figure 2 : Calculation of determinate shear flow at bifurcation

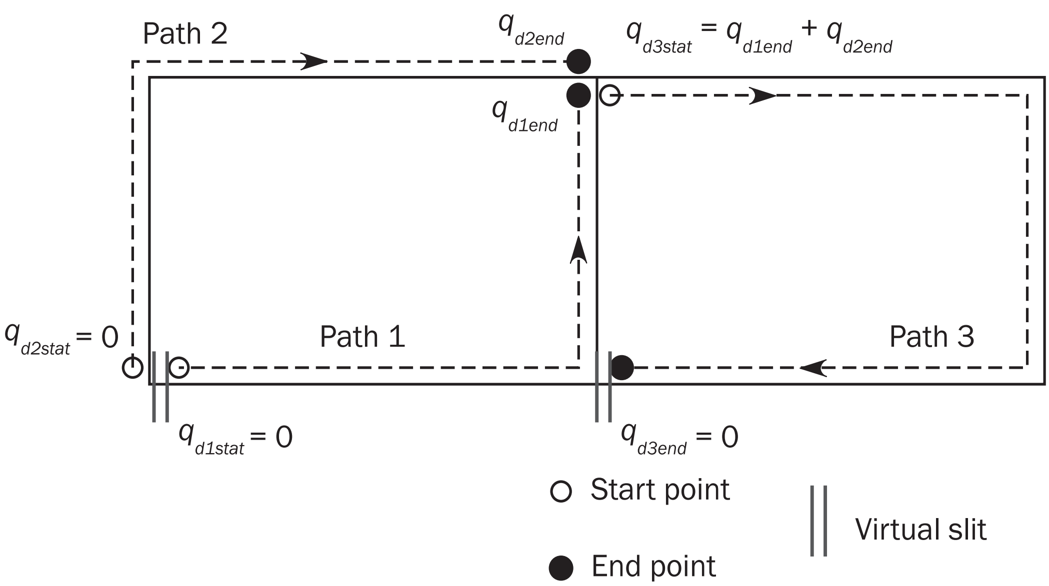


1.3 Indeterminate shear flow

1.3.1

The indeterminate shear flow is working around the closed cells and can be considered as a constant value within the same closed cell. The following system of equation for determination of indeterminate shear flows can be developed. In the equations, contour integrations of several parameters around all closed cells are performed.

$$q_{Ik} \oint_k \frac{1}{t_{n50}}\, ds - \sum_i q_{Ii} \oint_{k,i} \frac{1}{t_{n50}}\, ds = -\oint_k \frac{q_D}{t_{n50}}\, ds$$

where:

q_{Ik}, q_{Ii} : Indeterminate shear flow around the closed cell *k* and *i* respectively, in N/mm.

1.3.2

With assuming assembly of line segments shown in Figure 1, the equations in [1.3.1] can be expressed as follows:

$$q_{Ik} \sum_{cell\,k} \frac{\ell}{t_{n50}} - \sum_i q_{Ii} \left(\frac{\ell}{t_{n50}}\right)\Bigg|_{common\ wall\ with\ cell\,k} = -\sum_{cell\,k} \phi$$

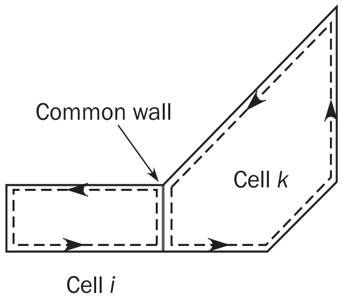
$$\phi = \int_0^{\ell} \frac{q_D(s)}{t_{n50}}\, ds = -\frac{\ell^2}{6 \times 10^3\, I_{y-n50}}\,(z_k + 2z_i - 3z_n) + \frac{\ell}{t_{n50}}\, q_{Di}$$

where:

q_{Di} : Determinate shear flow, in N/mm, calculated according to [1.2.2].

The difference in the directions of running coordinates specified in [1.2] and this sub-article is to be considered.

Figure 3 : Closed cells and common wall



1.4 Computation of several properties of the cross section

1.4.1

Properties of the cross section can be obtained by the following formulae where the cross section is assumed as the assembly of line segments:

$$\ell = \sqrt{(y_k - y_i)^2 + (z_k - z_i)^2}$$

$$a_{n50} = 10^{-3}\, \ell t_{n50} \qquad A_{n50} = \sum a_{n50}$$

$$s_{y-n50} = \frac{a_{n50}}{2}\,(z_k + z_i) \qquad S_{y-n50} = \sum s_{y-n50}$$

$$i_{y0-n50} = \frac{a_{n50}}{3}\,(z_k^2 + z_k z_i + z_i^2) \qquad I_{y0-n50} = \sum i_{y0-n50}$$

where:

a_{n50}, A_{n50}: Area of the line segment and the cross section respectively, in m^2.

$s_{y\text{-}n50}$, $S_{y\text{-}n50}$: First moment of the line segment and the cross section about the baseline, in m^3.

$i_{y0\text{-}n50}$, $I_{y0\text{-}n50}$: Moment inertia of the line segment and the cross section about the baseline, in m^4.

1.4.2

The height of horizontal neutral axis, z_G in m, can be obtained as follows:

$$z_G = \frac{S_{y-n50}}{A_{n50}}$$

1.4.3

Inertia moment about the horizontal neutral axis, in m^4, can be calculated as follows:

$$I_{y-n50} = I_{y0-n50} - z_n^2 A_{n50}$$

2 EXAMPLE OF CALCULATIONS FOR A SINGLE SIDE HULL CROSS SECTION

2.1 Cross section data

2.1.1

The cross section is shown in Figure 4. The coordinates of the node points marked by filled black circles in Figure 4 are given in Table 1, where the plate thickness and the line segments (marked by circles in Figure 4) of the cross section are given in Table 2.

The sample calculations are performed taking advantage of symmetry of the cross section.

Table 1 : Node coordinates of cross section

Node number	*Y* coordinate (m)	*Z* coordinate (m)
0	0.00	0.00
1	5.80	0.00
2	11.70	0.00
3	14.42	0.00
4	16.13	1.72
5	16.13	6.11
6	11.70	1.68
7	5.80	1.68
8	0.00	1.68
9	16.13	14.15
10	16.13	19.60
11	7.50	20.25
12	7.50	19.63

Table 2 : Calculation of cross sectional properties

Line no.	Node i	Node k	Thickness (mm)	Length (m)	a_{n50} (m^2)	$s_{y\text{-}n50}$ (m^3)	$i_{y0\text{-}n50}$ (m^4)
1	0	1	17.0	5.80	0.099	0.000	0.00
2	1	2	17.0	5.90	0.100	0.000	0.00

11	10	11	24.0	8.65	0.208	4.139	82.47
12	11	12	24.0	0.62	0.015	0.297	5.92
13	12	9	15.0	10.22	0.153	2.590	44.13
14	2	6	15.0	1.68	0.025	0.021	0.02
15	1	7	15.0	1.68	0.025	0.021	0.02
				Total	1.416	11.686	185.138

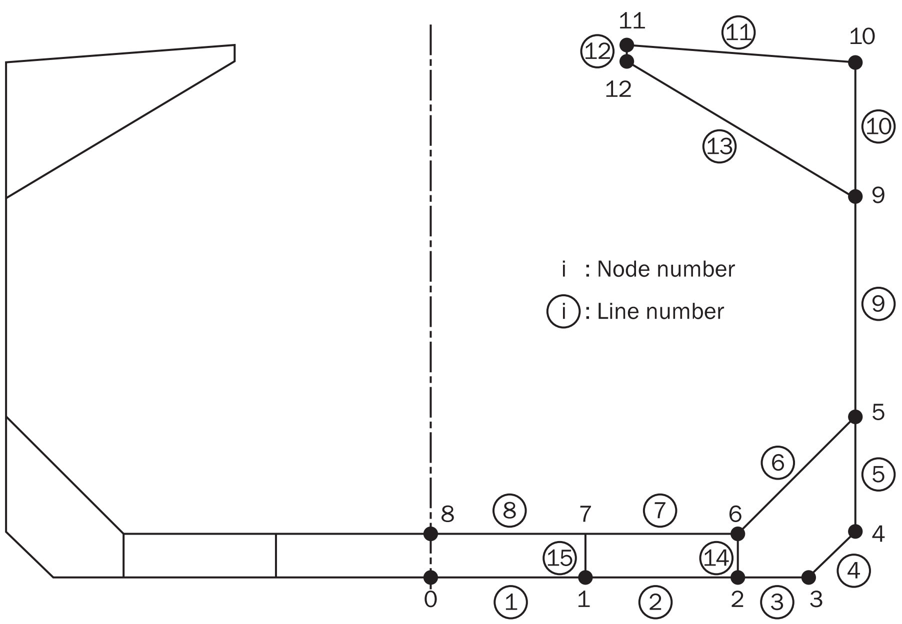
2.1.2

The Z coordinate of horizontal neutral axis and the inertia moment about the neutral axis are calculated as follow:

$$z_G = \frac{\sum s_{y-n50}}{\sum a_{n50}} = \frac{11.686}{1.416} = 8.255$$

$$I_{y-n50} = 2\left(\sum i_{y0-n50} - z_n^2 \sum a_{n50}\right) = 2(185.138 - 8.255^2 \times 1.416) = 177.34$$

Figure 4 : Numbering of nodes and lines



2.2 Calculations of the determinate shear flow

2.2.1

The virtual slits are added to cut the walls of the closed cells as shown in Figure 5. And then, the line integrations specified in [1.2.2] are performed to obtain determinate shear flow, q_D. The calculation results are shown in Table 3. The locations of the virtual slits and the paths of line integrations shown in Figure 5 are one such example. These definitions can be arbitrarily determined so as to calculate them easily.

2.3 Calculations of the indeterminate shear flow

2.3.1

To obtain the system of equations for indeterminate shear flows, the contour integrations around 3 closed cells as defined in Figure 6 are performed. The closed cell at the centre of double bottom is considered as an open shape since the symmetrical condition of the cross section is considered. The calculation results of contour integrations around the closed cells are shown in Table 4 to Table 6.

Table 4 : Contour integration of ℓ/t_{n50} and ϕ around cell 1

Line no.	Node *i*	Node *k*	q_{Di}×10^{-6} (N/mm)	ℓ/t_{n50}	ϕ×10^{-3} (N/mm)	Note
10	9	10	0.0	259.5	-0.65	-
11	10	11	-5.6	360.6	-4.45	-
12	11	12	-19.2	25.8	-0.51	-
13	12	9	-20.2	681.5	-16.59	-
			Total	1327.5	-22.19	-

2.3.2

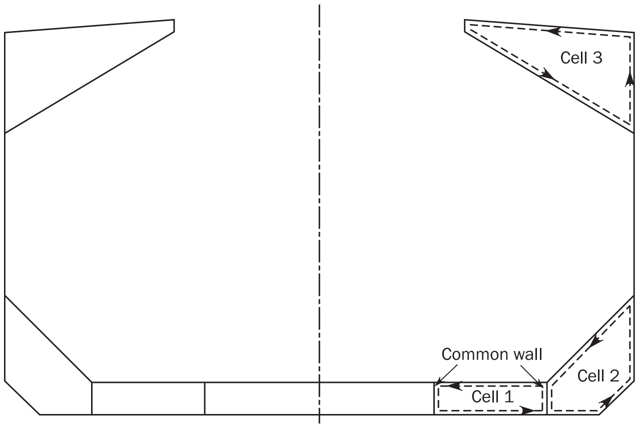
The following system of equations can be developed by using the results of the contour integration around each closed cell:

- Cell 1: $852.0\, q_{I1} - 112.0\, q_{I2} = 2.68 \times 10^{-3}$
- Cell 2: $-112.0\, q_{I1} + 988.3\, q_{I2} = 6.07 \times 10^{-3}$
- Cell 3: $1327.5\, q_{I3} = 2.219 \times 10^{-2}$

The solution of this system gives indeterminate shear flows of the closed cell 1 to 3:

$q_{I1} = 4.01 \times 10^{-6}$, $q_{I2} = 6.60 \times 10^{-6}$, $q_{I3} = 1.67 \times 10^{-5}$

Figure 6 : Numbering of closed cells

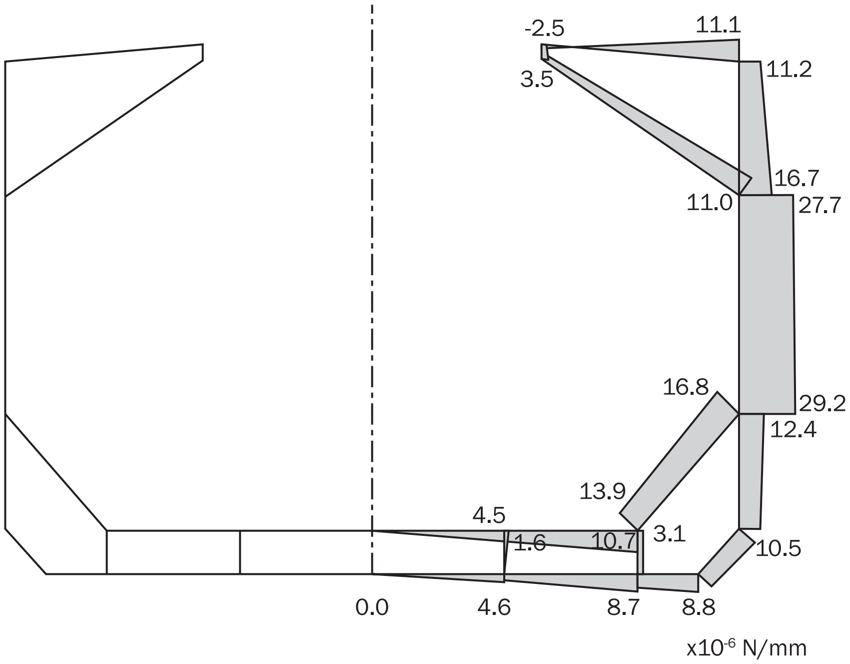


2.4 Summation

2.4.1

The shear flow q_v, at all locations of the cross section can be obtained by the summation of determinate shear flow, q_D and indeterminate shear flow, q_I as shown in Figure 7.

Figure 7 : Calculation results of shear flow q_v, in 10^{-6} N/mm for vertical shear force with 1 N



APPENDIX 2
HULL GIRDER ULTIMATE CAPACITY

SYMBOLS

For symbols not defined in this article, refer to Ch 1, Sec 4.

I_{y-n50} : Moment of inertia, in m^4, of the hull transverse section around its horizontal neutral axis, to be calculated according to Ch 5, Sec 1.

Z_{B-n50}, Z_{D-n50} : Section moduli, in m^3, at bottom and deck, respectively, defined in Ch 5, Sec 1.

R_{eHs} : Minimum yield stress, in N/mm^2, of the material of the considered stiffener.

R_{eHp} : Minimum yield stress, in N/mm^2, of the material of the considered plate.

A_{s-n50} : Net sectional area, in cm^2, of stiffener, without attached plating.

A_{p-n50} : Net sectional area, in cm^2, of attached plating.

1 GENERAL

1.1 Application

1.1.1

This appendix provides the criteria for obtaining the following ultimate longitudinal bending moment capacities:

- M_U to be used in the hull girder ultimate capacity check according to Ch 5, Sec 2,
- M_{UD} to be used in the hull girder residual strength capacity check according to Ch 5, Sec 3

1.1.2

The hull girder ultimate longitudinal bending moment capacity, M_U or M_{UD}, is defined as the maximum bending capacity of the hull girder beyond which the hull structure collapses. Hull girder failure is controlled by buckling, ultimate strength and yielding of longitudinal structural elements.

1.2 Methods

1.2.1 Incremental-iterative method

The hull girder ultimate bending capacity is to be assessed by the incremental-iterative method defined in [2].

1.2.2 Alternative methods

Principles for alternative methods for the calculation of the hull girder ultimate bending capacity; e.g. non-linear finite element analysis, are given in [3].

Application of alternative methods is to be agreed by the Society prior to commencement. Documentation of the analysis methodology and detailed comparison of its results are to be submitted for review and acceptance. The use of such methods may require the partial safety factors to be recalibrated.

1.3 Assumptions

1.3.1

The method for calculating the ultimate hull girder capacity is to identify the critical failure modes of all main longitudinal structural elements.

1.3.2

Structures compressed beyond their buckling limit have reduced load carrying capacity. All relevant failure modes for individual structural elements, such as plate buckling, torsional stiffener buckling, stiffener web buckling, lateral or global stiffener buckling; and their interactions, are to be considered in order to identify the weakest inter-frame failure mode.

1.3.3

Only vertical bending is considered. The effects of shear force, torsional loading, horizontal bending moment and lateral pressure are neglected.

1.3.4

For the calculation of the ultimate longitudinal bending moment capacity, M_{UD}, used in the hull girder residual strength check according to Ch 5, Sec 3, the structural members in way of the damage part are to be excluded from the members participating to the considered cross section strength.

2 INCREMENTAL-ITERATIVE METHOD

2.1 Assumptions

2.1.1

In applying the procedure described in [2.2], the following assumptions are generally to be made:

- The ultimate strength is calculated at hull transverse sections between two adjacent transverse webs.
- The hull girder transverse section remains plane during each curvature increment.
- The hull material has an elasto-plastic behaviour.
- The hull girder transverse section is divided into a set of elements, which are considered to act independently.

These elements are:

- Transversely framed plating panels and/or stiffeners with attached plating, whose structural behaviour is described in [2.3.1].
- Hard corners, constituted by plating crossing, whose structural behaviour is described in [2.3.2].
- According to the iterative procedure, the bending moment M_i acting on the transverse section at each curvature value χ_i is obtained by summing the contribution given by the stress σ acting on each element. The stress σ corresponding to the element strain, ε is to be obtained for each curvature increment from the non-linear load-end shortening curves σ-ε of the element.

These curves are to be calculated, for the failure mechanisms of the element, from the formulae specified in [2.2]. The stress, σ is selected as the lowest among the values obtained from each of the considered load-end shortening curves σ-ε.

The procedure is to be repeated until the value of the imposed curvature reaches the value χ_F in m^{-1}, in hogging and sagging condition, obtained from the following formula:

$$\chi_F = \pm 0.003 \frac{M_Y}{EI_{y-n50}}$$

where:

M_Y : Lesser of the values M_{Y1} and M_{Y2}, in kNm.

$M_{Y1} = 10^3\, R_{eH}\, Z_{B\text{-}n50}$.

$M_{Y2} = 10^3\, R_{eH}\, Z_{D\text{-}n50}$.

If the value χ_F is not sufficient to evaluate the peaks of the curve M-χ, the procedure is to be repeated until the value of the imposed curvature permits the calculation of the maximum bending moments of the curve.

2.2 Procedure

2.2.1 General

The curve M-χ is to be obtained by means of an incremental-iterative approach, summarised in the flow chart in Figure 1.

In this procedure, the ultimate hull girder bending moment capacity, M_U is defined as the peak value of the curve with vertical bending moment M versus the curvature χ of the ship cross section as shown in Figure 1. The curve is to be obtained through an incremental-iterative approach.

Each step of the incremental procedure is represented by the calculation of the bending moment M_i which acts on the hull transverse section as the effect of an imposed curvature χ_i.

For each step, the value χ_i is to be obtained by summing an increment of curvature, $\Delta\chi$ to the value relevant to the previous step χ_{i-1}. This increment of curvature corresponds to an increment of the rotation angle of the hull girder transverse section around its horizontal neutral axis.

This rotation increment induces axial strains, ε in each hull structural element, whose value depends on the position of the element. In hogging condition, the structural elements above the neutral axis are lengthened, while the elements below the neutral axis are shortened, and vice-versa in sagging condition.

The stress σ induced in each structural element by the strain ε is to be obtained from the load-end shortening curve σ-ε of the element, which takes into account the behaviour of the element in the non-linear elasto-plastic domain.

The distribution of the stresses induced in all the elements composing the hull transverse section determines, for each step, a variation of the neutral axis position, since the relationship σ-ε is non-linear. The new position of the neutral axis relevant to the step considered is to be obtained by means of an iterative process, imposing the equilibrium among the stresses acting in all the hull elements.

Once the position of the neutral axis is known and the relevant stress distribution in the section structural elements is obtained, the bending moment of the section M_i around the new position of the neutral axis, which corresponds to the curvature χ_i imposed in the step considered, is to be obtained by summing the contribution given by each element stress.

The main steps of the incremental-iterative approach described above are summarised as follows (see also Figure 1):

a) Step 1: Divide the transverse section of hull into stiffened plate elements.

b) Step 2: Define stress-strain relationships for all elements as shown in Table 1.

c) Step 3: Initialise curvature χ_1 and neutral axis for the first incremental step with the value of incremental curvature (i.e. curvature that induces a stress equal to 1% of yield strength in strength deck) as:

$$\chi_1 = \Delta\chi = 0.01\frac{R_{eH}}{E}\frac{1}{z_D - z_n}$$

where:

z_D : Z coordinate, in m, of strength deck at side, with respect to reference coordinate defined in Ch 1, Sec 4, [3.6]

d) Step 4: Calculate for each element the corresponding strain, $\varepsilon_i = \chi\ (z_i - z_n)$ and the corresponding stress σ_i.

e) Step 5: Determine the neutral axis z_{NA_cur} at each incremental step by establishing force equilibrium over the whole transverse section as:

$\Sigma A_{i\text{-}n50}\, \sigma_i = \Sigma A_{j\text{-}n50}\, \sigma_j$ (i-th element is under compression, j-th element under tension).

f) Step 6: Calculate the corresponding moment by summing the contributions of all elements as:

$$M_U = \sum \sigma_{Ui}\, A_{i-n50}\, \left|(z_i - z_{NA\_cur})\right|$$

g) Step 7: Compare the moment in the current incremental step with the moment in the previous incremental step. If the slope in M-χ relationship is less than a negative fixed value, terminate the process and define the peak value of M_U. Otherwise, increase the curvature by the amount of $\Delta\chi$ and go to Step 4.

2.2.2 Modelling of the hull girder cross section

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder ultimate strength.

Sniped stiffeners are also to be modelled, taking account that they do not contribute to the hull girder strength.

The structural members are categorised into a stiffener element, a stiffened plate element or a hard corner element.

The plate panel including web plate of girder or side stringer is idealised into either a stiffened plate element, an attached plate of a stiffener element or a hard corner element.

The plate panel is categorised into the following two kinds:

- Longitudinally stiffened panel of which the longer side is in the longitudinal direction, and
- Transversely stiffened panel of which the longer side is in the perpendicular direction to the longitudinal direction.

a) Hard corner element:

Hard corner elements are sturdier elements composing the hull girder transverse section, which collapse mainly according to an elasto-plastic mode of failure (material yielding); they are generally constituted by two plates not lying in the same plane.

The extent of a hard corner element from the point of intersection of the plates is taken equal to 20 t_{n50} on transversely stiffened panel and to 0.5 s on a longitudinally stiffened panel, see Figure 2.

where:

t_{n50} : Net offered thickness of the plate, in mm.

s : Spacing of the adjacent longitudinal stiffener, in m.

Bilge, sheer strake-deck stringer elements, girder-deck connections and face plate-web connections on large girders are typical hard corners.

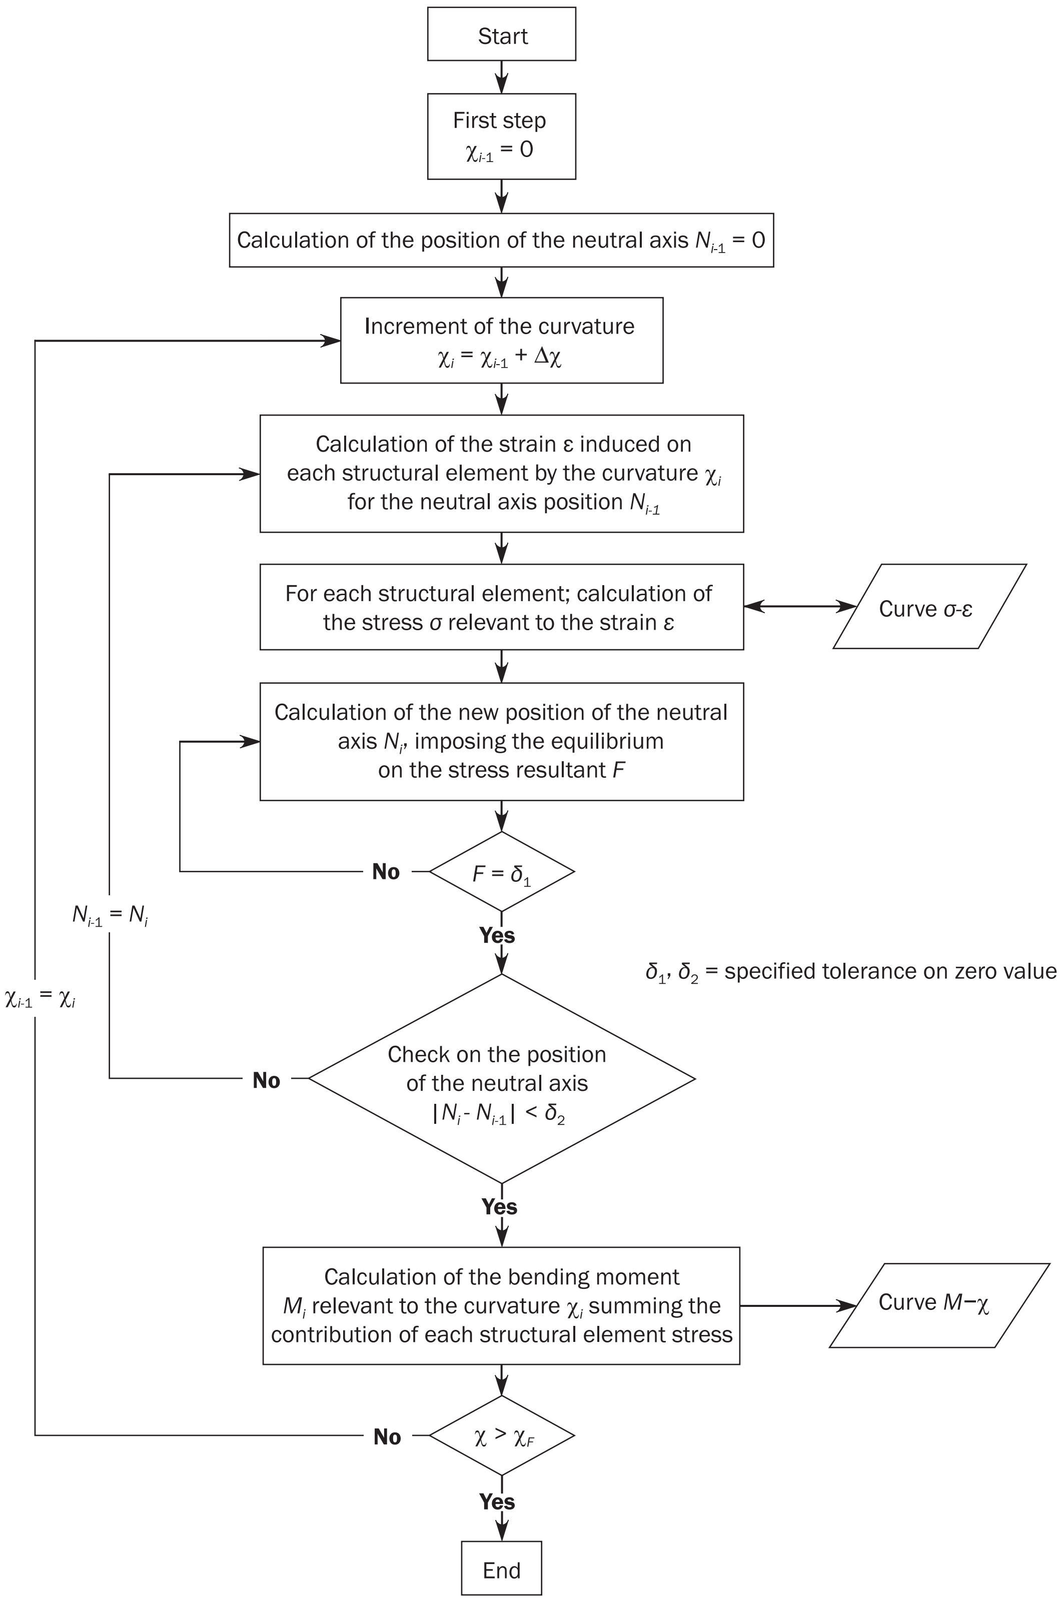
b) Stiffener element:

The stiffener constitutes a stiffener element together with the attached plate.

The attached plate width is in principle:

- Equal to the mean spacing of the stiffener when the panels on both sides of the stiffener are longitudinally stiffened, or
- Equal to the width of the longitudinally stiffened panel when the panel on one side of the stiffener is longitudinally stiffened and the other panel is of the transversely stiffened, see Figure 2.

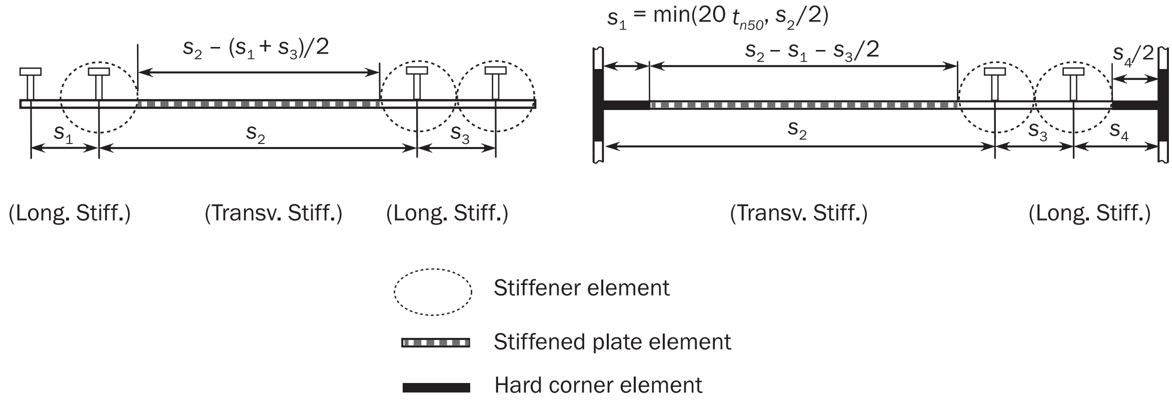
Figure 1 : Flow chart of the procedure for the evaluation of the curve *M*-χ



c) Stiffened plate element:

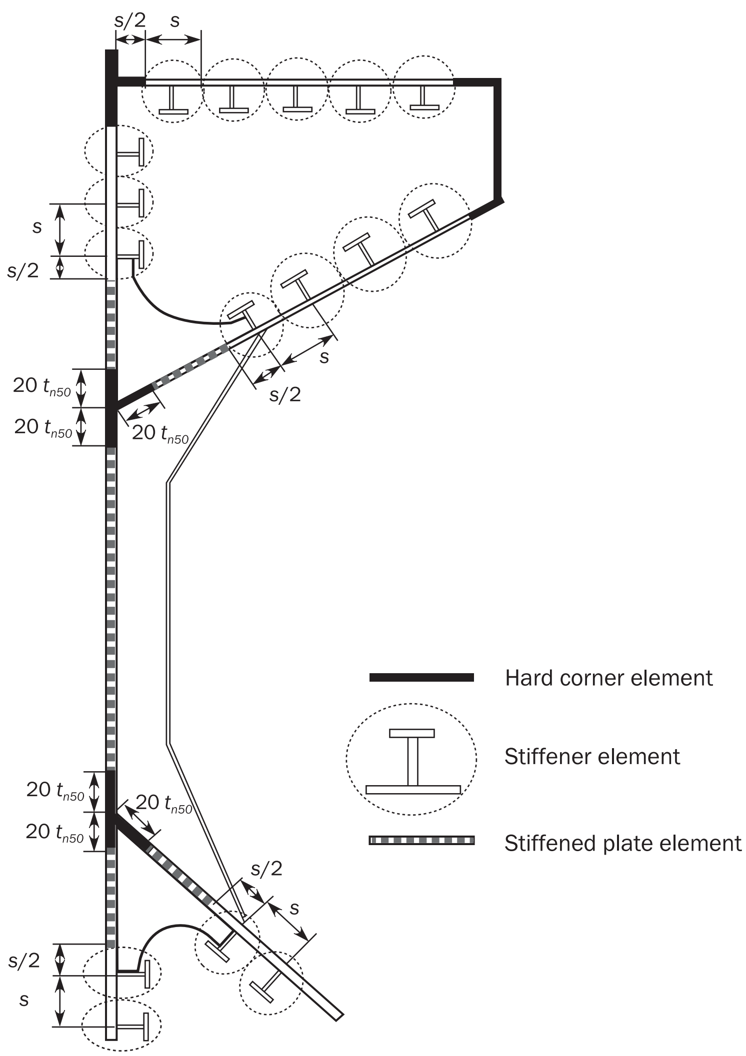
The plate between stiffener elements, between a stiffener element and a hard corner element or between hard corner elements is to be treated as a stiffened plate element, see Figure 2.

Figure 2 : Extension of the breadth of the attached plating and hard corner element



The typical examples of modelling of hull girder section are illustrated in Figure 3 and Figure 4. Notwithstanding the foregoing principle, these figures are to be applied to the modelling in the vicinity of upper deck, sheer strake and hatch side girder.

Figure 3 : Examples of the configuration of stiffened plate elements, stiffener elements and hard corner elements on a hull section



- In case of the knuckle point as shown in Figure 5, the plating area adjacent to knuckles in the plating with an angle greater than 30 deg is defined as a hard corner. The extent of one side of the corner is taken equal to 20 t_{n50} on transversely framed panels and to 0.5 *s* on longitudinally framed panels from the knuckle point.
- Where the plate members are stiffened by non-continuous longitudinal stiffeners, the non-continuous stiffeners are considered only as dividing a plate into various elementary plate panels.
- Where the opening is provided in the stiffened plate element, the openings are to be considered in accordance with Ch 5, Sec 1, [1.2.9].
- Where attached plating is made of steels having different thicknesses and/or yield stresses, an average thickness and/or average yield stress obtained from the following formula are to be used for the calculation.

$$t_{n50} = \frac{t_{1-n50}s_1 + t_{2-n50}s_2}{s} \qquad R_{eHp} = \frac{R_{eHp1}\, t_{1-n50}\, s_1 + R_{eHp2}\, t_{2-n50}\, s_2}{t_{n50}s}$$

where R_{eHp1}, R_{eHp2}, $t_{1\text{-}n50}$, $t_{2\text{-}n50}$, s_1, s_2 and s are shown in Figure 6.

Figure 4 : Extension of the breadth of the attached plating and hard corner element

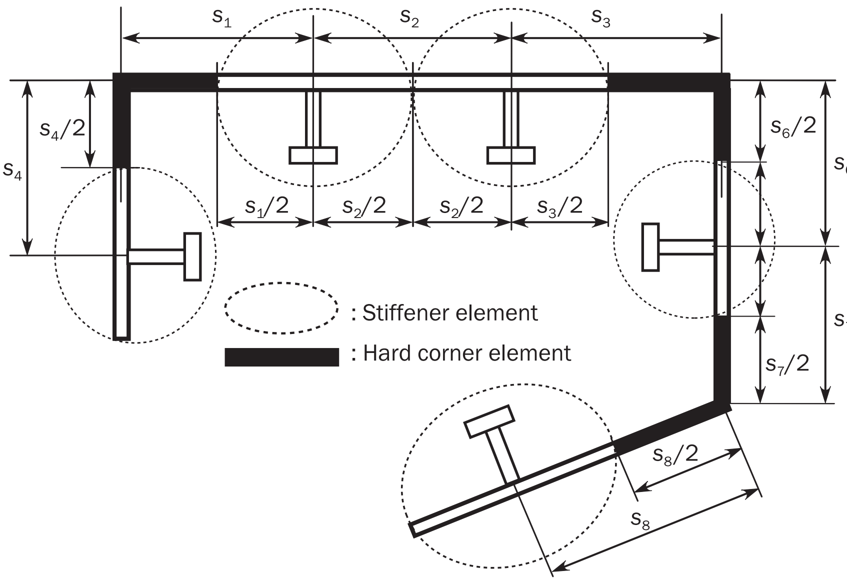


Figure 5 : Plating with knuckle point

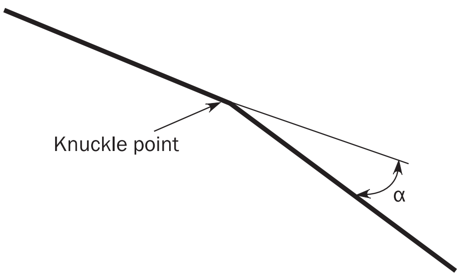

Figure 6 : Element with different thickness and yield strength

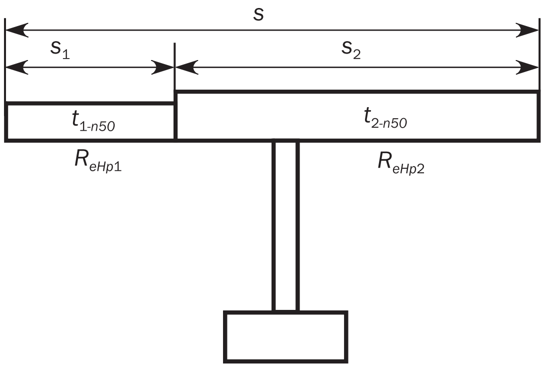


PART 1 CHAPTER 5 APPENDIX 2

2.3 Load-end shortening curves

2.3.1 Stiffened plate element and stiffener element

Stiffened plate element and stiffener element composing the hull girder transverse sections may collapse following one of the modes of failure specified in Table 1.

- Where the plate members are stiffened by non-continuous longitudinal stiffeners, the stress of the element is to be obtained in accordance with [2.3.3] to [2.3.8], taking into account the non-continuous longitudinal stiffener.

In calculating the total forces for checking the hull girder ultimate strength, the area of non-continuous longitudinal stiffener is to be assumed as zero.

- Where the opening is provided in the stiffened plate element, the considered area of the stiffened plate element is to be obtained by deducting the opening area from the plating in calculating the total forces for checking the hull girder ultimate strength. The consideration of the opening is in accordance with the requirement in Ch 5, Sec 1, [1.2.9].
- For stiffened plate element, the effective width of plate for the load shortening portion of the stress-strain curve is to be taken as full plate width, i.e. to the intersection of other plate or longitudinal stiffener – neither from the end of the hard corner element nor from the attached plating of stiffener element, if any. In calculating the total forces for checking the hull girder ultimate strength, the area of the stiffened plate element is to be taken between the hard corner element and the stiffener element or between the hard corner elements, as applicable.

Table 1 : Modes of failure of stiffened plate element and stiffener element

Element	Mode of failure	Curve σ-ε defined in
Lengthened stiffened plate element or stiffener element	Elasto-plastic collapse	[2.3.3]
Shortened stiffener element	Beam column buckling Torsional buckling Web local buckling of flanged profiles Web local buckling of flat bars	[2.3.4] [2.3.5] [2.3.6] [2.3.7]
Shortened stiffened plate element	Plate buckling	[2.3.8]

2.3.2 Hard corner element

The relevant load-end shortening curve σ-ε is to be obtained for lengthened and shortened hard corners according to [2.3.3].

2.3.3 Elasto-plastic collapse of structural elements

The equation describing the load-end shortening curve σ-ε for the elasto-plastic collapse of structural elements composing the hull girder transverse section is to be obtained from the following formula, valid for both positive (shortening) and negative (lengthening) strains, see Figure 7:

$\sigma = \Phi R_{eHA}$

where:

R_{eHA} : Equivalent minimum yield stress, in N/mm², of the considered element, obtained by the following formula:

$$R_{eHA} = \frac{R_{eHp} A_{p-50} + R_{eHs} A_{s-n50}}{A_{p-n50} + A_{s-n50}}$$

Φ : Edge function, equal to:

$\Phi = -1$ for $\varepsilon < -1$

$\Phi = \varepsilon$ for $-1 \leq \varepsilon \leq 1$

$\Phi = 1$ for $\varepsilon > 1$

ε : Relative strain, equal to:

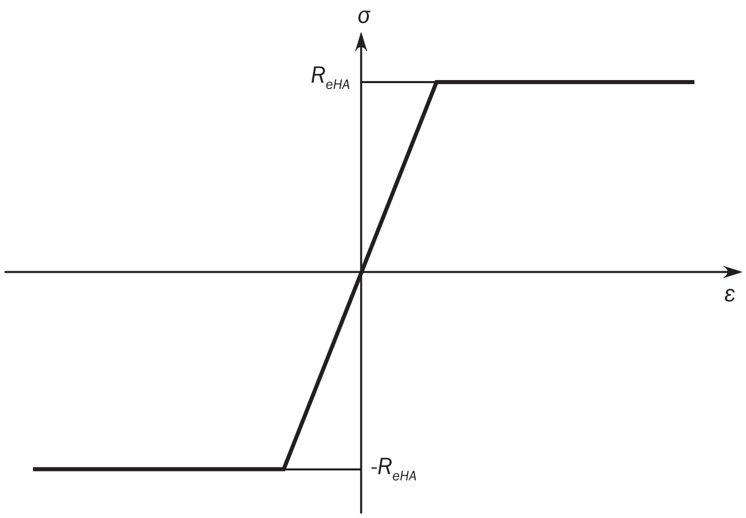
$$\varepsilon = \frac{\varepsilon_E}{\varepsilon_Y}$$

ε_E : Element strain.

ε_Y : Strain at yield stress in the element, equal to:

$$\varepsilon_Y = \frac{R_{eHA}}{E}$$

Figure 7 : Load-end curve σ-ε for elasto plastic collapse



2.3.4 Beam column buckling

The equation describing the load-end shortening curve σ_{CR1}-ε for the beam column buckling of stiffeners composing the hull girder transverse section is to be obtained from the following formula, see Figure 8:

$$\sigma_{CR1} = \Phi\sigma_{C1}\frac{A_{s-n50} + A_{pE-n50}}{A_{s-n50} + A_{p-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].

σ_{C1} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C1} = \frac{\sigma_{E1}}{\varepsilon} \quad \text{for} \quad \sigma_{E1} \le \frac{R_{eHB}}{2}\varepsilon$$

$$\sigma_{C1} = R_{eHB}\left(1 - \frac{R_{eHB}\,\varepsilon}{4\sigma_{E1}}\right) \quad \text{for} \quad \sigma_{E1} > \frac{R_{eHB}}{2}\varepsilon$$

R_{eHB} : Equivalent minimum yield stress, in N/mm^2, of the considered element, obtained by the following formula:

$$R_{eHB} = \frac{R_{eHp}\,A_{pEI-n50}\,\ell_{pE} + R_{eHs}\,A_{s-n50}\,\ell_{sE}}{A_{pEI-n50}\,\ell_{pE} + A_{s-n50}\,\ell_{sE}}$$

$A_{pEI-n50}$: Effective area, in cm^2, equal to:
$A_{pEI-n50} = 10\, b_{E1}\, t_{n50}$

ℓ_{pE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plate of width b_{E1} to the bottom of the attached plate.

ℓ_{sE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plating of width b_{E1} to the top of the stiffener.

ε : Relative strain, as defined in [2.3.3].

σ_{E1} : Euler column buckling stress, in N/mm², equal to:

$$\sigma_{E1} = \pi^2 E \frac{I_{E-n50}}{A_{E-n50}\, \ell^2} 10^{-4}$$

$I_{E\text{-}n50}$: Net moment of inertia of stiffeners, in cm⁴, with attached plating of width b_{E1}.

$A_{E\text{-}n50}$: Net area, in cm², of stiffeners with attached plating of width b_E.

b_{E1} : Effective width corrected for relative strain, in m, of the attached plating, equal to:

$$b_{E1} = \frac{s}{\beta_E} \quad \text{for} \quad \beta_E > 1.0$$

$$b_{E1} = s \quad \text{for} \quad \beta_E \le 1.0$$

β_E : $\beta_E = 10^3 \dfrac{s}{t_{n50}} \sqrt{\dfrac{\varepsilon R_{eHp}}{E}}$

A_{pE-n50} : Net sectional area, in cm², of attached plating of width b_E, equal to:

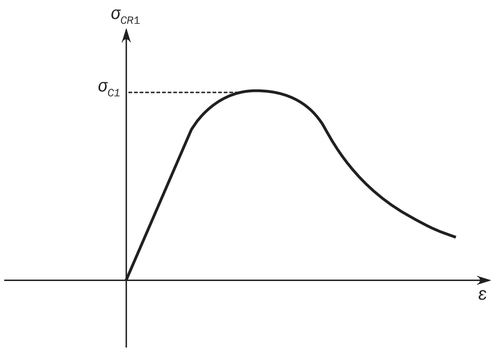
$$A_{pE\text{-}n50} = 10\, b_E\, t_{n50}$$

b_E : Effective width, in m, of the attached plating, equal to:

$$b_E = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right) s \quad \text{for} \quad \beta_E > 1.25$$

$$b_E = s \quad \text{for} \quad \beta_E \le 1.25$$

Figure 8 : Load-end shortening curve σ_{CR1}-ε for beam column buckling



2.3.5 Torsional buckling

The equation describing the load-end shortening curve σ_{CR2}-ε for the flexural-torsional buckling of stiffeners composing the hull girder transverse section is to be obtained according to the following formula, see Figure 9.

$$\sigma_{CR2} = \Phi \frac{A_{S-n50}\, \sigma_{C2} + A_{p-n50}\, \sigma_{CP}}{A_{S-n50} + A_{p-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].

σ_{C2} : Critical stress, in N/mm², equal to:

$$\sigma_{C2} = \frac{\sigma_{E2}}{\varepsilon} \quad \text{for} \quad \sigma_{E2} \le \frac{R_{eHs}}{2}\varepsilon$$

$$\sigma_{C2} = R_{eHs}\left(1 - \frac{R_{eHs}\,\varepsilon}{4\sigma_{E2}}\right) \quad \text{for} \quad \sigma_{E2} > \frac{R_{eHs}}{2}\varepsilon$$

σ_{E2} : Euler torsional buckling stress, in N/mm², taken as σ_{ET} in Ch 8, Sec 5, [2.3.4]

ε : Relative strain, as defined in [2.3.3].

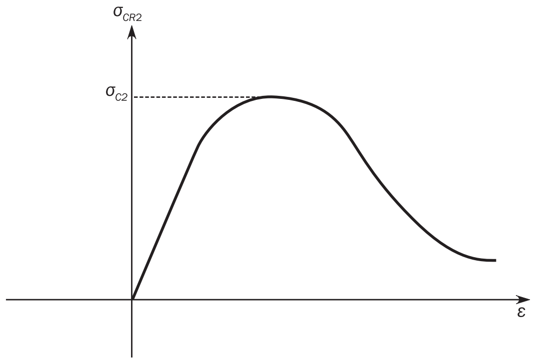
σ_{CP} : Buckling stress of the attached plating, in N/mm², equal to:

$$\sigma_{CP} = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right) R_{eHp} \quad \text{for} \quad \beta_E > 1.25$$

$$\sigma_{CP} = R_{eHp} \quad \text{for} \quad \beta_E \le 1.25$$

β_E : Coefficient, as defined in [2.3.4].

Figure 9 : Load-end shortening curve σ_{CR2}-ε for flexural-torsional buckling



2.3.6 Web local buckling of stiffeners made of flanged profiles

The equation describing the load-end shortening curve σ_{CR3}-ε for the web local buckling of flanged stiffeners composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR3} = \Phi \frac{10^3\ b_E\ t_{n50}\ R_{eHp} + (h_{we}\ t_{w-n50} + b_f\ t_{f-n50})\ R_{eHs}}{10^3\ st_{n50} + h_w\ t_{w-n50} + b_f\ t_{f-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].

b_E : Effective width, in m, of the attached shell plating, as defined in [2.3.4].

h_{we} : Effective height, in mm, of the web, equal to:

$$h_{we} = \left(\frac{2.25}{\beta_w} - \frac{1.25}{\beta_w^2}\right) h_w \quad \text{for} \quad \beta_w \ge 1.25$$

$$h_{we} = h_w \quad \text{for} \quad \beta_w < 1.25$$

β_w : $\beta_w = \dfrac{h_w}{t_{w-n50}} \sqrt{\dfrac{\varepsilon\ R_{eHs}}{E}}$

ε : Relative strain, as defined in [2.3.3].

2.3.7 Web local buckling of stiffeners made of flat bars

The equation describing the load-end shortening curve σ_{CR4}-ε for the web local buckling of flat bar stiffeners composing the hull girder transverse section is to be obtained from the following formula, see Figure 10:

$$\sigma_{CR4} = \Phi \frac{A_{P-n50}\ \sigma_{CP} + A_{s-n50}\ \sigma_{C4}}{A_{p-n50} + A_{s-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].

σ_{CP} : Buckling stress of the attached plating, in N/mm², as defined in [2.3.5].

σ_{C4} : Critical stress, in N/mm², equal to:

$$\sigma_{C4} = \frac{\sigma_{E4}}{\varepsilon} \qquad \text{for } \sigma_{E4} \le \frac{R_{eHs}}{2}\varepsilon$$

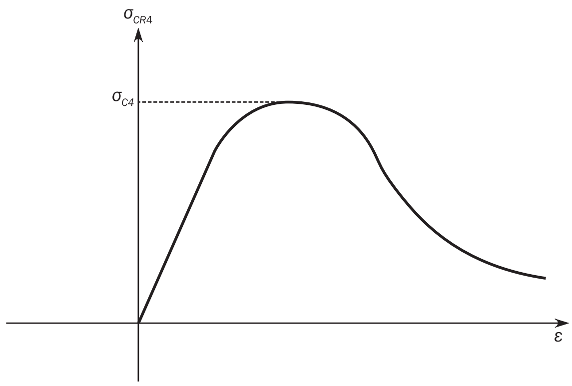
$$\sigma_{C4} = R_{eHs}\left(1 - \frac{R_{eHs}\,\varepsilon}{4\sigma_{E4}}\right) \quad \text{for } \sigma_{E4} > \frac{R_{eHs}}{2}\varepsilon$$

σ_{E4} : Local Euler buckling stress, in N/mm², equal to:

$$\sigma_{E4} = 160000\left(\frac{t_{w-n50}}{h_w}\right)^2$$

ε : Relative strain, as defined in [2.3.3].

Figure 10 : Load-end shortening curve σ_{CR4}-ε for web local buckling



2.3.8 Plate buckling

The equation describing the load-end shortening curve σ_{CR5}-ε for the buckling of transversely stiffened panels composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR5} = min\begin{cases} R_{eHp}\Phi \\ \Phi R_{eHp}\left[\frac{s}{\ell}\left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2}\right) + 0.1\left(1 - \frac{s}{\ell}\right)\left(1 + \frac{1}{\beta_E^2}\right)^2\right] \end{cases}$$

where:

Φ : Edge function, as defined in [2.3.3].

β_E : $\beta_E = 10^3\,\frac{s}{t_{n50}}\sqrt{\frac{\varepsilon\,R_{eHp}}{E}}$

s : Plate breadth, in m, taken as the spacing between the stiffeners.

ℓ : Longer side of the plate, in m.

3 ALTERNATIVE METHODS

3.1 General

3.1.1

The bending moment-curvature relationship, M-χ, may be established by alternative methods. Such models are to consider all the relevant effects important to the non-linear response with due considerations of:

a) Non-linear geometrical behaviour.

b) Inelastic material behaviour.

c) Geometrical imperfections and residual stresses (geometrical out-of-flatness of plate and stiffeners).

d) Simultaneously acting loads:

- Bi-axial compression.
- Bi-axial tension.
- Shear and lateral pressure.

e) Boundary conditions.

f) Interactions between buckling modes.

g) Interactions between structural elements such as plates, stiffeners, girders, etc.

h) Post-buckling capacity.

i) Overstressed elements on the compression side of hull girder cross section possibly leading to local permanent sets/buckle damages in plating, stiffeners etc (double bottom effects or similar).

3.2 Non-linear finite element analysis

3.2.1

Advanced non-linear finite element analyses models may be used for the assessment of the hull girder ultimate capacity. Such models are to consider the relevant effects important to the non-linear responses with due consideration of the items listed in [3.1.1].

3.2.2

Particular attention is to be given to modelling the shape and size of geometrical imperfections. It is to be ensured that the shape and size of geometrical imperfections trigger the most critical failure modes.

PART 1 CHAPTER 6

HULL LOCAL SCANTLING

Table of Contents

SECTION 1
GENERAL

1 APPLICATION

1.1 Application

1.1.1

This chapter applies to hull structure over the full length of the ship including fore end, cargo hold region, machinery space and aft end, the side shell above the freeboard deck, engine casing, exposed decks of superstructure and internal decks except those inside superstructure and deckhouse.

1.1.2

This chapter provides requirements for evaluation of plating, stiffeners and Primary Supporting Members (PSM) subject to lateral pressure, local loads and to hull girder loads, as applicable. Requirements are specified for:

- Load application in Ch 6, Sec 2.
- Minimum thickness of plates, stiffeners and PSM in Ch 6, Sec 3.
- Plating in Ch 6, Sec 4.
- Stiffeners in Ch 6, Sec 5.
- PSM and pillars in Ch 6, Sec 6.

In addition, other requirements not related to defined design load sets, are provided.

1.1.3 Required scantlings

The offered net scantling is to be greater than or equal to the required scantlings based on requirements provided in this chapter.

1.1.4 Additional local strength requirements

Additional local strength requirements are provided in Ch 10 considering bow impact loads, bottom slamming loads and sloshing loads, and for fore end, machinery space and aft end.

1.2 Acceptance criteria

1.2.1

Acceptance criteria set to be selected based on design load as follows:

- AC-S for design load S; static loads.
- AC-SD for design load S+D; combination of static and dynamic loads.

SECTION 2
LOAD APPLICATION

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 LOAD COMBINATION

1.1 Hull girder bending

1.1.1 Normal stresses

The normal stress σ_{hg}, in N/mm², induced by acting vertical and horizontal bending moments at the position being considered is given as follow. This stress is to be calculated for each design load set, as defined in [2] covering all dynamic load cases defined in Ch 4 in combination with M_{sw} both in hogging and in sagging.

$$\sigma_{hg} = \left(\frac{M_{sw} + M_{wv-LC}}{I_{y-n50}}\,(z - z_n) - \frac{M_{wh-LC}}{I_{z-n50}}\,y\right) 10^{-3}$$

where:

M_{sw} : Still water bending moment, in kNm, as defined in Ch 4, Sec 4, [2.2] in accordance with the considered design load scenario in Ch 4, Sec 7, Table 1.

M_{wv-LC} : Vertical wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, [3.5.2] in accordance with the considered design load scenario in Ch 4, Sec 7, Table 1, at the considered longitudinal position.

M_{wh-LC} : Horizontal wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, [3.5.4] in accordance with the considered design load scenario in Ch 4, Sec 7, Table 1, at the considered longitudinal position.

I_{y-n50} : Net vertical hull girder moment of inertia, at the longitudinal position being considered, in m⁴.

I_{z-n50} : Net horizontal hull girder moment of inertia, at the longitudinal position being considered, in m⁴.

y : Transverse coordinate of load calculation point, in m.

z : Vertical coordinate of the load calculation point under consideration, in m.

z_n : Distance from the baseline to the horizontal neutral axis, in m.

1.2 Lateral pressures

1.2.1 Static and dynamic pressures in intact conditions

The static and dynamic lateral pressures in intact condition induced by the sea and the various types of cargoes, ballast and other liquids are to be considered. Applied loads will depend on the location of the elements under consideration, and the adjacent type of compartments.

1.2.2 Lateral pressure in flooded conditions

Watertight boundaries of compartments not intended to carry liquids, excluding hull envelope, are to be subjected to lateral pressure in flooded conditions.

1.3 Pressure combination

1.3.1 Elements of the outer shell

If the compartment adjacent to the outer shell is intended to carry liquids, the static and dynamic lateral pressures to be considered are the differences between the internal pressures and the external sea pressures at the corresponding draught.

If the compartment adjacent to the outer shell is not intended to carry liquids, the internal pressures and external sea pressures are to be considered independently.

1.3.2 Elements other than those of the outer shell

Except as specified in [1.3.1], the static and dynamic lateral pressures on an element separating two adjacent compartments are those obtained considering the two compartments individually loaded.

2 DESIGN LOAD SETS

2.1 Application of load components

2.1.1 Application

These requirements apply to:

- Plating and stiffeners along the full length of the ship.
- PSM outside the cargo hold region.

2.1.2 Load components

The static and dynamic load components are to be determined in accordance with Ch 4, Sec 7, Table 1.

Radius of gyration, k_r, and metacentric height, GM, are to be in accordance with Ch 4, Sec 3, Table 1 and Ch 4, Sec 3, Table 2 for the considered loading conditions specified in the design load sets given in Table 1.

2.1.3 Design load sets for plating, stiffeners and PSM

Design load sets for plating, stiffeners and primary supporting members are given in Table 1.

In addition, the design load sets for primary supporting members of bulk carriers with length L less than 150 m and of oil tankers within the cargo hold region are given respectively in Pt 2, Ch 1, Sec 4, [4.2] and in Pt 2, Ch 2, Sec 3, [1.2].

Table 1 : Design load sets

Item	Design load set	Load component	Draught	Design load	Loading condition
External shell and exposed deck	SEA-1	P_{ex}, P_D	T_{SC}	S+D	Full Load condition (1)
	SEA-2	P_{ex}	T_{SC}	S	Harbour condition (2)
Water ballast tank (oil tanker and bulk carrier)	WB-1	$P_{in} - P_{ex}$ (3)	T_{BAL}	S+D	Normal ballast condition
	WB-2	$P_{in} - P_{ex}$ (3)	T_{BAL}	S+D	Normal ballast condition Water ballast exchange
	WB-3	$P_{in} - P_{ex}$ (3)	$0.25T_{SC}$	S	Harbour/test condition

Item	Design load set	Load component	Draught	Design load	Loading condition
Water ballast tank (bulk carrier) and bulk cargo hold assigned as ballast hold	WB-4	$P_{in} - P_{ex}$ **(3)**	T_{BAL-H} **(7)**	S+D	Heavy ballast condition
	WB-5 **(4)**	$P_{in} - P_{ex}$ **(3)**	T_{BAL-H} **(7)**	S+D	Heavy ballast condition Water ballast exchange
	WB-6 **(5)**	P_{in}	-	S	Harbour/test condition
Cargo oil tank	OT-1	P_{in}	T_{SC}	S+D	Full Load condition
	OT-2	P_{in}	$0.6T_{SC}$	S+D	Partial load condition
	OT-3	P_{in}	-	S	Harbour/Test condition
Bulk cargo hold	BC-1	P_{in}	T_{SC}	S+D	Homogeneous loading, fully filled
	BC-2	P_{in}	-	S	
	BC-3	P_{in}	T_{SC}	S+D	Homogeneous heavy cargo, partially filled (BC-A, B ships)
	BC-4	P_{in}	-	S	
	BC-5	P_{in}	T_{SC}	S+D	Alternate light cargo, fully filled (BC-A ships)
	BC-6	P_{in}	-	S	
	BC-7	P_{in}	T_{SC}	S+D	Alternate heavy cargo, partially filled (BC-A ships.)
	BC-8	P_{in}	-	S	
Other tanks (fuel oil tank, fresh water tank)	TK-1	$P_{in} - P_{ex}$ **(3)**	T_{BAL}	S+D	Normal ballast condition
	TK-2	$P_{in} - P_{ex}$ **(3)**	$0.25T_{SC}$	S	Harbour/test condition
Compartments not carrying liquids	FD-1 **(6)**	P_{in}	T_{SC}	S+D	Flooded condition
	FD-2 **(6)**	P_{in}	-	S	Flooded condition
Exposed deck, internal decks or platforms	DL-1 **(8)**	P_{dl}, F_U	T_{BAL}	S+D	Normal ballast condition
	DL-2 **(8)**	P_{dl}, F_U	-	S	Harbour condition

(1) For bulk carrier BC-A and BC-B, full load condition means 'homogeneous heavy cargo'.
(2) For external shell only.
(3) P_{ex} is to be considered for external shell only.
(4) Not to be applied to bulk cargo hold assigned as ballast hold.
(5) Bulk cargo hold only.
(6) FD-1 and FD-2 are not applicable to external shell and corrugations of transverse vertically corrugated bulkhead separating cargo holds. Requirement in flooded conditions of transverse corrugated bulkhead are given in Pt 2, Ch 1, Sec 3, [3].
(7) Minimum draught among heavy ballast conditions is to be used.
(8) Distributed or concentrated loads only. Need not be combined with simultaneously occurring green sea pressure.

SECTION 3
MINIMUM THICKNESSES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 PLATING

1.1 Minimum thickness requirements

1.1.1

The net thickness of plating in mm, is to comply with the appropriate minimum thickness requirements given in Table 1.

Table 1 : Minimum net thickness for plating

Element	Location	Area	Net thickness
Shell	Keel	-	$7.5 + 0.03\ L_2$
	Bottom Side shell Bilge	Fore Part	$6.5 + 0.03\ L_2$
		Machinery space Aft part	$7.0 + 0.03\ L_2$
		Elsewhere	$5.5 + 0.03\ L_2$
Breasthook		Fore part	6.5
Deck	Weather deck, strength deck, internal tank boundary	-	$4.5 + 0.02\ L_2$
	Platform deck	Machinery space	$2.8 + 0.0067\ s$
		Elsewhere	6.5
Inner bottom (1)	-	Machinery space	$6.6 + 0.024\ L_2$
		Elsewhere	$5.5 + 0.03\ L_2$
Longitudinal bulkheads of bulk carriers	Inner side, hopper tank top, top wing tank longitudinal bulkhead	Cargo hold region	$0.7\ L_2^{1/2}$
Bulkheads	Internal tank boundary, Transverse/longitudinal watertight bulkhead	-	$4.5 + 0.02\ L_2$
	Non-tight bulkhead, Wash bulkhead, Bulkheads between dry spaces.	-	$4.5 + 0.01\ L_2$
	Pillar bulkheads in fore and aft peaks	-	7.5
Other members	Diaphragms in lower/upper stool	-	$5.0 + 0.015\ L_2$
	Engine casing (in the cargo hold region)	Cargo hold region	5.5
	Engine casing (in way of accommodation)	Accommodation	4.0
	Other plates in general	-	$4.5 + 0.01\ L_2$
(1) Applicable for both tight and non tight members			

2 STIFFENERS AND TRIPPING BRACKETS

2.1 Minimum thickness requirements

2.1.1

The net thickness of the web and face plate, if any, of stiffeners and tripping brackets in mm, is to comply with the minimum net thickness given in Table 2.

In addition, the net thickness of the web of stiffeners and tripping brackets, in mm, is to be:

- Not less than 40% of the net required thickness of the attached plating, to be determined according to Ch 6, Sec 4.
- Less than twice the net offered thickness of the attached plating.

Table 2 : Minimum net thickness for stiffeners and tripping brackets

Element	Location	Net thickness
Stiffeners and attached end brackets	Watertight boundary	$3.5 + 0.015\, L_2$
	Other structure	$3.0 + 0.015\, L_2$
Cargo hold side frames webs of single side bulk carriers	Foremost hold [(1)]	$6.0 + 0.026\, L$
	Other holds [(1)]	$5.2 + 0.023\, L$
Tripping brackets		$5.0 + 0.015\, L_2$
(1) *L* needs not to be taken greater than 200 m		

3 PRIMARY SUPPORTING MEMBERS

3.1 Minimum thickness requirements

3.1.1

The net thickness of web plating and flange of primary supporting members in mm, is to comply with the minimum net thickness given in Table 3.

Table 3 : Minimum net thickness for primary supporting members

Element	Location		Net thickness
Double bottom centreline girder	Machinery space		$1.55\, L_2^{1/3} + 3.5$
	Elsewhere		$5.5 + 0.025\, L_2$
Other bottom girder	Machinery space		$1.7\, L_2^{1/3} + 1.0$
	Fore part of ships with $L \geq 150$ m		$0.7\, L_2^{1/2}$
	Elsewhere and fore part of ships with $L < 150$ m		$5.5 + 0.02\, L_2$
Girders bounding a duct keel	Machinery space		$0.8\, L_2^{1/2} + 2.5$
Bottom floor	Machinery space		$1.7\, L_2^{1/3} + 1.0$
	Fore part		$0.7\, L_2^{1/2}$
	Elsewhere		$0.6\, L_2^{1/2}$
Aft peak floor	-		$0.7\, L_2^{1/2}$
Other primary supporting member	Aft part / fore part		$0.7\, L_2^{1/2}$
	Elsewhere	In oil cargo tanks	$5.5 + 0.015\, L_2$
		For other cases	$0.6\, L_2^{1/2}$

SECTION 4
PLATING

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

α_p : Correction factor for the panel aspect ratio to be taken as follow but not to be taken greater than 1.0.

$$\alpha_p = 1.2 - \frac{b}{2.1\ a}$$

a : Length of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

b : Breadth of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

P : Design pressure for the considered design load set, see Ch 6, Sec 2, [2], calculated at the load calculation point defined in Ch 3, Sec 7, [2.2], in kN/m^2.

σ_{hg} : Hull girder bending stress, in N/mm^2, as defined in Ch 6, Sec 2, [1.1], calculated at the load calculation point as defined in Ch 3, Sec 7, [2.2].

χ : Coefficient taken equal to:

- In intact condition:
  - χ = 0.70 for inner bottom and hopper of bulk carriers,
  - χ = 1.00 for other cases.
- In flooded condition:
  - χ = 1.00 for collision bulkheads for acceptance criteria set AC-S,
  - χ = 0.95 for collision bulkheads for acceptance criteria set AC-SD,
  - χ = 1.15 for other watertight boundaries of compartments.

1 PLATING SUBJECTED TO LATERAL PRESSURE

1.1 Yielding check

1.1.1 Plating

The net thickness, t in mm, is not to be taken less than the greatest value for all applicable design load sets, as defined in Ch 6, Sec 2, [2.1.3], given by:

$$t = 0.0158\ \alpha_p\ b\sqrt{\frac{|P|}{\chi\ C_a\ R_{eH}}}$$

where:

C_a : Permissible bending stress coefficient for plate taken equal to:

$$C_a = \beta - \alpha\frac{|\sigma_{hg}|}{R_{eH}}$$, not to be taken greater than $C_{a\text{-}max}$.

β : Coefficient as defined in Table 1.

α : Coefficient as defined in Table 1.

C_{a-max} : Maximum permissible bending stress coefficient as defined in Table 1.

Table 1 : Definition β, α and C_{a-max}

Acceptance criteria set	Structural member		β	α	C_{a-max}
AC-S	Longitudinal strength members	Longitudinally stiffened plating	0.9	0.5	0.8
		Transversely stiffened plating	0.9	1.0	0.8
	Other members		0.8	0	0.8
AC-SD	Longitudinal strength members	Longitudinally stiffened plating	1.05	0.5	0.95
		Transversely stiffened plating	1.05	1.0	0.95
	Other members		1.0	0	1.0

1.2 Plating of corrugated bulkheads

1.2.1 Cold and hot formed corrugations

The net thicknesses, t in mm, of the web and flange plates of corrugated bulkheads are not to be taken less than the greatest value calculated for all applicable design load sets, as defined in Ch 6, Sec 2, [2.1.3], given by:

$$t = 0.0158\, b_p \sqrt{\frac{|P|}{C_{CB}\, R_{eH}}}$$

where:

b_p : Breadth of plane corrugation plating:

$b_p = a$ for flange plating, in mm, as defined in Ch 3, Sec 6, Figure 21.

$b_p = c$ for web plating, in mm, as defined in Ch 3, Sec 6, Figure 21.

C_{CB} : Permissible bending stress coefficient for corrugated bulkhead plating taken equal to:

- For acceptance criteria set AC-S for transverse corrugated bulkheads and vertically corrugated longitudinal bulkheads.

  $C_{CB} = 0.75$

- For acceptance criteria set AC-SD for transverse corrugated bulkheads and vertically corrugated longitudinal bulkheads.

  $C_{CB} = 0.90$

- For horizontally corrugated longitudinal bulkheads, without being greater than C_{CB-max}.

$$C_{CB} = \beta_{CB} - \alpha_{CB} \frac{|\sigma_{hg}|}{R_{eH}}$$

β_{CB} : Coefficient as defined in Table 2.

α_{CB} : Coefficient as defined in Table 2.

C_{CB-max} : Maximum permissible bending stress coefficient as defined in Table 2.

Table 2 : Definition β_{CB}, α_{CB} and C_{CB-max}

Acceptance criteria set	Structural member	β_{CB}	α_{CB}	C_{CB-max}
AC-S	Horizontally corrugated longitudinal bulkheads	0.90	0.50	0.75
AC-SD	Horizontally corrugated longitudinal bulkheads	1.05	0.50	0.90

1.2.2 Built-up corrugations

For built-up corrugations, with flange and web plate of different thickness, the net thickness, t_1 in mm, is to be taken as the greatest value calculated for all applicable design load sets, as defined in Ch 6, Sec 2, [2.1.3], given by:

$$t_1 = \sqrt{\frac{0.0005\, b_P^2\, |P|}{C_{CB}\, R_{eH}} - t_2^2}$$

where:

t_1 : Net thickness of the thicker plating, either flange or web, in mm.

t_2 : Net thickness of the thinner plating, either flange or web, in mm.

b_P : Breadth of thicker plate, either flange or web, in mm.

C_{CB} : Permissible bending stress coefficient as defined in [1.2.1].

2 SPECIAL REQUIREMENTS

2.1 Minimum thickness of keel plating

2.1.1

The net thickness of the keel plating is not to be taken less than the offered net thickness of the adjacent 2 m width bottom plating, measured from the edge of the keel strake.

The width of the keel is defined in Ch 3, Sec 6, [7.2.1].

2.2 Bilge plating

2.2.1 Definition of bilge area

The definition of bilge area is given in Ch 1, Sec 4, [3.8.1].

2.2.2 Bilge plate thickness within 0.4 *L* amidships

The net thickness of bilge plating is not to be taken less than the offered net thickness for the adjacent bottom shell or adjacent side shell plating, whichever is greater.

The net thickness of curved bilge plating, t, in mm, is not to be taken less than:

$$t = 6.45 \times 10^{-4}\,(P_{ex}\, s_b)^{0.4}\, R^{0.6}$$

where:

P_{ex} : Design sea pressure for the design load set SEA-1 as defined in Ch 6, Sec 2, [2.1.3] calculated at the lower turn of the bilge, in kN/m^2.

R : Effective bilge radius in mm.

$$R = R_0 + 0.5\,(\Delta s_1 + \Delta s_2)$$

R_0 : Radius of curvature, in mm. See Figure 1.

Δs_1 : Distance between the lower turn of bilge and the outermost bottom longitudinal, in mm, see Figure 1. Where the outermost bottom longitudinal is within the curvature, this distance is to be taken as zero.

Δs_2 : Distance between the upper turn of bilge and the lowest side longitudinal, in mm, see Figure 1. Where the lowest side longitudinal is within the curvature, this distance is to be taken as zero.

s_b : Distance between transverse stiffeners, webs or bilge brackets, in mm.

Longitudinally stiffened bilge plating is to be assessed as regular stiffened plating. The bilge thickness is not to be less than the minimum value obtained by [1.1.1] and [2.2.2]. A bilge keel is not considered as an effective 'longitudinal stiffening' member and unless other longitudinal stiffeners are fitted, this requirement has to be applied.

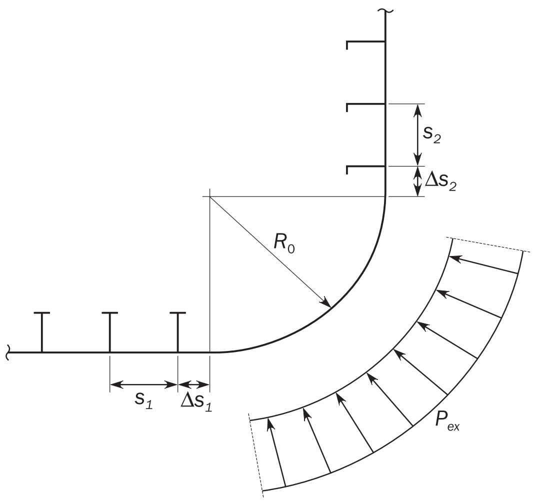
2.2.3 Bilge plate thickness outside 0.4 *L* amidships

For transversely stiffened bilge plating outside 0.4 *L* amidships, the bilge plate thickness requirement is to be specially considered based on evaluation of support provided by the hull form and internal stiffening arrangements. Outside of 0.4 *L* amidships, the bilge plating thickness and arrangement are to comply with the requirements to side shell or bottom plating in the same region. Effect of increased loading in the forward region is to be specially considered.

2.2.4 Transverse extension of bilge minimum plate thickness

Where a plate seam is located in the straight plate just below the lowest stiffener on the side shell, any increased thickness required for the bilge plating does not have to be extended to the adjacent plate above the bilge provided the plate seam is not more than $s_2/4$ below the lowest side longitudinal. Similarly, for the flat part of adjacent bottom plating, any increased thickness for the bilge plating does not have to be extended to the adjacent plate provided that the plate seam is not more than $s_1/4$ beyond the outboard bottom longitudinal. For definition of s_1 and s_2, see Figure 1.

Figure 1 : Transverse stiffened bilge plating



2.2.5 Hull envelope framing in bilge area

For transversely stiffened bilge plating, a longitudinal is to be fitted at the bottom and at the side close to the position where the curvature of the bilge plate starts. The scantling of those longitudinals are to be not less than the one of the closer adjacent stiffener. The distance between the lower turn of bilge and the outermost bottom longitudinal, Δs_1, is generally not to be greater than one-third of the spacing between the two outermost bottom longitudinals, s_1. Similarly, the distance between the upper turn of the bilge and the lowest side longitudinal, Δs_2, is generally not to be greater than one-third of the spacing between the two lowest side longitudinals, s_2. See Figure 1.

2.3 Side shell plating

2.3.1 Fender contact zone

The net thickness, *t* in mm, of the side shell plating within the fender contact zone as specified in [2.3.2] is not to be taken less than:

$$t = 26\left(\frac{b}{1000} + 0.7\right)\left(\frac{BT_{SC}}{R_{eH}{}^2}\right)^{0.25}$$

2.3.2 Application of fender contact zone requirement

The application extends within the cargo hold region as defined in Ch 1, Sec 1, [2.4.3], from the ballast draught T_{BAL} to 0.25 T_{SC} (minimum 2.2 m) above T_{SC}.

2.4 Sheer strake

2.4.1 General

The minimum width of the sheer strake is defined in Ch 3, Sec 6, [8.2.4].

2.4.2 Welded sheer strake

The net thickness of a welded sheer strake is not to be less than the offered net thickness of the adjacent 2 m width side plating, provided this plating is located entirely within the top wing tank or double side tank as the case may be.

2.4.3 Rounded sheer strake

The net thickness of a rounded sheer strake is not to be less than:

- The offered net thickness of the adjacent 2 m width deck plating, or
- The offered net thickness of the adjacent 2 m width side plating,

whichever is greater.

2.5 Deck stringer plating

2.5.1

The minimum width of deck stringer plating is defined in Ch 3, Sec 6, [9.1.2].

2.5.2

Within 0.6 L of amidships, the net thickness of the deck stringer plate is not to be less than the offered net thickness of the adjacent deck plating.

2.6 Supporting structure in way of corrugated bulkheads

2.6.1 General

Requirements for the arrangement of bulkhead as given in Ch 3, Sec 6, [10.4] are to be considered together with [2.6.2] to [2.6.4].

2.6.2 Lower stool

a) The net thickness of the stool top plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation. The extension of the top plate beyond the corrugation is not to be less than the as-built flange thickness of the corrugation.

b) The net thickness of the stool side plate, within the region of the corrugation depth from the stool top plate, is not to be less than the corrugated bulkhead flange net required thickness at the lower end and is to be of at least the same material yield strength. The net thickness may be reduced to 90% of corrugation flange thickness if continuity is provided between the corrugation web and supporting brackets inside the stool as defined in (c).

c) Continuity between corrugation web and lower stool supporting brackets is to be maintained inside the stool. Alternatively, lower stool supporting brackets inside the stool are to be aligned with every knuckle point of corrugation web.

d) The net thickness of supporting bracket is not to be less than 80% of the required net thickness of the corrugation webs and is to be of at least the same material yield strength.

e) The net thickness of supporting floors is not to be less than the net required thickness of the stool side plating (excluding the application of GRAB requirements as defined in Pt 2, Ch 1, Sec 6) connected to the inner bottom and is to be of at least the same material yield strength. If material of different yield strength is used, the required thickness is to be adjusted by the ratio of the two material factors *k*, as defined in Ch 3, Sec 1, [2.2.1].

f) Where a lower stool is fitted, particular attention is to be given to the through-thickness properties, and arrangements for continuity of strength, at the connection of the bulkhead stool to the inner bottom. For requirements for plates with specified through-thickness properties, see Ch 3, Sec 1, [2.5].

2.6.3 Upper stool

a) The net thickness of the stool bottom plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation. The extension of the top plate beyond the corrugation is not to be less than the as-built flange thickness of the corrugation.

b) The net thickness of the lower portion of stool side plating is not to be less than 80% of the upper part of the bulkhead plating as required by [1.2] and Pt 2, Ch 1, Sec 3, [3.1], as applicable, whichever is the greater, where the same material is used. If material of different yield strength is used, the required thickness is to be adjusted by the ratio of the two material factors *k* as defined in Ch 3, Sec 1, [2.2.1].

2.6.4 Local supporting structure in way of corrugated bulkheads without a lower stool

a) The net thickness of the supporting floors and pipe tunnel beams in way of a corrugated bulkhead are not to be less than the required net thickness of the corrugation flanges and are to be of at least the same material yield strength. The inner bottom and hopper tank in way of the corrugation is to be of at least the same material yield strength as the attached corrugation, and Z grade steel as defined in Ch 3, Sec 1, [2.5.1] is to be used unless through thickness properties are documented for approval.

b) Brackets/carlings arranged in line with the corrugation web are to have a depth of not less than 0.5 times the corrugation depth and a net thickness not less than 80% of the net thickness of the corrugation webs and are to be of at least the same material yield strength. Where support is provided by gussets with shedder plates instead of brackets/carlings, the height of the gusset plate, see h_G in Pt 2, Ch 1, Sec 3, Figure 5, is to be at least equal to the corrugation depth. The gusset plates are to be fitted in line with and between the corrugation flanges. The net thickness of the gusset and shedder plates is not to be less than 100% and 80%, respectively, of the net thickness of the corrugation flange and is to be of at least the same material yield strength.

2.7 Aft peak bulkhead

2.7.1

The net thickness of the aft peak bulkhead plating in way of the stern tube penetration is to be at least 1.6 times the required thickness for the bulkhead plating.

SECTION 5
STIFFENERS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

d_{shr} : Effective shear depth, in mm, as defined in Ch 3, Sec 7, [1.4.3].

ℓ_{bdg} : Effective bending span, in m, as defined in Ch 3, Sec 7, [1.1.2].

ℓ_{shr} : Effective shear span, in m, as defined in Ch 3, Sec 7, [1.1.3].

P : Design pressure for the design load set being defined in Ch 6, Sec 2 and calculated at the load calculation point defined in Ch 3, Sec 7, [3.2], in kN/m^2.

χ : Coefficient taken equal to:

- In intact condition:
  - χ = 0.90 for inner bottom and hopper of bulk carriers,
  - χ = 1.00 for other cases.
- In flooded condition: χ as defined in Ch 6, Sec 4 for flooded condition.

1 STIFFENERS SUBJECT TO LATERAL PRESSURE

1.1 Yielding check

1.1.1 Web plating

The minimum net web thickness, t_w in mm, is not to be taken less than the greatest value calculated for all applicable design load sets as defined in Ch 6, Sec 2, [2], given by:

$$t_w = \frac{f_{shr}\ |P|\ s\ \ell_{shr}}{d_{shr}\ \chi\ C_t\ \tau_{eH}} \quad \text{with } \chi\ C_t \text{ not to be taken greater than 1.0.}$$

where:

f_{shr} : Shear force distribution factor taken as:

- For continuous stiffeners with fixed ends, f_{shr} is not to be taken less than:
  - f_{shr} = 0.5 for horizontal stiffeners and upper end of vertical stiffeners.
  - f_{shr} = 0.7 for lower end of vertical stiffeners.
- For stiffeners with reduced end fixity, variable load or being part of grillage, the requirement in [1.2] applies.

C_t : Permissible shear stress coefficient for the design load set being considered, taken as:

- C_t = 0.75 for acceptance criteria set AC-S.
- C_t = 0.90 for acceptance criteria set AC-SD.

1.1.2 Section modulus

The minimum net section modulus, Z in cm^3, is not to be taken less than the greatest value calculated for all applicable design load sets as defined in Ch 6, Sec 2, [2.1.3], given by:

$$Z = \frac{|P|\, s\, \ell_{bdg}^{2}}{f_{bdg}\, \chi\, C_s\, R_{eH}}$$

where:

f_{bdg} : Bending moment factor taken as:

- For continuous stiffeners with fixed ends, f_{bdg} is not to be taken higher than:
  - f_{bdg} = 12 for horizontal stiffeners and upper end of vertical stiffeners.
  - f_{bdg} = 10 for lower end of vertical stiffeners.
- For stiffeners with reduced end fixity, variable load or being part of grillage, the requirement in [1.2] applies.

C_s : Permissible bending stress coefficient as defined in Table 1 for the design load set being considered.

σ_{hg} : Hull girder bending stress, in N/mm^2, as defined in Ch 6, Sec 2, [1.1], calculated at the load calculation point as defined in Ch 3, Sec 7, [3.2].

β_s : Coefficient as defined in Table 2.

α_s : Coefficient as defined in Table 2.

C_{s-max} : Coefficient as defined in Table 2.

Table 1 : Definition of C_s

Sign of hull girder bending stress, σ_{hg}	Lateral pressure acting on	Coefficient C_s
Tension (positive)	Stiffener side	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than C_{s-max}
Compression (negative)	Plate side	
Tension (positive)	Plate side	$C_s = C_{s-max}$
Compression (negative)	Stiffener side	

Table 2 : Definition of β_s, α_s and C_{s-max}

Acceptance criteria set	Structural member	β_s	α_s	C_{s-max}
AC-S	Longitudinal strength member	0.85	1.0	0.75
	Transverse or vertical member	0.75	0	0.75
AC-SD	Longitudinal strength member	1.0	1.0	0.9
	Transverse or vertical member	0.9	0	0.9

1.1.3 Group of stiffeners

Scantlings of stiffeners based on requirements in [1.1.1] and [1.1.2] may be decided based on the concept of grouping designated sequentially placed stiffeners of equal scantlings on a single stiffened panel. The scantling of the group is to be taken as the greater of the following:

- The average of the required scantling of all stiffeners within a group.
- 90% of the maximum scantling required for any one stiffener within the group.

1.1.4 Plate and stiffener of different materials

When the minimum specified yield stress of a stiffener exceeds the minimum specified yield stress of the attached plate by more than 35%, the following criterion is to be satisfied:

$$R_{eH-S} \le \left(R_{eH-P} - \frac{\alpha_S\, |\sigma_{hg}|}{\beta_S}\right)\frac{Z_P}{Z} + \frac{\alpha_S\, |\sigma_{hg}|}{\beta_S}$$

where:

R_{eH-S} : Minimum specified yield stress of the material of the stiffener, in N/mm^2.

R_{eH-P} : Minimum specified yield stress of the material of the attached plate, in N/mm^2.

σ_{hg} : Hull girder bending stress, in N/mm^2, as defined in Ch 6, Sec 2, [1.1] with $|\sigma_{hg}|$ not to be taken less than 0.4 R_{eH-P}.

Z : Net section modulus, in way of face plate/free edge of the stiffener, in cm^3.

Z_P : Net section modulus, in way of the attached plate of stiffener, in cm^3.

α_s, β_s : Coefficients defined in Table 2.

1.2 Beam analysis

1.2.1 Direct analysis

The maximum normal bending stress, σ and shear stress, τ in a stiffener using net properties with reduced end fixity, variable load or being part of grillage are to be determined by direct calculations taking into account:

- The distribution of static and dynamic pressures and forces, if any.
- The number and position of intermediate supports (e.g. decks, girders, etc).
- The condition of fixity at the ends of the stiffener and at intermediate supports.
- The geometrical characteristics of the stiffener on the intermediate spans.

1.2.2 Stress criteria

The stress is to comply with the following criteria where the coefficients C_t and C_s, are defined in [1.1.1] and [1.1.2].

- $\tau \leq \chi C_t \tau_{eH}$
- $\sigma \leq \chi C_s R_{eH}$

SECTION 6
PRIMARY SUPPORTING MEMBERS AND PILLARS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

P : Design pressure for the design load set being considered as defined in Ch 6, Sec 2 and calculated at the load calculation point as defined in Ch 3, Sec 7, [4.1.1], in kN/m^2.

ℓ_{bdg} : Effective bending span, as defined in Ch 3, Sec 7, [1.1.6], in m.

ℓ_{shr} : Effective shear span, as defined in Ch 3, Sec 7, [1.1.7], in m.

χ : Coefficient taken equal to:

- In intact condition:
  - χ = 0.90 for inner bottom and hopper of bulk carriers,
  - χ = 1.00 for other cases.
- In flooded condition: χ as defined in Ch 6, Sec 4 for flooded condition.

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to primary supporting members subjected to lateral pressure and concentrated loads and pillars subjected to compressive axial loads. The yielding check is to be carried out for such members subjected to specific loads.

2 PRIMARY SUPPORTING MEMBERS WITHIN CARGO HOLD REGION

2.1 Flooded condition

2.1.1

The requirements in this sub-article apply to the primary supporting members of watertight boundaries other than outer shell or tank boundaries, subject to lateral pressure in flooded condition.

2.1.2

The verification against flooded condition is to be made by using the pressure and hull girder loads for the appropriate design load set as defined in Ch 6, Sec 2 and the scantling requirements given in [3.2].

2.2 Bulk carriers

2.2.1 Bulk carriers having a length *L* of 150m and above

The scantlings of primary supporting members within the cargo hold region are to be verified by FE structural analysis as defined in Ch 7.

2.2.2 Bulk carriers having a length *L* less than 150m

The scantlings of primary supporting members within the cargo hold region are to comply with the requirements given in Pt 2, Ch 1, Sec 4, [4]. Alternatively, the scantlings of such members may be verified by direct strength assessment as deemed appropriate by the Society.

2.3 Oil tankers

2.3.1

Scantlings of primary supporting members within the cargo hold region are to comply with the requirements given in Pt 2, Ch 2, Sec 3, [1] and are to be verified by FE structural analysis, as defined in Ch 7.

3 PRIMARY SUPPORTING MEMBERS OUTSIDE CARGO HOLD REGION

3.1 Application

3.1.1

The requirements of this article apply to primary supporting members, subjected to lateral pressure within the fore part, aft part and machinery space.

3.2 Scantling requirements

3.2.1 Net section modulus

The net section modulus, Z_{n50} in cm^3, of primary supporting members subjected to lateral pressure is not to be taken less than the greatest value for all applicable design load sets defined in Ch 6, Sec 2, [2], given by:

$$Z_{n50} = 1000 \frac{|P|\ S\ \ell_{bdg}^2}{\chi\ f_{bdg}\ C_s\ R_{eH}}$$

where:

f_{bdg} : Bending moment distribution factor, as given in Table 2.

C_s : Permissible bending stress coefficient for the acceptance criteria set, as given in Table 1.

3.2.2 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of primary supporting members subjected to lateral pressure is not to be taken less than the greatest value for all applicable design load sets defined in Ch 6, Sec 2, [2], given by:

$$A_{shr-n50} = 10 \frac{f_{shr}\ |P|\ S\ \ell_{shr}}{\chi\ C_t\ \tau_{eH}}$$

where:

f_{shr} : Shear force distribution factor, as given in Table 2.

C_t : Permissible shear stress coefficient for the acceptance criteria set being considered, as given in Table 1.

Table 1 : Permissible bending and shear stress coefficients for primary supporting members

Acceptance criteria set	Structure attached to primary supporting member	C_s and C_t
AC-S	All boundaries, including decks and flats	0.70
AC-SD	All boundaries, including decks and flats	0.85

Table 2 : Bending moment and shear force factors, f_{bdg} and f_{shr}

Load and boundary condition				**Bending moment and shear force distribution factors (based on load at mid span, where load varies)**		
Position				**1**	**2**	**3**
Load model	**1** **Support**	**2** **Field**	**3** **Support**	f_{bdg1} f_{shr1}	f_{bdg2} -	f_{bdg3} f_{shr3}
A				12.0 0.50	24.0 -	12.0 0.50
B				- 0.38	14.2 -	8.0 0.63
C				- 0.50	8.0 -	- 0.50
D				15.0 0.30	23.3 -	10.0 0.70
E				- 0.20	16.8 -	7.5 0.80
F				- -	- -	2.0 1.0

Note 1: The bending moment distribution factor, f_{bdg} for the support positions is applicable for a distance of 0.2 ℓ_{bdg} from the end of the effective bending span of the primary supporting member.

Note 2: The shear force distribution factor, f_{shr} for the support positions is applicable for a distance of 0.2 ℓ_{shr} from the end of the effective shear span of the primary supporting member.

Note 3: Application of f_{bdg} and f_{shr}:

The section modulus requirement within 0.2 ℓ_{bdg} from the end of the effective span is to be determined using the applicable f_{bdg1} and f_{bdg3}, however f_{bdg} is not to be taken greater than 12.

The section modulus of mid-span area is to be determined using f_{bdg} = 24, or f_{bdg2} from the table if lesser.

The shear area requirement of end connections within 0.2 ℓ_{shr} from the end of the effective span is to be determined using f_{shr} = 0.5 or the applicable f_{shr1} or f_{shr3}, whichever is greater.

For models A through F, the value of f_{shr} may be gradually reduced outside of 0.2 ℓ_{shr} towards 0.5 f_{shr} at mid-span, where f_{shr} is the greater value of f_{shr1} and f_{shr3}.

3.3 Advanced calculation methods

3.3.1 Direct analysis

Where complex grillage structures are employed or cross ties are fitted in side shell primary supporting members, the scantlings are to be determined by direct calculation taking into account:

- The distribution of still water and wave pressure and forces, if any.
- The number and position of intermediate supports (e.g. decks, girders, etc).
- The condition of fixity at the ends of the primary supporting members and at intermediate supports.
- The geometrical characteristics of the primary supporting members on the intermediate spans.

3.3.2 Analysis criteria

The calculated stresses are to comply with the following criteria where the coefficients C_t and C_s, are defined in [3.2]:

- $\sigma \le \chi C_s R_{eH}$
- $\tau \le \chi C_t \tau_{eH}$

where:

τ : Shear stress in member, in N/mm², based on t_{n50}.

σ : Normal stress in member, in N/mm², based on t_{n50}.

4 PILLARS

4.1 Pillars subjected to compressive axial load

4.1.1 Criteria

The maximum applied compressive axial load on a pillar, F_{pill}, in kN, is to be taken as the greatest value calculated for all applicable design load sets defined in Ch 6, Sec 2, [2], and is given by the following formula:

$$F_{pill} = Pb_{a-sup}\ \ell_{a-sup} + F_{pill-upr}$$

where:

$b_{a\text{-}sup}$: Mean breadth of area supported, in m.

$\ell_{a\text{-}sup}$: Mean length of area supported, in m.

$F_{pill\text{-}upr}$: Axial load from pillar including axial load from pillars above, in kN, if any.

$A_{pill\text{-}n50}$: Net cross section area of the pillar, in cm².

The buckling check of the pillar is to be performed according to Ch 8, Sec 4, [5.1], with σ_{av} in N/mm², as defined in Ch 8, Sec 5, [3.1] given by:

$$\sigma_{av} = 10\frac{F_{pill}}{A_{pill-n50}}$$

4.2 Pillars subject to tensile axial load

4.2.1 Criteria

Pillars and PSM members subjected to tensile axial load are to satisfy the criteria given in [3.3.2].

PART 1 CHAPTER 7

DIRECT STRENGTH ANALYSIS

Table of Contents

SECTION 1
STRENGTH ASSESSMENT

1 GENERAL

1.1 Application

1.1.1

This chapter provides requirements applicable to ships having rule length L of 150 m or above to assess the scantlings of the hull structure using finite element analysis.

1.1.2

The finite element analysis consists of three parts:

a) Cargo hold analysis to assess the strength of longitudinal hull girder structural members, primary supporting structural members and bulkheads.

b) Fine mesh analysis to assess detailed stress levels in local structural details.

c) Very fine mesh analysis to assess the fatigue capacity of the structural details according to Ch 9.

1.1.3

The strength assessment performed with finite element analysis is to verify that the scantlings comply with the acceptance criteria specified in this chapter for:

- Cargo hold structural analysis performed in accordance with Ch 7, Sec 2.
- Local structural analysis performed in accordance with Ch 7, Sec 3.

1.1.4

Strength assessment based on finite element analysis is applicable for the entire cargo hold region.

1.1.5

The analysis is to verify the following:

a) Stress levels are within the acceptance criteria for yielding.

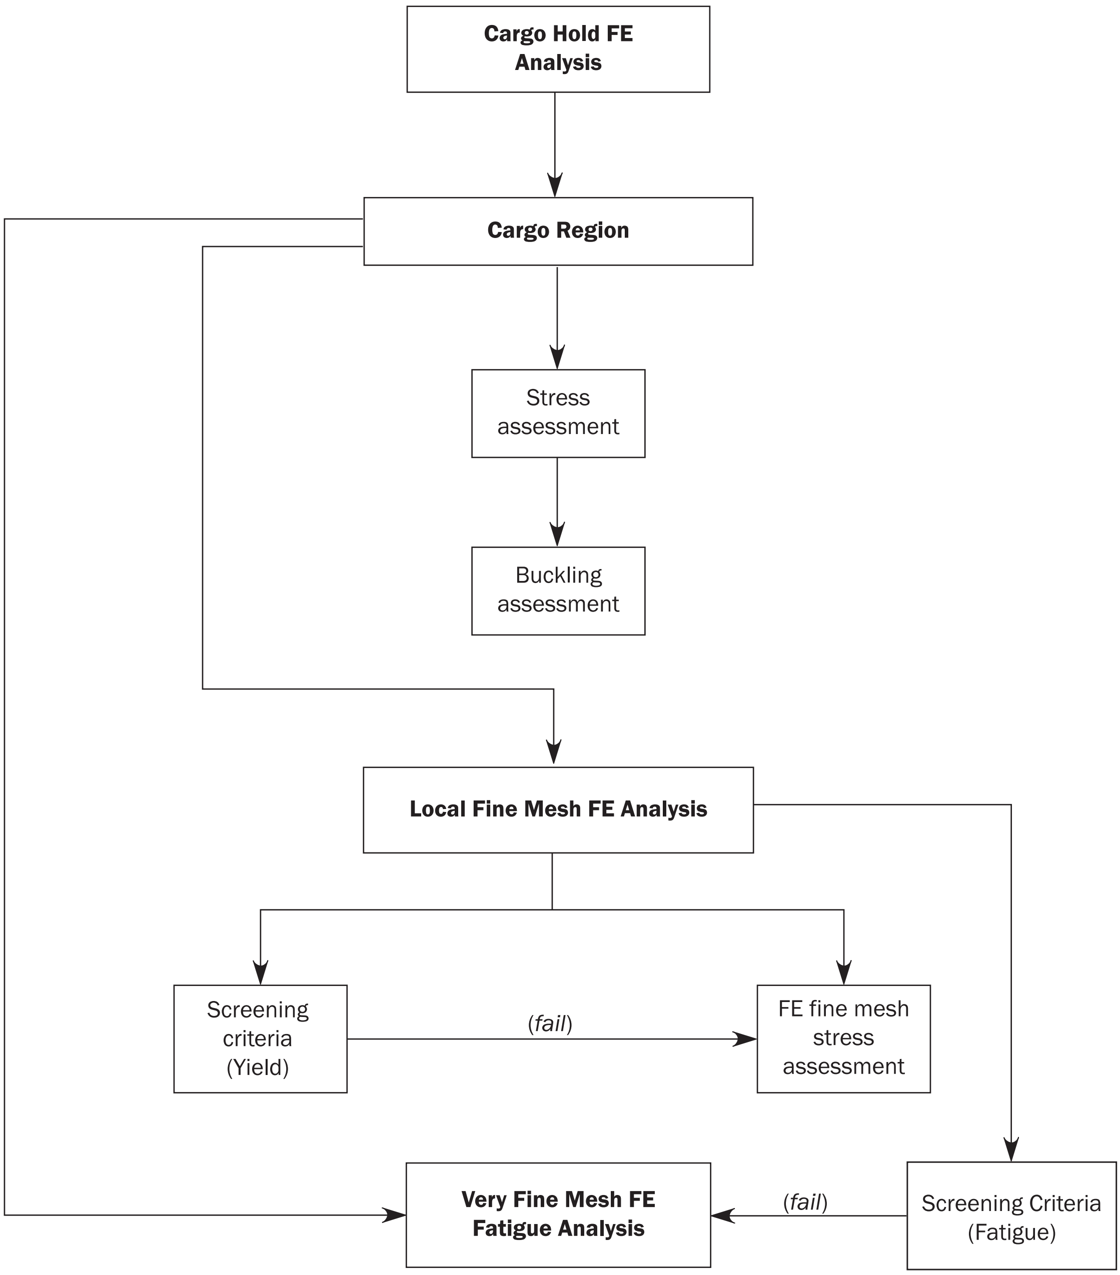
b) Buckling capability of plates and stiffened panels are within the acceptance criteria for bucking defined in Ch 8.

c) Fatigue capacity of structural details is within the acceptance criteria defined in Ch 9.

1.1.6

A flow diagram showing the minimum requirement of finite element analysis is shown in Figure 1.

Figure 1 : Flow diagram of finite element analysis



2 NET SCANTLING

2.1 Net scantling application

2.1.1

FE models for cargo hold FE analyses, local fine mesh FE analysis and very fine mesh FE analyses, are to be based on the net scantling approach, applying a corrosion addition of 0.5 t_c as defined in Ch 3, Sec 2, Table 1.

All buckling capacity assessment are to be based on corrosion addition t_c, as defined in Ch 3, Sec 2, Table 1.

3 FINITE ELEMENT TYPES

3.1 Used finite element types

3.1.1

The structural assessment is to be based on linear finite element analysis of three dimensional structural models. The general types of finite elements to be used in the finite element analysis are given in Table 1.

Table 1 : Types of finite element

Type of finite element	Description
Rod (or truss) element	Line element with axial stiffness only and constant cross sectional area along the length of the element.
Beam element	Line element with axial, torsional and bi-directional shear and bending stiffness and with constant properties along the length of the element.
Shell (or plate) element	Shell element with in-plane stiffness and out-of-plane bending stiffness with constant thickness.

3.1.2

Two node line elements and four node shell elements are, in general, considered sufficient for the representation of the hull structure. The mesh requirements given in this chapter are based on the assumption that these elements are used in the finite element models. However, higher order elements may also be used.

4 SUBMISSION OF RESULTS

4.1 Detailed report

4.1.1

A detailed report of the structural analysis is to be submitted by the designer/builder to demonstrate compliance with the specified structural design criteria. This report is to include the following information:

a) List of plans used including dates and versions.

b) Detailed description of structural modelling including all modelling assumptions and any deviations in geometry and arrangement of structure compared with plans.

c) Plots to demonstrate correct structural modelling and assigned properties.

d) Details of material properties, plate thickness, beam properties used in the model.

e) Details of boundary conditions.

f) Details of all loading conditions reviewed with calculated hull girder shear force, bending moment and torsional moment distributions.

g) Details of applied loads and confirmation that individual and total applied loads are correct.

h) Plots and results that demonstrate the correct behaviour of the structural model under the applied loads.

i) Summaries and plots of global and local deflections.

j) Summaries and sufficient plots of stresses to demonstrate that the design criteria are not exceeded in any member.

k) Plate and stiffened panel buckling analysis and results.

l) Tabulated results showing compliance, or otherwise, with the design criteria.

m) Proposed amendments to structure where necessary, including revised assessment of stresses, buckling and fatigue properties showing compliance with design criteria.

n) Reference of the finite element computer program, including its version and date.

5 COMPUTER PROGRAMS

5.1 Use of computer programs

5.1.1

Any finite element computation program complying with Ch 1, Sec 3 may be employed to determine the stress and deflection of the hull structure, provided that the combined effects of bending, shear, axial and torsional deformations are considered.

SECTION 2
CARGO HOLD STRUCTURAL STRENGTH ANALYSIS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

M_{sw} : Permissible vertical still water bending moment, in kNm, as defined in Ch 4, Sec 4.

M_{wv} : Vertical wave bending moment, in kNm, in hogging or sagging condition, as defined in Ch 4, Sec 4.

M_{wh} : Horizontal wave bending moment, in kNm, as defined in Ch 4, Sec 4.

M_{wt} : Wave torsional moment in seagoing condition, in kNm, as defined in Ch 4, Sec 4.

Q_{sw} : Permissible still water shear force, in kN, at the considered bulkhead position, as provided in Ch 4, Sec 4.

Q_{wv} : Vertical wave shear force, in kN, as defined in Ch 4, Sec 4.

$x_{b\text{-}aft}$, $x_{b\text{-}fwd}$: X-coordinate, in m, of respectively the aft and forward bulkhead of the mid-hold.

x_{aft} : *X*-coordinate, in m, of the aft end support of the FE model.

x_{fore} : *X*-coordinate, in m, of the fore end support of the FE model.

x_i : *X*-coordinate, in m, of web frame station *i*.

Q_{aft} : Vertical shear force, in kN, at aft bulkhead of mid-hold as defined in [4.4.6].

Q_{fwd} : Vertical shear force, in kN, at fore bulkhead of mid-hold as defined in [4.4.6].

$Q_{targ\text{-}aft}$: Target shear force, in kN, at the aft bulkhead of mid-hold as defined in [4.3.3].

$Q_{targ\text{-}fwd}$: Target shear force, in kN, at the forward bulkhead of mid-hold as defined in [4.3.3].

1 OBJECTIVE AND SCOPE

1.1 General

1.1.1

The cargo hold structural strength analysis is used for the assessment of scantlings of longitudinal hull girder structural members, primary supporting members and bulkheads within the cargo hold region. This section gives the requirements for cargo hold structural strength analysis.

1.1.2

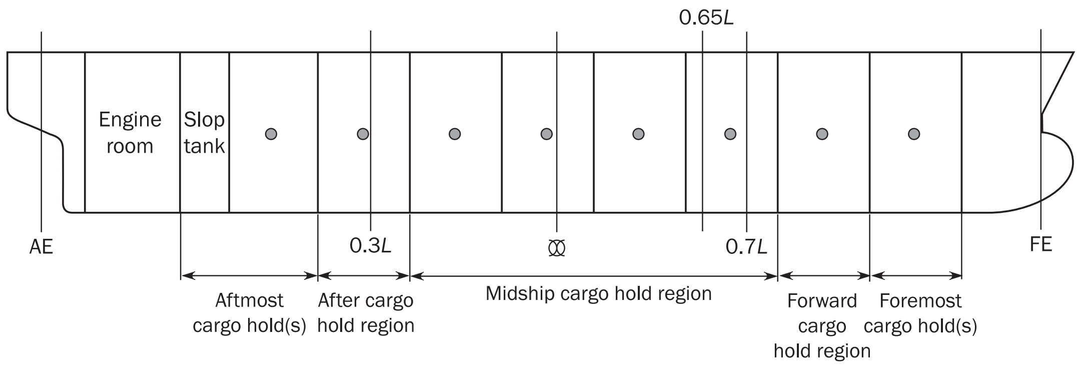
Cargo hold structural strength analysis is mandatory within the cargo hold region including the aft bulkhead of the aftmost cargo hold and the collision bulkhead. The evaluation areas are defined in [5.1].

1.1.3

For the purpose of FE structural assessment and load application, the cargo hold region contains the following cargo hold regions, which may vary depending on the ship length and cargo hold arrangement, as defined in Figure 1:

- Midship cargo hold region,
- Forward cargo hold region,
- After cargo hold region,
- Foremost cargo hold(s),
- Aftmost cargo hold(s).

Figure 1 : Definition of cargo hold regions for FE structural assessment



Holds in the forward cargo hold region are defined as holds with their longitudinal centre of gravity position forward of 0.7 *L* from AE, except foremost cargo hold.
Holds in the midship cargo hold region are defined as holds with their longitudinal centre of gravity position at or forward of 0.3 *L* from AE and at or aft of 0.7 *L* from AE.
Holds in the after cargo hold region are defined as holds with their longitudinal centre of gravity position aft of 0.3 *L* from AE, except aftmost cargo hold.
Foremost cargo hold(s) is (are) defined as hold(s) in the foremost location of the cargo hold region.
Aftmost cargo hold(s) is (are) defined as hold(s) in the aftmost location of the cargo hold region.

1.2 Cargo hold structural strength analysis procedure

1.2.1 Procedure description

The structural FE analysis is to be performed in accordance with the following:

- Model: Three cargo hold model with:
    - Extent as given in [2.2]
    - Finite element types as given in [2.3]
    - Structural modelling as defined in [2.4]
- Boundary conditions as defined in [2.5]
- FE load combinations as defined in [3]
- Load application as defined in [4]
- Evaluation area as defined in [5.1]
- Strength assessment as defined in [5.2] and [5.3]

1.2.2 Mid-hold definition

For the purpose of the FE analysis, the mid-hold is defined as the middle hold(s) of the three cargo hold length FE model.

In case of foremost and aftmost cargo hold assessment, the mid-hold represents the foremost and aftmost cargo hold including the slop tank if any, respectively.

1.2.3 Scantling assessment

The scantling assessment is carried out according to Ch 7, Sec 1 for each individual cargo hold using the FE load combinations defined in Ch 4, Sec 8 applicable to the considered cargo hold. The FE analysis results are applicable to the evaluation area as defined in [5.1.1], of the considered cargo hold.

The individual transverse bulkhead structural elements, inclusive plating, stiffeners and horizontal stringers, are to be assessed considering two cargo hold finite element analyses, i.e. the analysis for the hold forward and the one for the hold aft of the considered transverse bulkhead.

2 STRUCTURAL MODEL

2.1 Members to be modelled

2.1.1

All main longitudinal and transverse structural elements are to be modelled. These include:

- Inner and outer shell,
- Deck,
- Double bottom floors and girders,
- Transverse and vertical web frames,
- Hatch coamings,
- Stringers,
- Transverse and longitudinal bulkhead structures,
- Other primary supporting members,
- Other structural members which contribute to hull girder strength.

All plates and stiffeners on the structure, including web stiffeners, are to be modelled. Brackets which contribute to primary supporting member strength and the size of which is not less than the typical mesh size (s-by-s) described in [2.4.2], are to be modelled.

2.2 Extent of model

2.2.1 Longitudinal extent

Except the foremost and aftermost cargo hold models, the longitudinal extent of the cargo hold FE model is to cover three cargo hold lengths. The transverse bulkheads at the ends of the model are to be modelled. Where corrugated transverse bulkheads are fitted, the model is to include the extent of the bulkhead stool structure forward and aft of the tanks/holds at the model ends. The web frames at the ends of the model are to be modelled. Typical finite element models representing the midship cargo hold region of different ship type configurations are shown in Figure 3 and Figure 4.

The foremost and the aftmost cargo holds are located at the middle of the FE models as follows:

- Foremost cargo hold: from the after bulkhead of the cargo hold no. 2 to the ship's foremost cross section where the reinforced ring or web frame remains continuous from the base line to the strength deck.
- Aftermost cargo hold: from the after bulkhead of the engine room to the forward bulkhead of no. N-1 cargo hold, where N is the number of holds or sets of holds numbered from forward to aft.

Examples of finite element models representing the foremost and aftermost cargo holds of different ship type configurations are shown in Figure 5 and Figure 6.

2.2.2 Hull form modelling

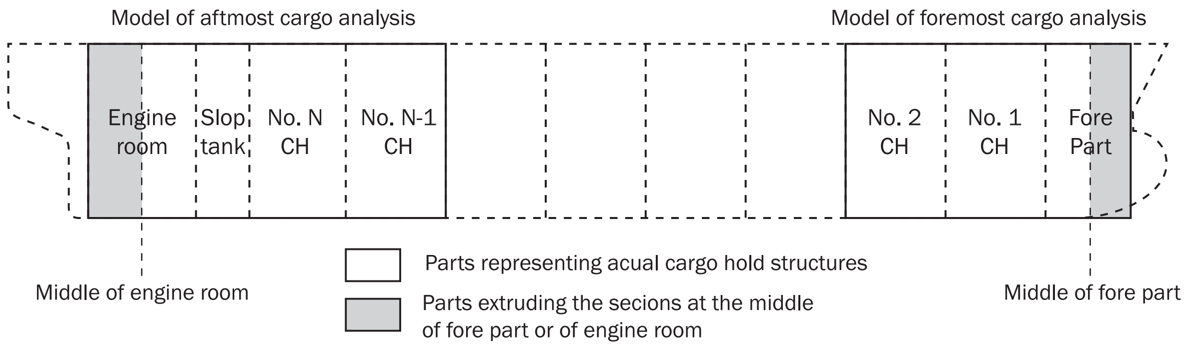
In general, the finite element model is to represent the geometry of the hull form. In the midship cargo hold region, the finite element model may be prismatic provided the mid-hold has a prismatic shape.

In the foremost cargo hold model, the hull form forward of the transverse section at the middle of the fore part up to the model end as defined in [2.2.1] may be modelled with a simplified geometry. The transverse section at the middle of the fore part up to the model end may be extruded out to the fore model end, as shown in Figure 2.

In the aftmost cargo hold model, the hull form aft of the middle of the machinery space may be modelled with a simplified geometry. The section at the middle of the machinery space may be extruded out to its aft bulkhead, as shown in Figure 2.

When the hull form is modelled by extrusion, the geometrical properties of the transverse section located at the middle of the considered space (fore or machinery space) are copied along the simplified model. The transverse web frames are to be considered along this extruded part with the same properties as the ones in the fore part or in the machinery space.

Figure 2 : Hull form simplification for foremost and aftmost cargo hold model



2.2.3 Transverse extent

Both port and starboard sides of the ship are to be modelled.

2.2.4 Vertical extent

The full depth of the ship is to be modelled including primary supporting members above the upper deck, trunks, forecastle and/or cargo hatch coaming, if any.

The superstructure or deck house in way of the machinery space and the bulwark are not required to be included in the model.

2.3 Finite element types

2.3.1

Shell elements are to be used to represent plates.

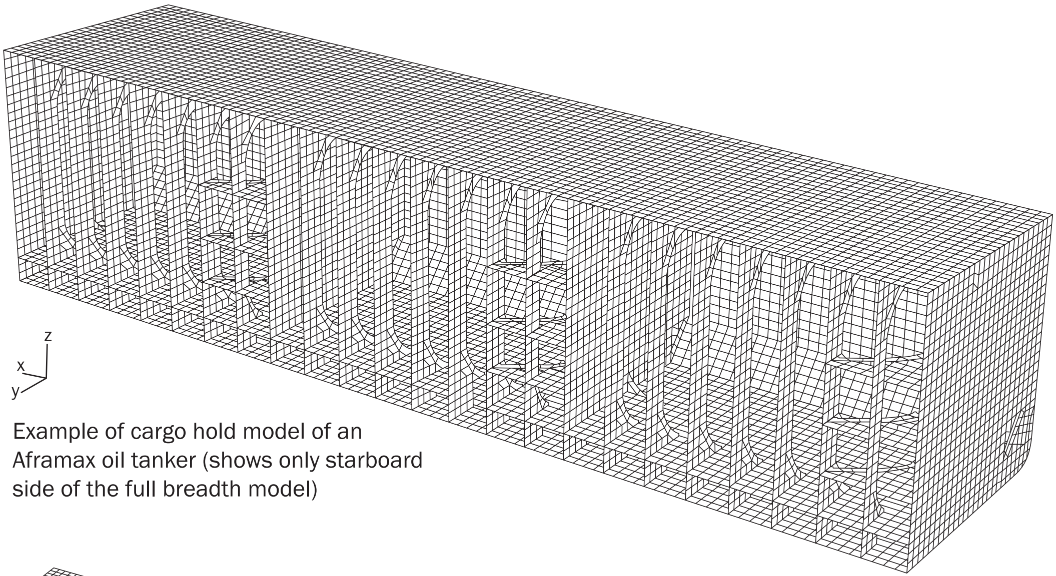
2.3.2

All stiffeners are to be modelled with beam elements having axial, torsional, bi-directional shear and bending stiffness. The eccentricity of the neutral axis is to be modelled.

2.3.3

Face plates of primary supporting members and brackets are to be modelled using rod or beam elements.

Figure 3 : Example of 3 cargo hold model within midship region of oil tankers



Example of cargo hold model of an Aframax oil tanker (shows only starboard side of the full breadth model)

s = Stiffener spacing

2.4 Structural modelling

2.4.1 Aspect ratio

The aspect ratio of the shell elements is in general not to exceed 3. The use of triangular shell elements is to be kept to a minimum. Where possible, the aspect ratio of shell elements in areas where there are likely to be high stresses or a high stress gradient is to be kept close to 1 and the use of triangular elements is to be avoided.

2.4.2 Mesh

The shell element mesh is to follow the stiffening system as far as practicable, hence representing the actual plate panels between stiffeners. In general, the shell element mesh is to satisfy the following requirements:

a) One element between every longitudinal stiffener, see Figure 7. Longitudinally, the element length is not to be greater than 2 longitudinal spaces with a minimum of three elements between primary supporting members.

b) One element between every stiffener on transverse bulkheads, see Figure 8.

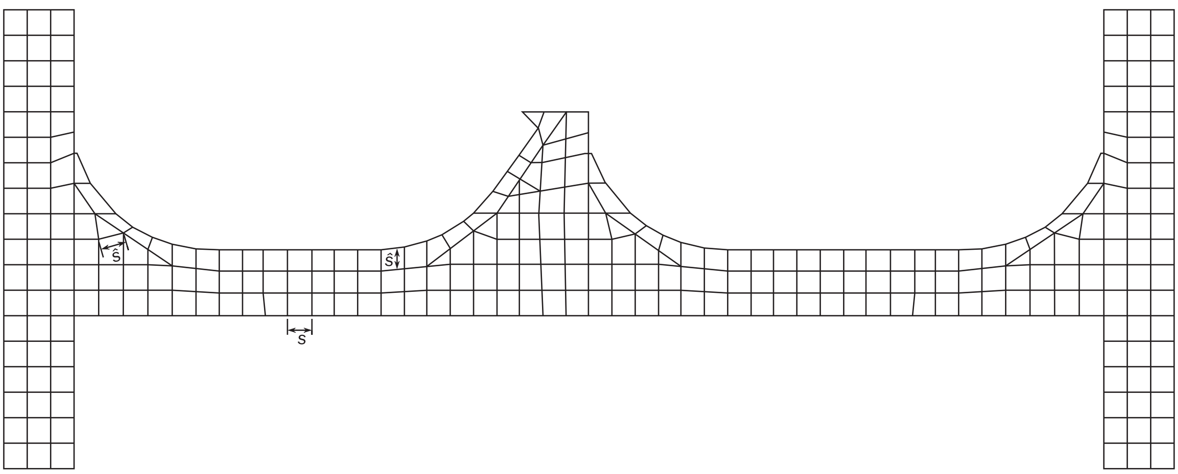
c) One element between every web stiffener on transverse and vertical web frames, cross ties and stringers, see Figure 7 and Figure 9.

d) At least 3 elements over the depth of double bottom girders, floors, transverse web frames, vertical web frames and horizontal stringers on transverse bulkheads. For cross ties, deck transverse and horizontal stringers on transverse wash bulkheads and longitudinal bulkheads with a smaller web depth, modelling using 2 elements over the depth is acceptable provided that there is at least 1 element between every web stiffener. For a single side bulk carrier, 1 element over the depth of side frames is acceptable. The mesh size of adjacent structure is to be adjusted accordingly.

e) The mesh on the hopper tank web frame and the topside web frame is to be fine enough to represent the shape of the web ring opening, as shown in Figure 7.

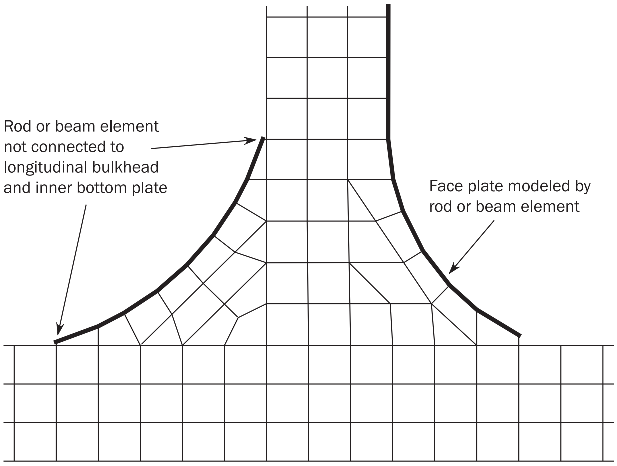
f) The curvature of the free edge on large brackets of primary supporting members is to be modelled to avoid unrealistic high stress due to geometry discontinuities. In general, a mesh size equal to the stiffener spacing is acceptable. The bracket toe may be terminated at the nearest nodal point provided that the modelled length of the bracket arm does not exceed the actual bracket arm length. The bracket flange is not to be connected to the plating, as shown in Figure 10. The modelling of the tapering part of the flange is to be in accordance with [2.4.8]. An example of acceptable mesh is shown in Figure 10. A finer mesh is to be used for the determination of detailed stress at the bracket toe, as given in Ch 7, Sec 3.

Figure 9 : Typical finite element mesh on horizontal transverse stringer on transverse bulkhead



s = Stiffener spacing

Figure 10 : Typical finite element mesh on transverse web frame main bracket



2.4.3 Finer mesh

Where the geometry cannot be adequately represented in the cargo hold model and the stress exceeds the cargo hold mesh acceptance criteria, a finer mesh may be used for such geometry to demonstrate satisfactory scantlings. The mesh size required for such analysis can be governed by the geometry. In such cases, the average stress within an area equivalent to that specified in [2.4] is to comply with the requirements given in [5.2].

2.4.4 Corrugated bulkhead

Diaphragms in the stools, supporting structure of corrugated bulkheads and internal longitudinal and vertical stiffeners on the stool plating are to be included in the model. Modelling is to be carried out as follows:

a) The corrugation is to be modelled with its geometric shape.

b) The mesh on the flange and web of the corrugation is in general to follow the stiffener spacing inside the bulkhead stool.

c) The mesh on the longitudinal corrugated bulkhead is to follow longitudinal positions of transverse web frames, where the corrections to hull girder vertical shear forces are applied in accordance with [4.4.7].

d) The aspect ratio of the mesh in the corrugation is not to exceed 2 with a minimum of 2 elements for the flange breadth and the web height.

e) Where difficulty occurs in matching the mesh on the corrugations directly with the mesh on the stool, it is acceptable to adjust the mesh on the stool in way of the corrugations.

f) For a corrugated bulkhead without an upper stool and/or lower stool, it may be necessary to adjust the geometry in the model. The adjustment is to be made such that the shape and position of the corrugations and primary supporting members are retained. Hence, the adjustment is to be made on stiffeners and plate seams if necessary.

g) When corrugated bulkhead is subjected to liquid cargo or ballast, dummy rod elements with a cross sectional area of 1 mm^2 are to be modelled at the corrugation knuckle between the flange and the web. Dummy rod elements are to be used as minimum at the two corrugation knuckles closest to the intersection between:

- Transverse and longitudinal bulkheads,
- Transverse bulkhead and inner hull,
- Transverse bulkhead and side shell.

h) Manholes in diaphragms are to be modelled according to [2.4.9].

2.4.5

Example of mesh arrangements of the cargo hold structure are shown in Figure 11 to Figure 14.

Figure 11 : Example of FE mesh arrangements of cargo hold structure for a bulk carrier

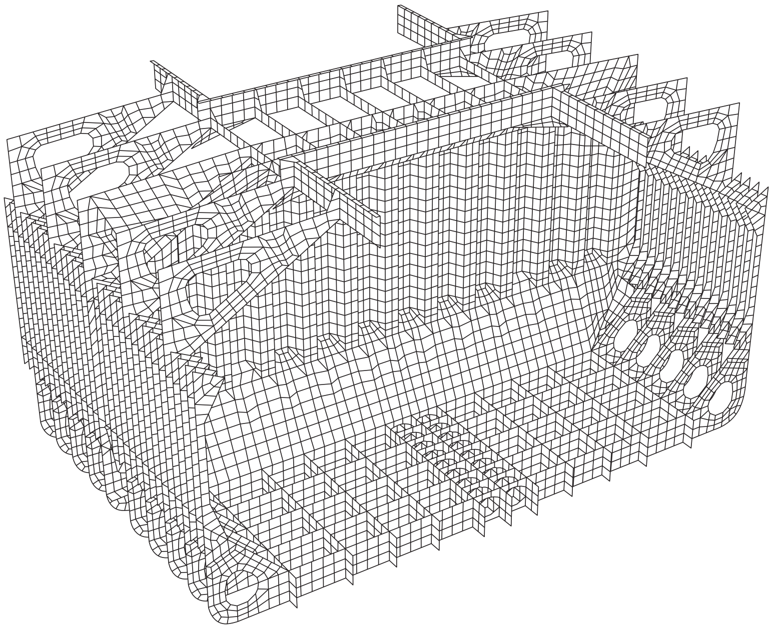


Figure 12 : Example of FE mesh on transverse corrugated bulkhead structure for a product tanker

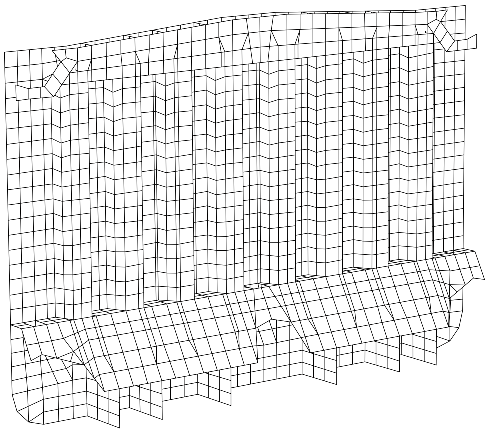

Figure 13 : Example of FE mesh arrangements of cargo tank structure for an aframax tanker

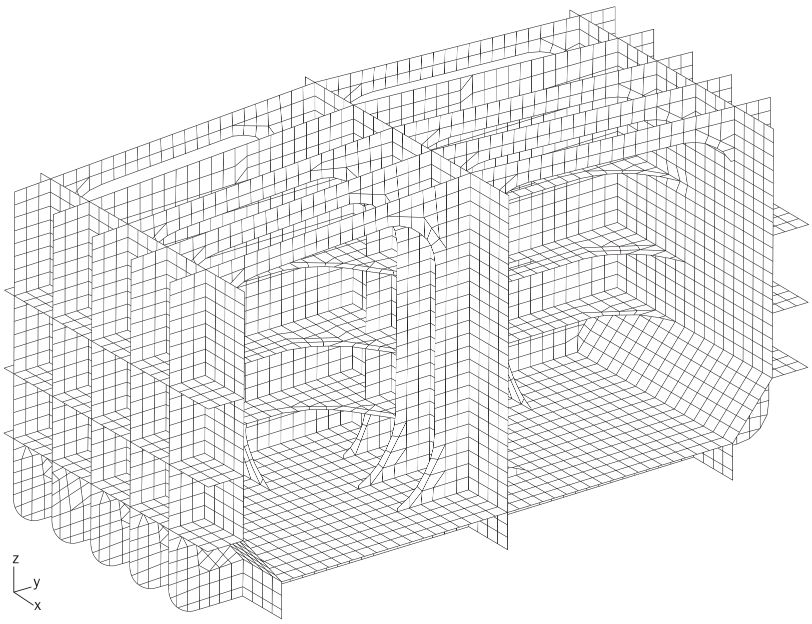

Figure 14 : Examples of FE mesh arrangements of cargo tank structure for VLCC and product tanker

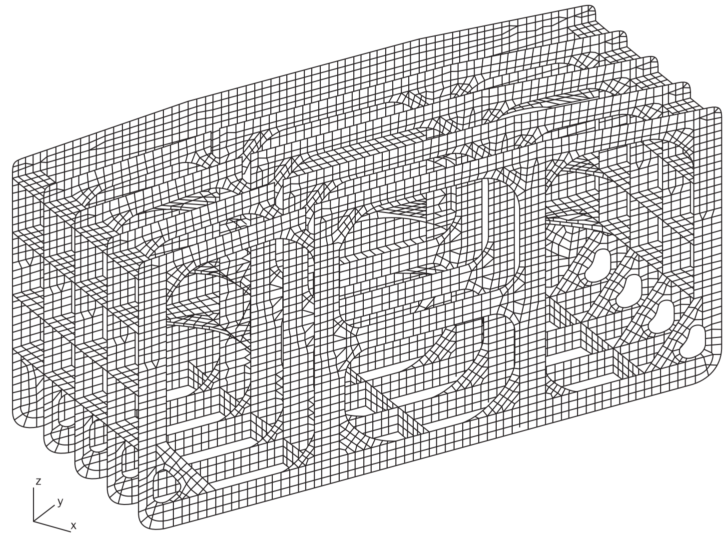

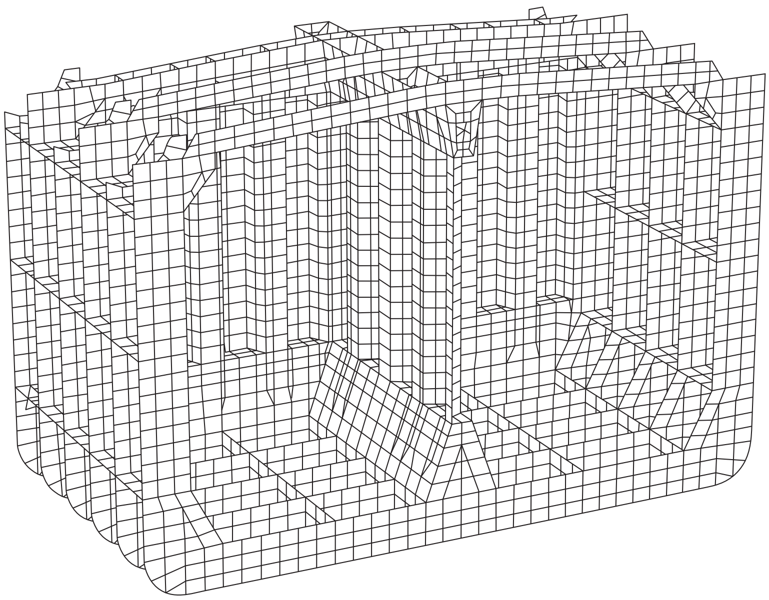

2.4.6 Sniped stiffener

Non continuous stiffeners are to be modelled as continuous stiffeners, i.e. the height web reduction in way of the snip ends are not to be modelled.

2.4.7 Web stiffeners of primary supporting members

Web stiffeners of primary supporting members are to be modelled. Where these stiffeners are not in line with the primary FE mesh, it is sufficient to place the line element along the nearby nodal points provided that the adjusted distance does not exceed 0.2 times the stiffener spacing under consideration. The stresses and buckling utilisation factors obtained need not be corrected for the adjustment. Buckling stiffeners on large brackets, deck transverses and stringers parallel to the flange are to be modelled. These stiffeners may be modelled using rod elements.

2.4.8 Face plate of primary supporting member

The effective cross sectional area at the curved part of the face plate of primary supporting members and brackets is to be calculated in accordance with Ch 3, Sec 7. The cross sectional area of a rod or beam element representing the tapering part of the face plate is to be based on the average cross sectional area of the face plate in way of the element length.

2.4.9 Openings

Methods of representing openings in webs of primary supporting members are to be in accordance with Table 1 except for manholes which are to be modelled by removing the adequate elements.

Table 1 : Representation of openings in primary supporting member webs

Criteria	Modelling decision
$h_o/h < 0.5$ and $g_o < 2.0$	Openings do not need to be modelled
$h_o/h \geq 0.5$ or $g_o \geq 2.0$	The geometry of the opening is to be modelled

where:

$$g_o = \left(1 + \frac{\ell_o^2}{2.6(h - h_o)^2}\right)$$

ℓ_o : Length of opening parallel to primary supporting member web direction, in m, see Figure 15. For sequential openings where the distance, d_o between openings is less than 0.25 h, the length ℓ_o is to be taken as the length across openings as shown in Figure 16.

h_o : Height of opening parallel to depth of web, in m, see Figure 15 and Figure 16.

h : Height of web of primary supporting member in way of opening, in m, see Figure 15 and Figure 16.

Figure 15 : Openings in web

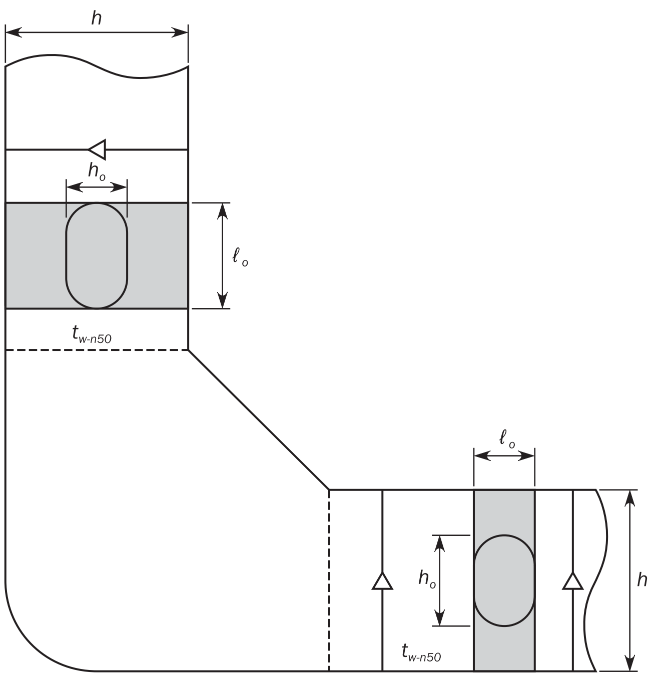

Figure 16 : Length lo for sequential openings with $d_o < h/4$

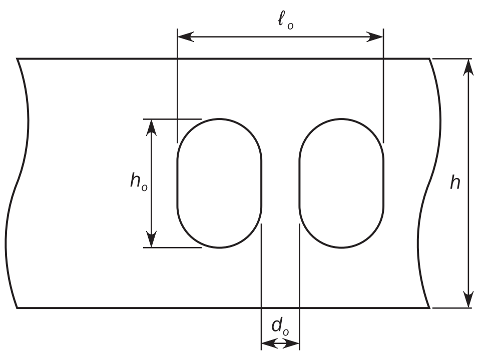

2.5 Boundary conditions

2.5.1 General

All boundary conditions described in this section are in accordance with the global coordinate system defined in Ch 4, Sec 1.

2.5.2 Application

The boundary conditions given [2.5.3] are applicable to cargo hold finite element model analyses in cargo hold region.

2.5.3 Boundary conditions

The boundary conditions consist of the rigid links at model ends, point constraints and end-beams. The rigid links connect the nodes on the longitudinal members at the model ends to an independent point at neutral axis in centreline. The boundary conditions to be applied at the ends of the cargo hold FE model, except for the foremost cargo hold, are given in Table 2. For the foremost cargo hold analysis, the boundary conditions to be applied at the ends of the cargo hold FE model are given in Table 3.

Table 2 : Boundary constraints at model ends except the foremost cargo hold models

Location	Translation			Rotation

Cross section	-	Rigid link	Rigid link	Rigid link	-	-
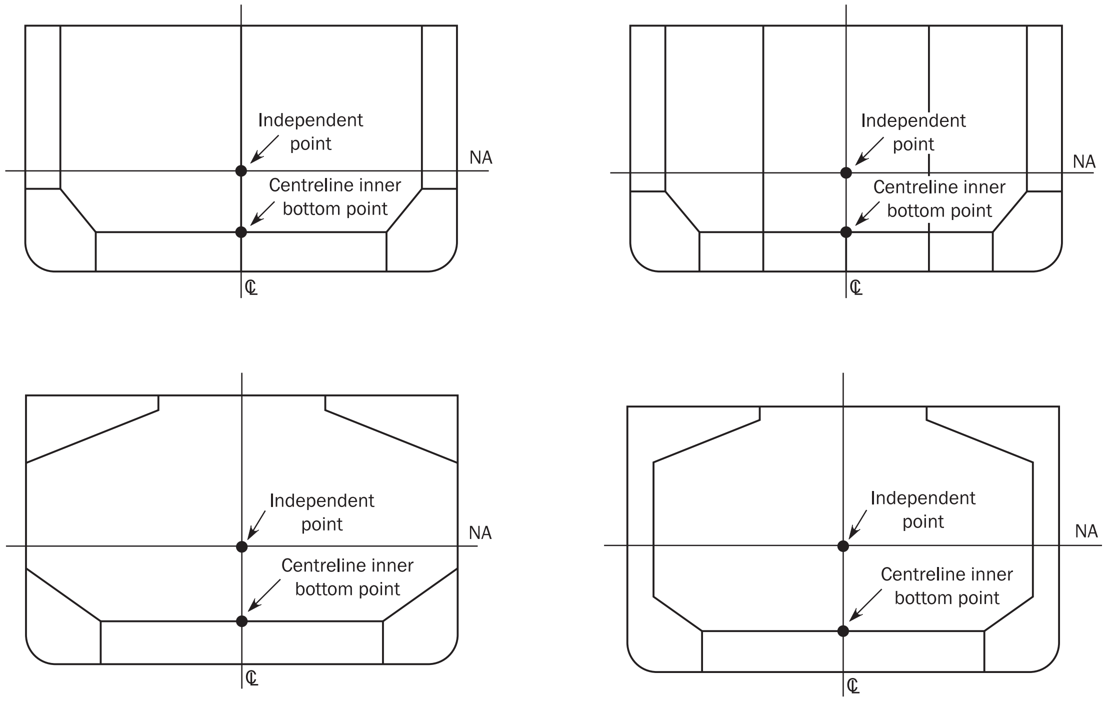
Note 1: [-] means no constraint applied (free). Note 2: See Figure 17. Note 3: Boundary constraints in fore end are to be located at the most forward reinforced ring or web frame which remains continuous from the base line to the strength deck.						

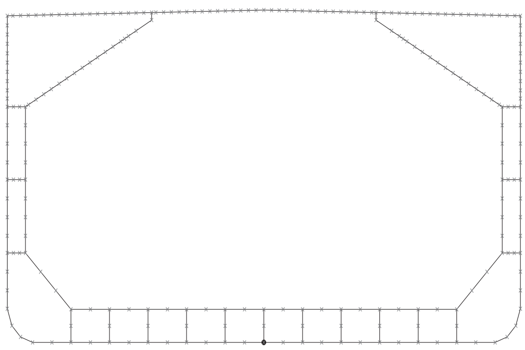
Figure 17 : Boundary conditions applied at the model end sections



2.5.4 End constraint beams

End constraint beams are to be modelled at the both end sections of the model along all longitudinally continuous structural members and along the cross deck plating of bulk carriers. An example of end beams at one end for a double hull bulk carrier is shown in Figure 18.

Figure 18 : End constraint beams for a bulk carrier



The properties of beams are calculated at fore and after sections separately and all beams at each end section have identical properties as follows:

- Net moment of inertia: $I_{yy\text{-}n50} = I_{zz\text{-}n50} = I_{xx\text{-}n50}$ (J) = 1/25 of the vertical hull girder moment of inertia of fore/aft end cross sections based on the net FE model.
- Net cross sectional area: $A_{y\text{-}n50}$ and $A_{z\text{-}n50}$ = 1/80 of the fore/aft end cross sectional areas based on the net FE model.

where:

$I_{yy\text{-}n50}$: Moment of inertia about local beam Y axial, in m^4.

$I_{zz\text{-}n50}$: Moment of inertia about local beam Z axial, in m^4.

$I_{xx\text{-}n50}$ (J) : Torsional inertia, in m^4.

$A_{y\text{-}n50}$: Shear area in local beam Y direction, in m^2.

$A_{z\text{-}n50}$: Shear area in local beam Z direction, in m^2.

3 FE LOAD COMBINATIONS

3.1 Design Load combinations

3.1.1 FE load combination definition

A FE load combination is defined as a loading pattern, a draught, a value of still water bending and shear force, associated with a given dynamic load case.

3.1.2 Mandatory load combinations

For cargo hold structural strength analysis, the design load combinations specified in Ch 4, Sec 8 are to be used for considered ship type and considered cargo hold regions.

Each design load combination given in Ch 4, Sec 8 consists of a loading pattern and dynamic load cases as given in Ch 4, Sec 2. Each load combination requires the application of the structural weight, internal and external pressures and hull girder loads. For seagoing condition, both static and dynamic load components (S+D) are applied. For harbour and tank testing condition, only static load components (S) are applied.

3.1.3 Additional loading conditions

Where the loading conditions specified by the designer are not covered by the load combinations given in Ch 4, Sec 8, these additional loading conditions are to be examined according to the procedure in [4].

4 LOAD APPLICATION

4.1 General

4.1.1 Structural weight

Effect of the weight of hull structure is to be included in static loads, but is not to be included in dynamic loads. Density of steel is to be taken as given in Ch 4, Sec 6.

4.1.2 Sign convention

Unless otherwise mentioned in this Section, the sign of moments and shear force is to be in accordance with the sign convention defined in Ch 4, Sec 1.

4.2 External and internal loads

4.2.1 External pressure

External pressure is to be calculated for each load case in accordance with Ch 4, Sec 5. External pressures include static sea pressure, wave pressure and green sea pressure.

The forces applied on the hatch cover by the green sea pressure are to be distributed along the top of the corresponding hatch coamings. The total force acting on the hatch cover is determined by integrating the hatch cover green sea pressure as defined in Ch 4, Sec 5, [5]. Then the total force is to be distributed to the total length of the hatch coamings using the average line load. The effect of the hatch cover self weight is to be ignored in the loads applied to the ship structure.

4.2.2 Internal pressure

Internal pressure is to be calculated for each load case in accordance with Ch 4, Sec 6 for design load scenarios given in Ch 4, Sec 7, Table 1. Internal pressures include static dry and liquid cargo, ballast and other liquid pressure, setting pressure on relief valve and dynamic pressure of dry and liquid cargo, ballast and other liquid pressure due to acceleration.

4.2.3 Pressure application on FE element

Constant pressure, calculated at the element's centroid, is applied to the shell element of the loaded surfaces, e.g. outer shell and deck for external pressure and tank/hold boundaries for internal pressure. Alternately, pressure can be calculated at element nodes applying linear pressure distribution within elements.

4.3 Hull girder loads

4.3.1 General

Each loading condition is to be associated with its corresponding hull girder loads which is to be applied to the model according to the procedure described in [4.4] for shear force and bending moment and in [4.5] for torsional moment. The hull girder loads are the combinations of still water hull girder loads and wave induced hull girder loads as specified in Ch 4, Sec 8. For each required FE load combination, the wave induced hull girder loads are to be calculated with the Load Combination Factors (LCFs), specified in Ch 4, Sec 2.

4.3.2 Target hull girder vertical bending moment

The target hull girder vertical bending moment, M_{v-targ}, in kNm, at a longitudinal position for a given FE load combination is taken as:

$$M_{v-targ} = C_{BM-LC}\ M_{sw} + M_{wv-LC}$$

where:

C_{BM-LC} : Percentage of permissible still water bending moment applied for the load combination under consideration as given in Ch 4, Sec 8,

M_{sw} : Permissible still water bending moments in kNm, at the considered longitudinal position for seagoing and harbour conditions as defined in Ch 4, Sec 4, [2.2.2] and Ch 4, Sec 4, [2.2.3] respectively.

M_{wv-LC} : Vertical wave bending moment in kNm, for the dynamic load case under consideration, calculated in accordance with Ch 4, Sec 4, [3.5.2].

The values of M_{v-targ} are taken as:

- Midship cargo hold region: the maximum hull girder bending moment within the mid-hold(s) for each individual cargo hold for each given FE load combination as defined in Ch 4, Sec 8.
- Outside midship cargo hold region: the values at all web frame and transverse bulkhead positions of the FE model under consideration.

Both $C_{BM-LC}\ M_{sw}$ *and* M_{wv-LC} are either in sagging or in hogging condition according to the FE load combinations given in the tables of Ch 4, Sec 8.

4.3.3 Target hull girder shear force

The target hull girder vertical shear force at the aft and forward transverse bulkheads of the mid-hold, $Q_{targ-aft}$ and $Q_{targ-fwd}$, in kN, for a given FE load combination is taken as:

- $Q_{fwd} \geq Q_{aft}$:

$$Q_{targ-aft} = C_{SF-LC} \cdot Q_{sw-neg} - \Delta Q_{swa} + f_\beta |C_{QW}| Q_{wv-neg}$$

$$Q_{targ-fwd} = C_{SF-LC} \cdot Q_{sw-pos} + \Delta Q_{swf} + f_\beta |C_{QW}| Q_{wv-pos}$$

- $Q_{fwd} < Q_{aft}$:

$$Q_{targ-aft} = C_{SF-LC} \cdot Q_{sw-pos} + \Delta Q_{swa} + f_\beta |C_{QW}| Q_{wv-pos}$$

$$Q_{targ-fwd} = C_{SF-LC} \cdot Q_{sw-neg} - \Delta Q_{swf} + f_\beta |C_{QW}| Q_{wv-neg}$$

where:

Q_{fwd}, Q_{aft}: Vertical shear forces, in kN, due to the local loads respectively at the forward and aft bulkhead position of the mid-hold, as defined in [4.4.7].

C_{SF-LC} : Percentage of permissible still water shear force as given in Ch 4, Sec 8, for the FE load combination under consideration.

Q_{sw-pos}, Q_{sw-neg}: Positive and negative permissible still water shear forces, in kN, at any longitudinal position for seagoing and harbour conditions as defined in Ch 4, Sec 4, [2.3.3] and Ch 4, Sec 4, [2.3.4] respectively.

ΔQ_{swf} : Shear force correction, in kN, for the considered FE loading pattern at the forward bulkhead taken as:

- For bulk carriers:

  Minimum of the absolute values of ΔQ_{mdf} as defined in Ch 5, Sec 1, [3.6.1] calculated at forward bulkhead for the mid-hold and the value calculated at aft bulkhead of the forward cargo hold taken as:

  $$\Delta Q_{swf} = Min(|\Delta Q_{mdf}|_{Mid}, |\Delta Q_{mdf}|_{Fwd})$$

- For oil tankers:

  $$\Delta Q_{swf} = 0$$

ΔQ_{swa} : Shear force correction, in kN, for the considered FE loading pattern at the aft bulkhead taken as:

- For bulk carriers:

  Minimum of the absolute values of ΔQ_{mdf} as defined in Ch 5, Sec 1, [3.6.1] calculated at aft bulkhead for the mid-hold and the value calculated at forward bulkhead of the aft cargo hold taken as:

  $$\Delta Q_{swa} = Min(|\Delta Q_{mdf}|_{Mid}, |\Delta Q_{mdf}|_{Aft})$$

- For oil tankers:

  $$\Delta Q_{swa} = 0$$

f_β : Wave heading factor, as given in Ch 4, Sec 4.

C_{QW} : Load combination factor for vertical wave shear force, as given in Ch 4, Sec 2.

Q_{wv-pos}, Q_{wv_neg}: Positive and negative vertical wave shear force, in kN, as defined in Ch 4, Sec 4, [3.2.1].

The values of $Q_{targ-aft}$ and $Q_{targ-fwd}$ are to be taken at after and forward transverse bulkheads of the mid-hold under consideration.

4.3.4 Target hull girder horizontal bending moment

The target hull girder horizontal bending moment, M_{h-targ}, in kNm, for a given FE load combination is taken as:

$$M_{h-targ} = M_{wh-LC}$$

where:

M_{wh-LC} : Horizontal wave bending moment, in kNm, for the dynamic load case under consideration, calculated in accordance with Ch 4, Sec 4, [3.5.4].

The values of M_{wh-LC} are taken as:

- Midship cargo hold region: the value calculated for the middle of the individual cargo hold under consideration.
- Outside midship cargo hold region: the values calculated at all web frame and transverse bulkhead positions of the FE model under consideration.

4.3.5 Target hull girder torsional moment

For bulk carriers only, the target hull girder torsional moment, $M_{wt-targ}$, in kNm, for the dynamic load cases OST and OSA is the value at the target location taken as:

$$M_{wt-targ} = M_{wt-LC}\ (x_{targ})$$

where:

$M_{wt-LC}\ (x)$: Wave torsional moment, in kNm, for the dynamic load case OST and OSA, defined in Ch 4, Sec 4, [3.5.5], calculated at x position.

x_{targ} : Target location for hull girder torsional moment taken as:

- For midship cargo hold region:
  - If $x_{mid} \le 0.531\ L$: after bulkhead of the mid-hold.
  - If $x_{mid} > 0.531\ L$: forward bulkhead of the mid-hold.
- Outside midship cargo hold region:

  The transverse bulkhead of mid-hold where the following formula is minimum:

$$\frac{M_{wt-LC}(x_{bhd})}{|M_{wt-LC}(x_{bhd})|} \cdot [M_{wt-LC}(x_{bhd}) - M_{T-FEM}(x_{bhd})]$$

x_{mid} : X-coordinate, in m, of the mid-hold centre.

x_{bhd} : X-coordinate, in m, of the after or forward transverse bulkhead of mid-hold.

For dynamic load cases of bulk carriers other than OST and OSA and for all dynamic load cases of oil tankers, hull girder torsional moment $M_{wt-targ}$, at middle of mid-hold is to be adjusted to zero.

4.4 Procedure to adjust hull girder shear forces and bending moments

4.4.1 General

The procedure given in this sub-article [4.4] describes how to adjust the hull girder horizontal bending moment, vertical force and vertical bending moment distribution on the three cargo hold FE model to achieve the required target values at required locations. The hull girder load target values are specified in [4.3].

The target locations for hull girder shear force are at the transverse bulkheads of the mid-hold. The final adjusted hull girder shear force at the target location should not exceed the target hull girder shear force.

The target location for hull girder bending moment is, in general, located at the centre of the mid-hold. If the maximum value of bending moment is not located at the centre of the mid-hold, the final adjusted maximum bending moment within the mid-hold is not to exceed the target hull girder bending moment.

4.4.2 Local load distribution

The following local loads are to be applied for the calculation of hull girder shear and bending moments:

a) Ship structural steel weight distribution over the length of the cargo hold model (static loads). The structural steel weight is to be calculated based on the FE model with a net thickness of 0.5 t_c deduction, as used in the cargo hold FE model.

b) Weight of cargo and ballast (static loads).

c) Static sea pressure, dynamic wave pressure and, where applicable, green sea load. For the harbour/tank testing load cases, only static sea pressure needs to be applied.

d) Dynamic cargo and ballast loads for seagoing load cases.

With the above local loads applied to the FE model, the FE nodal forces are obtained through FE loading procedure. The 3D nodal forces will then be lumped to each longitudinal station to generate the one dimension local load distribution. The longitudinal stations are located at transverse bulkheads/frames and typical longitudinal FE model nodal locations in between the frames according to the cargo hold model mesh size requirement. Any intermediate nodes created for modelling structural details are not treated as the longitudinal stations for the purpose of local load distribution. The nodal forces within half of forward and half of afterward of longitudinal station spacing are lumped to that station. The lumping process will be done for vertical and horizontal nodal forces separately to obtain the lumped vertical and horizontal local loads, f_{vi} and f_{hi}, at the longitudinal station i.

4.4.3 Hull girder forces and bending moment due to local loads

With the local load distribution, the hull girder load longitudinal distributions are obtained by assuming the model is simply supported at model ends. The reaction forces at both ends of the model and longitudinal distributions of hull girder shear forces and bending moments induced by local loads at any longitudinal station are determined by the following formulae:

$$R_{V\_fore} = -\frac{\sum_i (x_i - x_{aft})\ f_{vi}}{x_{fore} - x_{aft}} \qquad R_{V\_aft} = \sum_i f_{vi} + R_{V\_fore}$$

$$R_{H\_fore} = \frac{\sum_i (x_i - x_{aft})\ f_{hi}}{x_{fore} - x_{aft}} \qquad R_{H\_aft} = -\sum_i f_{hi} + R_{H\_fore}$$

$$F_l = \sum_i f_{li}$$

$$Q_{V\_FEM}\ (x_j) = R_{V\_aft} - \sum_i f_{vi} \qquad \text{when} \quad x_i < x_j$$

$$Q_{H\_FEM}\ (x_j) = R_{H\_aft} + \sum_i f_{hi} \qquad \text{when} \quad x_i < x_j$$

$$M_{V\_FEM}\ (x_j) = (x_j - x_{aft})\ R_{V\_aft} - \sum_i (x_j - x_i)\ f_{vi} \qquad \text{when} \quad x_i < x_j$$

$$M_{H\_FEM}\ (x_j) = (x_j - x_{aft})\ R_{H\_aft} + \sum_i (x_j - x_i)\ f_{hi} \qquad \text{when} \quad x_i < x_j$$

where:

R_{V_aft}, R_{V_fore}, R_{H_aft}, R_{H_fore} : Vertical and horizontal reaction forces at the aft and fore ends, in kN.

x_{aft} : *X*-coordinate of the aft end support, in m.

x_{fore} : *X*-coordinate of the fore end support, in m.

f_{vi} : Lumped vertical local load at longitudinal station *i* as defined in [4.4.2], in kN.

f_{hi} : Lumped horizontal local load at longitudinal station *i* as defined in [4.4.2], in kN.

F_l : Total net longitudinal force of the model, in kN.

f_{li} : Lumped longitudinal local load at longitudinal station *i* as defined in [4.4.2], in kN.

x_j : *X*-coordinate, in m, of considered longitudinal station *j*.

x_i : *X*-coordinate, in m, of longitudinal station *i*.

Q_{V_FEM} (x_j), Q_{H_FEM} (x_j), M_{V_FEM} (x_j), M_{H_FEM} (x_j) : Vertical and horizontal shear forces, in kN, and bending moments, in kNm, at longitudinal station x_j created by the local loads applied on the FE model. The sign convention for reaction forces is that a positive creates a positive shear force.

4.4.4 Longitudinal unbalanced force

In case total net longitudinal force of the model, F_l, is not equal to zero, the counter longitudinal force, $(F_x)_j$, is to be applied at one end of the model, where the translation on X-direction, δ_x, is fixed, by distributing longitudinal axial nodal forces to all hull girder bending effective longitudinal elements, as follows:

$$(F_x)_j = \frac{F_l}{A_{x-n50}} \frac{A_{j-n50}}{n_j}$$

where:

$(F_x)_j$: Axial force applied to a node of the *j*-th element, in kN.

F_l : Total net longitudinal force of the model, as defined in [4.4.3], in kN.

$A_{j\text{-}n50}$: Net cross sectional area of the *j*-th element, in m^2.

$A_{x\text{-}n50}$: Net cross sectional area of fore end section, in m^2,

$$A_{x-n50} = \sum_j A_{j-n50}$$

n_j : Number of nodal points of *j*-th element on the cross section, n_j = 1 for beam element, n_j = 2 for 4-node shell element.

4.4.5 Hull girder shear force adjustment procedure

The hull girder shear force adjustment procedure defined in this requirement applies to all FE load combinations given in Ch 4, Sec 8. The FE load combinations not directly covered by the load combination tables of Ch 4, Sec 8 are to be considered on a case by case basis.

The two following methods are to be used for the shear force adjustment:

- Method 1 (M1): for shear force adjustment at one bulkhead of the mid-hold as given in [4.4.6],
- Method 2 (M2): for shear force adjustment at both bulkheads of the mid-hold as given in [4.4.7].

For the considered FE load combination, the method to be applied is to be selected as follows:

- For maximum shear force load combination (Max SFLC), the method 1 applies at the bulkhead mentioned in Table 4 if the shear force after the adjustment with method 1 at the other bulkhead does not exceed the target value. Otherwise, the method 2 applies.
- For other shear force load combination:
    - The shear force adjustment is not requested when the shear forces at both bulkheads are lower or equal to the target values.
    - The method 1 applies when the shear force exceeds the target at one bulkhead and the shear force at the other bulkhead after the adjustment with method 1 does not exceed the target value. Otherwise the method 2 applies,
    - The method 2 applies when the shear forces at both bulkheads exceed the target values,

The “maximum shear force load combinations“ are marked as “Max SFLC“ in the load combination tables of Ch 4, Sec 8. The “other shear force load combinations“ are those which are not the maximum shear force load combinations. They are not marked in the load combination tables of Ch 4, Sec 8.

Table 4 : Mid-hold bulkhead location for shear force adjustment

Design loading conditions	Bulkhead location	M_{wv-LC}	Condition on Q_{fwd}	Mid-hold bulkhead for SF adjustment
Seagoing conditions	$x_{b-aft} > 0.5\ L$	< 0 (sagging)	$Q_{fwd} > Q_{aft}$	Fwd
			$Q_{fwd} \leq Q_{aft}$	Aft
		> 0 (hogging)	$Q_{fwd} > Q_{aft}$	Aft
			$Q_{fwd} \leq Q_{aft}$	Fwd
	$x_{b-fwd} < 0.5\ L$	< 0 (sagging)	$Q_{fwd} > Q_{aft}$	Aft
			$Q_{fwd} \leq Q_{aft}$	Fwd
		> 0 (hogging)	$Q_{fwd} > Q_{aft}$	Fwd
			$Q_{fwd} \leq Q_{aft}$	Aft
	$x_{b-aft} \leq 0.5\ L$ and $x_{b-fwd} \geq 0.5\ L$	-	-	(1)
Harbour and testing conditions	whatever the location	-	-	(1)

(1) For the FE load combinations covered by the load combination tables of Ch 4, Sec 8, the bulkhead where the shear force adjustment is to be done is indicated in those tables.

	Forward bulkhead
	Aft bulkhead

——— Vertical shear force after adjustment

- - - - - - - - Vertical shear force due to local loads

4.4.6 Method 1 for shear force adjustment at one bulkhead

The required adjustments in shear force at following transverse bulkheads of the mid-hold are given by:

- Aft bulkhead:

$$M_{Y\_aft} = M_{Y\_fore} = \frac{(x_{fore} - x_{aft})}{2}(Q_{targ-aft} - Q_{aft})$$

- Forward bulkhead

$$M_{Y\_aft} = M_{Y\_fore} = \frac{(x_{fore} - x_{aft})}{2}(Q_{targ-fwd} - Q_{fwd})$$

where:

M_{Y_aft}, M_{Y_fore}: Vertical bending moment, in kNm, to be applied at the aft and fore ends in accordance with [4.4.10], to enforce the hull girder vertical shear force adjustment as shown in Table 5. The sign convention is that of the FE model axis.

Q_{aft} : Vertical shear force, in kN, due to local loads at aft bulkhead location of mid-hold, x_{b_aft}, resulting from the local loads calculated according to [4.4.3].

Since the vertical shear force is discontinued at the transverse bulkhead location, Q_{aft} is the maximum absolute shear force between the stations located right after and right forward of the aft bulkhead of mid-hold.

Q_{fwd} : Vertical shear force, in kN, due to local loads at the forward bulkhead location of mid-hold, x_{b-_fwd}, resulting from the local loads calculated according to [4.4.3].

Since the vertical shear force is discontinued at the transverse bulkhead location, Q_{fwd} is the maximum absolute shear force between the stations located right after and right forward of the forward bulkhead of mid-hold.

4.4.7 Method 2 for vertical shear force adjustment at both bulkheads

The required adjustments in shear force at both transverse bulkheads of the mid-hold are to be made by applying:

- Vertical bending moments, M_{Y_aft}, M_{Y_fore} at model ends and,
- Vertical loads at the transverse frame positions as shown in Table 7 in order to generate vertical shear forces, ΔQ_{aft} and ΔQ_{fwd}, at the transverse bulkhead positions.

Table 6 shows examples of the shear adjustment application due to the vertical bending moments and to vertical loads.

$$M_{Y\_aft} = \frac{x_{fore} - x_{aft}}{2} \cdot \frac{Q_{targ-fwd} - Q_{fwd} + Q_{targ-aft} - Q_{aft}}{2}$$

$$M_{Y\_fore} = M_{Y\_aft}$$

$$\Delta Q_{fwd} = \frac{Q_{targ-fwd} - Q_{fwd} - (Q_{targ-aft} - Q_{aft})}{2}$$

$$\Delta Q_{aft} = -\Delta Q_{fwd}$$

where:

M_{Y_aft}, M_{Y_fore}: Vertical bending moment, in kNm, to be applied at the aft and fore ends in accordance with [4.4.10], to enforce the hull girder vertical shear force adjustment. The sign convention is that of the FE model axis.

ΔQ_{aft} : Adjustment of shear force, in kN, at aft bulkhead of mid-hold.

ΔQ_{fwd} : Adjustment of shear force, in kN, at fore bulkhead of mid-hold.

The above adjustments in shear forces, ΔQ_{aft} and ΔQ_{fwd}, at the transverse bulkhead positions are to be generated by applying vertical loads at the transverse frame positions as shown in Table 7. For bulk carriers, the transverse frame positions correspond to the floors. Vertical correction loads are not to be applied to any transverse tight bulkheads, any frames forward of the forward cargo hold and any frames aft of the aft cargo hold of the FE model.

The vertical loads to be applied to each transverse frame to generate the increase/decrease in shear force at the bulkheads may be calculated as shown in Table 7. In case of uniform frame spacing, the amount of vertical force to be distributed at each transverse frame may be calculated in accordance with Table 8.

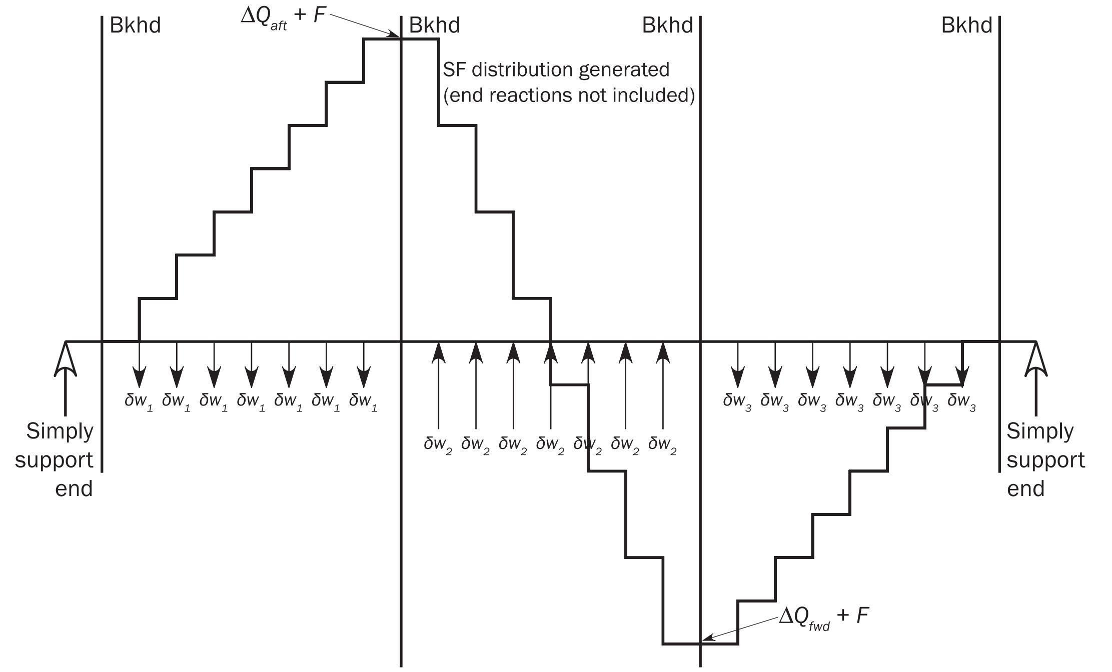
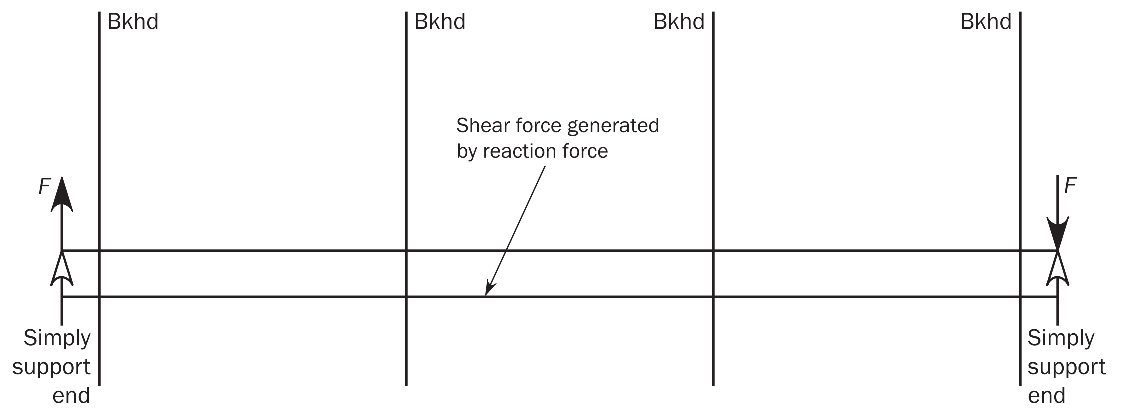
F = Reaction load generated by supported ends



Shear Force distribution due to adjusting vertical force at frames



Note: $F = 0$ if $\ell_1 = \ell_3$ and $\Delta\ell_{fore} = \Delta\ell_{end}$, and loads are symmetrical about mid-length of model

Note 1: For definition of symbols, see Table 8.

Table 8 : Formulae for calculation of vertical loads for adjusting vertical shear forces

$\delta w_1 = \dfrac{\Delta Q_{aft}\ (2\ell - \ell_2 - \ell_3) + \Delta Q_{fwd}\ (\ell_2 + \ell_3)}{(n_1 - 1)\ (2\ell - l_1 - 2\ell_2 - \ell_3)}$	$F = 0.5\left(\dfrac{W1\ (\ell_2 + \ell_1) - W3\ (\ell_2 + \ell_3)}{\ell}\right)$
$\delta w_2 = \dfrac{(W1 + W3)}{(n_2 - 1)} = \dfrac{(\Delta Q_{aft} - \Delta Q_{fwd})}{(n_2 - 1)}$	
$\delta w_3 = \dfrac{-\Delta Q_{fwd}\ (2\ell - \ell_1 - \ell_2) - \Delta Q_{aft}\ (\ell_1 + \ell_2)}{(n_3 - 1)\ (2\ell - \ell_1 - 2\ell_2 - \ell_3)}$	
where: ℓ_1 : Length of aft cargo hold of model, in m. ℓ_2 : Length of mid-hold of model, in m. ℓ_3 : Length of forward cargo hold of model, in m. ΔQ_{aft} : Required adjustment in shear force, in kN, at aft bulkhead of middle hold, see [4.4.7]. ΔQ_{fwd} : Required adjustment in shear force, in kN, at fore bulkhead of middle hold, see [4.4.7]. F : End reactions, in kN, due to application of vertical loads to frames. $W1$: Total evenly distributed vertical load, in kN, applied to aft hold of FE model, $(n_1 - 1)\ \delta w_1$. $W2$: Total evenly distributed vertical load, in kN, applied to mid-hold of FE model, $(n_2 - 1)\ \delta w_2$. $W3$: Total evenly distributed vertical load, in kN, applied to forward hold of FE model, $(n_3 - 1)\ \delta w_3$. n_1 : Number of frame spaces in aft cargo hold of FE model. n_2 : Number of frame spaces in mid-hold of FE model. n_3 : Number of frame spaces in forward cargo hold of FE model. δw_1 : Distributed load, in kN, at frame in aft cargo hold of FE model. δw_2 : Distributed load, in kN, at frame in mid-hold of FE model. δw_3 : Distributed load, in kN, at frame in forward cargo hold of FE model. $\Delta\ell_{end}$: Distance, in m, between end bulkhead of aft cargo hold to aft end of FE model. $\Delta\ell_{fore}$: Distance, in m, between fore bulkhead of forward cargo hold to forward end of FE model. ℓ : Total length, in m, of FE model including portions beyond end bulkheads: $= \ell_1 + \ell_2 + \ell_3 + \Delta\ell_{end} + \Delta\ell_{fore}$	
Note 1: Positive direction of loads, shear forces and adjusting vertical forces in the formulae is in accordance with Table 6 and Table 7. Note 2: $W1 + W3 = W2$. Note 3: The above formulae are only applicable if uniform frame spacing is used within each hold. The length and frame spacing of individual cargo holds may be different.	

If non-uniform frame spacing is used within each cargo hold, the average frame spacing ℓ_{av-i} is used to calculate the average distributed frame loads δw_{av-i}, according to Table 8, where i = 1, 2, 3 for each hold.

Then δw_{av-i} is redistributed to the non-uniform frame as follows:

$$\delta w_i^k = \delta w_{av-i} \frac{\ell^k_{av-i}}{\ell_{av-i}} \qquad k=1, 2, ..., \quad n_i - 1 \quad \text{, for each frame in cargo hold i, i=1, 2, 3}$$

where:

ℓ_{av-i} : Average frame spacing, in m, calculated as ℓ_i / n_i, in cargo hold i with i = 1, 2, 3.

ℓ_i : Length, in m, of the cargo hold i with i = 1, 2, 3 as defined in Table 8.

n_i : Number of frame spacing in cargo hold i with i = 1, 2, 3 as defined in Table 8.

δw_{av-i} : Average uniform frame spacing, in m, distributed force calculated according to Table 8 with the average frame spacing ℓ_{av-i} in cargo hold i with i = 1, 2, 3.

δw_i^k : Distributed load, in kN, for non-uniform frame k in cargo hold i.

$\ell^k{}_{av-i}$: Equivalent frame spacing, in m, for each frame k with k = 1, 2,..., n_i - 1, in cargo hold i, taken as:

$$\ell^k{}_{av-i} = \ell_i^1 - \frac{\ell_{av-i}\ \ell_i^1}{\ell_i^1 + \ell_i^{n_i}} + \frac{\ell_i^2}{2} \quad \text{for k = 1 (first frame), in cargo hold i}$$

$$\ell^k{}_{av-i} = \frac{\ell_i^k}{2} + \frac{\ell_i^{k+1}}{2} \quad \text{for k = 2, 3, ..., } n_1 \text{ - 2, in cargo i}$$

$$\ell^k{}_{av-i} = \ell_i^{n_i} - \frac{\ell_{av-i}\ \ell_i^{n_i}}{\ell_i^1 + \ell_i^{n_i}} + \frac{\ell_i^{n_i-1}}{2} \quad \text{for k = } n_i \text{ - 1 (last frame), in cargo i}$$

ℓ_i^k : Frame spacing, in m, between the frame k - 1 and k in the cargo hold i:

The required vertical load δw_i for a uniform frame spacing or δw_i^k for non-uniform frame spacing, are to be applied by following the shear flow distribution at the considered cross section, as described in Ch 5, App 1. For a frame section under vertical load δw_i, the shear flow, q_f, at the middle point of the element is calculated as:

$$q_{f-k} = \frac{\delta w_i}{I_{y-n50}} Q_{k-n50}$$

where:

$q_{f\text{-}k}$: Shear flow calculated at the middle of the k-th element of the transverse frame, in N/mm.

δw_i : Distributed load at each transverse frame location for i-th cargo hold, i = 1, 2, 3, as defined in Table 8, in N.

$I_{y\text{-}n50}$: Moment of inertia of the hull girder cross section, in mm^4.

$Q_{k\text{-}n50}$: First moment about neutral axis of the accumulative section area starting from the open end (shear stress free end) of the cross section to the point s_k for shear flow $q_{f\text{-}k}$, in mm^3, taken as;

$$Q_{k-n50} = \int_0^{s_k} z_{neu}\ t_{n50}\ ds$$

z_{neu} : Vertical distance from the integral point, s, to the vertical neutral axis.

t_{n50} : Net thickness, in mm, of the plate at the integral point of the cross section.

The distributed shear force at j-th FE grid of the transverse frame, $F_{j\text{-}grid}$, is obtained from the shear flow of the connected elements as following:

$$F_{j-gird} = \sum_{k=1}^{n} q_{f-k} \frac{\ell_k}{2}$$

where:

ℓ_k : Length of the k-th element of the transverse frame connected to the grid j, in mm.

n : Total number of elements connect to the grid j.

The shear flow has direction along the cross section and therefore the distributed force, $F_{j\text{-}grid}$, is a vector force. For vertical hull girder shear correction, the vertical and horizontal force components calculated with above mentioned shear flow method need to be applied to the cross section.

4.4.8 Procedure to adjust vertical and horizontal bending moments for midship cargo hold region

In case the target vertical bending moment needs to be reached, an additional vertical bending moment is to be applied at both ends of the cargo hold FE model to generate this target value in the mid-hold of the model. This end vertical bending moment is given as follows:

$$M_{v-end} = M_{v-targ} - M_{v-peak}$$

where:

$M_{v\text{-}end}$: Additional vertical bending moment, in kNm, to be applied to both ends of FE model in accordance with [4.4.10].

$M_{v\text{-}targ}$: Hogging (positive) or sagging (negative) vertical bending moment, in kNm, as specified in [4.3.2].

$M_{v\text{-}peak}$: Maximum or minimum bending moment, in kNm, within the length of the mid-hold due to the local loads described in [4.4.3] and due to the shear force adjustment as defined in [4.4.5].

$M_{v\text{-}peak}$ is to be taken as the maximum bending moment if $M_{v\text{-}targ}$ is hogging (positive) and as the minimum bending moment if $M_{v\text{-}targ}$ is sagging (negative). $M_{v\text{-}peak}$ is to be calculated as follows based on a simply supported beam model:

$$M_{v-peak} = \text{Extremum}\left\{M_{V\_FEM}(x) + M_{lineload} + M_{Y\_aft}\left(2\frac{x - x_{aft}}{x_{fore} - x_{aft}} - 1\right)\right\}$$

$M_{V\_FEM}(x)$: Vertical bending moment, in kNm, at position x, due to the local loads as described in [4.4.3].

M_{Y_aft} : End bending moment, in kNm, to be taken as:

- When method 1 is applied: the value as defined in [4.4.6].
- When method 2 is applied: the value as defined in [4.4.7].
- Otherwise: $M_{Y\_aft} = 0$

$M_{lineload}$: Vertical bending moment, in kNm, at position x, due to application of vertical line loads at frames according to method 2, to be taken as:

$$M_{lineload} = -(x - x_{aft})\,F - \sum_i (x - x_i)\,\delta w_i \quad \text{when} \quad x_i < x$$

F : Reaction force, in kN, at model ends due to application of vertical loads to frames as defined in Table 7.

x : X-coordinate, in m, of frame in way of the mid-hold.

δw_i : vertical load, in kN, at web frame station i applied to generate required shear force.

In case the target horizontal bending moment needs to be reached, an additional horizontal bending moment is to be applied at the ends of the cargo tank FE model to generate this target value within the mid-hold. The additional horizontal bending moment is to be taken as:

$$M_{h-end} = M_{h-targ} - M_{h-peak}$$

where:

$M_{h\text{-}end}$: Additional horizontal bending moment, in kNm, to be applied to both ends of the FE model according to [4.4.10].

$M_{h\text{-}targ}$: Horizontal bending moment, as defined in [4.3.4].

$M_{h\text{-}peak}$: Maximum or minimum horizontal bending moment, in kNm, within the length of the mid-hold due to the local loads described in [4.4.3].

$M_{h\text{-}peak}$ is to be taken as the maximum horizontal bending moment if $M_{h\text{-}targ}$ is positive (starboard side in tension) and as the minimum horizontal bending moment if $M_{h\text{-}targ}$ is negative (port side in tension).

$M_{h\text{-}peak}$ is to be calculated as follows based on a simply supported beam model:

$$M_{h-peak} = \text{Extremum}\{M_{H\_FEM}(x)\}$$

$M_{H\_FEM}(x)$: Horizontal bending moment, in kNm, at position x, due to the local loads as described in [4.4.3].

The vertical and horizontal bending moments are to be calculated over the length of the mid-hold to identify the position and value of each maximum/minimum bending moment.

4.4.9 Procedure to adjust vertical and horizontal bending moments outside midship cargo hold region

To reach the vertical hull girder target values at each frame and transverse bulkhead position, as defined in [4.3.2], the vertical bending moment adjustments, m_{vi}, are to be applied at web frames and transverse bulkhead positions of the finite element model, as shown in Figure 19. The vertical bending moment adjustment at each longitudinal location, i, is to be calculated as follows:

$$f(i) = -M_{v-targ}(i) + M_{V-FEM}(i) + M_{lineload}(i) + M_{Y-aft} \cdot \left(2 \cdot \frac{x_i - x_{aft}}{x_{fore} - x_{aft}} - 1\right)$$

$$m_{vi} = \frac{f(i) + f(i+1)}{2} - \sum_{j=0}^{i-1} m_{vj}$$

$$m_{v\_end} = -\sum_{j=0}^{n_t} m_{vj}$$

where:

i : Index corresponding to the i-th station, starting from i =1 at the aft end section up to n_t

n_t : Total number of longitudinal stations where the vertical bending moment adjustment, m_{vi}, is applied.

m_{vi} : Vertical bending moment adjustment, in kNm, to be applied at transverse frame or bulkhead at station i.

m_{v_end} : Vertical bending moment adjustment, in kNm, to be applied, at the fore end section (n_t+1 station).

m_{vj} : Argument of summation to be taken as:

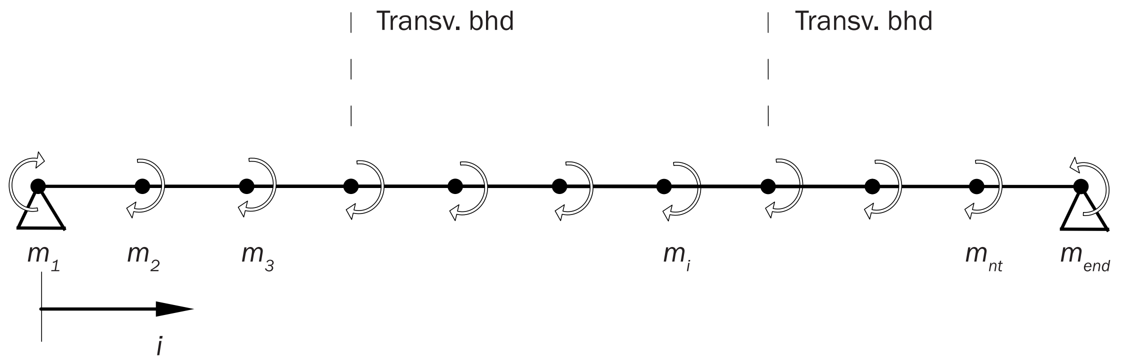
- m_{vo}= 0 when $j=0$
- $m_{vj} = m_{vi}$ when $j=i$

$M_{v\text{-}targ}(i)$: Required target vertical bending moment, in kNm, at station i, calculated in accordance with [4.3.2].

$M_{V\text{-}FEM}(i)$: Vertical bending moment distribution, in kNm, at station i due to local loads as given in [4.4.3].

$M_{lineload}(i)$:Vertical bending moment, in kNm, at station i, due to the line load for the vertical shear force correction as required in [4.4.8].

Figure 19 : Adjustments of bending moments outside midship cargo hold region.



m_{hi} can be substituted to m_{vi} in this figure

To reach the horizontal hull girder target values at each frame and transverse bulkhead position as defined in [4.3.4], the horizontal bending moment adjustments, m_{hi}, are to be applied at web frames and transverse bulkhead positions of the finite element model, as shown in Figure 19. The horizontal bending moment adjustment at each longitudinal location, i, is to be calculated as follows:

$$f(i) = M_{h-targ}(i) - M_{H-FEM}(i)$$

$$m_{hi} = \frac{f(i) + f(i+1)}{2} - \sum_{j=0}^{i-1} m_{hj}$$

$$m_{h\_end} = -\sum_{j=0}^{n_t} m_{hj}$$

where:

i : Longitudinal location for bending moment adjustments, m_{hi}.

n_t : Total number of longitudinal stations where the horizontal bending moment adjustment, m_{hi}, is applied.

m_{hi} : Horizontal bending moment adjustment, in kNm, to be applied at transverse frame or bulkhead at station i.

m_{h_end} : Horizontal bending moment adjustment, in kNm, to be applied at the fore end section (n_t+1 station).

m_{hj} : Argument of summation to be taken as:

- m_{ho} = 0 when $j=0$
- $m_{hj} = m_{hi}$ when $j=i$

$M_{h\text{-}targ}(i)$: Required target horizontal bending moment, in kNm, at station i, calculated in accordance with [4.3.4].

$M_{H\text{-}FEM}(i)$: Horizontal bending moment distribution, in kNm, at station i due to local loads as given in [4.4.3].

The vertical and horizontal bending moment adjustments, m_{vi} and m_{hi}, are to be applied at all web frames and bulkhead positions of the FE model. The adjustments are to be applied in FE model by distributing longitudinal axial nodal forces to all hull girder bending effective longitudinal elements in accordance with [4.4.10].

4.4.10 Application of bending moment adjustments on the FE model

The required vertical and horizontal bending moment adjustments are to be applied to the considered cross section of the cargo hold model by distributing longitudinal axial nodal forces to all hull girder bending effective longitudinal elements of the considered cross section according to Ch 5, Sec 1, [1.2] as follows:

- For vertical bending moment:

$$(F_x)_i = \frac{M_v}{I_{y-n50}} \frac{A_{i-n50}}{n_i} z_i$$

- For horizontal bending moment:

$$(F_x)_i = \frac{M_h}{I_{z-n50}} \frac{A_{i-n50}}{n_i} y_i$$

where:

M_v : Vertical bending moment adjustment, in kNm, to be applied to the considered cross section of the model.

M_h : Horizontal bending moment adjustment, in kNm, to be applied to the considered cross section the ends of the model.

$(F_x)_i$: Axial force, in kN, applied to a node of the i-th element.

$I_{y\text{-}n50}$: Hull girder vertical moment of inertia, in m^4, of the considered cross section about its horizontal neutral axis.

$I_{z\text{-}n50}$: Hull girder horizontal moment of inertia, in m^4, of the considered cross section about its vertical neutral axis.

Z_i : Vertical distance, in m, from the neutral axis to the centre of the cross sectional area of the *i*-th element.

Y_i : Horizontal distance, in m, from the neutral axis to the centre of the cross sectional area of the *i*-th element.

$A_{i\text{-}n50}$: Cross sectional area, in m^2, of the *i*-th element.

n_i : Number of nodal points of *i*-th element on the cross section, $n_i = 1$ for beam element, $n_i = 2$ for 4-node shell element.

For cross sections other than cross sections at the model end, the average area of the corresponding *i*-th elements forward and aft of the considered cross section is to be used.

4.5 Procedure to adjust hull girder torsional moments

4.5.1 General

The procedure in this sub-article describes how to adjust the hull girder torsional moment distribution on the cargo hold FE model to achieve the target torsional moment at the target location. The hull girder torsional moment target values are given in [4.3.5].

4.5.2 Torsional moment due to local loads

Torsional moment, in kNm, at longitudinal station *i* due to local loads, $M_{T\text{-}FEMi}$ in kNm, is determined by the following formula (see Figure 20):

$$M_{T-FEMi} = \sum_k [f_{hik}(z_{ik} - z_r)] - \sum_k (f_{vik} y_{ik})$$

where:

$M_{T\text{-}FEMi}$: Lumped torsional moment, in kNm, due to local load at longitudinal station *i*.

z_r : Vertical coordinate of torsional reference point, in m:

For bulk carrier, $z_r = 0$.

For oil tanker, $z_r = z_{sc}$, shear centre at the middle of the mid-hold.

f_{hik} : Horizontal nodal force, in kN, of node *k* at longitudinal station *i*.

f_{vik} : Vertical nodal force, in kN, of node *k* at longitudinal station *i*.

y_{ik} : *Y*-coordinate, in m, of node *k* at longitudinal station *i*.

z_{ik} : *Z*-coordinate, in m, of node *k* at longitudinal station *i*.

$M_{T\text{-}FEM0}$: Lumped torsional moment, in kNm, due to local load at aft end of the FE model (forward end for foremost cargo hold model), taken as:

$$M_{T-FEM0} = \sum_k [f_{h0k}(z_{0k} - z_r)] - \sum_k (f_{v0k}\, y_{0k}) + R_{H\_fwd}\,(z_{ind} - z_r) \text{ for foremost cargo hold model}$$

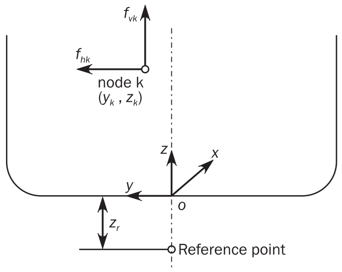
$$M_{T-FEM0} = \sum_k [f_{h0k}(z_{0k} - z_r)] - \sum_k (f_{v0k}\, y_{0k}) + R_{H\_aft}\,(z_{ind} - z_r) \text{ for the other cargo hold models}$$

R_{H_fwd} : Horizontal reaction forces, in kN, at the forward end, as defined in [4.4.3].

R_{H_aft} : Horizontal reaction forces, in kN, at the aft end, as defined in [4.4.3].

z_{ind} : Vertical coordinate, in m, of independent point as defined in [2.5.3].

Figure 20 : Station forces and acting location of torsional moment at section



4.5.3 Hull girder torsional moment

The hull girder torsional moment, $M_{T\text{-}FEM}$ (x_j) in kNm, is obtained by accumulating the station torsional moment from the aft end section (forward end for foremost cargo hold model) as follows:

$$M_{T-FEM}\ (x_j)\ =\ \sum_i M_{T-FEMi}$$

- when $x_i \geq x_j$ for foremost cargo hold model,
- when $x_i < x_j$ otherwise.

where:

$M_{T\text{-}FEM}$ (x_j): Hull girder torsional moment, in kNm, at longitudinal station x_j.

x_j : X-coordinate, in m, of considered longitudinal station j.

The torsional moment distribution given in [4.5.2], has a step at each longitudinal station.

4.5.4 Procedure to adjust hull girder torsional moment to target value

The torsional moment is to be adjusted by applying a hull girder torsional moment $M_{T\text{-}end}$ in kNm, at the independent point of the aft end section of the model (forward end for foremost cargo hold model), given as follows:

$$M_{T-end}\ =\ M_{wt-targ} - M_{T-FEM}\ (x_{targ})$$

where:

x_{targ} : X-coordinate, in m, of the target location for hull girder torsional moment, as defined in [4.3.5].

$M_{wt\text{-}targ}$: Target hull girder torsional moment, in kNm, specified in [4.3.5], to be achieved at the target location.

$M_{T\text{-}FEM}$ (x_{targ}): Hull girder torsional moment, in kNm, at target location due to local loads.

Due to the step of hull girder torsional moment at each longitudinal station, the hull girder torsional moment is to be selected from the values aft and forward of the target location as follows: Maximum value for positive torsional moment and minimum value for negative torsional moment.

4.6 Summary of hull girder load adjustments

4.6.1

The required methods of hull girder load adjustments for different cargo hold regions are given in Table 9.

Table 9 : Overview of hull girder load adjustments in FE analyses

	Midship cargo hold region	After and Forward cargo hold region	Aft most cargo holds	Foremost cargo holds
Adjustment of Vertical Shear Forces	See [4.4.5]			
Adjustment of Bending Moments	See [4.4.8]	See [4.4.9]		
Adjustment of Torsional Moment	See [4.5.4]			

5 ANALYSIS CRITERIA

5.1 General

5.1.1 Evaluation areas

Verification of results against the acceptance criteria is to be carried out within the longitudinal extent of the mid-hold, as shown in Figure 21 and Figure 22.

Figure 21 : Longitudinal extent of evaluation area for oil tanker

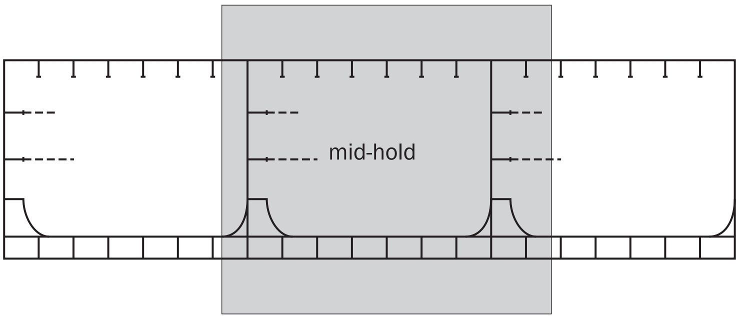


Figure 22 : Longitudinal extent of evaluation area for bulk carrier

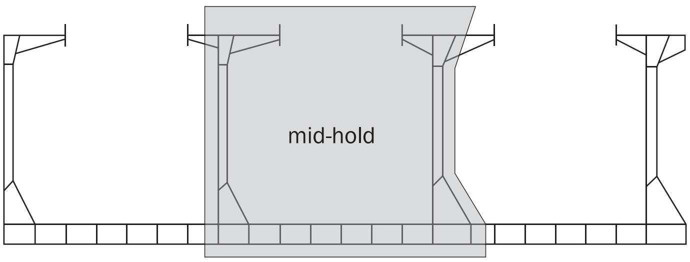

5.1.2 Structural members

The following structural elements within the evaluation area are to be verified with the criteria given in [5.2] and [5.3]:

- All hull girder longitudinal structural members,
- All primary supporting structural members and bulkheads within the mid-hold,
- All structural members being part of the transverse bulkheads, such as:
    - For oil tanker: stringer, buttress structure, stool tanks, partial girders together with attached transverse structures,
    - For bulk carrier: stool tanks together with connected longitudinal girders and double bottom floors,
- All structural members being part of the collision bulkhead, and extending to one web frame spacing forward of the collision bulkhead,
- All structural members being part of the forward transverse bulkhead of the machinery space and all hull girder longitudinal structural members aft of this transverse bulkhead within the extent of 15% of the aftmost cargo hold length excluding slop tanks.

5.2 Yield strength assessment

5.2.1 Von Mises stress

For all plates of the structural members defined in [5.1.2], the von Mises stress, σ_{vm}, in N/mm², is to be calculated based on the membrane normal and shear stresses of the shell element. The stresses are to be evaluated at the element centroid of the mid-plane (layer), as follows:

$$\sigma_{vm} = \sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau_{xy}^2}$$

where:

σ_x, σ_y : Element normal membrane stresses, in N/mm².

τ_{xy} : Element shear stress, in N/mm².

5.2.2 Axial stress in beams and rod elements

For beams and rod elements, the axial stress, σ_{axial}, in N/mm², is to be calculated based on axial force alone. The axial stress is to be evaluated at the middle of element length.

5.2.3 Coarse mesh permissible yield utilisation factors

The coarse mesh permissible yield utilisation factors, λ_{yperm}, given in Table 10, are based on the mesh sizes and element types described in [2.3] to [2.4].

The yield utilisation factor resulting from element stresses of each structural component are not to exceed the permissible values as given in Table 10.

Table 10 : Coarse mesh permissible yield utilisation factor

Structural component	Coarse mesh permissible yield utilisation factor, λ_{yperm}
Plating of all longitudinal hull girder structural members, primary supporting structural members and bulkheads. Face plate of primary supporting members modelled using shell or rod elements. Dummy rod of corrugated bulkhead	1.0 (load combination S+D) 0.8 (load combination S)
Corrugation of vertically corrugated bulkheads with lower stool and horizontally corrugated bulkhead, under lateral pressure from liquid loads, for shell elements only. Supporting structure in way of lower end of corrugated bulkheads without lower stool (1).	0.90 (load combination S+D) 0.72 (load combination S)
Corrugation of vertically corrugated bulkheads without lower stool under lateral pressure from liquid loads and without lower stool, for shell elements only.	0.81 (load combination S+D) 0.65 (load combination S)
(1) Supporting structure for a transverse corrugated bulkhead refers to the structure in the longitudinal direction within half a web frame space forward and aft of the bulkhead, and within a vertical extent equal to the corrugation depth. Supporting structure for a longitudinal corrugated bulkhead refers to the structure in transverse direction within 3 longitudinal stiffener spacings from each side of the bulkhead, and within a vertical extent equal to the corrugation depth.	

5.2.4 Yield criteria

The structural elements given in [5.1.2] are to comply with the following criteria:

$$\lambda_y \le \lambda_{yperm}$$

where:

λ_y : Yield utilisation factor.

$\lambda_y = \frac{\sigma_{vm}}{R_Y}$ for shell elements in general.

$\lambda_y = \frac{|\sigma_{axial}|}{R_Y}$ for rod or beam elements in general.

σ_{vm} : Von Mises stress, in N/mm^2.

σ_{axial} : Axial stress in rod or beam element, in N/mm^2.

λ_{yperm} : Coarse mesh permissible yield utilisation factors defined in Table 10.

The yield check criteria is to be based on axial stress for the following members:

- The flange of primary supporting members,
- The intersections between the flange and web of the corrugations, according to [5.2.5].

Where the von Mises stress of the elements in the cargo hold FE model in way of the area under investigation by fine mesh exceeds the yield criteria, average von Mises stress, obtained from the fine mesh analysis, calculated over an area equivalent to the mesh size of the cargo hold finite element model is to satisfy the yield criteria above.

In way of cut-outs, yield utilisation factor is to be obtained with shear stress correction, as given in [5.2.6].

5.2.5 Corrugation of corrugated bulkhead

The stress in corrugation of corrugated bulkheads is to be evaluated based on:

a) The von Mises stress, σ_{vm}, in shell elements on the flange and web of the corrugation.

b) The axial stress, σ_{axial}, in dummy rod elements, modelled with unit cross sectional properties at the intersection between the flange and web of the corrugation.

5.2.6 Shear stress correction for cut-outs

Except as indicated in [5.2.7], the element shear stress in way of cut-outs in webs is to be corrected for loss in shear area in accordance with the following formula. The corrected element shear stress is to be used to calculate the von Mises stress of the element for verification against the yield criteria.

$$\tau_{cor} = \frac{h\ t_{mod-n50}}{A_{shr-n50}}\tau_{elem}$$

where:

τ_{cor} : Corrected element shear stress, in N/mm^2.

h : Height of web of girder, in mm, in way of opening, see Table 1. Where the geometry of the opening is modelled, h is to be taken as the height of web of the girder deducting the height of the modelled opening.

$t_{mod-n50}$: Modelled web thickness, in mm, in way of opening.

$A_{shr-n50}$: Effective net shear area of web, in mm^2, taken as the web area deducting the area lost of all openings, including slots for stiffeners, calculated in accordance with Ch 3, Sec 7, [1.4.8].

τ_{elem} : Element shear stress, in N/mm^2, before correction.

5.2.7 Exceptions for shear stress correction for openings

Correction of element shear stress due to presence of cut-outs is not required for cases given in Table 11 provided λ_y/C_r complies with the criteria given in [5.2.4].

Table 11 : Exceptions for shear stress correction

Identification	Figure	Difference between modelled shear area and the net effective shear area in % of the net effective shear area $\frac{A_{FEM-n50} - A_{shr-n50}}{A_{shr-n50}} \cdot 100\%$	Reduction factor for yield criteria, C_r
Upper and lower slots for local support stiffeners fitted with lugs or collar plates		< 15%	0.85
Upper or lower slots for local support stiffeners fitted with lugs or collar plates		< 20%	0.80
In way of opening; upper and lower slots for local support stiffeners fitted with collar plates		< 40%	0.60
$A_{shr-n50}$: Effective net shear area of the web, in mm^2, taken as the web area without the all opening areas and without the slots for stiffeners, in accordance with Ch 3, Sec 7, [1.4.8].			

5.3 Buckling strength assessment

5.3.1

All structural elements in FE analysis carried out in accordance with this Section are to be assessed individually against the buckling requirements as defined in Ch 8, Sec 4.

SECTION 3
LOCAL STRUCTURAL STRENGTH ANALYSIS

1 OBJECTIVE AND SCOPE

1.1 General

1.1.1

The local strength analysis of structural details is to be in accordance with the requirements given in this section.

1.1.2

The selection of critical locations on the structural members for fine mesh analysis is to be in accordance with this section.

1.1.3 Fine mesh analysis procedure

The details to be assessed by fine mesh analysis are to be modelled according to the requirements given in [4], under the FE load combinations defined in [5] and to comply with the criteria given in [6].

1.1.4 Scope of local structural strength verification

The fine mesh verification is to be performed as follows:

- Fine mesh analysis for the structural details given in [2],
- Screening procedure according to [3].

2 LOCAL AREAS TO BE ASSESSED BY FINE MESH ANALYSIS

2.1 List of mandatory structural details

2.1.1 List of structural details

In the midship cargo hold region, the following structural details are to be assessed according to the fine mesh analysis procedure defined in [1.1.3]:

a) Hopper knuckles for ship with double side as given in [2.1.2],

b) Side frame end brackets and lower hopper knuckle for single side bulk carrier as given in [2.1.3],

c) Large openings as given in [2.1.4],

d) Connections of deck and double bottom longitudinal stiffeners to transverse bulkhead as given in [2.1.5],

e) Connections of corrugated bulkhead to adjoining structure as given in [2.1.6].

For each above mentioned structural detail, one fine mesh model is required within all the cargo hold models covering the midship cargo hold region. The selection of the location of this fine mesh model is to be based on requirements given from [2.1.2] to [2.1.6] from all cargo hold analyses in the midship cargo hold region.

2.1.2 Hopper knuckles for ship with double side

Fine mesh analysis is to be carried out for the lower and upper hopper knuckles of either welded or bent type, in way of a typical transverse web frame, as indicated in Figure 1.

For double side arrangements without the hopper plating, i.e. where the inner hull longitudinal bulkhead is fitted directly to the inner bottom, fine mesh analysis is to be carried out for the heel of the transverse web frame.

The transverse web frame which, in the cargo hold analysis, has the maximum yield utilisation factor, λ_y, in knuckle is to be selected for the fine mesh analysis.

2.1.3 Side frame end brackets and lower hopper knuckle for single side bulk carrier

Fine mesh analysis is to be carried out for the lower hopper knuckle of either welded or bent type, lower and upper end bracket of side frame, as indicated in Figure 2.

The side frame which in the cargo hold analysis has the maximum yield utilisation factor, λ_y, in end bracket joints is to be selected for the fine mesh analysis.

Figure 1 : Mandatory areas at hopper knuckles for ships with double side

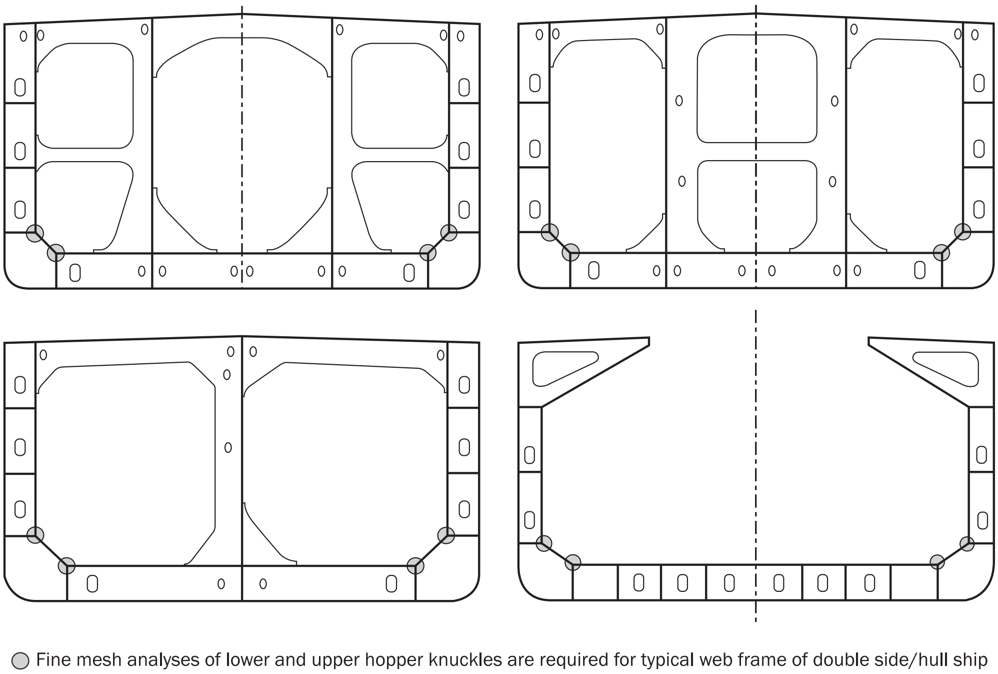

Figure 2 : Mandatory areas at lower upper knuckle and side frame end brackets for single side bulk carrier

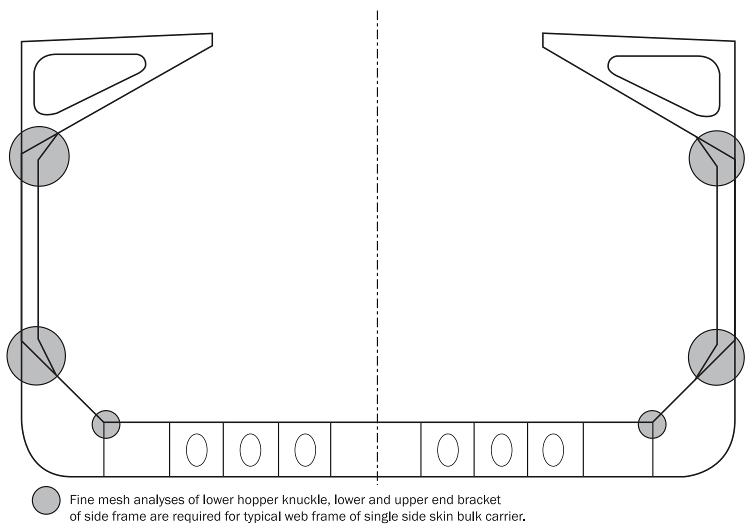

2.1.4 Large openings

Large openings in way of primary supporting members, for which their geometry is required to be represented in the cargo hold model in accordance with Ch 7, Sec 2, [2.4.9], are to be assessed by fine mesh analysis.

The structural member in way of the large openings having the maximum yield utilisation factor, λ_y, in the cargo hold analysis is to be selected for the fine mesh analysis.

2.1.5 Connections between deck and double bottom longitudinal stiffeners and adjoining structures of transverse bulkhead

Fine mesh analysis is to be carried out for the connections of deck and double bottom longitudinal stiffeners and adjoining structures of transverse bulkhead, either plane or corrugated bulkhead. The adjoining structures of transverse bulkhead include the structural members in way of the bulkhead, the partial deck girders and partial double bottom girders, if any.

For example, the following structural members are to be assessed, some of them being shown in Figure 3:

- At least one pair of connections between inner and outer bottom longitudinal stiffeners and adjoining structures of transverse bulkhead.
- At least one pair of connections between inner and outer bottom longitudinal stiffeners and adjoining structures of adjacent floor to the transverse bulkhead.
- At least one connection between deck longitudinal stiffener (fitted above or below deck) and adjoining vertical structure of transverse oil tight bulkhead.
- Connection between deck longitudinal partial girder on top of transverse oil tight bulkheads when fitted and adjoining vertical structure of transverse oil tight bulkhead.
- Connection between bottom longitudinal partial girder in way of transverse oil tight bulkheads when fitted and adjoining vertical structure of transverse oil tight bulkhead.

The selection of the connections between longitudinal and vertical stiffeners to be analysed is to be based on the maximum relative deflection between supports, i.e. between floor and transverse bulkhead or between deck transverse and transverse bulkhead. Where there is a significant variation in end connection arrangement between stiffeners or scantlings, analyses of additional connections may be required by the Society.

2.1.6 Connections between corrugation and adjoining lower structure

Fine mesh analysis is to be carried out for connections between corrugation and adjoining lower supporting structures. For example, the following structural members, as shown in Figure 4, are to be assessed:

- Connection of the corrugation and supporting structure in way of lower stool shelf plate.
- Connection of the corrugation and lower supporting structure to inner bottom if no lower stool is fitted.
- Connection of the corrugation and the upper corner of the gusset plate if shedder plate with a gusset plate is fitted at top of the lower stool.

The corrugation unit as defined in Ch 8, Sec 4, [3.3.2] which, in the cargo hold analysis, has the maximum yield utilisation factor, λ_y, in way of the corrugation connection, is to be selected for the fine mesh analysis.

Where there is a significant variation in the arrangement of supporting structure of the corrugation, analysis of additional locations may be required by the Society.

For ships with both longitudinal and transverse corrugated bulkheads, fine mesh analysis is required for the connection between corrugations and supporting structure in way of the lower stool shelf plate or inner bottom, if no lower stool is fitted, at the intersection between longitudinal and transverse corrugated bulkheads.

Figure 3 : Examples of mandatory areas at connections between double bottom and deck longitudinals and adjoining structure of transverse bulkhead

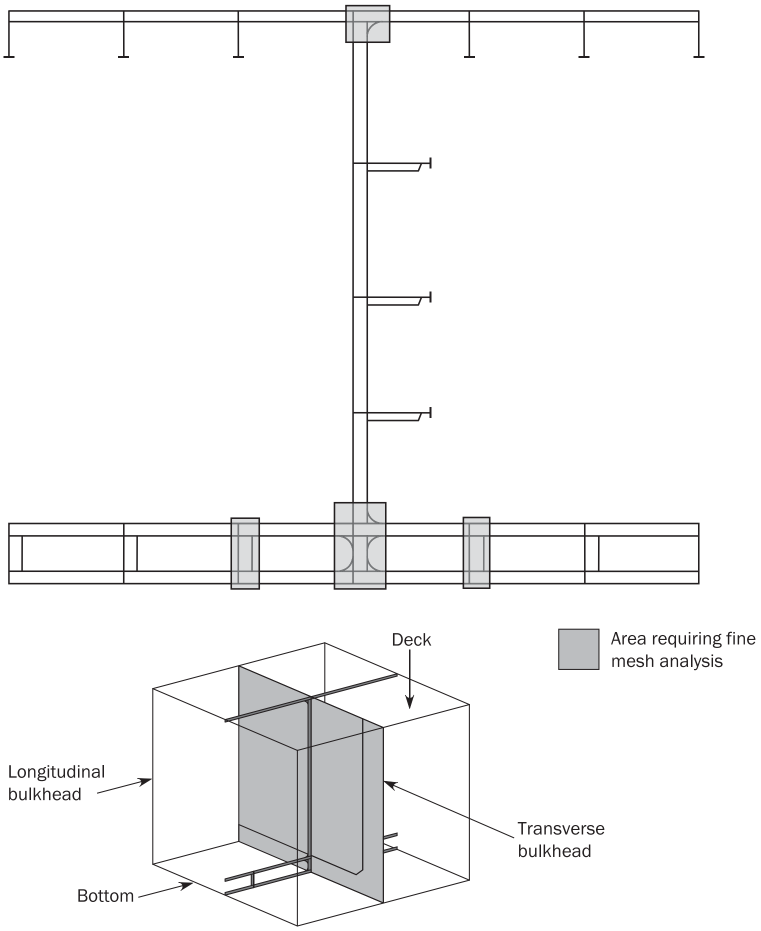

Figure 4 : Mandatory areas at connections between corrugations and adjoining lower stool

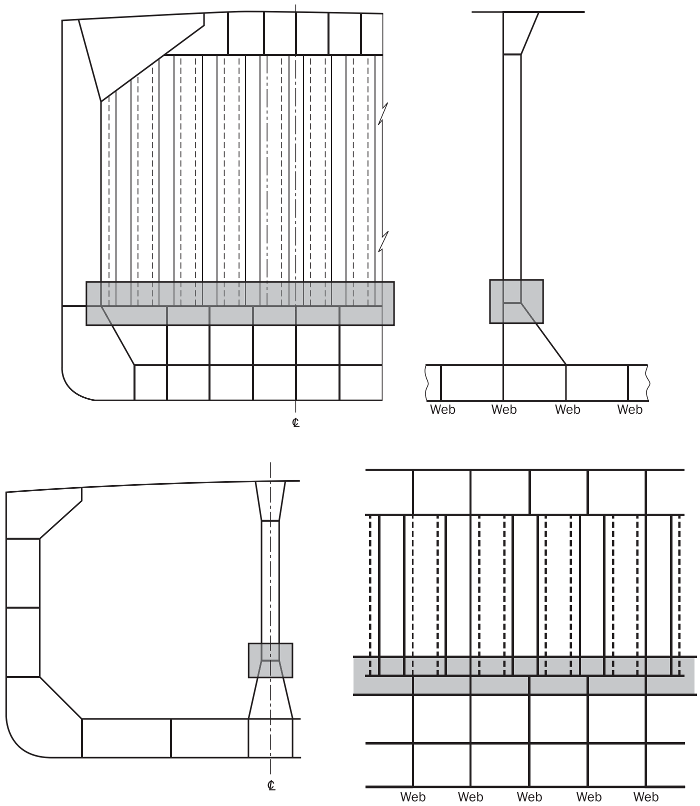


3 SCREENING PROCEDURE

3.1 Screening areas

3.1.1

The structural details subject to this screening procedure are checked in the following ship areas:

- Within the full cargo hold region for the details given in [3.2.1],
- Outside midship cargo hold region for the details given in [3.2.2].

Table 1 : Screening areas of transverse web frame in oil tanker

	Bracket toes	
	Openings (shaded regions)	
	Other Openings (unshaded regions)	Screening check to be performed except if: $h_o/h < 0.35$ and $g_o < 1.2$, and, each end of the opening forms a semi circle arc (i.e. radius of opening equal to $b/2$). h_o, h and g_o is defined in Ch 7, Sec 2, [2.4.9], b is the smallest of the length and breadth of the opening.

3.2 List of structural details

3.2.1 Cargo hold region

The following structural details and areas in the cargo hold region are to be evaluated by screening:

a) Openings in way of web of primary supporting members, such as transverse web frame as indicated in Table 1 and Table 2, horizontal stringers as indicated in Table 3, floors and longitudinal girders in double bottom.

b) Bracket toes on transverse web frame as indicated in Table 1 and Table 2, horizontal stringer and transverse plane bulkhead connected to double bottom or buttress structure specified in Table 3.

c) Heels of transverse bulkhead horizontal stringers specified in Table 3.

d) Connections of transverse lower stool to double bottom girders and longitudinal lower stool to double bottom floors as indicated in Figure 5.

e) Connection of lower hopper to transverse lower stool structure as indicated in Figure 5.

f) Connection of topside tank to inner side as indicated in Figure 6.

g) Connection of corrugation and upper supporting structure to upper stool as indicated in Figure 7.

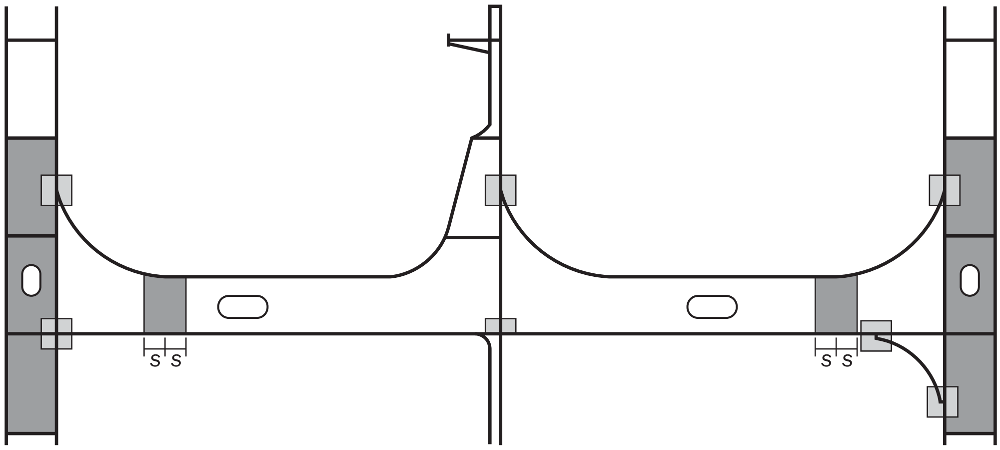
h) Hatch corner area, such as the hatch coaming end bracket, the hatch corner and the hatch end beam connection as indicated in Figure 8.

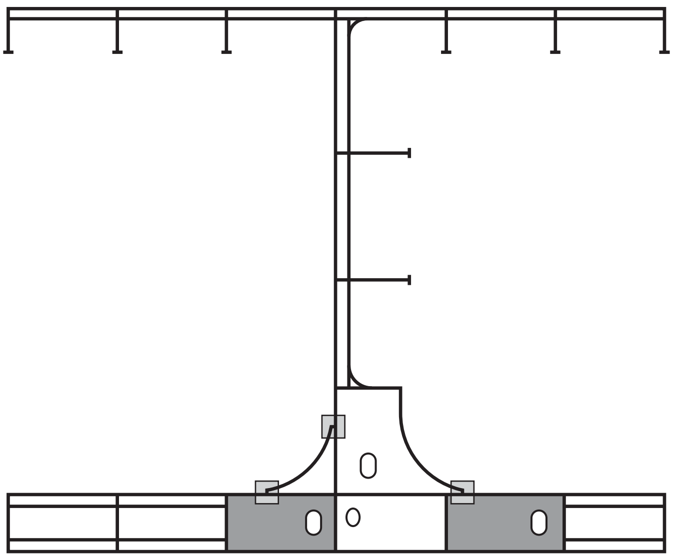
Within each group of the structural details having the same geometry and the same relative location inside the cargo region, the screening verification can be performed for the detail for which the yield utilisation factor, λ_y, is maximum

Table 2 : Screening areas for transverse web frame in bulk carrier

		(light grey box)	Bracket toes	
(dark grey box)	Openings (shaded regions)	
(white box)	Other Openings (unshaded regions)	Screening check to be performed except if: h_o/h < 0.35 and g_o < 1.2, and, each end of the opening forms a semi circle arc (i.e. radius of opening equal to $b/2$). h_o, h and g_o is defined in Ch 7, Sec 2, [2.4.9], b is the smallest of the length and breadth of the opening.

Table 3 : Screening areas for horizontal stringer and transverse bulkhead to double bottom connections in oil tanker





(light grey box)	Bracket toes and heels	
(dark grey box)	Openings (shaded regions)	
(white box)	Other Openings (unshaded regions)	Screening check to be performed except if: $h_o/h < 0.35$ and $g_o < 1.2$, and, each end of the opening forms a semi circle arc (i.e. radius of opening equal to $b/2$). h_o, h and g_o is defined in Ch 7, Sec 2, [2.4.9], b is the smallest of the length and breadth of the opening.

Figure 5 : Screening areas at connections of lower stool to inner bottom and hopper tank

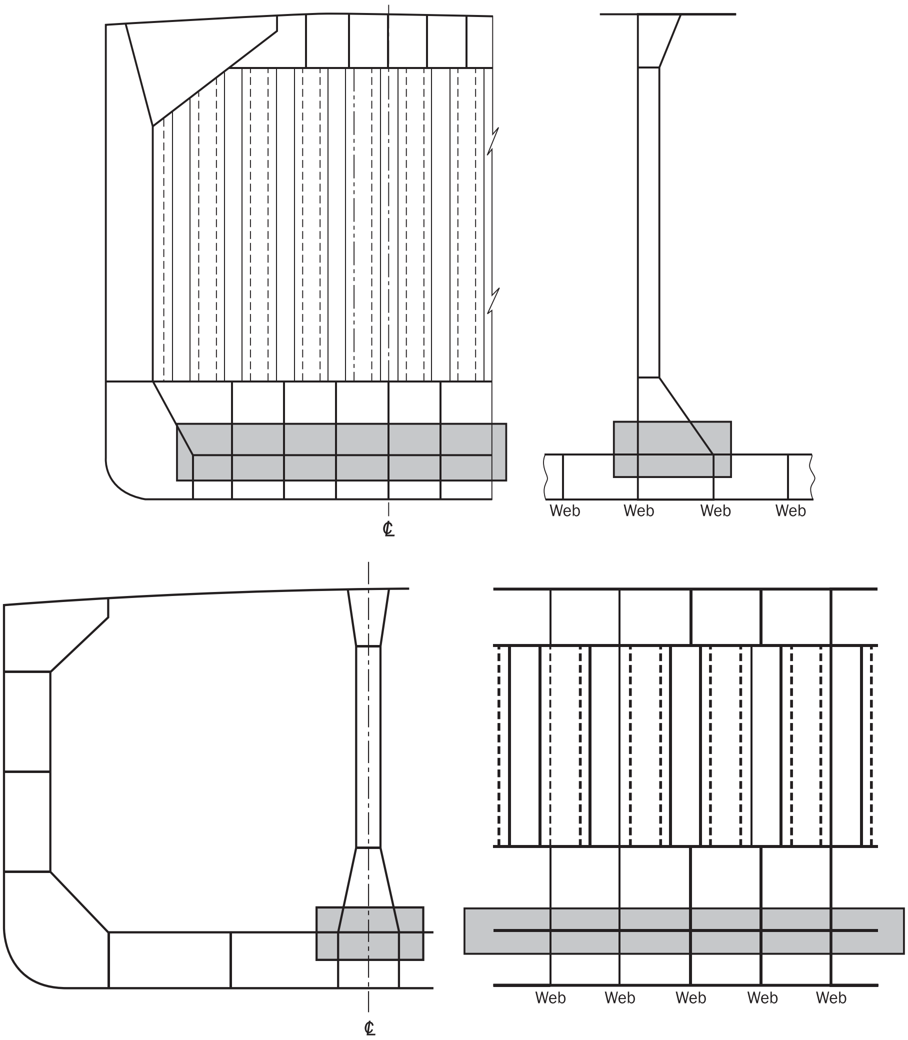


Figure 6 : Screening areas at connections of topside tank to inner side

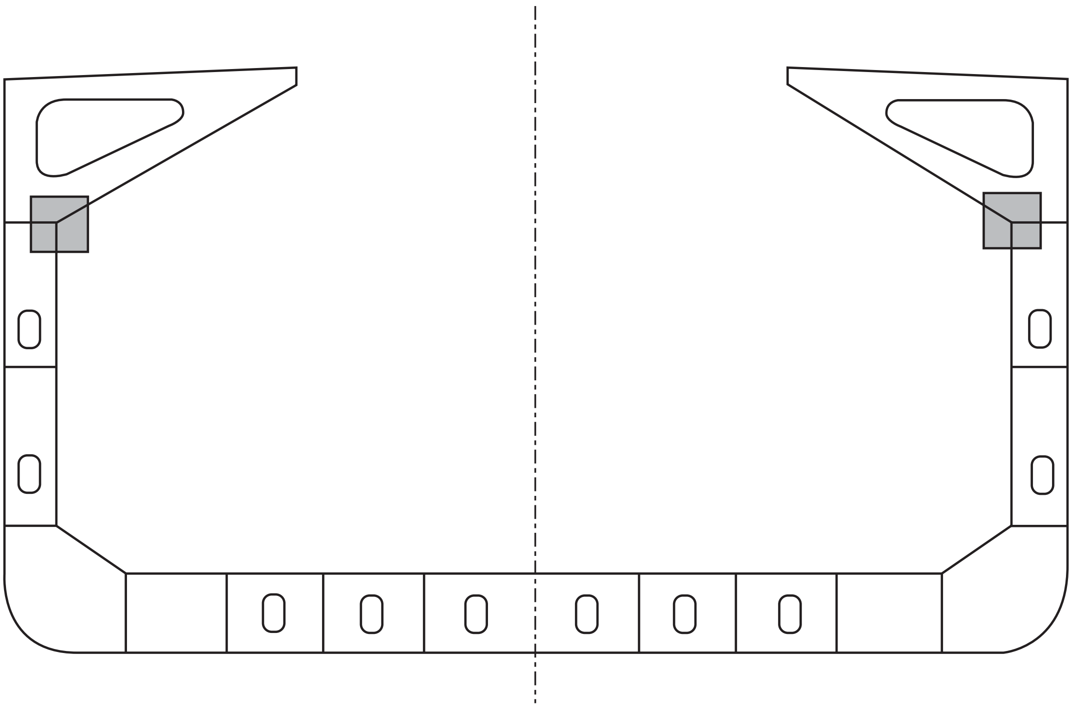

Figure 7 : Screening areas at connection of corrugation and upper supporting structure to upper stool

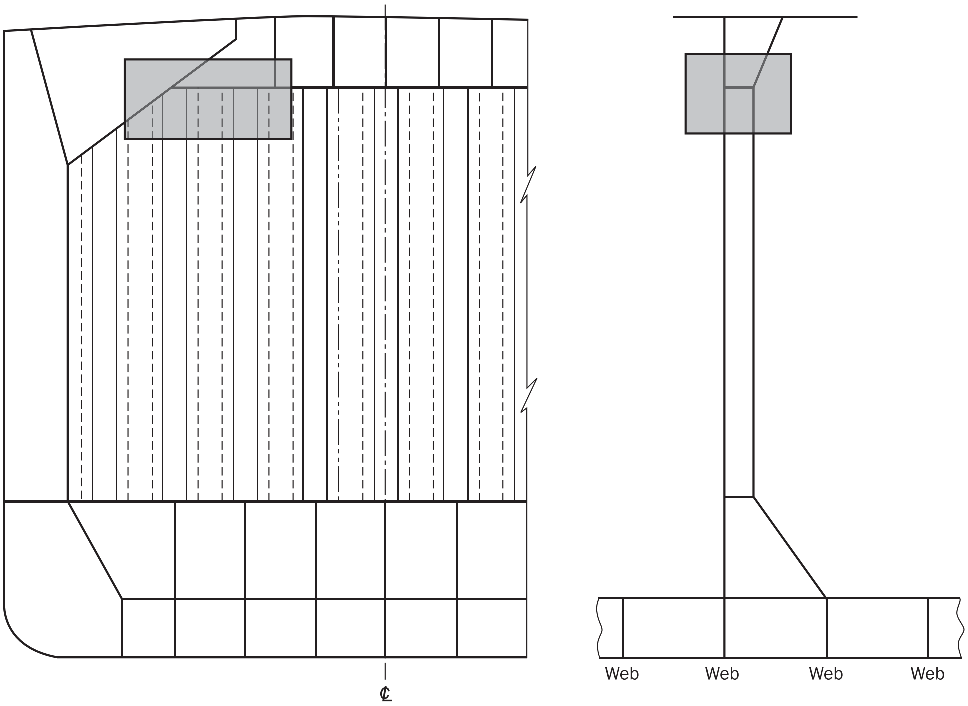

Figure 8 : Screening areas at hatch corner in bulk carrier

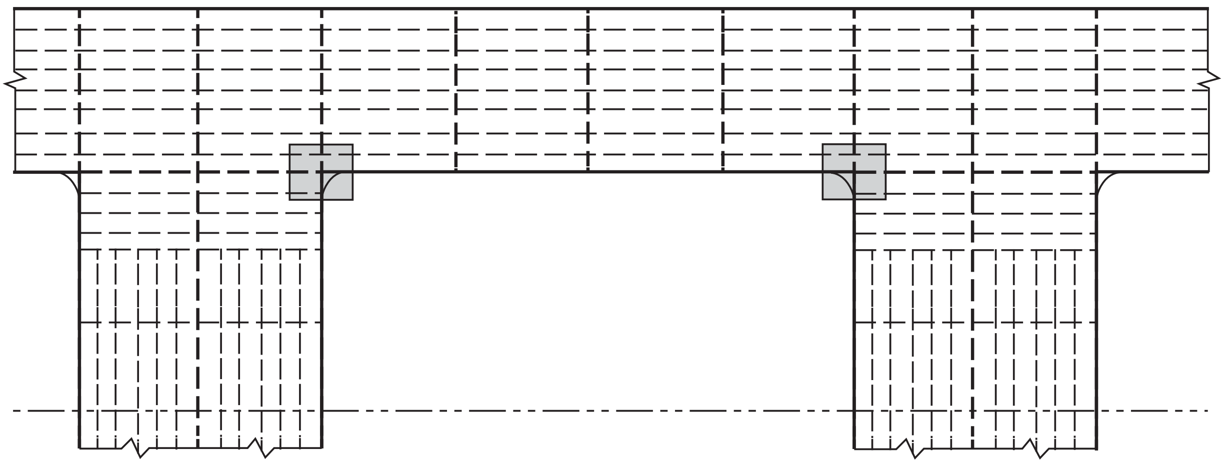


3.2.2 Outside midship cargo hold region

The following structural details outside midship cargo hold region are to be evaluated by screening:

a) Hopper knuckle, as defined in [2.1.2] and [2.1.3],

b) Side frame end bracket, as defined in [2.1.3],

c) Large openings, as defined in [2.1.4],

d) Connections of corrugation to adjoining structure, as defined in [2.1.6],

The above mentioned structural details to be screened are to be similar in its geometry, its proportion and its relative location to the corresponding detail modelled in fine mesh in the midship cargo hold region.

When the above mentioned structural details outside the midship cargo hold region are different from the corresponding detail modelled in fine mesh in the midship cargo hold region, a fine mesh analysis is to be performed for the detail located where the yield utilisation factor, λ_y, is maximum for structural details having the same geometry and the same relative location,

When it is deemed necessary, the Society may request a fine mesh analysis to be performed according to [1.1.3].

3.3 Screening criteria

3.3.1 Screening factors and permissible screening factors

The screening factors, λ_{sc}, and the permissible screening factors, λ_{scperm}, are given in Table 4 for the screening areas defined in [3.1].

Table 4 : Screening factors and permissible screening factors

Type of Details	Screening factors, λ_{sc}	Permissible screening factors, λ_{scperm}	
Within the whole cargo hold region		**S+D**	**S**
Openings in way of webs of primary supporting members, such as transverse web frame as indicated in Table 1 and Table 2, horizontal stringers as indicated in Table 3, floors and longitudinal girders in double bottom.	Table 5	1.70	1.36
Bracket toes on transverse web frames as indicated in Table 1 and Table 2, horizontal stringers and transverse plane bulkhead to double bottom connection or buttress structure specified in Table 3.	Table 6	1.50	1.20
Heels of transverse bulkhead horizontal stringers specified in Table 3.	Table 7	1.50	1.20
Connections of transverse lower stool to double bottom girders and longitudinal lower stool to double bottom floors as indicated in Figure 5. The connection of lower hopper to transverse lower stool structure as indicated in Figure 5. The connection of topside tank to inner side as indicated in Figure 6. The connection of corrugation and upper supporting structure to upper stool as indicated in Figure 7.	λ_y	$0.75\ \lambda_{yperm}$	
Hatch corner area.	λ_y	$0.95\ \lambda_{yperm}$	
Outside midship cargo hold region			
Hopper knuckle	$\lambda_{sc} = \dfrac{K_{sc} \cdot \sigma_c}{R_Y}$ **(1)**	$1.50\ f_f$	$1.20\ f_f$
Side frame end bracket **(2)**		$1.50\ f_f$	$1.20\ f_f$
Large openings		$1.70\ f_f$	$1.36\ f_f$
Connections of corrugation to adjoining structure		$1.50\ f_f$	$1.20 f_f$

where:

λ_y : Coarse mesh yield utilisation factor, as defined in Ch 7, Sec 2, [5.2.4].

λ_{yperm} : Coarse mesh permissible yield utilisation factor, as defined in Ch 7, Sec 2, [5.2.4].

K_{sc} : Screening stress concentration factor, taken as:

$$K_{sc} = \frac{\sigma_{FM}}{\sigma_{CM}}$$

σ_{FM} : Von Mises fine mesh stress, in N/mm^2, for the considered detail calculated in the midship cargo hold region according to [2].

σ_{CM} : Von Mises coarse mesh stress, in N/mm^2, for the considered detail calculated in the midship cargo hold region according to Ch 7, Sec 2.

σ_c : Von Mises coarse mesh stress, in N/mm^2, for the area in way of considered detail.

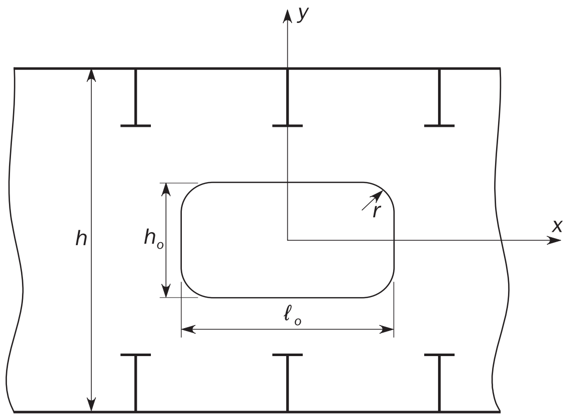
f_f : Fatigue factor defined in [6.2.1].

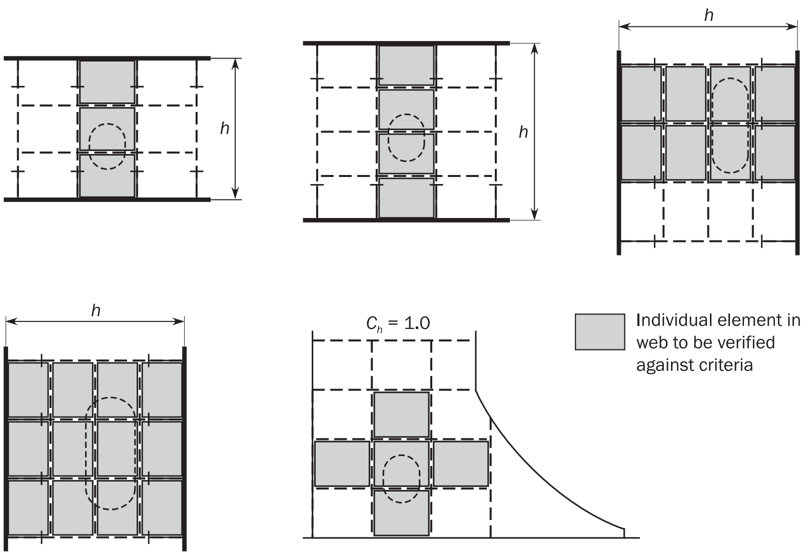
(1) For each screened detail, σ_{FM} and σ_{CM} are to be taken from the corresponding elements in the same plane position.

(2) For the side frame end brackets of single side bulk carrier, σ_{FM} and σ_{CM} are to be taken at the corresponding elements representing the flange of the end brackets.

Table 5 : Screening factor for openings in primary supporting members

λ_{sc}	: Screening factor taken as $\lambda_{sc} = 0.85 C_h \left(\lvert \sigma_x + \sigma_y \rvert + \left(2 + \left(\frac{\ell_0}{2r} \right)^{0.74} + \left(\frac{h_0}{2r} \right)^{0.74} \right) \lvert \tau_{xy} \rvert \right) \frac{k}{235}$
C_h	: Coefficient taken as (2): • For opening in web of PSM. $C_h = 1.0 - 0.23 \left(\frac{h_0}{h} \right) + 2.12 \left(\frac{h_0}{h} \right)^2$ • For opening in web of main bracket and buttress (see figures below). $C_h = 1.0$
r	: Radius of opening, in mm.
h_0	: Height of opening parallel to depth of web, in mm.
ℓ_0	: Length of opening parallel to girder web direction, in mm.
h	: Height of web of girder in way of opening, in mm.
σ_x	: Axial stress in element *x*-direction determined from cargo hold FE analysis according to the coordinate system shown, in N/mm^2.
σ_y	: Axial stress in element *y*-direction determined from cargo hold FE analysis according to the coordinate system shown, in N/mm^2.
τ_{xy}	: Element shear stress determined from cargo hold FE analysis (1), in N/mm^2.



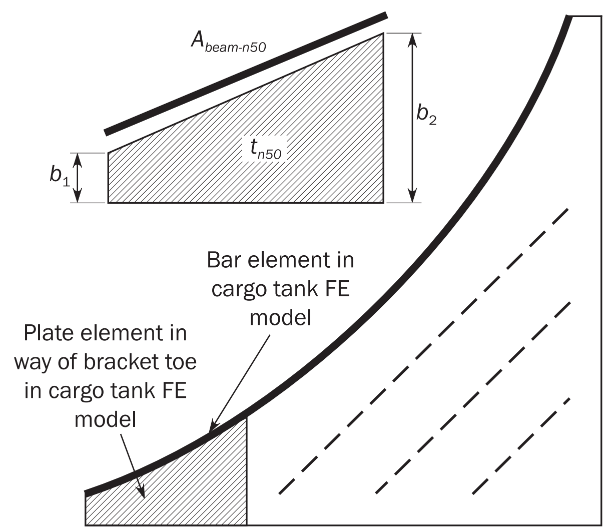


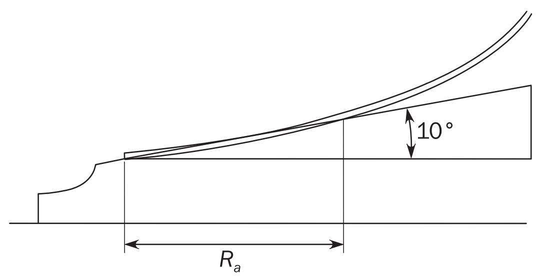
(1) The element shear stress is to be adjusted using the formula given in Ch 7, Sec 2, [5.2.6] prior to the evaluation of yield utilisation factor for verification against the screening criteria.

(2) Where the geometry of the opening is required to be modelled in accordance with Ch 7, Sec 2, [2.4.9], fine mesh FE analysis is to be carried out to determine the stress level and the screening criteria are not applicable.

Table 6 : Screening factor for bracket toes of primary supporting members

λ_{sc}	: Screening factor taken as: $$\lambda_{sc} = C_a\left(0.75\left(\frac{b_2}{b_1}\right)^{0.5}\sigma_{vm} + 0.55\left(\frac{A_{beam-n50}}{b_1\ t_{n50}}\right)^{0.5}\lvert\sigma_{beam}\rvert\right)\frac{k}{235}$$
C_a	: Coefficient taken as: $$C_a = 1.0 - 0.2\left(\frac{R_a}{1400}\right)^2$$
b_1, b_2	: Height of shell element in way of bracket toe in cargo hold FE model, in mm.
$A_{beam\text{-}n50}$	: Sectional area of beam or rod element in cargo hold FE model representing the face plate of bracket, in mm^2.
σ_{beam}	: Beam or rod element axial stress determined from cargo hold FE analysis, in N/mm^2.
σ_{vm}	: Von Mises stress of shell element in way of bracket toe determined from cargo hold FE analysis, in N/mm^2.
t_{n50}	: Net thickness of shell element in way of bracket toe, in mm.
R_a	: Leg length, in mm, not to be taken as greater than 1400 mm.





3.3.2 Screening criteria

Stresses in areas defined in [3.1], calculated for all applicable FE load combinations given in [5], are to be checked against the following screening criteria.

$\lambda_{sc} \leq \lambda_{scperm}$

where:

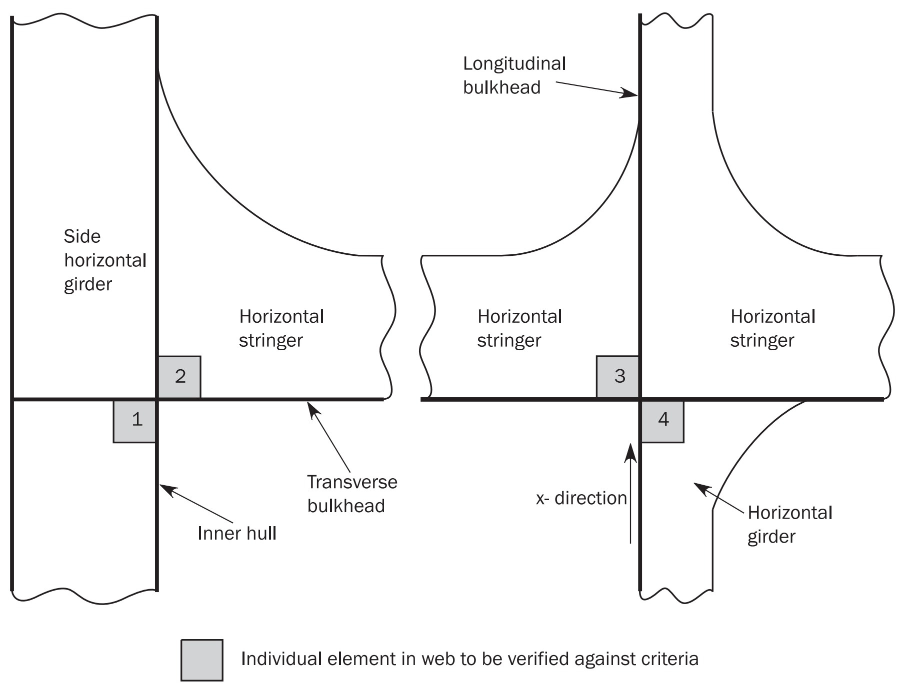
λ_{sc} : Screening factor defined in [3.3.1]

λ_{scperm} : Permissible screening factor defined in [3.3.1]

Where the screening criteria are not met, fine mesh analysis of the corresponding structural detail is required and to be performed according to [1.1.3].

Table 7 : Screening factor for heels of transverse bulkhead horizontal stringers

λ_{sc}	: Screening factor taken as: • For heels at side horizontal girder and transverse bulkhead horizontal stringer, at the locations 1, 2 and 3 in figure below. $\lambda_{sc} = 3.0\ \sigma_{vm}\ \dfrac{k}{235}$ • For heel at longitudinal bulkhead horizontal stringer, at the location 4 in figure below. $\lambda_{sc} = 5.2\ \lvert\sigma_x\rvert\ \dfrac{k}{235}$
σ_x	: Axial stress in element *x* direction determined from cargo hold FE analysis in accordance with the coordinate system shown, in N/mm^2.
σ_{vm}	: Von Mises stress of shell element in way of heel determined from cargo hold FE analysis, in N/mm^2.



▢	Individual element in web to be verified against criteria.

4 STRUCTURAL MODELLING

4.1 General

4.1.1

Evaluation of detailed stresses requires the use of refined finite element mesh in way of areas of high stress. This fine mesh analysis can be carried out by fine mesh zones incorporated into the cargo hold model. Alternatively, separate local FE model with fine mesh zones in conjunction with the boundary conditions obtained from the cargo hold model may be used.

4.2 Extent of model

4.2.1

If a separate local fine mesh model is used, its extent is to be such that the calculated stresses at the areas of interest are not significantly affected by the imposed boundary conditions. The boundary of the fine mesh model is to coincide with primary supporting members in the cargo hold model, such as web frame, girders, stringers and floors.

4.3 Mesh size

4.3.1

The mesh size in the fine mesh zones is not to be greater than 50 × 50 mm.

4.3.2

The extent of the fine mesh zone is not to be less than 10 elements in all directions from the area under investigation. A smooth transition of mesh density from fine mesh zone to the boundary of the fine mesh model is to be maintained.

4.4 Elements

4.4.1

All plating within the fine mesh zone is to be represented by shell elements. The aspect ratio of elements within the fine mesh zone is to be kept as close to 1 as possible. Variation of mesh density within the fine mesh zone and the use of triangular elements are to be avoided. In all cases, the elements within the fine mesh model are to have an aspect ratio not exceeding 3. Distorted elements, with element corner angles of less than 45° or greater than 135°, are to be avoided. Stiffeners inside the fine mesh zone are to be modelled using shell elements. Stiffeners outside the fine mesh zones may be modelled using beam elements.

4.4.2

Where fine mesh analysis is required for main bracket end connections, including the end connection of hold frames of single skin bulk carriers, the fine mesh zone is to be extended at least 10 elements in all directions from the area subject to assessment, see Figure 9.

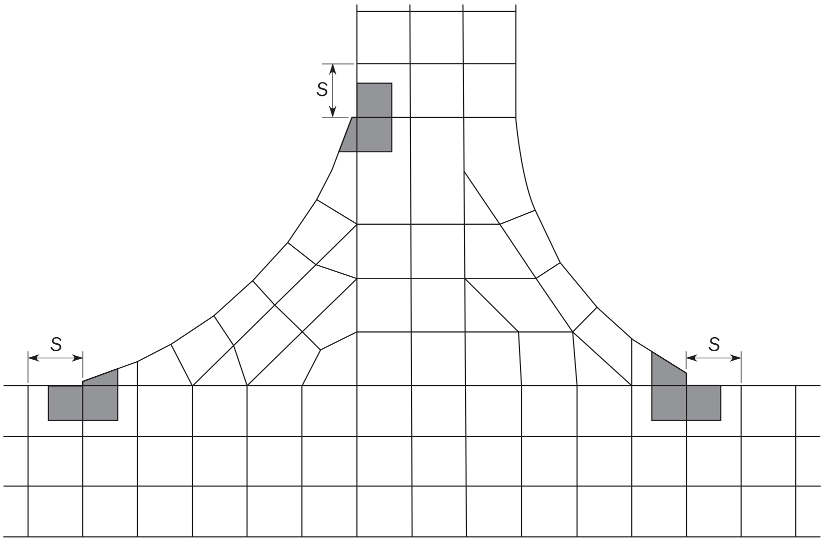
4.4.3

Where fine mesh analysis is required for an opening, the first two layers of elements around the opening are to be modelled with mesh size not greater than 50 × 50 mm. A smooth transition from the fine mesh to the coarser mesh is to be maintained. Edge stiffeners which are welded directly to the edge of an opening are to be modelled with shell elements. Web stiffeners close to an opening may be modelled using rod or beam elements located at a distance of at least 50 mm from the edge of the opening. Example of fine mesh zone around an opening is shown in Figure 10.

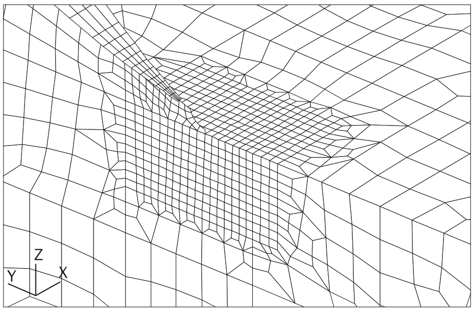
4.4.4

Face plates of openings, primary supporting members and associated brackets are to be modelled with at least two elements across their width on either side.

Figure 9 : Fine mesh zone around bracket toes



Fine mesh zone
Element size ≤50 mm × 50 mm
Extent - at least 10 elements in all directions
Face plate modelled by plate elements



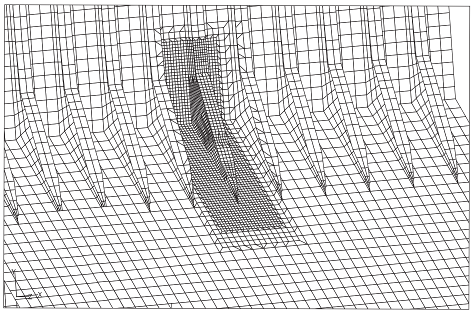


Figure 10 : Fine mesh zone around an opening

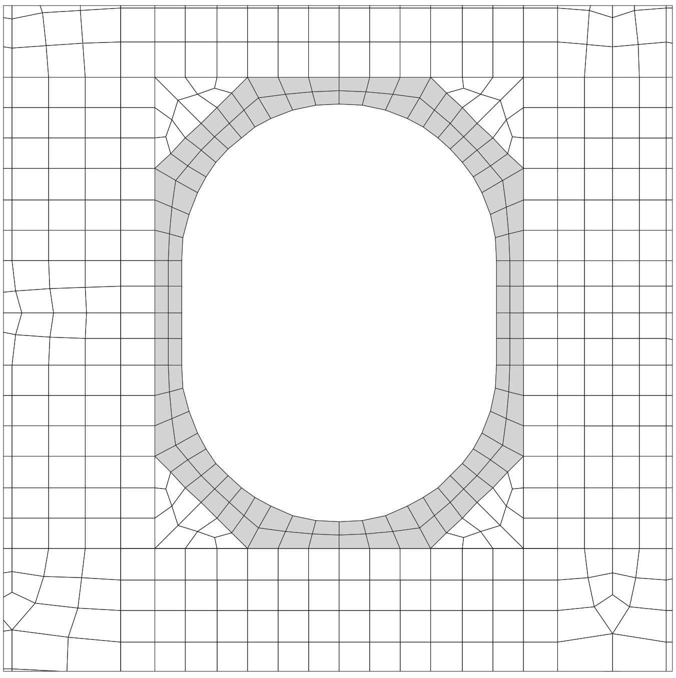


Fine mesh zone:
Element size ≤50 mm × 50 mm

4.5 Transverse web frames

4.5.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-section are applicable to the analysis of a typical transverse web frame.

4.5.2

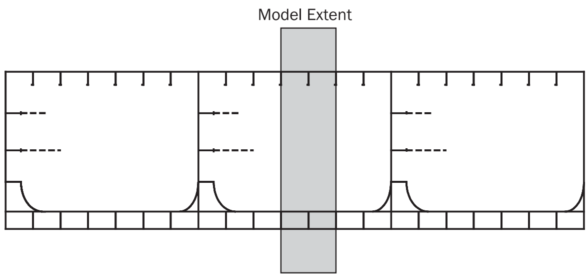
Where a FE sub model is used, the model is to have an extent of at least 1+1 web frame spaces, i.e. one web frame space extending either side of the transverse web frame under investigation. For bulk carriers, the web frame space is the longer space of web frames in the upper wing and the lower hopper tanks. The transverse web frames forward and aft of the web frame under investigation need not be included in the sub model.

4.5.3

The full depth and full breadth of the ship are to be modelled, see Figure 11.

Figure 12 shows a close up view of the finite element mesh at the lower part of the vertical web and backing brackets.

Figure 11 : Example of extent of local model for fine mesh analysis of web frame bracket connections and openings



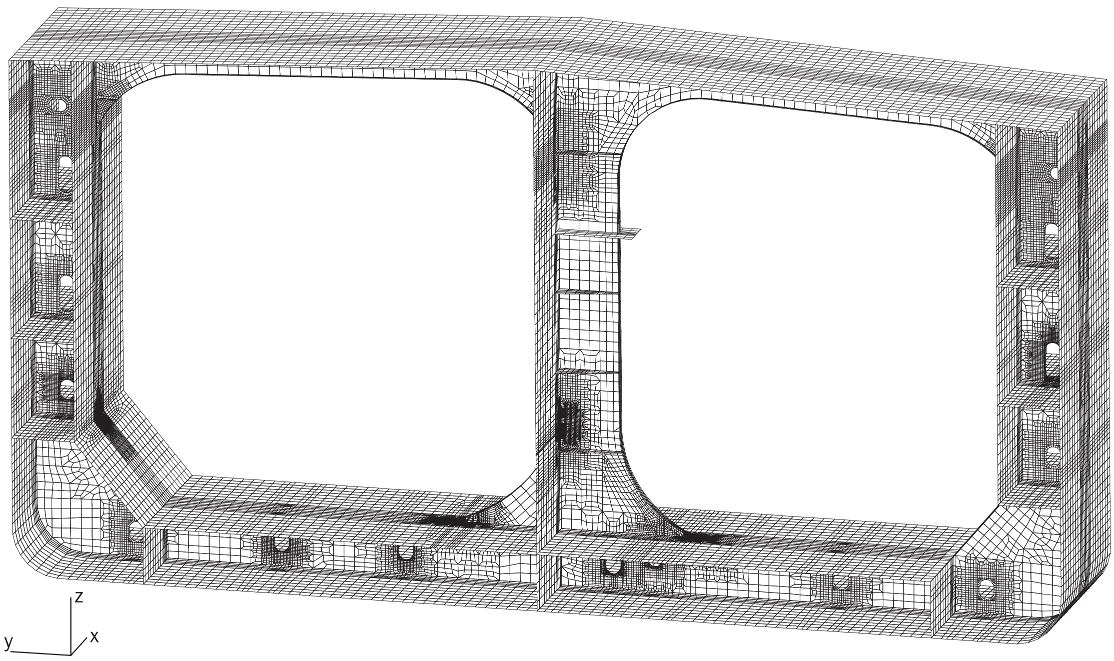


Figure 12 : Close-up view of finite element mesh at the lower part of a transverse web frame

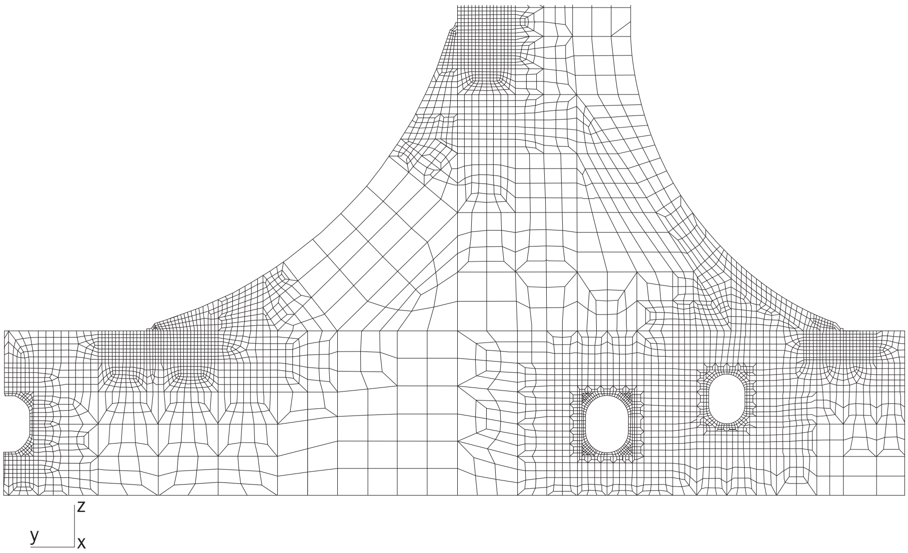
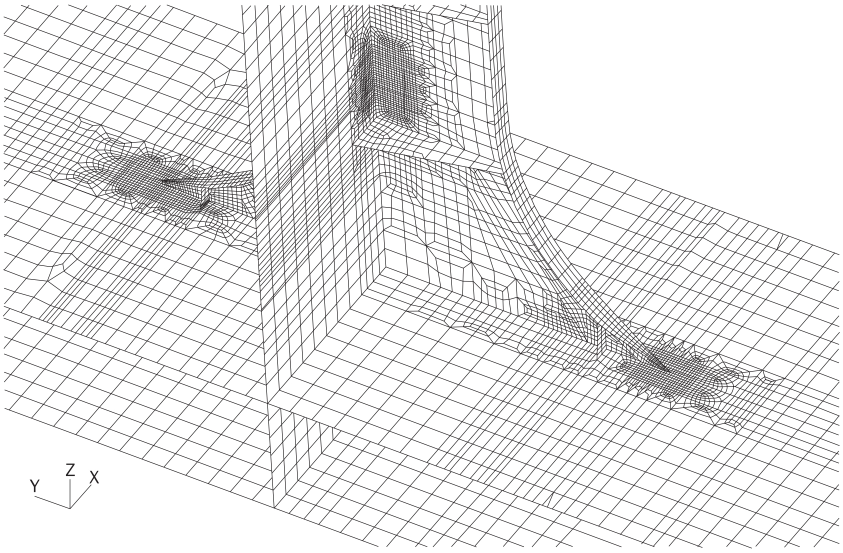




4.6 Transverse bulkhead stringers, buttress and adjacent web frame

4.6.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-section are applicable to the analysis of transverse bulkhead structures and adjacent web frame.

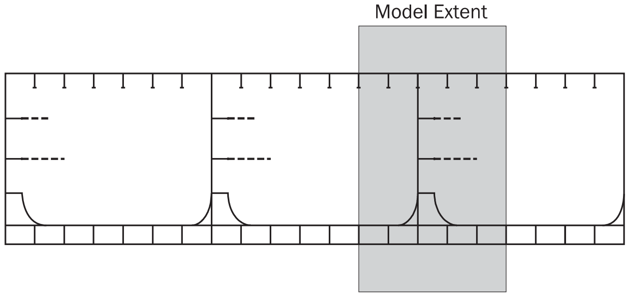
4.6.2

Due to the structural interaction among the transverse bulkhead, horizontal stringers, web frames, deck and double bottom, it is recommended that the FE local model represents a full section of the hull. Longitudinally, the ends of the model should be extended at least one web frame space beyond the areas that require investigation, see Figure 13.

4.6.3

Alternatively, it is acceptable to use a number of local models, as shown in Figure 14, to analyse different parts of the structure. For the analysis of the transverse bulkhead horizontal stringers the full breadth of the ship are to be modelled. For the analysis of buttress structure, the local model width should be at least 4+4 longitudinal spaces, i.e. four longitudinal spaces at each side of the buttress.

Figure 13 : Example of local model for fine mesh analysis of transverse bulkhead and adjacent structure



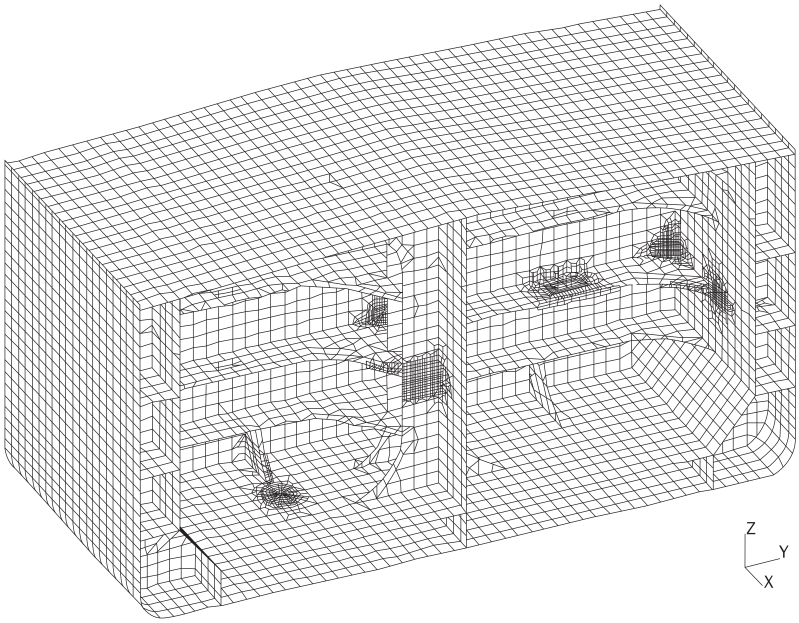


Figure 14 : Example of local analysis of transverse bulkhead structure using local models

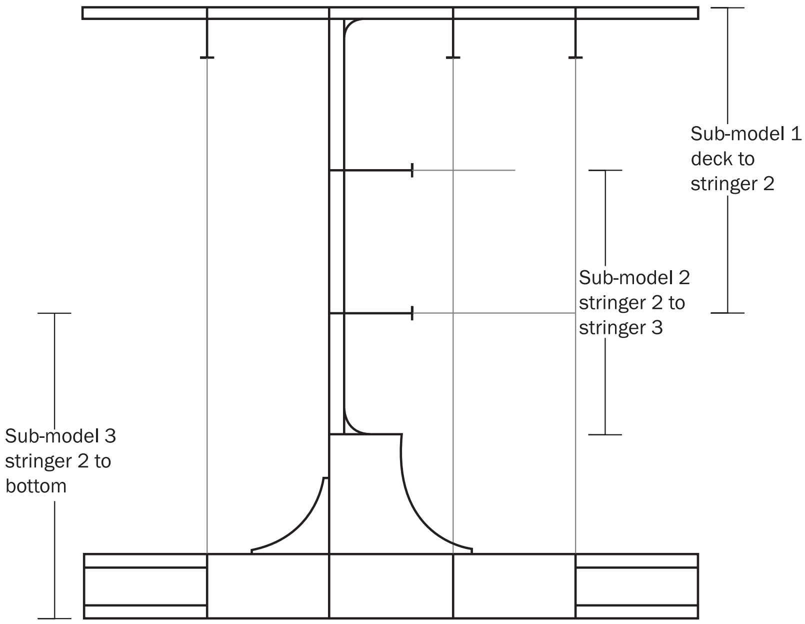

4.6.4

Figure 15 shows the finite element mesh on a transverse bulkhead horizontal stringer. Figure 16 shows the local model for the analysis of buttress connections to transverse bulkhead and double bottom structure, and openings.

Figure 15 : Example of finite element mesh on transverse bulkhead horizontal stringer

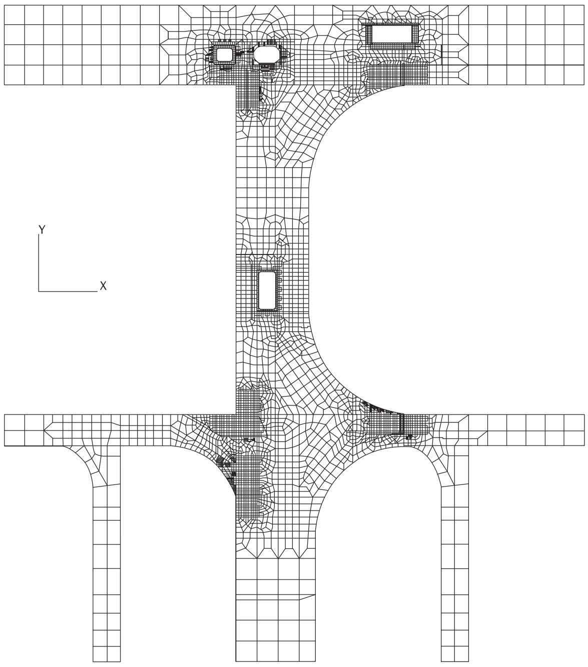

Figure 16 : Example of local model for the analysis of buttress connections to bulkhead and double bottom structure, showing port half of model

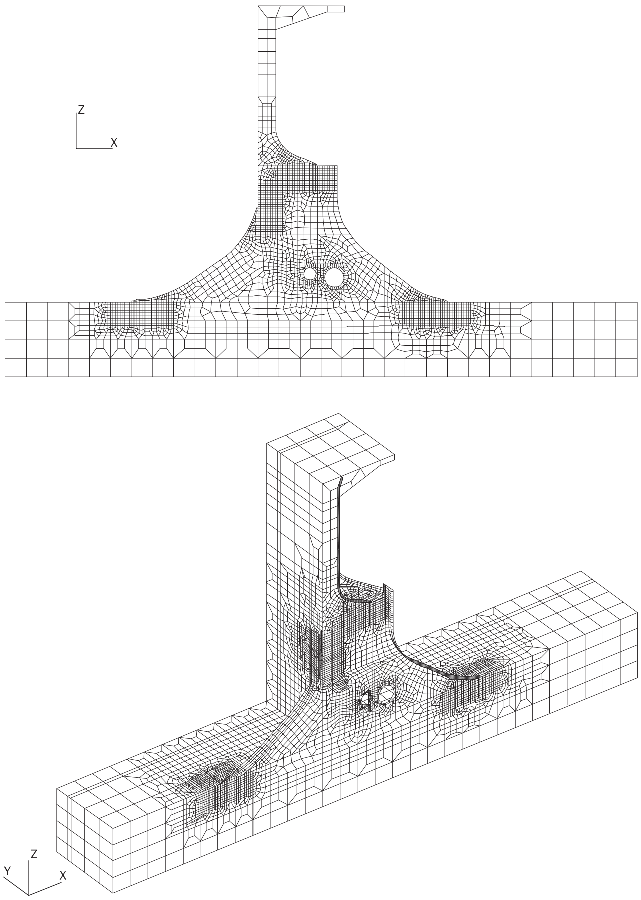


4.7 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners

4.7.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-section are applicable specifically to the analysis of longitudinal and vertical stiffener end connections and attached web stiffeners.

4.7.2

Where a local FE model is used, each end of the model is to be extended longitudinally at least two web frame spaces from the areas under investigation. The model width is to be at least 2+2 longitudinal spaces. Figure 17 shows the longitudinal extent of the local model for the analysis of deck and double bottom longitudinal stiffeners and adjoining transverse bulkhead vertical stiffener.

4.7.3

The web of the longitudinal stiffeners outside of the fine mesh zone should be represented by at least 3 shell elements across its depth. Similar size elements should be used to represent the plating of the bottom shell and inner bottom. The flange of the longitudinal stiffeners and face plate of brackets should be modelled with at least two shell elements across its width at one side.

4.7.4

The mesh size and extent of the fine mesh zone is to be in accordance with [4.3.1], see also Figure 17.

4.8 Corrugated bulkheads

4.8.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-article are applicable to the analysis of connections of corrugated bulkheads to lower stool and the connection between lower stool and inner bottom.

4.8.2

The minimum extents of the local model are as follows, see also Figure 18:

a) Vertically, the model is to be extended from the bottom of the ship to a level at least 2 m above the corrugation and lower stool connection. The upper boundary of the local model is to coincide with the horizontal mesh line of the cargo hold FE model for the purpose of applying boundary displacements, see [4.2].

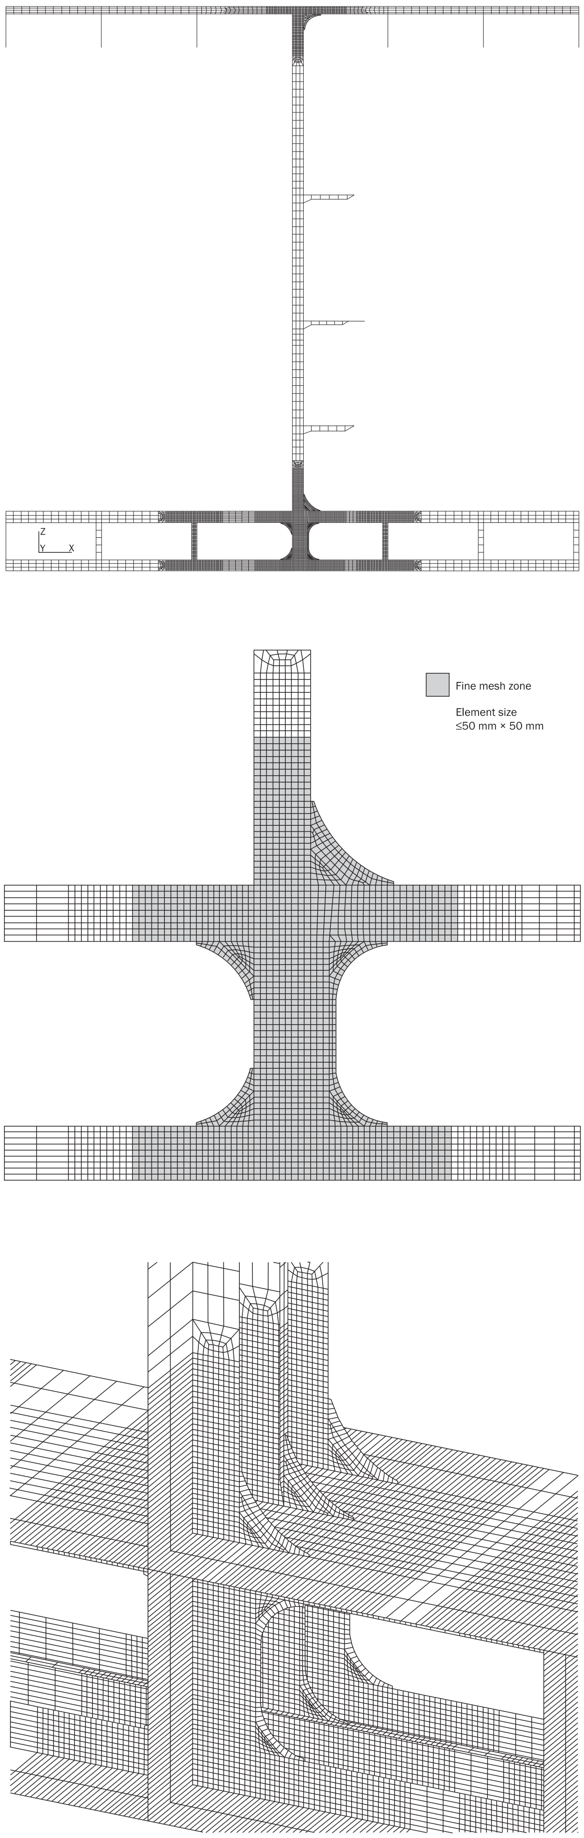
b) For transverse corrugated bulkheads, the local model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. the local model covers two lower stool transverse web/diaphragm spaces). The end diaphragms need not be modelled.

c) For the longitudinal corrugated bulkheads, the local model is to be extended to the nearest web frame on each side of the fine mesh zone (i.e. the local model covers two frame spaces). The end web frames need not be modelled.

d) For the corrugation and lower stool connection located close to the intersection of transverse and longitudinal corrugated bulkheads, such as for product tanker, the local model is to cover the structure between the diaphragms (in transverse direction) and web frames (in longitudinal direction) closest to the detail, whichever is relevant. In addition the local model is to be extended at least one diaphragm/web frame outside the intersection between the transverse stool and the longitudinal stool.

e) For lower stool to inner bottom connection, the connection between inner bottom, lower stool plate, diaphragm and double bottom girder, where applicable, is the centre of the fine mesh zone.

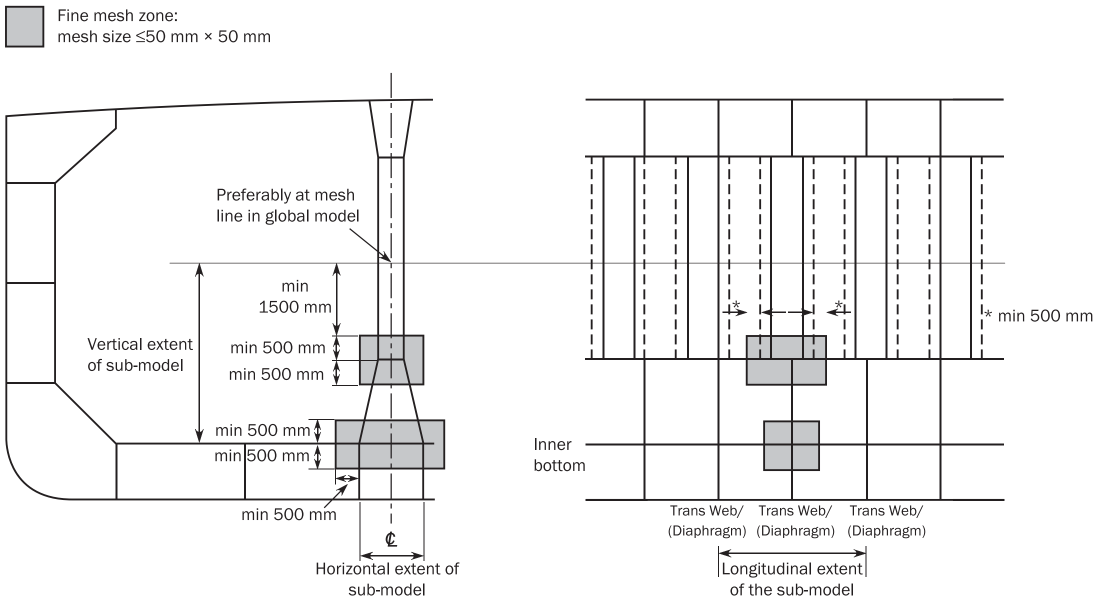
Figure 17 : Example of local model for fine mesh analysis of end connections and web stiffeners of deck and double bottom longitudinals



4.8.3

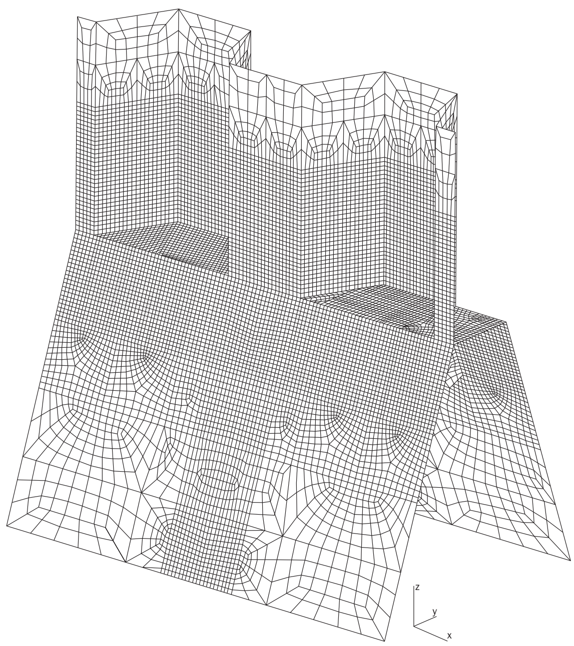
For corrugation connection, the fine mesh zone is to cover at least the corrugation flange under investigation, the adjacent corrugation webs and a further extension of 500 mm from each end of the corrugation web, i.e. the fine mesh zone covers at least four corrugation knuckles, see Figure 18 and Figure 19. The mesh size within the fine mesh zone is not to be greater than 50 × 50 mm.

Figure 18 : Extent of local model and fine mesh zone for the analysis of corrugated bulkhead connection to lower stool and inner bottom



Above figures show extent of local model and fine mesh zone on longitudinal corrugated bulkhead connection to lower stool. Similar extent applies to transverse corrugated bulkhead.
The model extents shown above are the minimum extents.

Figure 19 : Example of partial local model for the analysis of connection of corrugated bulkhead to lower stool



4.8.4

Diaphragm webs, brackets inside the lower stool and vertical stiffeners on the stool side plate are to be modelled at their actual positions within the extent of the local model. Shell elements are to be used for modelling of diaphragm, bracket and stiffener webs. Shell elements are be used to represent the flange of stiffeners and brackets in the fine mesh zone.

4.8.5

Stiffeners on the lower stool plate are to be represented by beam elements.

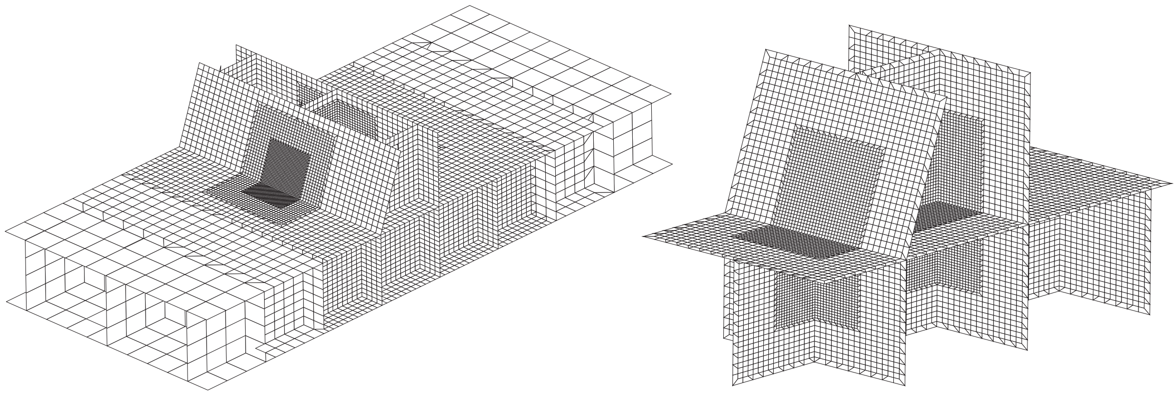
4.8.6

Figure 19 shows the details of finite element local model for the fine mesh analysis of longitudinal bulkhead to lower stool connection.

4.8.7

Figure 20 shows the details finite element local model for the fine mesh analysis of lower stool to inner bottom connection.

Figure 20 : Example of partial local model for the analysis of connection of lower stool to inner bottom



4.9 Hatch corner structures

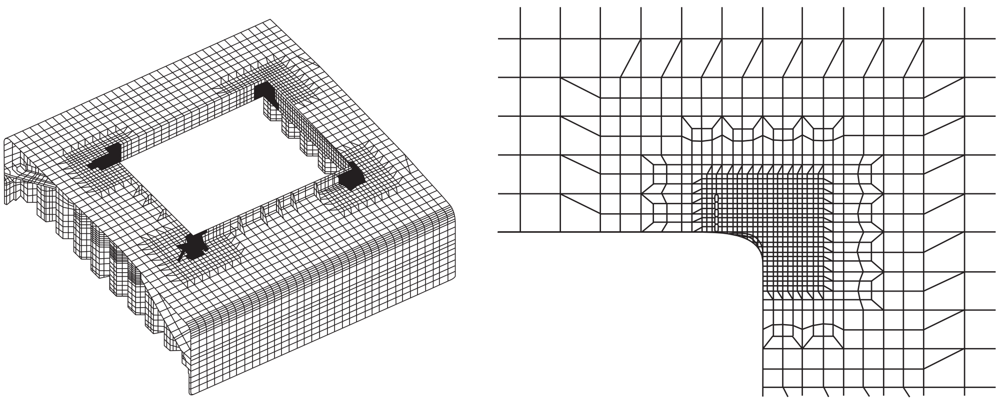
4.9.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-article are applicable to the analysis of hatch corner structures.

4.9.2

The high stress areas, such as the hatch coaming end bracket, the hatch corner and the hatch end beam connection, need to be analysed by fine mesh model. The fine mesh zones should cover these areas, see Figure 21.

Figure 21 : Example of local model for the analysis of hatch opening structures



5 FE LOAD COMBINATIONS

5.1 General

5.1.1

The fine mesh detailed stress analysis is to be carried out for all FE load combinations applied to the corresponding cargo hold analysis.

5.2 Application of loads and boundary conditions

5.2.1 General

Where a separate local model is used for the fine mesh detailed stress analysis, the nodal displacements from the cargo tank model are to be applied to the corresponding boundary nodes on the local model as prescribed displacements. Alternatively, equivalent nodal forces from the cargo tank model may be applied to the boundary nodes.

Where there are nodes on the local model boundaries which are not coincident with the nodal points on the cargo tank model, it is acceptable to impose prescribed displacements on these nodes using multi-point constraints. The use of linear multi-point constraint equations connecting two neighbouring coincident nodes is considered sufficient.

All local loads, including any loads applied for hull girder bending moment and/or shear force corrections, in way of the structure represented by the separate local finite element model are to be applied to the model.

6 ANALYSIS CRITERIA

6.1 Stress assessment

6.1.1 General

Stress assessment of the fine mesh analysis is to be carried out for the FE load combinations specified in Ch 4, Sec 8.

6.1.2 Reference stress

Reference stress is von Mises stress, σ_{vm}, which is to be calculated based on the membrane normal and shear stresses of the shell element evaluated at the element centroid. The stresses are to be evaluated at the mid plane of the element.

6.1.3 Permissible stress

The maximum permissible stresses are based on the mesh size of 50 × 50 mm as specified in [4.1] to [4.4]. Where a smaller mesh size is used, an area weighted von Mises stress calculated over an area equal to the specified mesh size may be used to compare with the permissible stresses. The averaging is to be based only on elements with their entire boundary located within the desired area. The average stress is to be calculated based on stresses at element centroid; stress values obtained by interpolation and/or extrapolation are not to be used. Stress averaging is not to be carried across structural discontinuities and abutting structure.

6.2 Acceptance criteria

6.2.1

Verification of stress results against the acceptance criteria is to be carried out in accordance with [6.1].

The structural assessment is to demonstrate that the stress complies with the following criteria:

$\lambda_f \leq \lambda_{fperm}$

where:

λ_f : Fine mesh yield utilisation factor.

$$\lambda_f = \frac{\sigma_{vm}}{R_Y} \quad \text{for shell elements in general}$$

$$\lambda_f = \frac{|\sigma_{axial}|}{R_Y} \quad \text{for rod or beam elements in general}$$

σ_{vm} : Von Mises stress, in N/mm^2.

σ_{axial} : Axial stress in rod element, in N/mm^2.

λ_{fperm} : Permissible fine mesh utilisation factor, taken as:

- Element not adjacent to weld:
  - λ_{fperm} = 1.70 f_f for S+D
  - λ_{fperm} = 1.36 f_f for S
- Element adjacent to weld:
  - λ_{fperm} = 1.50 f_f for S+D
  - λ_{fperm} = 1.20 f_f for S

f_f : Fatigue factor, taken as:

- f_f = 1.0 in general,
- f_f = 1.2 for details defined in Ch 9, Sec 2, Table 1, complying with the fatigue assessment criteria.

Note 1: The maximum permissible stresses are based on the mesh size of 50 × 50 mm. Where a smaller mesh size is used, an average von Mises stress calculated in accordance with [6.1] over an area equal to the specified mesh size may be used to compare with the permissible stresses.

Note 2: Average von Mises stress is to be calculated based on weighted average against element areas:

$$\sigma_{vm-av} = \frac{\sum_1^n A_i \, \sigma_{vm-i}}{\sum_1^n A_i}$$

where:

$\sigma_{vm\text{-}av}$ is the average von Mises stress.

Note 3: Stress averaging is not to be carried across structural discontinuities and abutting structure.

6.2.2 Lower stool not fitted to a transverse or longitudinal corrugated bulkhead

Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the permissible stresses given in [6.2.1] are to be reduced by 10% for the areas under investigation by fine mesh analysis.

PART 1 CHAPTER 8

BUCKLING

Table of Contents

SECTION 1
GENERAL

1 INTRODUCTION

1.1 Assumption

1.1.1

This chapter contains the strength criteria for buckling and ultimate strength of local supporting members, primary supporting members and other structures such as pillars, corrugated bulkheads and brackets. These criteria are to be applied as specified in Ch 6 for hull local scantlings and in Ch 7 for direct strength analysis.

1.1.2

For each structural member, the characteristic buckling strength is to be taken as the most unfavourable/critical buckling failure mode.

1.1.3

Unless otherwise specified, the scantling requirements of structural members in this chapter are based on net scantling obtained by removing t_c from the gross offered thickness, where t_c is defined in Ch 3, Sec 3.

1.1.4

In this chapter, compressive and shear stresses are to be taken as positive, tension stresses are to be taken as negative.

2 APPLICATION

2.1 Scope

2.1.1

The buckling checks are to be performed according to:

- Ch 8, Sec 2 for the slenderness requirements of plates, longitudinal and transverse stiffeners, primary supporting members and brackets.
- Ch 8, Sec 3 for the prescriptive buckling requirements of plates, longitudinal and transverse stiffeners, supporting members and other structures.
- Ch 8, Sec 4 for the buckling requirements of the FE analysis for the plates, stiffened panels and other structures.
- Ch 8, Sec 5 for the buckling capacity of prescriptive and FE buckling requirements.

2.1.2 Stiffener

The buckling check of the stiffeners referred to in this Chapter is applicable to the stiffener fitted along the long edge of the buckling panel.

2.1.3 Enlarged stiffener

Enlarged stiffeners, with or without web stiffening, used for Permanent Means of Access (PMA) are to comply with the following requirements:

a) Slenderness requirements for primary supporting members as follows:
   - For enlarged stiffener web, see item (a) of Ch 8, Sec 2, [4.1.1].
   - For enlarged stiffener flange, see item (b) of Ch 8, Sec 2, [4.1.1] and Ch 8, Sec 2, [5.1].
   - For stiffeners fitted on enlarged stiffener web, see Ch 8, Sec 2, [3.1.1] and Ch 8, Sec 2, [3.1.3].

b) Buckling strength of prescriptive requirements as follows:
   - For enlarged stiffener web, see Ch 8, Sec 3, [3.2].
   - For stiffeners fitted on enlarged stiffener web, see Ch 8, Sec 3, [3.1] and Ch 8, Sec 3, [3.3].

c) All structural elements used for PMA are to be complied with for the buckling requirements of the FE analysis in Ch 8, Sec 4 when applicable.

d) Buckling strength of longitudinal PMA platforms without stiffeners fitted on enlarged stiffener web is to be checked using the criteria for local supporting members in Ch 8, Sec 3, [3.1] and Ch 8, Sec 3, [3.3].

3 DEFINITIONS

3.1 General

3.1.1 Buckling definition

'Buckling' is used as a generic term to describe the strength of structures, generally under in-plane compressions and/or shear and lateral load. The buckling strength or capacity can take into account the internal redistribution of loads depending on the load situation, slenderness and type of structure.

3.1.2 Buckling capacity

Buckling capacity based on this principle gives a lower bound estimate of ultimate capacity, or the maximum load the panel can carry without suffering major permanent set.

Buckling capacity assessment utilises the positive elastic post-buckling effect for plates and accounts for load redistribution between the structural components, such as between plating and stiffeners. For slender structures, the capacity calculated using this method is typically higher than the ideal elastic buckling stress (minimum Eigen value). Accepting elastic buckling of structural components in slender stiffened panels implies that large elastic deflections and reduced in-plane stiffness will occur at higher buckling utilisation levels.

3.1.3 Assessment methods

The buckling assessment is carried out according to one of the two methods taking into account different boundary condition types:

- Method A: All the edges of the elementary plate panel are forced to remain straight (but free to move in the in-plane directions) due to the surrounding structure/neighbouring plates.
- Method B: The edges of the elementary plate panel are not forced to remain straight due to low in-plane stiffness at the edges and/or no surrounding structure/neighbouring plates.

3.2 Buckling utilisation factor

3.2.1

The utilisation factor, η, is defined as the ratio between the applied loads and the corresponding ultimate capacity or buckling strength.

3.2.2

For combined loads, the utilisation factor, η_{act}, is to be defined as the ratio of the applied equivalent stress and the corresponding buckling capacity, as shown in Figure 1, and is to be taken as:

$$\eta_{act} = \frac{W_{act}}{W_u} = \frac{1}{\gamma_c}$$

where:

W_{act} : Applied equivalent stress due to the combined membrane stresses, in N/mm²:

$$W_{act} = \sqrt{\sigma_x^2 + \sigma_y^2 + \tau^2} \quad \text{for plate}$$

$$W_{act} = \sigma_a + \sigma_b + \sigma_w \quad \text{for stiffener}$$

σ_x : Membrane stress applied in *x* direction, in N/mm².

σ_y : Membrane stress applied in *y* direction, in N/mm².

τ : Membrane shear stress applied in *xy* plane, in N/mm².

σ_a : Actual stress in the stiffener as defined in Ch 8, Sec 5, [2.3], in N/mm².

σ_b : Bending stress in the stiffener as defined in Ch 8, Sec 5, [2.3], in N/mm².

σ_w : Warping stress in the stiffener as defined in Ch 8, Sec 5, [2.3], in N/mm².

W_u : Equivalent buckling capacity, in N/mm², to be taken as:

$$W_u = \sqrt{\sigma_{cx}^2 + \sigma_{cy}^2 + \tau_c^2} \quad \text{for plate}$$

$$W_u = \frac{R_{eH-S}}{S} \quad \text{for stiffener}$$

σ_{cx}, σ_{cy}, τ_c: Critical stress, in N/mm², defined in Ch 8, Sec 5, [2.2] for plates and in Ch 8, Sec 5, [2.3] for stiffeners.

R_{eH-S} : Specified minimum yield stress of the stiffener, in N/mm².

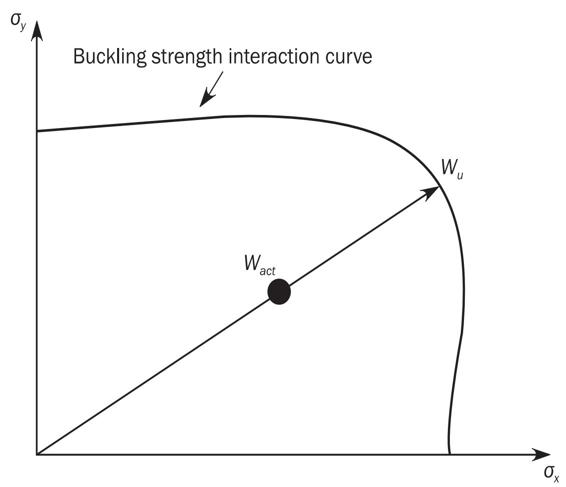
S : Partial safety factor as defined in Ch 8, Sec 5.

γ_c : Stress multiplier factor at failure.

For each typical failure mode, the corresponding capacity of the panel is calculated by applying the actual stress combination and then increasing or decreasing the stresses proportionally until collapse.

Figure 1 illustrates the buckling capacity and the buckling utilisation factor of a structural member subject to σ_x and σ_y stresses.

Figure 1 : Example of buckling capacity and buckling utilisation factor



3.3 Allowable buckling utilisation factor

3.3.1 General structural elements

The allowable buckling utilisation factor is defined in Table 1.

Table 1 : Allowable buckling utilisation factor

Structural component	η_{all}, Allowable buckling utilisation factor
Plates and stiffeners Stiffened and unstiffened panels Vertically stiffened side shell plating of single side skin bulk carrier Web plate in ways of openings	1.00 for load combination: S+D 0.80 for load combination: S
Struts, pillars and cross ties	0.75 for load combination: S+D 0.65 for load combination: S
Corrugation of vertically corrugated bulkheads with lower stool and horizontally corrugated bulkhead, under lateral pressure from liquid loads, for shell elements only. Supporting structure in way of lower end of corrugated bulkheads without lower stool.	0.90 for load combination: S+D 0.72 for load combination: S
Corrugation of vertically corrugated bulkheads without lower stool under lateral pressure from liquid loads, for shell elements only.	0.81 for load combination: S+D 0.65 for load combination: S
Note 1: Supporting structure for a transverse corrugated bulkhead refers to the structure in longitudinal direction within half a web frame space forward and aft of the bulkhead, and within a vertical extent equal to the corrugation depth. Note 2: Supporting structure for a longitudinal corrugated bulkhead refers to the structure in transverse direction within three longitudinal stiffener spacings from each side of the bulkhead, and within a vertical extent equal to the corrugation depth.	

3.4 Buckling acceptance criteria

3.4.1

A structural member is considered to have an acceptable buckling strength if it satisfies the following criterion:

$\eta_{act} \le \eta_{all}$

where:

η_{act} : Buckling utilisation factor based on the applied stress, defined in [3.2.2].

η_{all} : Allowable buckling utilisation factor as defined in [3.3].

SECTION 2
SLENDERNESS REQUIREMENTS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

$b_{f\text{-}out}$: Maximum distance, in mm, from mid thickness of the web to the flange edge, as shown in Figure 1.

h_w : Depth of stiffener web, in mm, as shown in Figure 1.

ℓ_b : Effective length of edge of bracket, in mm, as defined in Table 3.

ℓ : Length of stiffener between effective supports, in m.

s_{eff} : Effective width of attached plate of stiffener, in mm, taken equal to:

$s_{eff} = 0.8\ s$

t_f : Net flange thickness, in mm.

t_p : Net thickness of plate, in mm.

t_w : Net web thickness, in mm.

1 STRUCTURAL ELEMENTS

1.1 General

1.1.1

All structural elements are to comply with the applicable slenderness and proportion requirements given in [2] to [4].

2 PLATES

2.1 Net thickness of plate panels

2.1.1

The net thickness of plate panels is to satisfy the following criteria:

$$t_p \geq \frac{b}{C}\sqrt{\frac{R_{eH}}{235}}$$

where:

C : Slenderness coefficient taken as:

C = 100 for hull envelope and cargo and tank boundaries.

C = 125 for other structures.

R_{eH} : Specified minimum yield stress of the plate material, in N/mm^2.
The mild steel value may be used in this slenderness criterion provided the requirements specified in Sec 3 and Sec 4 are satisfied for the strake assumed in mild steel material.

This requirement does not apply to transversely stiffened bilge plates and radius gunwale.

3 STIFFENERS

3.1 Proportions of stiffeners

3.1.1 Net thickness of all stiffener types

The net thickness of stiffeners is to satisfy the following criteria:

a) Stiffener web plate:

$$t_w \geq \frac{h_w}{C_w}\sqrt{\frac{R_{eH}}{235}}$$

b) Flange:

$$t_f \geq \frac{b_{f-out}}{C_f}\sqrt{\frac{R_{eH}}{235}}$$

where:

C_w, C_f : Slenderness coefficients given in Table 1.

Figure 1 : Stiffener scantling parameters

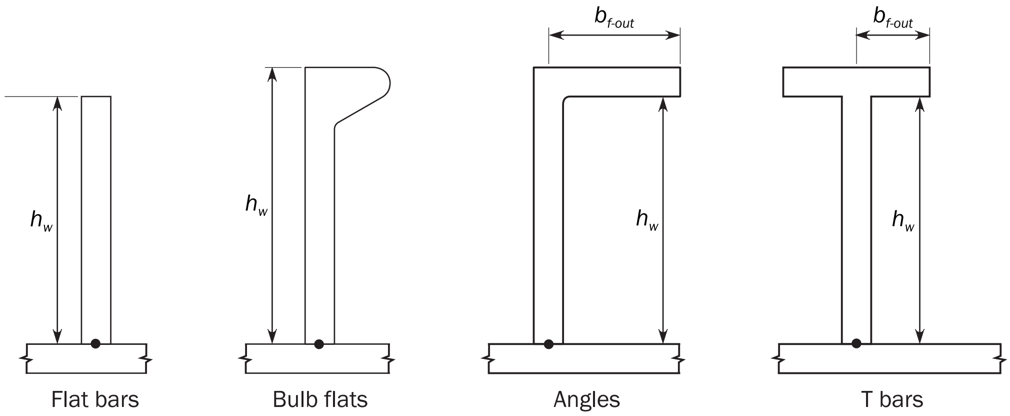


Table 1 : Slenderness coefficients

Type of Stiffener	C_w	C_f
Angle bars	75	12
T-bars	75	12
Bulb bars	45	-
Flat bars	22	-

3.1.2 Net dimensions of angle and T-bars

The total flange breadth b_f in mm, for angle and T-bars is to satisfy the following criterion:

$$b_f \geq 0.25 h_w$$

3.1.3 Bending stiffness of stiffeners

The net moment of inertia, in cm^4, about the neutral axis parallel to the effective attached plate of stiffener, s_{eff}, is not to be less than the minimum value given by:

$$I_{st} \geq C\,\ell^2 A_{eff}\frac{R_{eH}}{235}$$

where:

A_{eff} : Net sectional area of stiffener including effective attached plate, s_{eff}, in cm^2.

R_{eH} : Specified minimum yield stress of the material of the attached plate, in N/mm^2.

C : Slenderness coefficient taken as:

C = 1.43 for longitudinal stiffeners including sniped stiffeners.

C = 0.72 for other stiffeners.

4 PRIMARY SUPPORTING MEMBERS

4.1 Proportions and stiffness

4.1.1 Proportions of web plate and flange

The net thicknesses of the web plates and flanges of primary supporting members are to satisfy the following criteria:

a) Web plate:

$$t_w \geq \frac{s_w}{C_w}\sqrt{\frac{R_{eH}}{235}}$$

b) Flange:

$$t_f \geq \frac{b_{f-out}}{C_f}\sqrt{\frac{R_{eH}}{235}}$$

where:

s_w : Plate breadth, in mm, taken as the spacing of the web stiffeners.

C_w : Slenderness coefficient for the web plate taken as:

$C_w = 100$

C_f : Slenderness coefficient for the flange taken as:

$C_f = 12$

4.1.2 Deck transverse primary supporting members

The net moment of inertia for deck transverse primary supporting members, $I_{psm-n50}$, in cm^4, supporting deck longitudinals subject to axial compressive hull girder stress, is to comply, within its central half of the bending span, with the following criterion:

$$I_{psm-n50} \geq 300\,\frac{\ell_{bdg}^4}{S^3 s}\,I_{st}$$

where:

$I_{psm-n50}$: Net moment of inertia, in cm^4, of deck transverse primary supporting member, with effective width of attached plate equal to 0.8S.

ℓ_{bdg} : Effective bending span of deck transverse primary supporting member, in m, as defined in Ch 3, Sec 7.

S : Spacing of deck transverse primary supporting members, in m, as defined in Ch 3, Sec 7.

I_{st} : Moment of inertia of deck stiffeners within the central half of the bending span, in cm^4, as given in [3.1.3].

4.2 Web stiffeners of primary supporting members

4.2.1 Proportions of web stiffeners

The net thickness of web and flange of web stiffeners fitted on primary supporting members is to satisfy the requirements specified in [3.1.1] and [3.1.2].

4.2.2 Bending stiffness of web stiffeners

The net moment of inertia, in cm^4, of web stiffener, I_{st}, fitted on primary supporting members, with effective attached plate, s_{eff}, is not to be less than the minimum moment of inertia defined in Table 2.

Table 2 : Stiffness criteria for web stiffeners

Stiffener arrangement		Minimum moment of inertia of web stiffeners, in cm^4
A	Web stiffeners fitted along the PSM span 	$I_{st} \geq C\ \ell^2\ A_{eff}\ \dfrac{R_{eH}}{235}$
B	Web stiffeners fitted normal to the PSM span 	$I_{st} \geq 1.14\ \ell\ s^2\ t_w \left(2.5\ \dfrac{1000\ell}{s} - 2\ \dfrac{s}{1000\ell}\right)\dfrac{R_{eH}}{235}\ 10^{-5}$

where:

C : Slenderness coefficient to be taken as:
C = 1.43 for longitudinal stiffeners including sniped stiffeners.
C = 0.72 for other stiffeners.

ℓ : Length of web stiffener, in m.
For web stiffeners welded to local supporting members, the length is to be measured between the flanges of the local support members.
For sniped web stiffeners, the length is to be measured between the lateral supports, e.g. the total distance between the flanges of the primary supporting member as shown for stiffener arrangement B.

A_{eff} : Net section area of web stiffener including effective attached plate, s_{eff}, in cm^2.

t_w : Net web thickness of the primary supporting member, in mm.

R_{eH} : Specified minimum yield stress of the material of the web plate of the primary supporting member, in N/mm^2.

5 BRACKETS

5.1 Tripping brackets

5.1.1 Unsupported flange length

The unsupported length of the flange of the primary supporting member, in m, i.e. the distance between tripping brackets, is not to be greater than:

$$S_b = b_f\ C \sqrt{\frac{A_{f-n50}}{\left(A_{f-n50} + \dfrac{A_{w-n50}}{3}\right)}\left(\frac{235}{R_{eH}}\right)}$$

, but need not be less than $S_{b\text{-}min}$.

where:

b_f : Flange breadth of primary supporting members, in mm.

C : Slenderness coefficient taken as:

C = 0.022 for symmetrical flanges.

C = 0.033 for asymmetrical flanges.

$A_{f\text{-}n50}$: Net cross sectional area of flange, in cm^2.

$A_{w\text{-}n50}$: Net cross sectional area of the web plate, in cm^2.

R_{eH} : Specified minimum yield stress of the PSM material, in N/mm^2.

$S_{b\text{-}min}$: Minimum unsupported flange length taken as:

$S_{b\text{-}min}$ = 3.0 m for the cargo tank/hold region, on tank/hold boundaries or the hull envelope including external decks.

$S_{b\text{-}min}$ = 4.0 m for other areas.

5.1.2 Edge stiffening

Tripping brackets on primary supporting members are to be stiffened by a flange or edge stiffener if the effective length of the edge, ℓ_b as defined in Table 3, in mm, is greater than:

$$\ell_b = 75t_b$$

where:

t_b : Bracket net web thickness, in mm.

5.2 End brackets

5.2.1 Proportions

The net web thickness of end brackets, in mm, subject to compressive stresses is not to be less than:

$$t_b = \frac{d_b}{C}\sqrt{\frac{R_{eH}}{235}}$$

where:

d_b : Depth of brackets, in mm, as defined in Table 3.

C : Slenderness coefficient as defined in Table 3.

R_{eH} : Specified minimum yield stress of the end bracket material, in N/mm^2.

5.3 Edge reinforcement

5.3.1 Edge reinforcements of bracket edges

The depth of stiffener web, h_w in mm, of edge stiffeners in way of bracket edges is not to be less than:

$$h_w = C\,\ell_b\sqrt{\frac{R_{eH}}{235}} \quad \text{or 50 mm, whichever is greater.}$$

where:

C : Slenderness coefficient taken as:

C = 75 for end brackets.

C = 50 for tripping brackets.

R_{eH} : Specified minimum yield stress of the stiffener material, in N/mm^2.

5.3.2 Proportions of edge stiffeners

The net thickness of the web plate and flange of the edge stiffener is to satisfy the requirements specified in [3.1.1] and [3.1.2].

Table 3 : Buckling coefficient, *C*, for proportions of brackets

Mode	*C*
Brackets without edge stiffener 	$C = 20\left(\frac{d_b}{\ell_b}\right) + 16$ where: $0.25 \leq \frac{d_b}{\ell_b} \leq 1.0$
Brackets with edge stiffener 	$C = 70$

6 OTHER STRUCTURES

6.1 Pillars

6.1.1 Proportions of I-section pillars

For I-sections, the thickness of the web plate and the flange thickness are to comply with requirements specified in [3.1.1] and [3.1.2].

6.1.2 Proportions of box section pillars

The thickness of thin walled box sections is to comply with the requirements specified in item (a) of [3.1.1].

6.1.3 Proportions of circular section pillars

The net thickness, t, of circular section pillars, in mm, is to comply with the following criterion:

$$t \geq \frac{r}{50}$$

where:

r : Mid thickness radius of the circular section, in mm.

6.2 Edge reinforcement in way of openings

6.2.1 Depth of edge stiffener

When fitted as shown in Figure 2, the depth of web, h_w in mm, of edge stiffeners in way of openings is not to be less than:

$$h_w = C\,\ell\,\sqrt{\frac{R_{eH}}{235}}$$ or 50 mm, whichever is greater.

where:

C : Slenderness coefficient taken as:

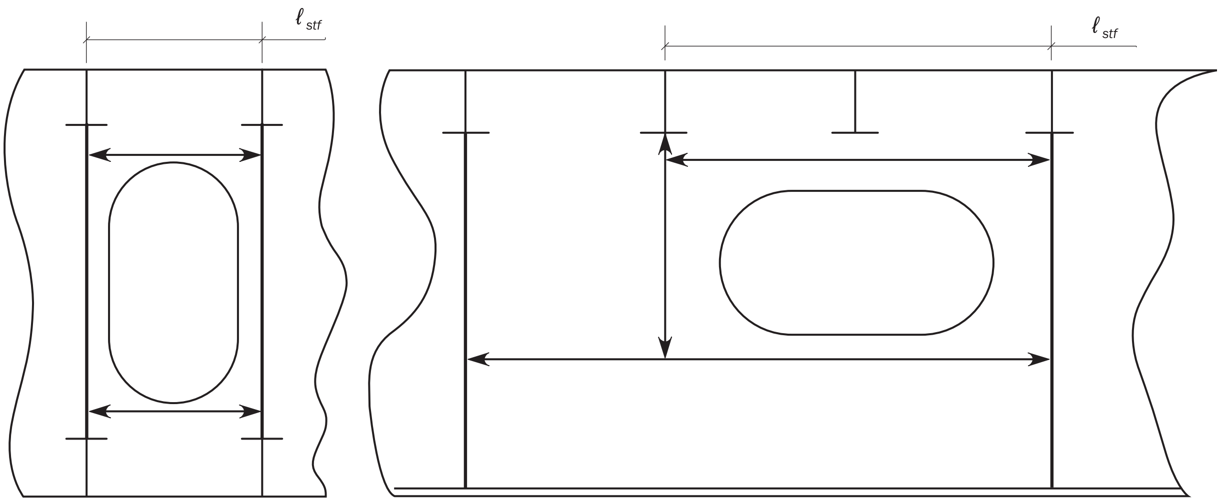
$C = 50$

R_{eH} : Specified minimum yield stress of the edge stiffener material, in N/mm^2.

6.2.2 Proportions of edge stiffeners

The net thickness of the web plate and flange of the edge stiffener is to satisfy the requirements specified in [3.1.1] and [3.1.2].

Figure 2 : Typical edge reinforcements



SECTION 3
PRESCRIPTIVE BUCKLING REQUIREMENTS

SYMBOLS

η_{all} : Allowable buckling utilisation factor, as defined in Ch 8, Sec 1, [3.3].

EPP : Elementary Plate Panel as defined in Ch 3, Sec 7, [2.1].

LCP : Load calculation point as defined in Ch 3, Sec 7, [2.2.2] and Ch 3, Sec 7, [3.2].

1 GENERAL

1.1 Scope

1.1.1

This section applies to plate panels and stiffeners subject to hull girder compression and shear stresses. In addition the following structural members subject to compressive stresses are to be checked:

- Corrugation of transverse vertically corrugated bulkhead.
- Corrugation of longitudinal corrugated bulkhead.
- Strut.
- Pillar.
- Cross tie.

1.1.2

The hull girder buckling strength requirements apply along the full length of the ship.

1.1.3 Design load sets

The buckling checks are to be performed for all design load sets defined in Ch 6, Sec 2, [2], both in intact and in flooded conditions with pressure combination defined in Ch 6, Sec 2, [1.3].

For each design load set, for all dynamic load cases, the lateral pressure is to be determined according to Ch 4 at the load calculation point defined in Ch 3, Sec 7, and is to be applied together with the hull girder stress combinations given in [2.2].

1.2 Equivalent plate panel

1.2.1

In longitudinal stiffening arrangement, when the plate thickness varies over the width b, of a plate panel, the buckling check is to be performed for an equivalent plate panel width, combined with the smaller plate thickness, t_1. The width of this equivalent plate panel, b_{eq}, in mm, is defined by the following formula:

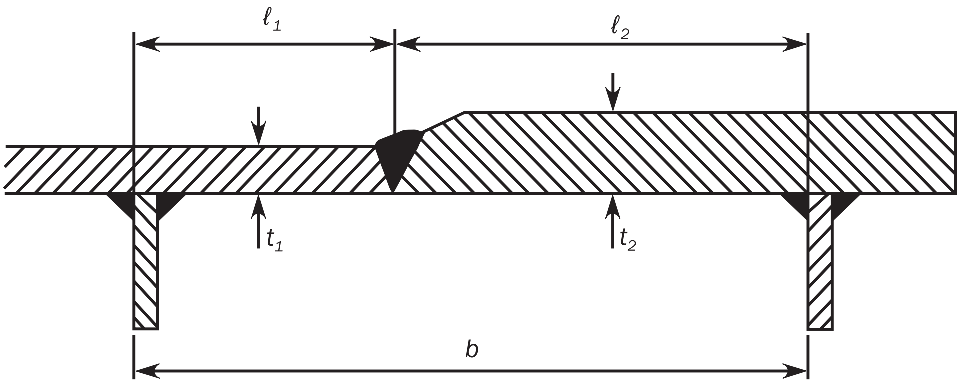
$$b_{eq} = \ell_1 + \ell_2 \left(\frac{t_1}{t_2}\right)^{1.5}$$

where:

ℓ_1 : Width of the part of the plate panel with the smaller plate thickness, t_1, in mm, as defined in Figure 1.

ℓ_2 : Width of the part of the plate panel with the greater plate thickness, t_2, in mm, as defined in Figure 1.

Figure 1 : Plate thickness change over the width



1.2.2

In transverse stiffening arrangement, when a EPP is made with different thicknesses, the buckling check of the plate and stiffeners is to be made for each thickness considered constant on the EPP, the stresses and pressures being estimated for the EPP at the LCP.

1.2.3 Materials

When the plate panel is made of different materials, the minimum yield strength is to be used for the buckling assessment.

2 HULL GIRDER STRESS

2.1 General

2.1.1

The hull girder bending stresses, σ_{hg}, in N/mm², are determined according to Ch 6, Sec 2.

2.1.2

The hull girder shear stresses, τ_{hg}, in N/mm², in the plate i are determined as follows:

$$\tau_{hg} = \frac{Q_{Tot}(x)\ q_{vi}}{t_{i-n50}} 10^3$$

where:

$Q_{Tot}(x)$: Total vertical shear force, in kN, at the ship longitudinal location x, taken as the greater of the following values:

- For the design load combination S+D
  - For seagoing operations:

    $$Q_{Tot}(x) = |Q_{sw} + Q_{wv-LC}|$$

  - For flooded conditions at sea for bulk carriers having a length L of 150 m or above:

    $$Q_{Tot}(x) = |Q_{sw-f} + Q_{wv-LC}|$$

- For the design load combination S

- For harbour/sheltered water operations:

$$Q_{Tot}(x) = |Q_{sw-p}|$$

q_{vi} : Contribution ratio in way of the plate *i*, as defined in Ch 5, Sec 1, [3.2.1].

t_{i-n50} : Net thickness of the plate *i*, in mm as defined in Ch 5, Sec 1, [3.2.1], used for shear stress calculation.

Q_{sw} : Permissible positive or negative still water shear force for seagoing operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.3].

Q_{sw-p} : Permissible positive or negative still water shear force for harbour/sheltered operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.4].

Q_{sw-f} : Permissible positive or negative still water shear force in flooded condition at sea, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.5].

Q_{wv-LC} : Vertical wave shear force in seagoing condition, in kN, in intact or flooded conditions at the hull transverse section considered for the considered dynamic load case, defined in Ch 4, Sec 4, [3.5.3].

2.2 Stress combinations

2.2.1

Each elementary plate panel and stiffeners are to satisfy the criteria defined in [3] with the following stress combinations:

a) Longitudinal stiffening arrangement:

- Stress combination 1 with:

$$\sigma_x = \sigma_{hg}$$
$$\sigma_y = 0$$
$$\tau = 0.7\tau_{hg}$$

- Stress combination 2 with:

$$\sigma_x = 0.7\sigma_{hg}$$
$$\sigma_y = 0$$
$$\tau = \tau_{hg}$$

b) Transverse stiffening arrangement:

- Stress combination 1 with:

$$\sigma_x = 0$$
$$\sigma_y = \sigma_{hg}$$
$$\tau = 0.7\tau_{hg}$$

- Stress combination 2 with:

$$\sigma_x = 0$$
$$\sigma_y = 0.7\sigma_{hg}$$
$$\tau = \tau_{hg}$$

where:

σ_{hg} : Hull girder bending stress in the elementary plate panel or stiffener, as defined in [2.1.1], in N/mm².

τ_{hg} : Hull girder shear stress, in N/mm², in the elementary plate panel or stiffener attached plate as defined in [2.1.2].

3 BUCKLING CRITERIA

3.1 Overall stiffened panel

3.1.1

The buckling strength of overall stiffened panels is to satisfy the following criterion:

$\eta_{Overall} \leq \eta_{all}$

where:

$\eta_{Overall}$: Maximum utilisation factor as defined in Ch 8, Sec 5, [2.1].

3.2 Plates

3.2.1

The buckling strength of elementary plate panels is to satisfy the following criterion:

$\eta_{Plate} \leq \eta_{all}$

where:

η_{Plate} : Maximum plate utilisation factor calculated according to SP-A, as defined in Ch 8, Sec 5, [2.2].

For the determination of η_{Plate} of the vertically stiffened side shell plating of single side skin bulk carrier between hopper and topside tanks, the cases 9 and 12 of Ch 8, Sec 5, Table 3 corresponding to the shorter edge of the plate panel clamped are to be considered together with a mean σ_y stress and $\psi_y = 1$.

3.3 Stiffeners

3.3.1

The buckling strength of stiffeners or of side frames of single side skin bulk carriers is to satisfy the following criterion:

$\eta_{Stiffener} \leq \eta_{all}$

where:

$\eta_{Stiffener}$: Maximum stiffener utilisation factor, as defined in Ch 8, Sec 5, [2.3].

Note 1: This capacity check can only be fulfilled when the overall stiffened panel capacity, as defined in [3.1.1], is satisfied.

3.4 Vertically corrugated transverse and longitudinal bulkheads

3.4.1

The shear buckling strength of vertically corrugated transverse and longitudinal bulkheads is to satisfy the following criterion:

$\eta_{Shear} \leq \eta_{all}$

where:

η_{Shear} : Maximum shear corrugated bulkhead utilisation factor.

$$\eta_{Shear} = \frac{\tau_{bhd}}{\tau_c}$$

τ_{bhd} : Shear stress, in N/mm^2, in the bulkhead taken as

- For longitudinal bulkheads: hull girder shear stress defined in [2.1.2]
- For transverse bulkheads: shear stress in the corrugation defined in Pt 2, Ch 1, Sec 3, [3.2.1].

τ_c : Shear critical stress, in N/mm^2, as defined in Ch 8, Sec 5, [2.2.3].

3.5 Horizontally corrugated longitudinal bulkhead

3.5.1

Each corrugation, within the extension of half flange, web and half flange, is to satisfy the following criterion:

$\eta \leq \eta_{all}$

where:

η : Overall column utilisation factor, as defined in Ch 8, Sec 5, [3.1].

3.6 Struts, pillars and cross ties

3.6.1

The compressive buckling strength of struts, pillars and cross ties is to satisfy the following criterion:

$\eta \leq \eta_{all}$

where:

η : Maximum buckling utilisation factor of struts, pillars or cross ties, defined in Ch 8, Sec 5, [3.1].

SECTION 4
BUCKLING REQUIREMENTS FOR DIRECT STRENGTH ANALYSIS

SYMBOLS

η_{all} : Allowable buckling utilisation factor, as defined in Ch 8, Sec 1, [3.3].

α : Aspect ratio of the plate panel, defined in Ch 8, Sec 5.

1 GENERAL

1.1 Scope

1.1.1

The requirements of this Section apply for the buckling assessment of direct strength analysis subjected to compressive stress, shear stress and lateral pressure.

1.1.2

All structural elements in the FE analysis carried out according to Ch 7 are to be assessed individually. The buckling checks have to be performed for the following structural elements:

- Stiffened and unstiffened panels.
- Web plate in way of openings.
- Corrugated bulkhead.
- Vertically stiffened side shell of single side skin bulk carrier.
- Struts, pillars and cross ties.

2 STIFFENED AND UNSTIFFENED PANELS

2.1 General

2.1.1

The plate panel of hull structure is to be modelled as stiffened or unstiffened panel. Method A and Method B as defined in Ch 8, Sec 1, [3] are to be used according to Table 1 and Figure 1 to Figure 9.

2.1.2 Average thickness of plate panel

Where the plate thickness along a plate panel is not constant, the panel used for the buckling assessment is to be modelled according to Ch 7 with a weighted average thickness taken as:

$$t_{avr} = \frac{\sum_{1}^{n} A_i \ t_i}{\sum_{1}^{n} A_i}$$

where:

A_i : Area of the *i*-th plate element.

t_i : Net thickness of the *i*-th plate element.

n : Number of finite elements defining the buckling plate panel.

Table 1 : Structural members

Structural elements	Assessment method	Normal panel definition
Longitudinal structure, see Figure 1, Figure 5 and Figure 7		
Longitudinally stiffened panels Shell envelope Deck Inner hull Hopper tank side Longitudinal bulkheads	SP-A	Length: between web frames Width: between primary supporting members
Double bottom longitudinal girders in line with longitudinal bulkhead or connected to hopper tank side	SP-A	Length: between web frames Width: full web depth
Web of double bottom longitudinal girders not in line with longitudinal bulkhead or not connected to hopper tank side	SP-B	Length: between web frames Width: full web depth
Web of horizontal girders in double side space connected to hopper tank side	SP-A	Length: between web frames Width: full web depth
Web of horizontal girders in double side space not connected to hopper tank side	SP-B	Length: between web frames Width: full web depth
Web of single skin longitudinal girders or stringers	UP-B	Plate between local stiffeners/face plate/PSM
Transverse structure, see Figure 2, Figure 6 and Figure 8		
Web of transverse deck frames including brackets	UP-B	Plate between local stiffeners/face plate/PSM
Vertical web in double side space	SP-B	Length: full web depth Width: between primary supporting members
Irregularly stiffened panels, e.g. web panels in way of hopper tank and bilge	UP-B	Plate between local stiffeners/face plate/PSM
Double bottom floors	SP-B	Length: full web depth Width: between primary supporting members
Vertical web frame including brackets	UP-B	Plate between vertical web stiffeners/face plate/PSM
Cross tie web plate	UP-B	Plate between vertical web stiffeners/face plate/PSM
Transverse oil-tight and watertight bulkheads, see Figure 3 and transverse wash bulkheads, see Figure 4		
Regularly stiffened bulkhead panels inclusive the secondary buckling stiffeners perpendicular to the regular stiffener (such as carlings)	SP-A	Length: between primary supporting members Width: between primary supporting members
Irregularly stiffened bulkhead panels, e.g. web panels in way of hopper tank and bilge	UP-B	Plate between local stiffeners/face plate

Structural elements	Assessment method	Normal panel definition
Web plate of bulkhead stringers including brackets	UP-B	Plate between web stiffeners /face plate
Transverse corrugated bulkheads and cross deck, see Figure 9		
Upper/lower stool including stiffeners	SP-A	Length: between internal web diaphragms Width: length of stool side
Stool internal web diaphragm	UP-B	Plate between local stiffeners /face plate / PSM
Cross deck	SP-A	Plate between local stiffeners/ PSM
Note 1: SP and UP stand for stiffened and unstiffened panel respectively. Note 2: A and B stand for Method A and Method B respectively.		

2.1.3 Yield stress of the plate panel

The panel yield stress R_{eH_P} is taken as the minimum value of the specified yield stresses of the elements within the plate panel.

2.2 Stiffened panels

2.2.1

To represent the overall buckling behaviour, each stiffener with attached plate is to be modelled as a stiffened panel of the extent defined in Table 1.

2.2.2

If the stiffener properties or stiffener spacing varies within the stiffened panel, the calculations are to be performed separately for all configurations of the panels, i.e. for each stiffener and plate between the stiffeners. Plate thickness, stiffener properties and stiffener spacing at the considered location are to be assumed for the whole panel.

Figure 1 : Longitudinal plates for oil tankers

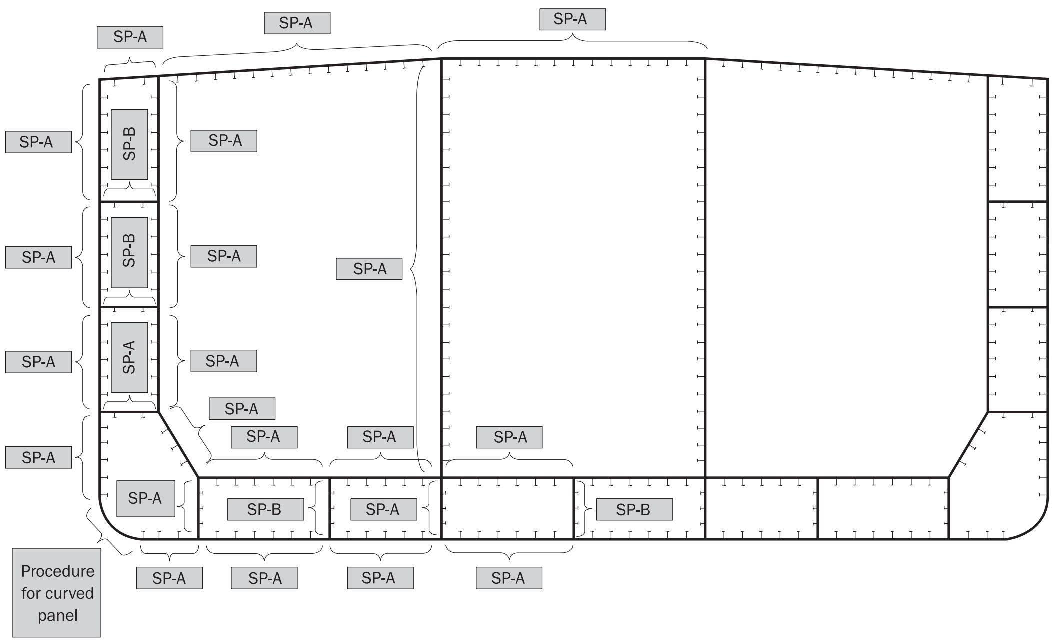


Figure 2 : Transverse web frames for oil tankers

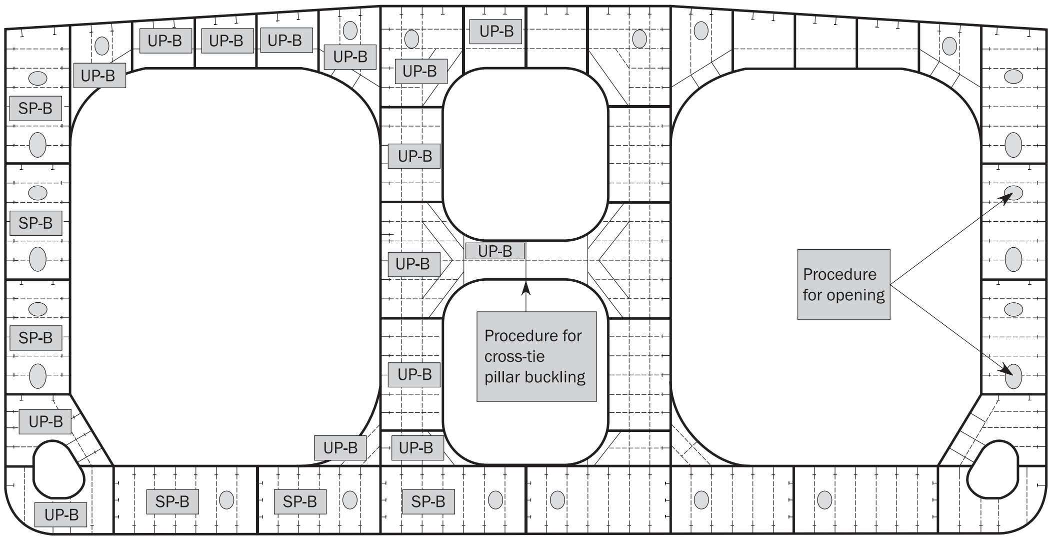

Figure 3 : Transverse bulkhead for oil tankers

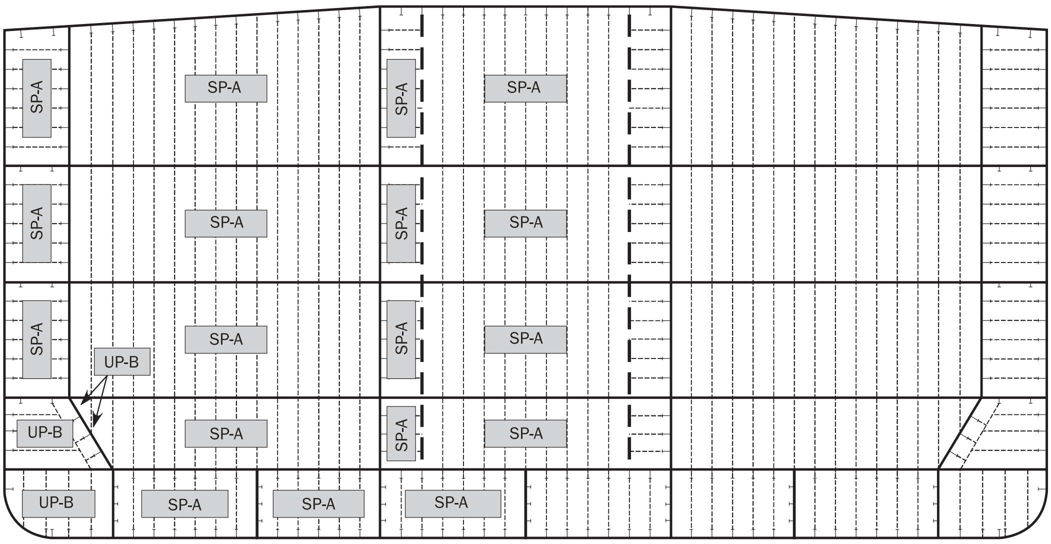

Figure 4 : Cross tie

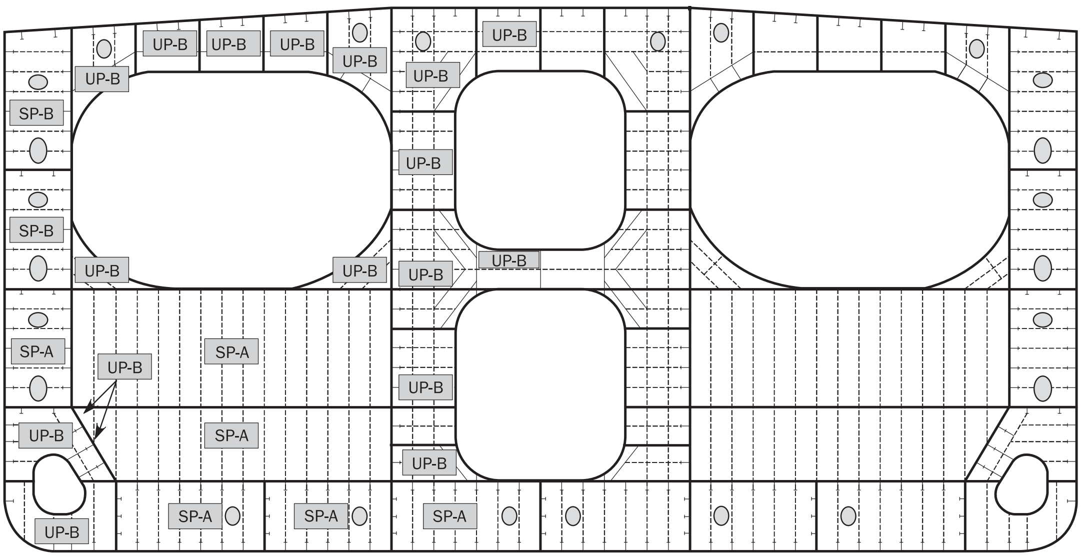

Figure 5 : Longitudinal plates for single hull bulk carrier

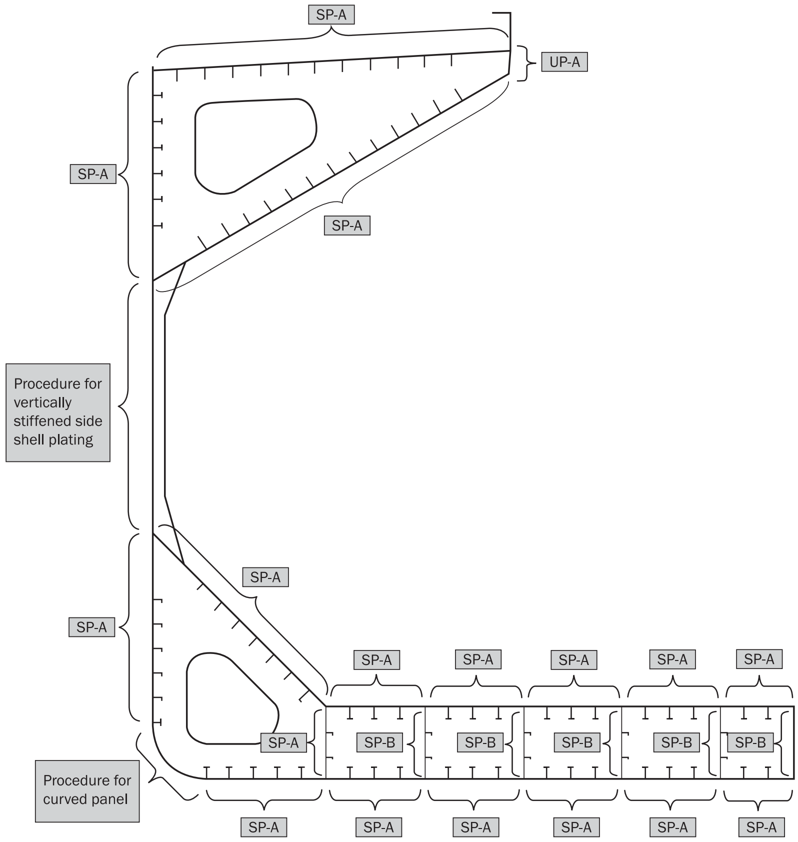

Figure 6 : Transverse web frames for single hull bulk carrier

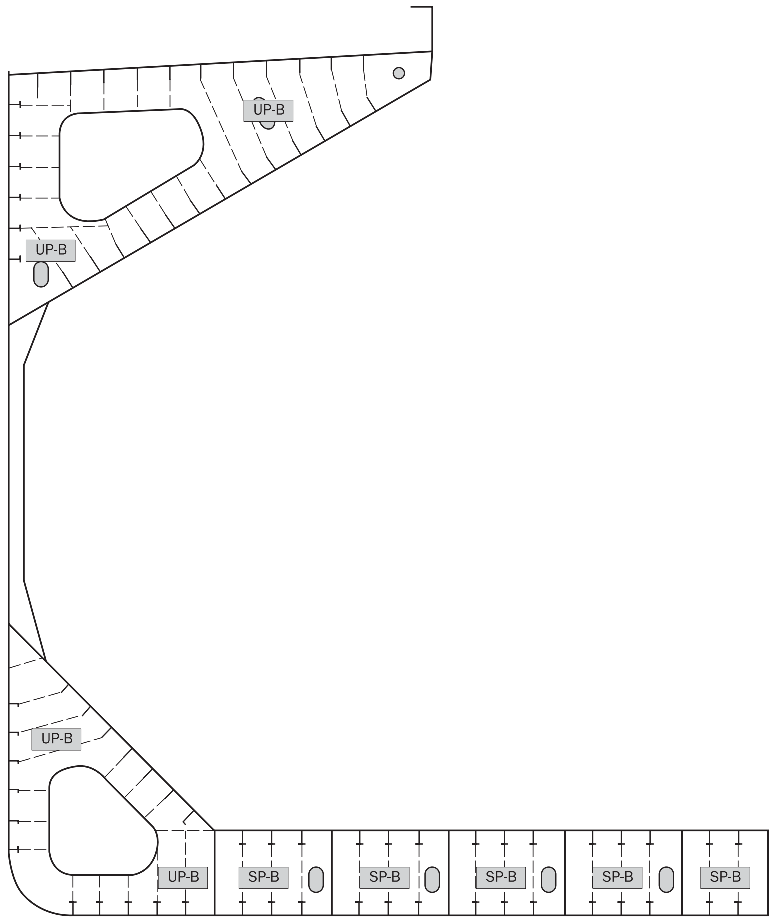

Figure 7 : Longitudinal plates for double hull bulk carrier

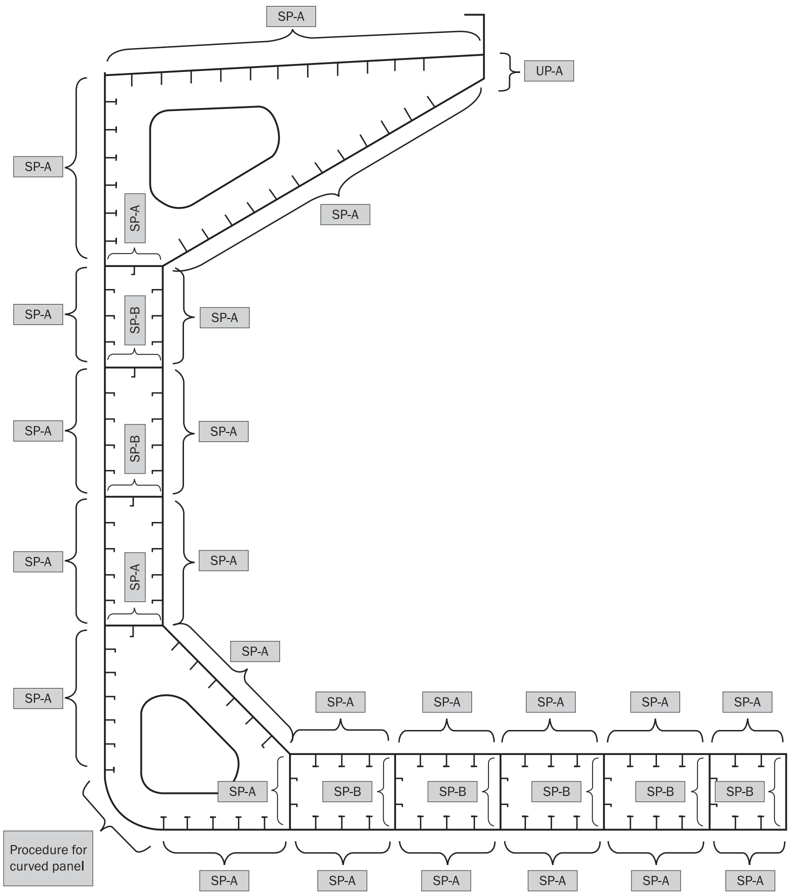

Figure 8 : Transverse web frames for double hull bulk carrier

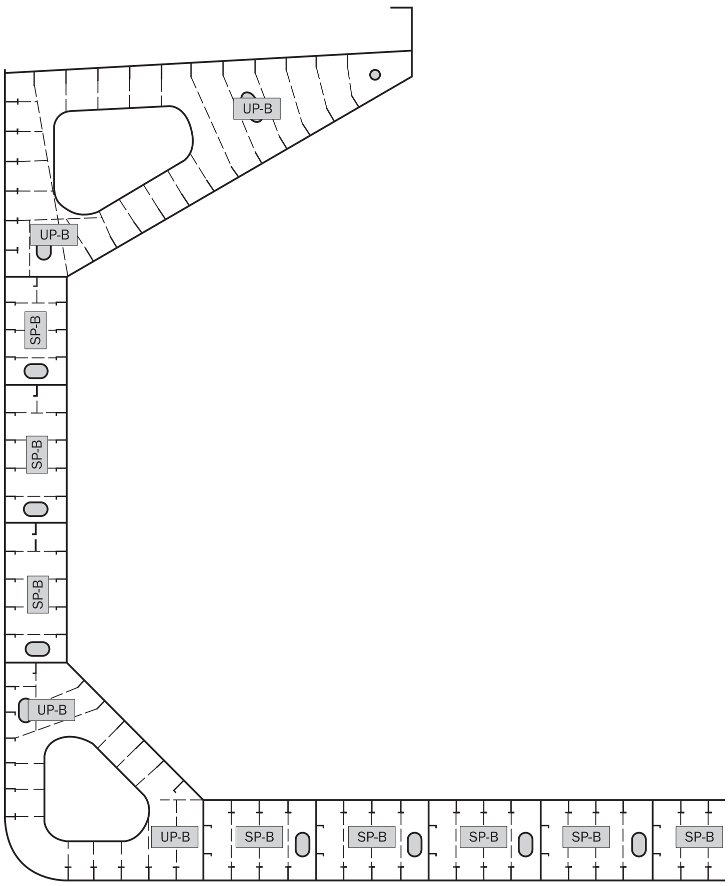

Figure 9 : Corrugated bulkhead and cross deck for bulk carriers

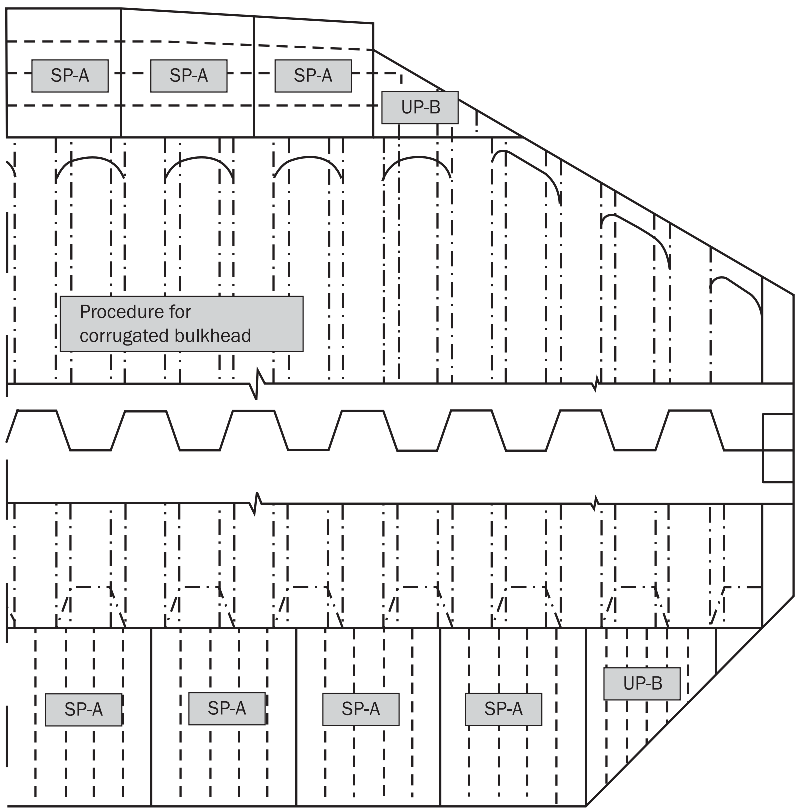
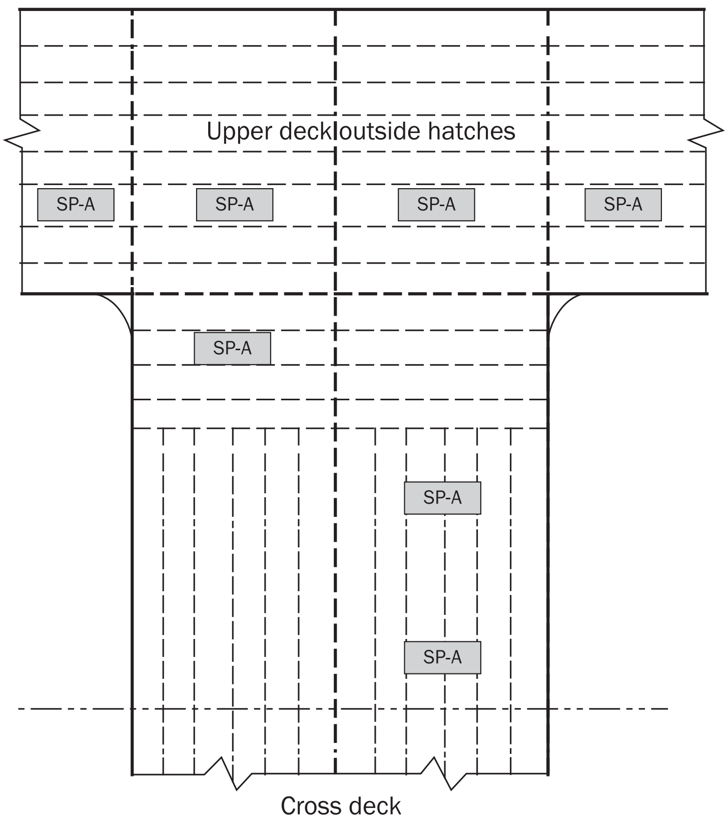




2.3 Unstiffened panels

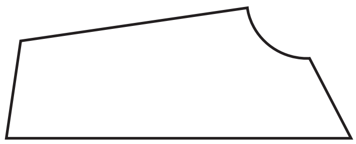
2.3.1 Irregular plate panel

In way of web frames, stringers and brackets, the geometry of the panel (i.e. plate bounded by web stiffeners/face plate) may not have a rectangular shape. In this case, an equivalent rectangular panel is to be defined according to [2.3.2] for irregular geometry and [2.3.3] for triangular geometry and to comply with buckling assessment.

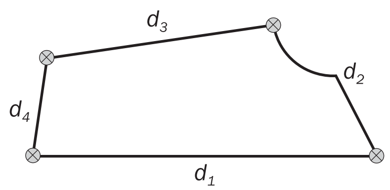
2.3.2 Modelling of an unstiffened panel with irregular geometry

Unstiffened panels with irregular geometry are to be idealised to equivalent panels for plate buckling assessment according to the following procedure:

a) The four corners closest to a right angle, 90 deg, in the bounding polygon for the plate are identified.

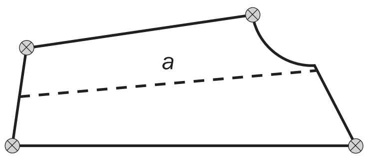


b) The distances along the plate bounding polygon between the corners are calculated, i.e. the sum of all the straight line segments between the end points.



c) The pair of opposite edges with the smallest total length is identified, i.e. minimum of $d_1 + d_3$ and $d_2 + d_4$

d) A line joins the middle points of the chosen opposite edges (i.e. a mid point is defined as the point at half the distance from one end). This line defines the longitudinal direction for the capacity model. The length of the line defines the length of the capacity model, *a* measured from one end point.



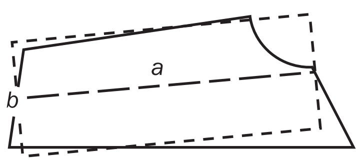
e) The length of shorter side, *b* in mm, is to be taken as:

$$b = A/a$$

where:

A : Area of the plate, in mm²

a : length defined in (d), in mm

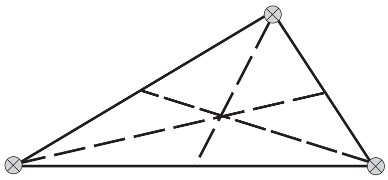


f) The stresses from the direct strength analysis are to be transformed into the local coordinate system of the equivalent rectangular panel. These stresses are to be used for the buckling assessment.

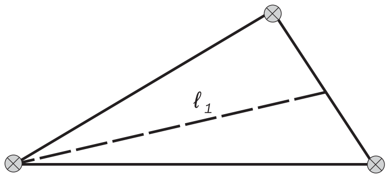
2.3.3 Modelling of an unstiffened plate panel with triangular geometry

Unstiffened panels with triangular geometry are to be idealised to equivalent panels for plate buckling assessment according to the following procedure:

a) Medians are constructed as shown below.



b) The longest median is identified. This median the length of which is ℓ_1 in mm, defines the longitudinal direction for the capacity model.

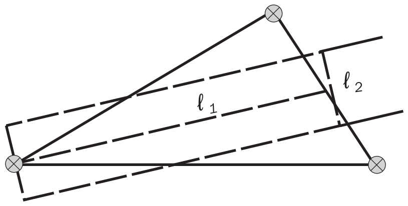


c) The width of the model, ℓ_2, in mm, is to be taken as:

$$\ell_2 = A/\ell_1$$

where:

A : Area of the plate, in mm²



d) The lengths of shorter side, b, and of the longer side, a, in mm, of the equivalent rectangular plate panel are to be taken as:

$$b = \frac{\ell_2}{C_{tri}}$$

$$a = \ell_1 \cdot C_{tri}$$

where:

$$C_{tri} = 0.4\frac{\ell_2}{\ell_1} + 0.6$$

e) The stresses from the direct strength analysis are to be transformed into the local coordinate system of the equivalent rectangular panel and are to be used for the buckling assessment of the equivalent rectangular panel.

2.4 Reference stress

2.4.1

The stress distribution is to be taken from the direct strength analysis and applied to the buckling model.

2.4.2

The reference stresses are to be calculated using the Stress based reference stresses as defined in App 1.

2.5 Lateral pressure

2.5.1

The lateral pressure applied to the direct strength analysis is also to be applied to the buckling assessment.

2.5.2

Where the lateral pressure is not constant over a buckling panel defined by a number of finite plate elements, an average lateral pressure, N/mm², is calculated using the following formula:

$$P_{avr} = \frac{\sum_{1}^{n} A_i \, P_i}{\sum_{1}^{n} A_i}$$

where:

A_i : Area of the *i*-th plate element, in mm².

P_i : Lateral pressure of the *i*-th plate element, in N/mm².

n : Number of finite elements in the buckling panel.

2.6 Buckling criteria

2.6.1 UP-A

The compressive buckling strength of UP-A is to satisfy the following criterion:

$\eta_{UP\text{-}A} \leq \eta_{all}$

where:

$\eta_{UP\text{-}A}$: Maximum plate utilisation factor, calculated according to Method A as defined in Ch 8, Sec 5, [2.2].

2.6.2 UP-B

The compressive buckling strength of UP-B is to satisfy the following criterion:

$\eta_{UP\text{-}B} \leq \eta_{all}$

where:

$\eta_{UP\text{-}B}$: Maximum plate utilisation factor, calculated according to Method B as defined in Ch 8, Sec 5, [2.2].

2.6.3 SP-A

The compressive buckling strength of SP-A is to satisfy the following criterion:

$\eta_{SP\text{-}A} \leq \eta_{all}$

where:

$\eta_{SP\text{-}A}$: Maximum stiffened panel utilisation factor taken as the maximum of:

- The overall stiffened panel capacity as defined in Ch 8, Sec 5, [2.1].
- The plate capacity calculated according to Method A as defined in Ch 8, Sec 5, [2.2].
- The stiffener buckling strength as defined in Ch 8, Sec 5, [2.3] considering separately the properties (thickness, dimensions), the pressures defined in [2.5.2] and the reference stresses of each EPP at both sides of the stiffener.

Note 1: The stiffener buckling capacity check can only be fulfilled when the overall stiffened panel capacity, as defined in Ch 8, Sec 5, [2.1], is satisfied.

2.6.4 SP-B

The compressive buckling strength of SP-B is to satisfy the following criterion:

$\eta_{SP\text{-}B} \leq \eta_{all}$

where:

$\eta_{SP\text{-}B}$: Maximum stiffened panel utilisation factor taken as the maximum of:

- The overall stiffened panel capacity as defined in Ch 8, Sec 5, [2.1].
- The plate capacity calculated according to Method B as defined in Ch 8, Sec 5, [2.2].
- The stiffener buckling strength as defined in Ch 8, Sec 5, [2.3] considering separately the properties (thickness, dimensions), the pressures defined in [2.5.2] and the reference stresses of each EPP at both sides of the stiffener.

Note 1: The stiffener buckling capacity check can only be fulfilled when the overall stiffened panel capacity, as defined in Ch 8, Sec 5, [2.1], is satisfied.

2.6.5 Web plate in way of openings

The web plate of primary supporting members with openings is to satisfy the following criterion:

$\eta_{opening} \leq \eta_{all}$

where:

$\eta_{opening}$: Maximum web plate utilisation factor in way of openings, as defined in Ch 8, Sec 5, [2.4].

3 CORRUGATED BULKHEAD

3.1 General

3.1.1

Three buckling failure modes are to be assessed on corrugated bulkheads:

- Corrugation overall column buckling.
- Corrugation flange panel buckling.
- Corrugation web panel buckling.

3.2 Reference stress

3.2.1

Each corrugation flange and web panel is to be assessed.

3.2.2

The membrane stresses at element centroid are to be used.

3.2.3

The maximum normal stress parallel to the corrugation, σ_x, is the maximum of the 2 following stresses:

- The normal stress parallel to the corrugation taken at $b/2$ from the corrugation ends,
- The normal stress parallel to the corrugation within the mid span of the corrugation.

When the corrugation end is fitted with a shedder plate, the normal stress parallel to the corrugation at end is to be taken at $b/2$ from the intersection of the shedder plate with the point at mid breadth of the flange or of the web, as the case may be.

The maximum shear stress is the shear stress which is maximum at the corrugation flange or web at the point $b/2$ from ends as defined above for the normal stress parallel to the corrugation.

The in plane stresses, σ_x and σ_y, and shear stress, τ, are to be taken as the element stresses averaged over the width of the considered member (flange or web) at the considered location.

When the stress value at $b/2$ from ends cannot be obtained directly from FE element, the stress at this location is to be obtained by interpolation. This interpolation is to be made on elements extending over a distance equal to $3b$ to a point located at $b/2$ from the end of the corrugation or from the intersection of the shedder plate if fitted, measured at the mid breadth of the flange or of the web. The interpolation of the in plane stresses, σ_x and σ_y, are to be made in accordance with Ch 8, App 1, [2.1].

The shear stress at $b/2$ is obtained by linear interpolation between the elements most close to '$b/2$' location.

For the application of this requirement, b is defined as follows:

b : Width of the considered member of the corrugation, i.e. flange or web.

3.2.4

Where more than one plate thicknesses are used for flange panel, maximum stress is to be obtained for each thickness range and to be checked with the buckling criteria for each thickness.

3.3 Overall column buckling

3.3.1

The overall buckling failure mode of corrugated bulkheads subjected to axial compression is to be checked for column buckling (e.g. horizontally corrugated bulkheads and vertically corrugated bulkheads subjected to local vertical forces).

Table 2 : Application of overall column buckling for corrugated bulkhead

Bulkhead orientation	Corrugation Orientation	
	Horizontal	Vertical
Longitudinal bulkhead	Required	Required, when subjected to local vertical forces (e.g. crane loads)
Transverse bulkhead	Required	

3.3.2

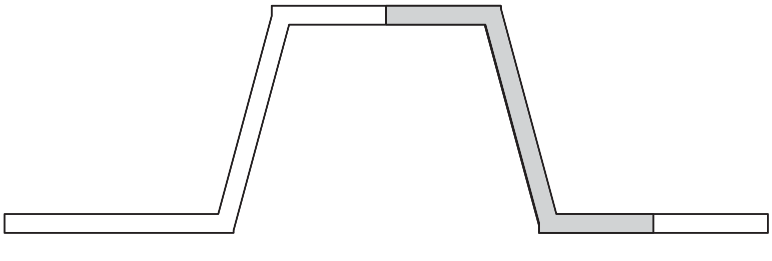
Each corrugation unit within the extension of half flange, web and half flange (i.e. single corrugation as shown in grey in Figure 10) is to satisfy the following criterion:

$\eta_{Overall} \leq \eta_{all}$

where:

$\eta_{Overall}$: Maximum overall column utilisation factor, as defined in Ch 8, Sec 5, [3.1.1] and Ch 8, Sec 5, [3.1.2], considered as a pillar with a unsupported length taken as the length of the corrugation.

Figure 10 : Single Corrugation



3.3.3

End constraint factor, f_{end} corresponding to pinned ends is to be applied except for fixed end support to be used in way of stool with width exceeding 2 times the depth of the corrugation.

3.4 Local buckling

3.4.1

The compressive buckling strength of a unit flange and a unit web of corrugation bulkheads is to satisfy the following criterion:

$\eta_{Corr} \le \eta_{all}$

where:

η_{Corr} : Maximum unit flange or unit web utilisation factor, as defined in Ch 8, Sec 5, [3.2.1].

Two stress combinations are to be considered for the application of the above criterion:

- The maximum normal stress parallel to the corrugation, σ_x, combined with the stress perpendicular to the corrugation, σ_y, and with the shear stress, τ, at the location where the maximum normal stress parallel to the corrugation occurs.
- The maximum shear stress, τ, combined with the normal stress parallel to the corrugation, σ_x, and with the stress perpendicular to the corrugation, σ_y, at the location where the maximum shear stress occurs.

The buckling assessment is to be performed for an aspect ratio α equal to 2, and for the thicknesses of the member where the maximum compressive/shear stress occurs (see [3.2.4]).

4 VERTICALLY STIFFENED SIDE SHELL OF SINGLE SIDE SKIN BULK CARRIER

4.1 Buckling criteria

4.1.1 Side shell plating

The compressive buckling strength of the vertically stiffened side shell plating of single side skin bulk carrier is to satisfy the following criterion:

$\eta_{vss} \le \eta_{all}$

where:

η_{vss} : Maximum vertically stiffened side shell plating utilisation factor calculated according to Method A as defined in Ch 8, Sec 5, [2.2.1] and for the cases 8, 9 and 12 of Ch 8, Sec 5, Table 3 corresponding to the shorter edge of the plate panel clamped, considering the following stress combinations:

- Pure vertical stress:
  - The maximum vertical stress of stress elements is used with

    $\alpha = 1$ and $\psi_x = 1$.
- Maximum vertical stress combined with longitudinal and shear stress:
  - The maximum vertical stress in the buckling panel plus the shear and longitudinal stresses at the location where the maximum vertical stress occurs is used with

    $\alpha = 2$ and $\psi_x = \psi_y = 1$.
  - The plate thickness to be considered in the buckling strength check is the one where the maximum vertical stress occurs.
- Maximum shear stress combined with longitudinal and vertical stress:

- The maximum shear stress in the buckling panel plus the longitudinal and vertical stresses at the location where maximum shear stress occurs is used with

  $\alpha = 2$ and $\psi_x = \psi_y = 1$.

- The plate thickness to be considered in the buckling strength check is the one where the maximum shear stress occurs.

- Distributed longitudinal stress associated with vertical and shear stress:
  - The actual size of the buckling panel is used to define α.
  - The average values for longitudinal, vertical and shear stresses are to be used.
  - $\psi_x = \psi_y = 1$.
  - The plate thickness to be considered in the buckling strength check is the minimum thickness of the buckling panel.

4.1.2 Side frames

The buckling strength of side frames of single side skin bulk carriers is to satisfy the following criterion:

$\eta_{Stiffener} \leq \eta_{all}$

where:

$\eta_{Stiffener}$: Maximum stiffener utilisation factor, as defined in Ch 8, Sec 5, [2.3].

5 STRUTS, PILLARS AND CROSS TIES

5.1 Buckling criteria

5.1.1

The compressive buckling strength of struts, pillars and cross ties is to satisfy the following criterion:

$\eta_{Pillar} \leq \eta_{all}$

where:

η_{Pillar} : Maximum utilisation factor of struts, pillars or cross ties, as defined in Ch 8, Sec 5, [3.1].

SECTION 5
BUCKLING CAPACITY

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

A_s : Net sectional area of the stiffener without attached plating, in mm^2.

a : Length of the longer side of the plate panel as defined in Table 3, in mm.

b : Length of the shorter side of the plate panel as defined in Table 3, in mm.

b_{eff} : Effective width of the attached plating of a stiffener, in mm, as defined in [2.3.5].

b_{eff1} : Effective width of the attached plating of a stiffener, in mm, without the shear lag effect taken as:

- For $\sigma_x > 0$
  - For prescriptive assessment:

    $$b_{eff1} = \frac{C_{x1}b_1 + C_{x2}b_2}{2}$$

  - For FE analysis:

    $$b_{eff1} = C_x b$$

- For $\sigma_x \leq 0$

  $$b_{eff1} = b$$

b_f : Breadth of the stiffener flange, in mm.

b_1, b_2 : Width of plate panel on each side of the considered stiffener, in mm.

C_{x1},C_{x2} : Reduction factor defined in Table 3 calculated for the EPP1 and EPP2 on each side of the considered stiffener according to case 1.

e_f : Distance from attached plating to centre of flange, in mm, as shown in Figure 1 to be taken as:

$e_f = h_w$ for flat bar profile.

$e_f = h_w - 0.5\ t_f$ for bulb profile.

$e_f = h_w + 0.5\ t_f$ for angle and Tee profiles.

F_{long} : Coefficient defined in [2.2.4].

F_{tran} : Coefficient defined in [2.2.5].

h_w : Depth of stiffener web, in mm, as shown in Figure 1.

ℓ : Span, in mm, of stiffener equal to spacing between primary supporting members or span of side frame equal to the distance between the hopper tank and top wing tank as defined in Pt 2, Ch 1, Sec 2, Figure 2.

R : Radius of curved plate panel, in mm.

R_{eH_P} : Specified minimum yield stress of the plate in N/mm^2.

R_{eH_S} : Specified minimum yield stress of the stiffener in N/mm^2.

S : Partial safety factor to be taken as:

- S = 1.1 for structures which are exposed to local concentrated loads (e.g. container loads on hatch covers, foundations).
- S = 1.15 for bulk carrier stiffeners located on the hatchway coamings, the sloping plate of the topside and hopper tanks, the inner bottom, the inner side if any, the side shell of single side skin construction and the top and bottom stools of transverse bulkheads.
- S = 1.0 for all other cases.

t_p : Net thickness of plate panel, in mm.

t_w : Net stiffener web thickness, in mm.

t_f : Net flange thickness, in mm.

x axis : Local axis of a rectangular buckling panel parallel to its long edge.

y axis : Local axis of a rectangular buckling panel perpendicular to its long edge.

α : Aspect ratio of the plate panel, defined in Table 3 to be taken as:

$$\alpha = \frac{a}{b}$$

β : Coefficient taken as:

$$\beta = \frac{1-\psi}{\alpha}$$

ω : Coefficient taken as:

$$\omega = min\ (3;\alpha)$$

σ_x : Stress applied on the edge along x axis of the buckling panel, in N/mm^2.

σ_y : Stress applied on the edge along y axis of the buckling panel, in N/mm^2.

σ_1 : Maximum stress, in N/mm^2.

σ_2 : Minimum stress, in N/mm^2.

σ_E : Elastic buckling stress, in N/mm^2 to be taken as:

$$\sigma_E = \frac{\pi^2 E}{12(1-\nu^2)}\left(\frac{t_p}{b}\right)^2$$

τ : Applied shear stress, in N/mm^2.

τ_c : Buckling strength in shear, in N/mm^2, as defined in [2.2.3].

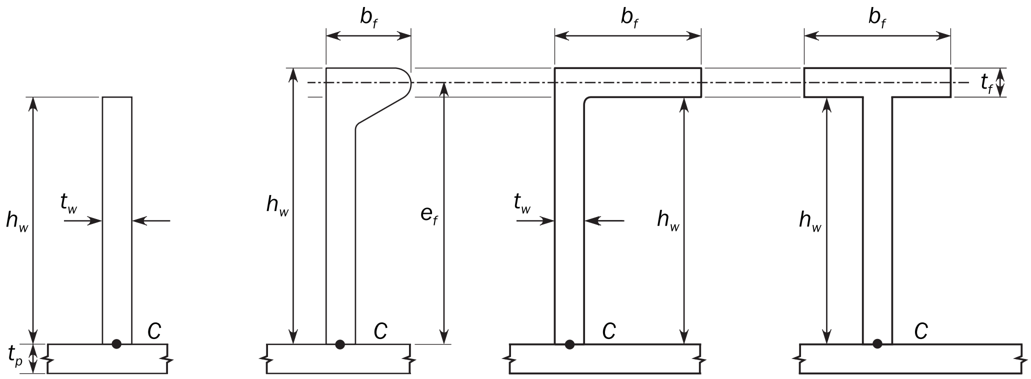
ψ : Edge stress ratio to be taken as:

$$\psi = \frac{\sigma_2}{\sigma_1}$$

γ : Stress multiplier factor acting on loads. When the factor is such that the loads reach the interaction formulae, $\gamma = \gamma_c$.

γ_c : Stress multiplier factor at failure.

Figure 1 : Stiffener cross sections



1 General

1.1 Scope

1.1.1

This section contains the methods for determination of the buckling capacity of plate panels, stiffeners, primary supporting members, struts, pillars, cross ties and corrugated bulkheads.

1.1.2

For the application of this section, the stresses σ_x, σ_y and τ applied on the structural members are defined in:

- Ch 8, Sec 3 for prescriptive requirements.
- Ch 8, Sec 4 for FE analysis requirements.

1.1.3 Ultimate buckling capacity

The ultimate buckling capacity is calculated by applying the actual stress combination and then increasing or decreasing the stresses proportionally until the interaction formulae defined in [2.1.1], [2.2.1], and [2.3.4] are equal to 1.0.

1.1.4 Buckling utilisation factor

The buckling utilisation factor of the structural member is equal to the highest utilisation factor obtained for the different buckling modes.

1.1.5 Lateral pressure

The lateral pressure is to be considered as constant in the buckling strength assessment.

2 Interaction Formulae

2.1 Overall stiffened panel capacity

2.1.1

The elastic stiffened panel limit state is based on the following interaction formula:

$$\frac{P_z}{c_f} = 1$$

where c_f and P_z are defined in [2.3.4].

2.2 Plate capacity

2.2.1 Plate limit state

The plate limit state is based on the following interaction formulae:

$$\frac{\gamma_{c1}\,\sigma_x\,S}{\sigma_{cx3}} = 1 \quad \text{for } \sigma_x \geq 0$$

$$\frac{\gamma_{c2}\,\sigma_y\,S}{\sigma_{cy3}} = 1 \quad \text{for } \sigma_y \geq 0$$

$$\frac{\gamma_{c3}|\tau|S}{\tau_c} = 1$$

$$\left[\left(\frac{\gamma_{c4}\,\sigma_x\,S}{\sigma_{cx1}}\right)^2 + \left(\frac{\gamma_{c4}\,\sigma_y\,S}{\sigma_{cy1}}\right)^2 - \left(\frac{\gamma_{c4}\,\sigma_x\,S}{\sigma_{cx1}}\right)\left(\frac{\gamma_{c4}\,\sigma_y\,S}{\sigma_{cy1}}\right)\right]\zeta + \left(\frac{\gamma_{c4}\,|\sigma_x|\,S}{\sigma_{cx2}} + \frac{\gamma_{c4}\,|\sigma_y|\,S}{\sigma_{cy2}}\right)(1-\zeta) = 1$$

with

$$\gamma_c = min(\gamma_{c1}, \gamma_{c2}, \gamma_{c3}, \gamma_{c4})$$

where:

σ_x, σ_y : Applied normal stress to the plate panel, in N/mm^2, to be taken as defined in [2.2.7].

τ : Applied shear stress to the plate panel, in N/mm^2.

ζ : Weighting factor to be taken as given in Table 1.

σ_{cx1}, σ_{cx2}, σ_{cx3}: Ultimate critical stresses, in N/mm^2, in direction parallel to the longer edge of the buckling panel as defined in [2.2.3].

σ_{cy1}, σ_{cy2}, σ_{cy3}: Ultimate critical stresses, in N/mm^2, in direction parallel to the shorter edge of the buckling panel as defined in [2.2.3].

τ_c : Ultimate critical shear stresses, in N/mm^2, as defined in [2.2.3].

γ_{c1}, γ_{c2}, γ_{c3}, γ_{c4}: Stress multiplier factors at failure for each of the above different limit states. γ_{c1} and γ_{c2} are only to be considered when $\sigma_x \geq 0$ and $\sigma_y \geq 0$ respectively.

Table 1 : Definition of weighting factor ζ and coefficients κ_{x1}, κ_{x2}, κ_{y1}, κ_{y2}

Applied Stress		ζ	κ_{x1}	κ_{x2}	κ_{y1}	κ_{y2}
$\sigma_x \geq 0$	$\sigma_y \geq 0$	$min\left[1\ ,\ 0.6\dfrac{min(5,\alpha)^{0.2}}{\beta_p^{\ 1/min(5,\alpha)}}\right]$	κ_{x3}		κ_{y3}	
$\sigma_x < 0$ or $\sigma_y < 0$		1.0	κ_{x4}	-	κ_{y4}	-

2.2.2 Reference degree of slenderness

The reference degree of slenderness is to be taken as:

$$\lambda = \sqrt{\frac{R_{eH\_P}}{K\sigma_E}}$$

where:

K : Buckling factor, as defined in Table 3 and Table 4.

2.2.3 Ultimate critical stresses

The ultimate critical stresses of plate panels are to be taken as:

$$\sigma_{cx1} = \kappa_{x1}\,R_{eH\_P} \qquad \sigma_{cx2} = \kappa_{x2}\,R_{eH\_P} \qquad \sigma_{cx3} = \kappa_{x3}\,R_{eH\_P}$$

$$\sigma_{cy1} = \kappa_{y1}\,R_{eH\_P} \qquad \sigma_{cy2} = \kappa_{y2}\,R_{eH\_P} \qquad \sigma_{cy3} = \kappa_{y3}\,R_{eH\_P}$$

The ultimate critical stress of plate panels subject to shear is to be taken as:

$$\tau_c = C_\tau \frac{R_{eH\_P}}{\sqrt{3}}$$

where:

κ_{x1}, κ_{x2}, κ_{y1}, κ_{y2}: Coefficients defined in Table 1.

κ_{x3}, κ_{x4}, κ_{y3}, κ_{y4}:Coefficients to be taken as:

$$\kappa_{x3} = \frac{C_x^2}{2\varsigma_{x\tau}}\left\{\sqrt{\left(\frac{1-\varsigma_{x\tau}}{C_x}\right)^2 - \frac{4\varsigma_{x\tau}}{C_x^2}\left[\varsigma_{x\tau}\left(\frac{\gamma_c|\tau|S}{\tau_c}\right)^2 + (1-\varsigma_{x\tau})\frac{\gamma_c|\tau|S}{\tau_c} - 1\right]} - \frac{1-\varsigma_{x\tau}}{C_x}\right\}$$

$$\kappa_{y3} = \frac{C_y^2}{2\varsigma_{y\tau}}\left\{\sqrt{\left(\frac{1-\varsigma_{y\tau}}{C_y}\right)^2 - \frac{4\varsigma_{y\tau}}{C_y^2}\left[\varsigma_{y\tau}\left(\frac{\gamma_c|\tau|S}{\tau_c}\right)^2 + (1-\varsigma_{y\tau})\frac{\gamma_c|\tau|S}{\tau_c} - 1\right]} - \frac{1-\varsigma_{y\tau}}{C_y}\right\}$$

$$\kappa_{x4} = \kappa_{y4} = \sqrt{1 - 3\left(\frac{\gamma_c|\tau|S}{R_{eH\_P}}\right)^2}$$

$$\varsigma_{x\tau} = \frac{1}{\sqrt{\beta_p}}$$

$$\varsigma_{y\tau} = \frac{min(5,\alpha)^{0.3}}{\sqrt{\beta_p}}$$

$$\beta_p = \frac{b}{t_p}\sqrt{\frac{R_{eH\_P}}{E}}$$

C_x, C_y, C_τ :Reduction factors, as defined in Table 3 and Table 4.

- For SP-A and UP-A, C_y is calculated according to Table 3 by using

  $$c_1 = \left(1 - \frac{1}{\alpha}\right) \geq 0$$

- For SP-B and UP-B, C_y is calculated according to Table 3 by using

  $$c_1 = 1$$

- For vertically stiffened single side skin of bulk carrier, C_y is calculated according to Table 3 by using

  $$c_1 = \left(1 - \frac{1}{\alpha}\right) \geq 0$$

- For corrugation of corrugated bulkheads, C_y is calculated according to Table 3 by using

  $$c_1 = \left(1 - \frac{1}{\alpha}\right) \geq 0$$

The boundary conditions for plates are to be considered as simply supported, see cases 1, 2 and 11 of Table 3. If the boundary conditions differ significantly from simple support, a more appropriate boundary condition can be applied according to the different cases of Table 3 subject to the agreement of the Society.

2.2.4 Correction factor F_{long}

The correction factor F_{long} depending on the edge stiffener types on the longer side of the buckling panel is defined in Table 2. An average value of F_{long} is to be used for plate panels having different edge stiffeners. For stiffener types other than those mentioned in Table 2, the value of c is to be agreed by the Society. In such a case, value of c higher than those mentioned in Table 2 can be used, provided it is verified by buckling strength check of panel using non-linear FE analysis and deemed appropriate by the Society.

Table 2 : Correction factor F_{long}

Structural element types			F_{long}	c
Unstiffened Panel			1.0	N/A
Stiffened Panel	Stiffener not fixed at both ends		1.0	N/A
	Stiffener fixed at both ends	Flat bar (1)	$F_{long} = c + 1$ for $\frac{t_w}{t_p} > 1$ $F_{long} = c\left(\frac{t_w}{t_p}\right)^3 + 1$ for $\frac{t_w}{t_p} \le 1$	0.10
		Bulb profile		0.30
		Angle profile		0.40
		T profile		0.30
		Girder of high rigidity (e.g. bottom transverse)	1.4	N/A
(1) t_w is the net web thickness, in mm, without the correction defined in [2.3.2].				

2.2.5 Correction factor F_{tran}

The correction factor F_{tran} is to be taken as:

- For transversely framed EPP of single side skin bulk carrier, between the hopper and top wing tank:
  - F_{tran} = 1.25 when the two adjacent frames are supported by one tripping bracket fitted in way of the adjacent plate panels.
  - F_{tran} = 1.33 when the two adjacent frames are supported by two tripping brackets each fitted in way of the adjacent plate panels.
  - F_{tran} = 1.15 elsewhere.
- For other cases: F_{tran} = 1

2.2.6 Curved plate panels

Table 4 applies to curved plate panels with $R/t_p \le 2500$. Otherwise, Table 3 is applicable.

For the application of Table 4, the stresses and coefficients are to be taken as:

- For $d \ge g$: $\sigma_{ax}=\sigma_x$, $\sigma_{tg}=\sigma_y$, $C_x=C_{ax}$ and $C_y=C_{tg}$.
- Otherwise : $\sigma_{ax}=\sigma_y$, $\sigma_{tg}=\sigma_x$, $C_x=C_{tg}$ and $C_y=C_{ax}$.

Table 3 : Buckling factor and reduction factor for plane plate panels

Case	Stress ratio ψ	Aspect ratio α	Buckling factor K	Reduction factor C

	$\frac{d}{R} > \sqrt{\frac{R}{t_p}}$	$K = 0.3\frac{d^2}{R^2} + 0.291\left(\frac{R^2}{d\ t_p}\right)^2$	
4 	$\frac{d}{R} \le 8.7\sqrt{\frac{R}{t_p}}$	$K = \sqrt{3}\sqrt{28.3 + \frac{0.67\ d^3}{R^{1.5}\ t_p^{\ 1.5}}}$	$C_\tau = 1$ for $\lambda \le 0.4$; $C_\tau = 1.274 - 0.686\lambda$ for $0.4 < \lambda \le 1.2$; $C_\tau = \frac{0.65}{\lambda^2}$ for $\lambda > 1.2$
	$\frac{d}{R} > 8.7\sqrt{\frac{R}{t_p}}$	$K = \sqrt{3}\ \frac{0.28d^2}{R\sqrt{Rt_p}}$	

Explanations for boundary conditions:

- - - - - - - - - Plate edge free.

——— Plate edge simply supported.

▬▬▬ Plate edge clamped.

Note 1: For curved plate panels, the C-value need not be taken less than for the expanded plane panel.

2.2.7 Applied normal stress to plate panel

The normal stress, σ_x and σ_y, in N/mm^2, to be applied for the plate panel capacity calculation as given in [2.2.1] are to be taken as follows:

- For FE analysis, the reference stresses as defined in Ch 8, Sec 4, [2.4].
- For prescriptive assessment, the axial or transverse compressive stresses calculated according to Ch 8, Sec 3, [2.2.1], at load calculation points of the considered elementary plate panel, as defined in Ch 3, Sec 7, [2].
- For grillage analysis where the stresses are obtained based on beam theory, the stresses taken as:

$$\sigma_x = \frac{\sigma_{xb} + \nu\sigma_{yb}}{1-\nu^2}$$

$$\sigma_y = \frac{\sigma_{yb} + \nu\sigma_{xb}}{1-\nu^2}$$

where:

σ_{xb}, σ_{yb} : Stress, in N/mm^2, from grillage beam analysis respectively along x or y axis of the attached buckling panel.

The shear stress τ, in N/mm^2, to be applied for the plate panel capacity calculation as given in [2.2.1] are to be taken as follows:

- For FE analysis, the reference shear stresses as defined in Ch 8, Sec 4, [2.4].
- For prescriptive assessment, the shear stresses calculated according to Ch 8, Sec 3, [2.2.1], at load calculation points of the considered elementary plate panel, as defined in Ch 3, Sec 7, [2].
- For grillage beam analysis, $\tau = 0$ in the attached buckling panel.

2.3 Stiffeners

2.3.1 Buckling modes

The following buckling modes are to be checked:

- Stiffener induced failure (*SI*).
- Associated plate induced failure (*PI*).

2.3.2 Web thickness of flat bar

For accounting the decrease of the stiffness due to local lateral deformation, the effective web thickness of flat bar stiffener, in mm, is to be used in [2.3.4] for the calculation of the net sectional area, A_s, the net section modulus, *Z,* and the moment of inertia, *I*, of the stiffener and is taken as:

$$t_{w\_red} = t_w\left(1-\frac{2\pi^2}{3}\left(\frac{h_w}{s}\right)^2\left(1-\frac{b_{eff1}}{s}\right)\right)$$

2.3.3 Idealisation of bulb profile

Bulb profiles are to be considered as equivalent angle profiles, as defined in Ch 3, Sec 7, [1.4.1].

2.3.4 Ultimate buckling capacity

When $\sigma_a + \sigma_b + \sigma_w > 0$, the ultimate buckling capacity for stiffeners is to be checked according to the following interaction formula:

$$\frac{\gamma_c\ \sigma_a + \sigma_b + \sigma_w}{R_{eH}}S = 1$$

where:

σ_a : Effective axial stress, in N/mm², at mid span of the stiffener, acting on the stiffener with its attached plating.

$$\sigma_a = \sigma_x \frac{s\ t_p + A_s}{b_{eff1}\ t_p + A_s}$$

σ_x : Nominal axial stress, in N/mm², acting on the stiffener with its attached plating.

- For FE analysis, σ_x is the FE corrected stress as defined in [2.3.6] in the attached plating in the direction of the stiffener axis.
- For prescriptive assessment, σ_x is the axial stress calculated according to Ch 8, Sec 3, [2.2.1] at load calculation point of the stiffener, as defined in Ch 3, Sec 7, [3].
- For grillage beam analysis, σ_x is the stress acting along the x-axis of the attached buckling panel.

R_{eH} : Specified minimum yield stress of the material, in N/mm²:

$R_{eH} = R_{eH\_S}$ for stiffener induced failure (*SI*).

$R_{eH} = R_{eH\_P}$ for plate induced failure (*PI*).

σ_b : Bending stress in the stiffener, in N/mm²:

$$\sigma_b = \frac{M_0 + M_1}{1000Z}$$

Z : Net section modulus of stiffener, in cm³, including effective width of plating according to [2.3.5], to be taken as:

- The section modulus calculated at the top of stiffener flange for stiffener induced failure (*SI*).
- The section modulus calculated at the attached plating for plate induced failure (*PI*).

C_{PI} : Plate induced failure pressure coefficient:

$C_{PI} = 1$ if the lateral pressure is applied on the side opposite to the stiffener.

$C_{PI} = -1$ if the lateral pressure is applied on the same side as the stiffener.

C_{SI} : Stiffener induced failure pressure coefficient:

$C_{SI} = -1$ if the lateral pressure is applied on the side opposite to the stiffener.

$C_{SI} = 1$ if the lateral pressure is applied on the same side as the stiffener.

M_1 : Bending moment, in Nmm, due to the lateral load P:

$$M_1 = C_i \frac{|P| s \ell^2}{24 \times 10^3} \quad \text{for continuous stiffener}$$

$$M_1 = C_i \frac{|P| s \ell^2}{8 \times 10^3} \quad \text{for sniped stiffener}$$

P : Lateral load, in kN/m².

- For FE analysis, P is the average pressure as defined in Ch 8, Sec 4, [2.5.2] in the attached plating.
- For prescriptive assessment, P is the pressure calculated at load calculation point of the stiffener, as defined in Ch 3, Sec 7, [3].

C_i : Pressure coefficient:

$C_i = C_{SI}$ for stiffener induced failure (*SI*).

$C_i = C_{PI}$ for plate induced failure (*PI*).

M_0 : Bending moment, in Nmm, due to the lateral deformation w of stiffener:

$$M_0 = F_E \left(\frac{P_z\, w}{c_f - P_z} \right) \quad \text{with} \quad c_f - P_z > 0$$

F_E : Ideal elastic buckling force of the stiffener, in N.

$$F_E = \left(\frac{\pi}{\ell} \right)^2 E\, I\, 10^4$$

I : Moment of inertia, in cm^4, of the stiffener including effective width of attached plating according to [2.3.5]. I is to comply with the following requirement:

$$I \geq \frac{s\, t_p^3}{12 \times 10^4}$$

t_p : Net thickness of plate, in mm, to be taken as

- For prescriptive requirements: the mean thickness of the two attached plating panels,
- For FE analysis: the thickness of the considered EPP on one side of the stiffener.

P_z : Nominal lateral load, in N/mm^2, acting on the stiffener due to stresses, σ_x, σ_y and τ, in the attached plating in way of the stiffener mid span:

$$P_z = \frac{t_p}{s} \left(\sigma_{xl} \left(\frac{\pi\, s}{\ell} \right)^2 + 2c\, \gamma\, \sigma_y + \sqrt{2} \tau_1 \right)$$

$$\sigma_{xl} = \gamma\, \sigma_x \left(1 + \frac{A_s}{s t_p} \right) \quad \text{but not less than 0}$$

$$\tau_1 = \gamma |\tau| - t_p \sqrt{R_{eH\_p}\, E \left(\frac{m_1}{a^2} + \frac{m_2}{b^2} \right)} \quad \text{but not less than 0}$$

σ_y : Stress applied on the edge along y axis of the buckling panel, in N/mm^2, but not less than 0.

- For FE analysis, σ_y is the FE corrected stress as defined in [2.3.6] in the attached plating in the direction perpendicular to the stiffener axis.
- For prescriptive assessment, σ_y is the maximum compressive stress calculated according to Ch 8, Sec 3, [2.2.1], at load calculation points of the stiffener attached plating, as defined in Ch 3, Sec 7, [2].
- For grillage beam analysis, σ_y is the stress acting along the y-axis of the attached buckling panel.

τ : Applied shear stress, in N/mm^2.

- For FE analysis, τ is the reference shear stress as defined in Ch 8, Sec 4, [2.4.2] in the attached plating.
- For prescriptive assessment, τ is the shear stress calculated according to Ch 8, Sec 3, [2.2.1] at load calculation point of the stiffener attached plating, as defined in Ch 3, Sec 7, [2].
- For grillage beam analysis, $\tau = 0$ in the attached buckling panel.

m_1, m_2 : Coefficients taken equal to:

$m_1 = 1.47,\ m_2 = 0.49$ for $\alpha \geq 2$

$m_1 = 1.96,\ m_2 = 0.37$ for $\alpha < 2$

c : Factor taking into account the stresses in the attached plating acting perpendicular to the stiffener's axis:

$$c = 0.5(1+\psi) \quad \text{for} \quad 0 \leq \psi \leq 1$$

$$c = \frac{1}{2(1-\psi)} \quad \text{for} \quad \psi < 0$$

ψ : Edge stress ratio for case 2 according to Table 3.

w : Deformation of stiffener, in mm:

$$w = w_0 + w_1$$

w_0 : Assumed imperfection, in mm, to be taken as:

$w_0 = \ell / 1000$ in general.

$w_0 = -w_{na}$ for stiffeners sniped at both ends considering stiffener induced failure (*SI*).

$w_0 = w_{na}$ for stiffeners sniped at both ends considering plate induced failure (*PI*).

$w_{na:}$: Distance from the mid-point of attached plating to the neutral axis of the stiffener calculated with the effective width of the attached plating according to [2.3.5].

w_1 : Deformation of stiffener, in mm, at mid-point of stiffener span due to lateral load P. In case of uniformly distributed load, w_1 is to be taken as:

$$w_1 = C_i \frac{|P| s \ell^4}{384 \times 10^7\ EI} \quad \text{in general}$$

$$w_1 = C_i \frac{5|P| s \ell^4}{384 \times 10^7\ EI} \quad \text{for stiffeners sniped at both ends}$$

c_f : Elastic support provided by the stiffener, in N/mm^2:

$$c_f = F_E \left(\frac{\pi}{\ell}\right)^2 (1 + c_p)$$

$$c_p = \frac{1}{1 + \dfrac{0.91}{c_{xa}}\left(\dfrac{12I}{st_p^3}10^4 - 1\right)}$$

c_{xa} : Coefficient to be taken as:

$$c_{xa} = \left(\frac{\ell}{2s} + \frac{2s}{\ell}\right)^2 \quad \text{for} \quad \ell \geq 2s$$

$$c_{xa} = \left(1 + \left(\frac{\ell}{2s}\right)^2\right)^2 \quad \text{for} \quad \ell < 2s$$

σ_w : Stress due to torsional deformation, in N/mm^2, to be taken as:

$$\sigma_w = Ey_w\left(\frac{t_f}{2} + h_w\right)\Phi_0\left(\frac{\pi}{\ell}\right)^2\left(\frac{1}{1 - \dfrac{0.4R_{eH\_S}}{\sigma_{ET}}} - 1\right) \quad \text{for stiffener induced failure } (SI).$$

$$\sigma_w = 0 \quad \text{for plate induced failure } (PI).$$

y_w : Distance, in mm, from centroid of stiffener cross section to the free edge of stiffener flange, to be taken as:

$$y_w = \frac{t_w}{2} \quad \text{for flat bar.}$$

$$y_w = b_f - \frac{h_w t_w^2 + t_f b_f^2}{2A_s} \quad \text{for angle and bulb profiles.}$$

$$y_w = \frac{b_f}{2} \quad \text{for T profile.}$$

Φ_0 : Coefficient taken as:

$$\Phi_0 = \frac{\ell}{h_w} 10^{-3}$$

σ_{ET} : Reference stress for torsional buckling, in N/mm²:

$$\sigma_{ET} = \frac{E}{I_P}\left(\frac{\varepsilon \pi^2 I_\omega 10^2}{\ell^2} + 0.385 I_T\right)$$

I_P : Net polar moment of inertia of the stiffener, in cm⁴, about point C as shown in Figure 1, as defined in Table 5.

I_T : Net St. Venant's moment of inertia of the stiffener, in cm⁴, as defined in Table 5.

I_ω : Net sectional moment of inertia of the stiffener, in cm⁶, about point C as shown in Figure 1, as defined in Table 5.

ε : Degree of fixation.

$$\varepsilon = 1 + \frac{\left(\frac{\ell}{\pi}\right)^2 10^{-3}}{\sqrt{I_\omega\left(\frac{0.75s}{t_p^3} + \frac{e_f - 0.5t_f}{t_w^3}\right)}}$$

A_w : Net web area, in mm².

A_f : Net flange area, in mm².

Table 5 : Moments of inertia

	Flat bars (1)	Bulb, angle and T profiles
I_P	$\frac{h_w^3 t_w}{3\times10^4}$	$\left(\frac{A_w (e_f - 0.5t_f)^2}{3} + A_f e_f^2\right) 10^{-4}$
I_T	$\frac{h_w t_w^3}{3\times10^4}\left(1 - 0.63\frac{t_w}{h_w}\right)$	$\frac{(e_f - 0.5t_f) t_w^3}{3\times10^4}\left(1 - 0.63\frac{t_w}{e_f - 0.5t_f}\right) + \frac{b_f t_f^3}{3\cdot10^4}\left(1 - 0.63\frac{t_f}{b_f}\right)$
I_ω	$\frac{h_w^3 t_w^3}{36\times10^6}$	$\frac{A_f e_f^2 b_f^2}{12\times10^6}\left(\frac{A_f + 2.6A_w}{A_f + A_w}\right)$ for bulb and angle profiles. $\frac{b_f^3 t_f e_f^2}{12\times10^6}$ for T profiles.
(1)	t_w is the net web thickness, in mm. t_{w_red} as defined in [2.3.2] is not to be used in this table.	

2.3.5 Effective width of attached plating

The effective breadth of attached plating of stiffeners, b_{eff}, in mm, is to be taken as:

- For $\sigma_x > 0$:
  - For FE analysis,

    $$b_{eff} = min\ (C_x\ b, \chi_s\ s)$$

  - For prescriptive assessment,

    $$b_{eff} = min\left(\frac{C_{x1}\ b_1 + C_{x2}\ b_2}{2}, \chi_s\ s\right)$$

- For $\sigma_x \le 0$:
  - $b_{eff} = \chi_s\ s$

where:

χ_s : Effective breadth coefficient to be taken as:

$$\chi_s = min\left[\frac{1.12}{1 + \frac{1.75}{\left(\frac{\ell_{eff}}{s}\right)^{1.6}}};1.0\right] \quad \text{for} \quad \frac{\ell_{eff}}{s} \ge 1$$

$$\chi_s = 0.407\frac{\ell_{eff}}{s} \quad \text{for} \quad \frac{\ell_{eff}}{s} < 1$$

ℓ_{eff} : Effective length of the stiffener, in mm, taken as:

$\ell_{eff} = \frac{\ell}{\sqrt{3}}$ for stiffener fixed at both ends.

$\ell_{eff} = 0.75\ell$ for stiffener simply supported at one end and fixed at the other.

$\ell_{eff} = \ell$ for stiffener simply supported at both ends.

2.3.6 FE corrected stresses for stiffener capacity

When the reference stresses σ_x and σ_y obtained by FE analysis according to Ch 8, Sec 4, [2.4] are both compressive, they are to be corrected according to the following formulae:

- If $\sigma_x < \nu\sigma_y$:

  $$\sigma_{xcor} = 0$$

  $$\sigma_{ycor} = \sigma_y$$

- If $\sigma_y < \nu\sigma_x$:

  $$\sigma_{xcor} = \sigma_x$$

  $$\sigma_{ycor} = 0$$

- In the other cases:

  $$\sigma_{xcor} = \sigma_x - \nu\sigma_y$$

  $$\sigma_{ycor} = \sigma_y - \nu\sigma_x$$

2.4 Primary supporting members

2.4.1 Web plate in way of openings

The web plate of primary supporting members with openings is to be assessed for buckling based on the combined axial compressive and shear stresses.

The web plate adjacent to the opening on both sides is to be considered as individual unstiffened plate panels as shown in Table 6.

The interaction formula of [2.2.1] is to be used with:

- $\sigma_x = \sigma_{av}$
- $\sigma_y = 0$
- $\tau = \tau_{av}$

where:

σ_{av} : Weighted average compressive stress in the area of web plate being considered according to case 1, 2 or 3 in Table 3, in N/mm^2.

τ_{av} : Weighted average shear stress in the area of web plate being considered according to case 11 or 13 in Table 3, in N/mm^2.

For the application of the Table 6, the weighted average shear stress is to be taken as:

- Opening modelled in primary supporting members:
  - Configuration a) when using case 13:
    - In *P1* : $\tau_{av} = \tau_{av}(P1)\ (h-h_0)/h$
    - In *P2*: $\tau_{av} = \tau_{av}(P2)\ (h-h_0)/h$
  - Configuration b) when using case 11:
    - In *P1*: $\tau_{av} = \tau_{av}(P1)$
    - In *P2*: $\tau_{av} = \tau_{av}(P2)$
  - Configuration c):
    - In *P1* when using case 13: $\tau_{av} = \tau_{av}(P1)\ (h-h_0)/h$
    - In *P2* when using case 13: $\tau_{av} = \tau_{av}(P2)\ (h-h_0)/h$
    - In *P3* when using case 11: $\tau_{av} = \tau_{av}(P3)$
- Opening not modelled in primary supporting members:
  - Configuration a) when using case 13:
    - $\tau_{av} = \tau_{av}(\text{web})$
  - Configuration b) when using case 11:
    - In *P1*: $\tau_{av} = \tau_{av}(P1)\ h/(h-h_0)$
    - In *P2*: $\tau_{av} = \tau_{av}(P2)\ h/(h-h_0)$
  - Configuration c):
    - In *P1* when using case 13: $\tau_{av} = \tau_{av}(\text{web})$
    - In *P2* when using case 13: $\tau_{av} = \tau_{av}(\text{web})$
    - In *P3* when using case 11: $\tau_{av} = \tau_{av}(P3)\ h/(h-h_0)$

where:

h : Height, in m, of the web of the primary supporting member in way of the opening.

h_0 : Height in m, of the opening measured in the depth of the web.

$\tau_{av}(P1)$, $\tau_{av}(P2)$, $\tau_{av}(P3)$: Weighted average shear stress, in N/mm^2, within the areas *P1*, *P2* and *P3*, as shown in Table 6.

τ_{av}(web): Weighted average shear stress, in N/mm^2, in the area of the web marked with a dash rectangular shape, as shown in Table 6.

2.4.2 Reduction factors of web plate in way of openings

The reduction factors, C_x or C_y in combination with, C_τ of the plate panel(s) of the web adjacent to the opening is to be taken as shown in Table 6.

2.4.3

The equivalent plate panel of web plate of primary supporting members crossed by perpendicular stiffeners is to be idealised as shown in Figure 2.

3 Other Structures

3.1 Struts, pillars and cross ties

3.1.1 Buckling utilisation factor

The buckling utilisation factor, η, for axially compressed struts, pillars and cross ties is to be taken as:

$$\eta = \frac{\sigma_{av}}{\sigma_{cr}}$$

where:

σ_{av} : Average axial compressive stress in the member, in N/mm^2.

σ_{cr} : Minimum critical buckling stress, in N/mm^2, taken as:

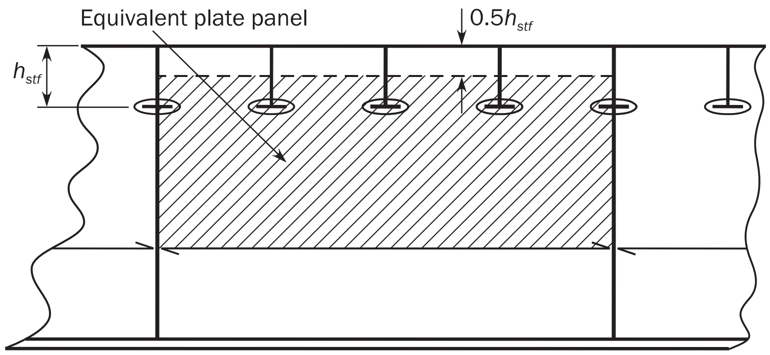
$$\sigma_{cr} = \sigma_E \quad \text{for} \quad \sigma_E \le 0.5 R_{eH\_S}$$

$$\sigma_{cr} = \left(1 - \frac{R_{eH\_S}}{4\sigma_E}\right) R_{eH\_S} \quad \text{for} \quad \sigma_E > 0.5 R_{eH\_S}$$

σ_E : Minimum elastic compressive buckling stress, in N/mm^2, according to [3.1.2] to [3.1.4].

R_{eH_S} : Specified minimum yield stress of the considered member, in N/mm^2. For built up members, the lowest specified minimum yield stress is to be used.

Figure 2 : Web plate idealisation



The correction of panel breadth is applicable also for other slot configurations provided that the web or collar plate is attached to at least one side of the passing stiffener.

Table 6 : Reduction factors

Configuration	C_x, C_y	C_τ
(a) Without edge reinforcements: 	Separate reduction factors are to be applied to areas *P1* and *P2* using case 3 in Table 3, with edge stress ratio: $\psi = 1.0$	A common reduction factor is to be applied to areas *P1* and *P2* using case 13 in Table 3 for area marked: (b) With edge reinforcements: 	Separate reduction factors are to be applied for areas *P1* and *P2* using C_x for case 1 or C_y for case 2 in Table 3 with stress ratio: $\psi = 1.0$	Separate reduction factors are to be applied for areas *P1* and *P2* using case 11 in Table 3.
(c) Example of hole in web: 	Panels *P1* and *P2* are to be evaluated in accordance with (a). Panel *P3* is to be evaluated in accordance with (b).	
Note 1: Web panels to be considered for buckling in way of openings are shown shaded and numbered *P1*, *P2*, etc.		

3.1.2 Elastic column buckling stress

The elastic compressive column buckling stress, σ_{EC}, in N/mm^2 of members subject to axial compression is to be taken as:

$$\sigma_{EC} = \pi^2 E f_{end} \frac{I}{A\, \ell_{pill}^2} 10^{-4}$$

where:

I : Net moment of inertia about the weakest axis of the cross section, in cm^4.

A : Net cross sectional area of the member, in cm^2.

ℓ_{pill} : Length of the member, in m, taken as:

- For pillar and strut: unsupported length of the member
- For cross tie:
  - In centre tank: distance between the flanges of longitudinal stiffeners on the starboard and port longitudinal bulkheads to which the cross tie's horizontal stringer is attached.
  - In wing tank: distance between the flanges of longitudinal stiffeners on the longitudinal bulkhead to which the cross tie's horizontal stringer is attached, and the inner hull plating.

f_{end} : End constraint factor, taken as:

- For pillar and strut:
  - f_{end} = 1.0 where both ends are simply supported.
  - f_{end} = 2.0 where one end is simply supported and the other end is fixed.
  - f_{end} = 4.0 where both ends are fixed.
- For cross tie:
  - f_{end} = 2.0

A pillar end may be considered fixed when brackets of adequate size are fitted. Such brackets are to be supported by structural members with greater bending stiffness than the pillar.

3.1.3 Elastic torsional buckling stress

The elastic torsional buckling stress, σ_{ET}, in N/mm^2, with respect to axial compression of members is to be taken as:

$$\sigma_{ET} = \frac{GI_{sv}}{I_{pol}} + \frac{\pi^2 f_{end} Ec_{warp}}{I_{pol}\ \ell_{pill}^2} 10^{-4}$$

where:

I_{sv} : Net St. Venant's moment of inertia, in cm^4, see Table 7 for examples of cross sections.

I_{pol} : Net polar moment of inertia about the shear centre of cross section, in cm^4

$$I_{pol} = I_y + I_z + A\ (y_0^2 + z_0^2)$$

c_{warp} : Warping constant, in cm^6, see Table 7 for examples of cross sections.

ℓ_{pill} : Length of the member, in m as defined in [3.1.2].

y_0 : Transverse position of shear centre relative to the cross sectional centroid, in cm, see Table 7 for examples of cross sections.

z_0 : Vertical position of shear centre relative to the cross sectional centroid, in cm, see Table 7 for examples of cross sections.

A : Net cross sectional area, in cm^2, as defined in [3.1.2]

I_y : Net moment of inertia about y axis, in cm^4.

I_z : Net moment of inertia about z axis, in cm^4.

3.1.4 Elastic torsional/column buckling stress

For cross sections where the centroid and the shear centre do not coincide, the interaction between the torsional and column buckling mode is to be examined. The elastic torsional/column buckling stress, σ_{ETF}, with respect to axial compression is to be taken as:

$$\sigma_{ETF} = \frac{1}{2\zeta}\left[(\sigma_{EC}+\sigma_{ET}) - \sqrt{(\sigma_{EC}+\sigma_{ET})^2 - 4\zeta\,\sigma_{EC}\,\sigma_{ET}}\right]$$

where:

ζ : Coefficient taken as:

$$\zeta = 1 - \frac{(y_0^2 + z_0^2)\,A}{I_{pol}}$$

y_0 : Transverse position of shear centre relative to the cross sectional centroid, in cm, as defined in [3.1.3].

z_0 : Vertical position of shear centre relative to the cross sectional centroid, in cm, as defined in [3.1.3].

A : Net cross sectional area, in cm^2, as defined in [3.1.2].

I_{pol} : Net polar moment of inertia about the shear centre of cross section, in cm^4 as defined in [3.1.3].

σ_{EC} : Elastic column compressive buckling stress, as defined in [3.1.2].

σ_{ET} : Elastic torsional buckling stress, as defined in [3.1.3].

3.2 Corrugated bulkhead

3.2.1

The buckling utilisation factor of flange and web of corrugation of corrugated bulkheads is based on the combination of in plane stresses and shear stress.

The interaction curve of [2.2.1] is to be used with the following coefficients:

- $\alpha = 2$
- $\psi_x = \psi_y = 1$

Table 7 : Cross sectional properties

	$I_{sv} = \frac{1}{3}\,(2b_f\,t_f^3 + d_{wt}\,t_w^3)\;10^{-4}$	cm^4
	$c_{warp} = \frac{d_{wt}^2\,b_f^3\,t_f}{24}\;10^{-6}$	cm^6
	$I_{sv} = \frac{1}{3}\,(b_f\,t_f^3 + d_{wt}\,t_w^3)\;10^{-4}$	cm^4
	$y_0 = 0$	cm
	$z_0 = -\frac{0.5d_{wt}^2\,t_w}{d_{wt}\,t_w + b_f\,t_f}\;10^{-1}$	cm
	$c_{warp} = \frac{b_f^3\,t_f^3 + 4d_{wt}^3\,t_w^3}{144}\;10^{-6}$	cm^6
	$I_{sv-n50} = \frac{1}{3}\,(b_{fu}\,t_f^3 + 2d_{wt}\,t_w^3)\;10^{-4}$	cm^4
	$y_0 = 0$	cm
	$z_0 = -\frac{d_{wt}^2\,t_w\,10^{-1}}{2d_{wt}\,t_w + b_f\,t_f} - \frac{0.5d_{wt}^2\,t_w\,10^{-1}}{d_{wt}\,t_w + b_{fu}\,t_f/6}$	cm
	$c_{warp} = \frac{b_{fu}^2\,d_{wt}^3\,t_w\,(3d_{wt}\,t_w + 2b_{fu}\,t_f)}{12(6d_{wt}\,t_w + b_{fu}\,t_f)}\;10^{-6}$	cm^6
	$I_{sv} = \frac{1}{3}\,(b_{f1}\,t_{f1}^3 + 2b_{f2}\,t_{f2}^3 + b_{f3}\,t_{f3}^3 + d_{wt}\,t_w^3)\;10^{-4}$	cm^4
	$y_0 = 0$	cm
	$z_0 = z_s - \frac{(b_{f3}\,d_{wt}\,t_{f3} + 0.5d_{wt}^2\,t_w)\;10^{-1}}{d_{wt}\,t_w + b_{f1}\,t_{f1} + 2b_{f2}\,t_{f2} + b_{f3}\,t_{f3}}$	cm
	$c_{warp} = \left(I_{f1}\,z_s^2 + \frac{I_{f2}\,b_{f1}^2}{200} + I_{f3}\left(\frac{d_{wt}}{10} - z_s\right)^2\right)$	cm^6
	$I_{f1} = \left(\frac{(b_{f1} - t_{f2})^3\,t_{f1}}{12} + \frac{b_{f2}\,t_{f2}\,b_{f1}^2}{2}\right)\;10^{-4}$	cm^4
	$I_{f2} = \frac{b_{f2}^3\,t_{f2}}{12}\;10^{-4}$	cm^4
	$I_{f3} = \frac{b_{f3}^3\,t_{f3}}{12}\;10^{-4}$	cm^4
	$z_s = \frac{I_{f3}\,d_{wt}}{I_{f1} + I_{f3}}\;10^{-1}$	cm

Note 1: All dimensions are in mm.

Note 2: Cross sectional properties are given for typical cross sections. Properties for other cross sections are to be determined by direct calculation.

APPENDIX 1
STRESS BASED REFERENCE STRESSES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

a : Length, in mm, of the longer side of the plate panel as defined in Sec 5.

b : Length, in mm, of the shorter side of the plate panel as defined in Sec 5.

A_i : Area, in mm^2, of the *i*-th plate element of the buckling panel.

n : Number of plate elements in the buckling panel.

σ_{xi} : Actual stress, in N/mm^2, at the centroid of the *i*-th plate element in x direction, applied along the shorter edge of the buckling panel.

σ_{yi} : Actual stress, in N/mm^2, at the centroid of the *i*-th plate element in y direction, applied along the longer edge of the buckling panel.

ψ : Edge stress ratio as defined in Sec 5.

τ_i : Actual membrane shear stress, in N/mm^2, at the centroid of the *i*-th plate element of the buckling panel.

1 STRESS BASED METHOD

1.1 Introduction

1.1.1

This section provides a method to determine stress distribution along edges of the considered buckling panel by 2nd order polynomial curve, by linear distribution using least square method and by weighted average approach. This method is called Stress based Method.

The reference stress is the stress components at centre of plate element transferred into the local system of the considered buckling panel.

1.1.2 Definition

A regular panel is a plate panel of rectangular shape. An irregular panel is plate panel which is not regular, as detailed in Ch 8, Sec 4, [2.3.1].

1.2 Stress application

1.2.1 Regular panel

The reference stresses are to be taken as defined in [2.1] for a regular panel when the following conditions are satisfied:

- At least, one plate element centre is located in each third part of the long edge *a* of a regular panel and
- This element centre is located at a distance in the panel local x direction not less than *a*/4 to at least one of the element centres in the adjacent third part of the panel.

Otherwise, the reference stresses are to be taken as defined in [2.2] for an irregular panel.

1.2.2 Irregular panel

The reference stresses of an irregular panel are to be taken as defined in [2.2].

2 REFERENCE STRESSES

2.1 Regular Panel

2.1.1 Longitudinal stress

The longitudinal stress σ_x applied on the shorter edge of the buckling panel is to be calculated as follows:

- For plate buckling assessment, the distribution of σ_x(x) is assumed as 2nd order polynomial curve as:

$$\sigma_x(x) = C \cdot x^2 + D \cdot x + E$$

The best fitting curve $\sigma_x(x)$ is to be obtained by minimising the square error Π considering the area of each element as a weighting factor.

$$\Pi = \sum_{i=1}^{n} A_i[\sigma_{ix} - (Cx_i^2 + Dx_i + E)]^2$$

The unknown coefficients *C*, *D* and *E* must yield zero first derivatives, $\partial\Pi$ with respect to *C*,*D* and *E* respectively.

$$\begin{cases} \dfrac{\partial\Pi}{\partial C} = 2\displaystyle\sum_{i=1}^{n} A_i x_i^2[\sigma_{ix} - (Cx_i^2 + Dx_i + E)] = 0 \\ \dfrac{\partial\Pi}{\partial D} = 2\displaystyle\sum_{i=1}^{n} A_i x_i[\sigma_{ix} - (Cx_i^2 + Dx_i + E)] = 0 \\ \dfrac{\partial\Pi}{\partial E} = 2\displaystyle\sum_{i=1}^{n} A_i[\sigma_{ix} - (Cx_i^2 + Dx_i + E)] = 0 \end{cases}$$

The unknown coefficients *C*, *D* and *E* can be obtained by solving the 3 above equations.

$$\sigma_{x1} = \frac{1}{b}\int_0^b \sigma_x(x)dx = \frac{b^2}{3}C + \frac{b}{2}D + E$$

$$\sigma_{x2} = \frac{1}{b}\int_{a-b}^{a} \sigma_x(x)dx = \left(a^2 - ab + \frac{b^2}{3}\right)C + \left(a - \frac{b}{2}\right)D + E$$

If $-D/2C < b/2$ or $-D/2C > a-b/2$, σ_{x3} is to be ignored. Otherwise, σ_{x3} is taken as:

$$\sigma_{x3} = \frac{1}{b}\int_{xmin}^{xmax} \sigma_x(x)dx = \frac{b^2}{12}C - \frac{D^2}{4C} + E$$

where:

$$x_{min} = -\frac{b}{2} - \frac{D}{2C}$$

$$x_{max} = \frac{b}{2} - \frac{D}{2C}$$

The longitudinal stress is to be taken as:

$$\sigma_x = max(\sigma_{x1};\sigma_{x2};\sigma_{x3})$$

The edge stress ratio is to be taken as:

$$\psi_x = 1$$

- For stiffener buckling assessment, $\sigma_x(x)$ applied on the shorter edge of the attached plate is to be taken as:

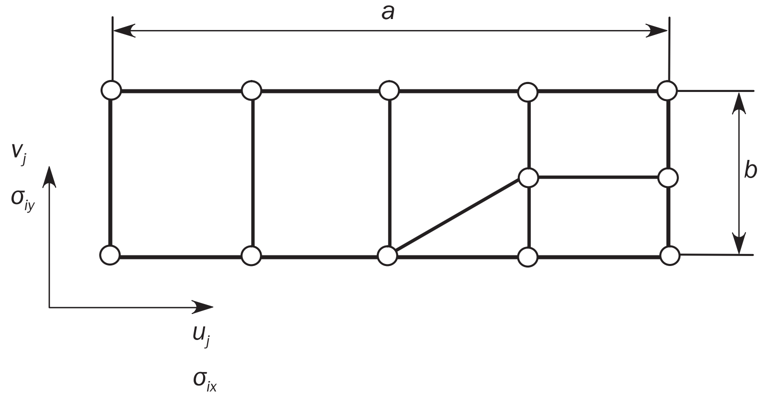
$$\sigma_x = \frac{\sum_{1}^{n} A_i \, \sigma_{xi}}{\sum_{1}^{n} A_i}$$

The edge stress ratio ψ_x for the stress σ_x is equal to 1.0.

2.1.2 Transverse stress

The transverse stress σ_y applied along the longer edges of the buckling panel is to be calculated by extrapolation of the transverse stresses of all elements up to the shorter edges of the considered buckling panel.

Figure 1 : Buckling panel



The distribution of $\sigma_y(x)$ is assumed as straight line. Therefore:

$$\sigma_y(x) = A + Bx$$

The best fitting curve $\sigma_y(x)$ is to be obtained by the least square method minimising the square error Π considering area of each element as a weighting factor.

$$\Pi = \sum_{i=1}^{n} A_i \, [\sigma_{iy} - (A + Bx_i)]^2$$

The unknown coefficients C and D must yield zero first partial derivatives, $\partial\Pi$ with respect to C and D, respectively.

$$\begin{cases} \dfrac{\partial\Pi}{\partial A} = 2\sum_{i=1}^{n} A_i \, [\sigma_{iy} - (A + Bx_i)] = 0 \\ \dfrac{\partial\Pi}{\partial B} = 2\sum_{i=1}^{n} A_i \, x_i \, [\sigma_{iy} - (A + Bx_i)] = 0 \end{cases}$$

The unknown coefficients A and B are obtained by solving the 2 above equations and are given as follow:

$$\begin{cases} A = \dfrac{\left(\sum_{i=1}^{n} A_i \, \sigma_{iy}\right)\left(\sum_{i=1}^{n} A_i \, x_i^2\right) - \left(\sum_{i=1}^{n} A_i \, x_i\right)\left(\sum_{i=1}^{n} A_i \, x_i \, \sigma_{iy}\right)}{\left(\sum_{i=1}^{n} A_i\right)\left(\sum_{i=1}^{n} A_i \, x_i^2\right) - \left(\sum_{i=1}^{n} A_i \, x_i\right)^2} \\ B = \dfrac{\left(\sum_{i=1}^{n} A_i\right)\left(\sum_{i=1}^{n} A_i \, x_i \, \sigma_{iy}\right) - \left(\sum_{i=1}^{n} A_i \, x_i\right)\left(\sum_{i=1}^{n} A_i \, \sigma_{iy}\right)}{\left(\sum_{i=1}^{n} A_i\right)\left(\sum_{i=1}^{n} A_i \, x_i^2\right) - \left(\sum_{i=1}^{n} A_i \, x_i\right)^2} \end{cases}$$

$$\sigma_y = max \; (A, A + Ba)$$

$$\psi_y = \frac{min \; (A, A + Ba)}{max \; (A, A + Ba)} \quad \text{for } \sigma_y \geq 0$$

$$\psi_y = 1 \quad \text{for } \sigma_y < 0$$

2.1.3 Shear stress

The shear stress τ is to be calculated using a weighted average approach, and is to be taken as:

$$\tau = \frac{\sum_{1}^{n} A_i \, \tau_i}{\sum_{1}^{n} A_i}$$

2.2 Irregular panel

2.2.1 Reference stresses

The longitudinal, transverse and shear stresses are to be calculated using a weighted average approach. They are to be taken as:

$$\sigma_x = \frac{\sum_{1}^{n} A_i \, \sigma_{xi}}{\sum_{1}^{n} A_i}$$

$$\sigma_y = \frac{\sum_{1}^{n} A_i \, \sigma_{yi}}{\sum_{1}^{n} A_i}$$

$$\tau = \frac{\sum_{1}^{n} A_i \tau_i}{\sum_{1}^{n} A_i}$$

The edge stress ratios are to be taken as:

$$\psi_x = 1$$

$$\psi_y = 1$$

PART 1 CHAPTER 9

FATIGUE

Table of Contents

SECTION 6
Detail Design Standard

SECTION 1
GENERAL CONSIDERATIONS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

T_{DF} : Design fatigue life, in year, specified by the designer, but not to be taken less than 25 years.

1 RULE APPLICATION FOR FATIGUE REQUIREMENTS

1.1 Scope

1.1.1 General

This chapter provides requirements applicable to ships having rule length *L* between 150 m and 500 m to evaluate fatigue strength of the ship's structural details considering an operation time in North Atlantic environment equal to the design fatigue life, T_{DF}.

1.1.2 Assessed area

Fatigue assessment is performed for structural details located in the ship's cargo hold region in order to prevent the following types of fatigue failure:

- Fatigue cracks initiating from the toe of the weld and propagating into the plate.
- Fatigue cracks initiating from free edge of non-welded details.

1.1.3 Structural details to be assessed

The structural details required for fatigue assessment are given in Ch 9, Sec 2:

- Structural details to be checked are listed in:
    - Ch 9, Sec 2, [1] for simplified stress analysis according to Ch 9, Sec 4, or
    - Ch 9, Sec 2, [2] for finite element stress analysis according to Ch 9, Sec 5.
- Structural details to be checked by screening fatigue assessment are listed in Ch 9, Sec 2, Table 2.

Additional specific details may be requested to be checked on a case-by-case basis by the Society.

1.1.4 Detail design standard

Detail design standard given in Ch 9, Sec 6 provides welding requirement at critical structural details in order to prevent the following types of fatigue failure:

- Fatigue cracks initiating from the weld toe into the base material.
- Fatigue cracks initiating from the weld root and propagating into the plate section under the weld.
- Fatigue cracks initiating from the weld root and propagating through the weld throat.
- Fatigue cracks initiating from surface irregularity or notch at the free edge into the base material.

1.1.5 Material

The fatigue assessment is applicable for steel material with specified minimum yield stress less than or equal to 390 N/mm^2. For steel with specified minimum yield stress value higher than 390 N/mm^2 and for steels with improved fatigue performance, the S-N curves to be used are considered by the Society on a case-by-case basis.

1.1.6 Wave loads

Fatigue assessment is based on quasi-static wave loads.

1.1.7 Loads other than wave loads

Fatigue induced by low cycle loads such as cargo variations or impact loads such as sloshing in partially filled tanks which may induce fatigue damage is disregarded in this chapter.

2 DEFINITION

2.1 Hot spots

2.1.1

Hot spots are locations in the structure where fatigue cracks may initiate due to the combined effect of nominal structural stress fluctuation and stress raising effects due to the weld geometry or similar effects due to notch in the base material.

Hot spots may be located at:

- Weld toe.
- Weld root of partial penetration or fillet weld.
- Base material at free edge of plate.

2.2 Nominal stress

2.2.1

Nominal stress is the stress in a structural component taking into account macro-geometric effect but disregarding the stress concentration due to structural discontinuities and the presence of welds. Nominal stress is to be obtained either using coarse or fine mesh FE analysis, as required in Ch 9, Sec 5 or using analytical calculation based on beam theory, as required in Ch 9, Sec 4.

2.3 Hot spot stress

2.3.1

Hot spot stress is the stress at the weld toe taking into account the stress concentration due to structural discontinuities and presence of welded attachments but disregarding the non-linear stress peak caused by the notch at the weld toe. The hot spot stresses to be considered correspond to the two principal stresses on the surface plating at the weld toe. The first principal stress acts within ±45°, perpendicular to the weld and the second principal stress acts outside ±45°.

The hot spot stress is to be obtained by multiplying the nominal stress by a Stress Concentration Factor (SCF), according to Ch 9, Sec 4, [5] or directly by a very fine mesh FE analysis, according to Ch 9, Sec 5, [3] and Ch 9, Sec 5, [4].

2.4 Local stress at free edge

2.4.1

Local stress at free edge is the stress at the plate free edge derived using finite element analysis according to Ch 9, Sec 5, [3.2].

2.5 Fatigue stress

2.5.1

Fatigue stress is the stress relevant for fatigue assessment purpose, i.e.:

- Maximum of the two principal hot spot stress for weld toe with the mean stress effect and thickness effect corrections.
- Local stress at free edge with corrections due to the base material surface finishing, mean stress effect, thickness effect and material strength.

3 ASSUMPTIONS

3.1 General

3.1.1

The following assumptions are made in the fatigue assessment:

a) A linear cumulative damage model, i.e. Palmgren-Miner's Rule, given in Ch 9, Sec 3, [5], has been used in connection with the design S-N curves, given in Ch 9, Sec 3, [4].

b) Design fatigue life, T_{DF}, is taken not less than 25 years.

c) Rule quasi-static wave induced loads are based on North Atlantic wave environment. They are determined at 10^{-2} probability level of exceedance by the Equivalent Design Wave (EDW) concept.

d) Net thickness t_{n50} approach is used, according to [5].

e) Type of stress used for crack initiating at the weld toe is the hot spot stress. Type of stress used for crack initiating at free edge of non-welded details is local stress at free edge.

f) Fatigue stress range $\Delta\sigma_{FS}$ may be calculated by simplified stress analysis or by finite element stress analysis for details with more complex geometry.

g) Long term distribution of stress range of a structural detail is assumed to follow a two-parameter Weibull distribution. Weibull shape parameter ξ is equal to 1 and the fatigue stress range $\Delta\sigma_{FS}$ is given at the reference probability level of exceedance equal to 10^{-2}.

h) The acceptance criteria for fatigue checking are the total fatigue damage D to be less than 1 for the design fatigue life, as required in Ch 9, Sec 3, [2].

4 METHODOLOGY

4.1 Principles

4.1.1 General

Appropriate fatigue strength of structural details is ensured by use of:

- Detail design standards given in Ch 9, Sec 6, providing specific design requirements.
- Fatigue strength assessment by fatigue life calculation, based on three different methods for hot spot stress calculation: simplified stress analysis, very fine mesh finite element stress analysis and fatigue screening assessment.

4.2 Simplified stress analysis

4.2.1

Procedure based on simplified stress analysis, required in Ch 9, Sec 4, is used to determine the hot spot stress at weld toe of longitudinal stiffener end connections, given in Ch 9, Sec 2, [1.1].

Nominal stresses are calculated by using analytical method based on beam theory according to Ch 9, Sec 4, [3] and Ch 9, Sec 4, [4]. Hot spot stresses are obtained by multiplying nominal stresses by stress concentration factors (SCF) of the considered detail according to Ch 9, Sec 4, [5.2].

4.3 Finite element stress analysis

4.3.1

Procedure based on finite element stress analysis, required in Ch 9, Sec 5, is used to determine hot spot stress at weld toe of specified structural details, from very fine mesh models.

The hot spot stress is generally highly dependent on the finite element model used for representing the structure.

General procedure for the calculation of hot spot stress at weld toe for any welded details except for web stiffened cruciform joints is given in Ch 9, Sec 5, [3.1]. Procedure for the calculation of hot spot stress at the flange connections for web stiffened cruciform joints is given in Ch 9, Sec 5, [4]. Calculation of local stress for non-welded area is provided in Ch 9, Sec 5, [3.2].

A list of details for which the fatigue assessment is to be made through a compulsory very fine mesh finite element analysis or through the compliance with the design standard given in Ch 9, Sec 6 if a very fine mesh finite element analysis is omitted, is given respectively in Ch 9, Sec 2, Table 1 and Ch 9, Sec 2, Table 3.

4.4 Fatigue screening assessment

4.4.1

A fatigue screening procedure is used to assess the fatigue strength of specified structural details, given in Ch 9, Sec 2, [2.1.3]. The screening procedure is based on screening hot spot stress at weld toe of specified structural details determined by multiplying the stresses obtained from a local fine mesh finite element model, required in Ch 7, Sec 3, by stress magnification factor η of the considered detail, given in Ch 9, Sec 5, Table 2.

4.5 Fatigue design standards

4.5.1

Detail design standards given in Ch 9, Sec 6 are provided to ensure improved fatigue performance of critical structural details. Alternative detail design configurations may be accepted subject to demonstration of satisfactory fatigue performance.

5 CORROSION MODEL

5.1 Net thickness

5.1.1 General

The fatigue assessment should be performed based on net thicknesses according to Ch 3, Sec 2.

5.1.2 Stress correction

The hull girder stresses for simplified stress analysis and stresses calculated by FE analysis are to be corrected by multiplying the calculated stress by f_c, correction factor taken as:

$f_c = 0.95$

6 LOADING CONDITIONS

6.1 Description

6.1.1

Fatigue analyses are to be carried out for representative loading conditions according to the intended ship's operation as given in [6.2] and [6.3].

6.2 Loading conditions for oil tankers

6.2.1

The loading conditions to be considered for oil tankers and corresponding fraction of time for each loading condition, $\alpha_{(j)}$, are defined in Table 1. The standard loading conditions for fatigue assessment of oil tankers are provided in Ch 4, Sec 8, [5.1].

Table 1 : Fraction of time in each loading condition for oil tanker

Loading conditions	$\alpha_{(j)}$
Full Load condition (Homogeneous)	0.5
Normal ballast condition	0.5

6.3 Loading conditions for bulk carriers

6.3.1

The loading conditions to be considered for bulk carriers and corresponding fraction of time for each loading condition, $\alpha_{(j)}$, are defined respectively in Table 2 and Table 3 depending on the ship's type (BC-A, BC-B, BC-C). The standard loading conditions for fatigue assessment of bulk carriers are provided in Ch 4, Sec 8, [5.2].

7 LOAD CASES

7.1 Assumptions

7.1.1

The load cases to be considered for fatigue assessment are given in Ch 4, Sec 2, [3].

The design load scenario for fatigue assessment is defined in Ch 4, Sec 7, Table 3.

For each loading condition defined in [6], all fatigue load cases are to be considered to generate the combination of dynamic loads for fatigue assessment

7.1.2 Predominant load case

The predominant load case for each loading condition (j) is defined as load case where the fatigue stress range for the critical location is the maximum among all fatigue load cases.

Table 2 : Loading conditions for bulk carriers

Ship type	Full load condition		Ballast condition	
	Homogeneous	Alternate	Normal ballast	Heavy ballast
BC-A	X	X	X	X
BC-B	X	-	X	X
BC-C	X	-	X	X

Table 3 : Fraction of time for each loading condition of bulk carriers

Ship length	Loading conditions	$\alpha_{(j)}$	
		BC-A	BC-B, BC-C
L < 200 m	Homogeneous	0.60	0.70
	Alternate	0.10	-
	Normal ballast	0.15	0.15
	Heavy ballast	0.15	0.15
$L \geq$ 200 m	Homogeneous	0.25	0.50
	Alternate	0.25	-
	Normal ballast	0.20	0.20
	Heavy ballast	0.30	0.30

SECTION 2
STRUCTURAL DETAILS TO BE ASSESSED

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

EA : Empty cargo hold in alternate loading condition.

FA : Full cargo hold in alternate loading condition.

1 SIMPLIFIED STRESS ANALYSIS

1.1 Structural details to be assessed

1.1.1

Critical structural details to be checked over the full extent of the cargo region for fatigue assessment by simplified stress analysis according to Ch 9, Sec 1 are:

- End connections of longitudinal stiffeners to transverse bulkheads, including swash bulkheads,
- End connections of longitudinal stiffeners to floors and web frames.

2 FINITE ELEMENT ANALYSIS

2.1 Structural details to be assessed

2.1.1 General

Critical structural details to be checked for fatigue by finite element analysis according to Ch 9, Sec 5 are given in [2.1.2] to [2.1.4].

Table 4 to Table 18 give the list of hot spots for structural details.

2.1.2 Details to be checked by very fine mesh analysis

Critical structural details to be assessed for fatigue by very fine mesh analysis according to Ch 9, Sec 5, [1] to Ch 9, Sec 5, [4] are provided in Table 1, irrespective of their compliance with the design standard given in Ch 9, Sec 6.

2.1.3 Details to be checked by screening fatigue assessment

The structural details listed in Table 2 for which FE fine mesh models have been analysed according to yielding requirements given in Ch 7, Sec 3 are to be assessed using the screening fatigue procedure as given in Ch 9, Sec 5, [6].

2.1.4 Details in accordance with detail design standard

Table 3 gives critical structural details for which fatigue assessment by very fine mesh analysis can be omitted if their design is in accordance with detail design standard given in Ch 9, Sec 6.

Table 1 : Structural details to be assessed by very fine mesh analysis

No	Critical detail	Applicability	
		Oil tanker	Bulk carrier
1	Welded lower hopper knuckle connection (intersection of hopper sloping plate, inner bottom plate, longitudinal girder, floor and transverse web) at the most critical frame location. (1)	One cargo tank (4)	Ballast hold
2	Radiused lower hopper knuckle connection (intersection of knuckled inner bottom plate, longitudinal girder, floor and transverse web) at the most critical frame location. (1)	One cargo tank (4)	Ballast hold
3	Welded upper knuckle connection (intersection of hopper sloping plate, inner hull longitudinal bulkhead, transverse web and side stringer) where the angle between hopper plate and inner hull longitudinal bulkhead is less than 130 deg, at the most critical frame location. (1)	One cargo tank (4)	Ballast hold of double side bulk carrier
4	Connections of transverse bulkhead lower stools to the inner bottom plating in way of double bottom girders. (2) (3)	One cargo tank (4)	Ballast hold
5	Upper side frame bracket toe in case of flat bottom of top wing tank. (1)	N/A	FA hold (4), EA hold (4) and ballast hold of single skin bulk carrier
6	Deck plating and longitudinal hatch coaming end bracket toe.	N/A	Two aftermost holds, midship hold and two foremost holds

(1) The most critical frame position is generally, but not necessarily, located closest to the mid length of the hold. Where a swash bulkhead is fitted, this is generally located closest to the mid length between the swash bulkhead and the oil-tight bulkhead.
(2) Stool connections at each end of the hold are to be checked unless these are symmetrical about mid-hold.
(3) Position at the mid breadth location of the largest hold.
(4) Cargo hold located closest to the midship.

Table 2 : Structural details for screening fatigue assessment

No	Critical detail	Applicability	
		Oil tanker	Bulk carrier
1	Bracket toe of transverse web frame	Applicable (1)	N/A
2	Toe of horizontal stringer	Applicable (1)	N/A
3	Lower hopper knuckle connection in EA hold (2) and in FA hold (2) not assigned as a ballast hold	N/A	Applicable (1)
4	Connections of transverse bulkhead lower stool to inner bottom in EA hold (2) and in FA hold (2) where the ballast hold is not assigned to the ship	N/A	Applicable (1)

(1) For details assessed by fine mesh analysis according to Ch 7, Sec 3, [2.1] and Ch 7, Sec 3, [3.3.2].
(2) Cargo hold located closest to the midship

Table 3 : Structural details to be assessed by very fine mesh analysis if not designed in accordance with detail design standard

No	Critical detail	Corresponding detail design standard	Applicability	
			Oil tanker	Bulk carrier
1	Radiused upper hopper knuckle connection (intersection of knuckled inner side plate, side girder and transverse web) at the most critical frame location. (1)	Ch 9, Sec 6, [4]	One cargo tank (4)	Ballast hold of double side bulk carrier
2	Corrugated transverse bulkhead to lower stool or inner bottom plating connection. (2) (3)	Ch 9, Sec 6, [6] and Ch 9, Sec 6, [7]	One cargo tank (4)	Ballast hold
3	Corrugated transverse bulkhead to upper stool. (2) (3)	Ch 9, Sec 6, [6]	N/A	Ballast hold
4	Cruciform heel connections between side stringers in double side and transverse bulkhead horizontal stringers, for the stringer closest to the mid depth and for the uppermost one.	Ch 9, Sec 6, [5]	One cargo tank (4)	N/A
5	Lower side frame bracket toe at the most critical frame position. (1)	Ch 9, Sec 6, [8]	N/A	FA hold (4), EA hold (4) and ballast hold of single skin bulk carrier
6	Cut out for longitudinal stiffeners in web-frame without web stiffener connection.	Ch 9, Sec 6, [2.1]	One cargo tank (4)	FA hold (4), EA hold (4) and ballast hold
7	Scallops in way of block joints on strength deck close to mid hold (and down to 0.1D from deck corner).	Ch 9, Sec 6, [3]	One cargo tank (4)	FA hold (4), EA hold (4) and ballast hold

(1) The most critical frame position is generally, but not necessarily, located closest to the mid length of the hold. Where a swash bulkhead is fitted, this is generally located closest to the mid length between the swash bulkhead and the oil-tight bulkhead.
(2) Stool connections at each end of the hold are to be checked unless these are symmetrical about mid-hold.
(3) Position at the mid breadth location of the largest hold in the considered transverse section.
(4) Cargo hold located closest to the midship.

Table 4 : Hot spots for welded lower hopper knuckle connection

Hot spot 2: Inner longitudinal bulkhead at bracket toe Hot spot 3: Transverse bulkhead at bracket toe Hot spot 6: Side stringer, in way of bracket toe Hot spot 7: Horizontal stringer in way of bracket toe	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 5: Where a face plate is fitted to the bracket, the weld connection of face plate to bracket in way of the face plate termination	Ch 9, Sec 5, [3.1], type '*b*'

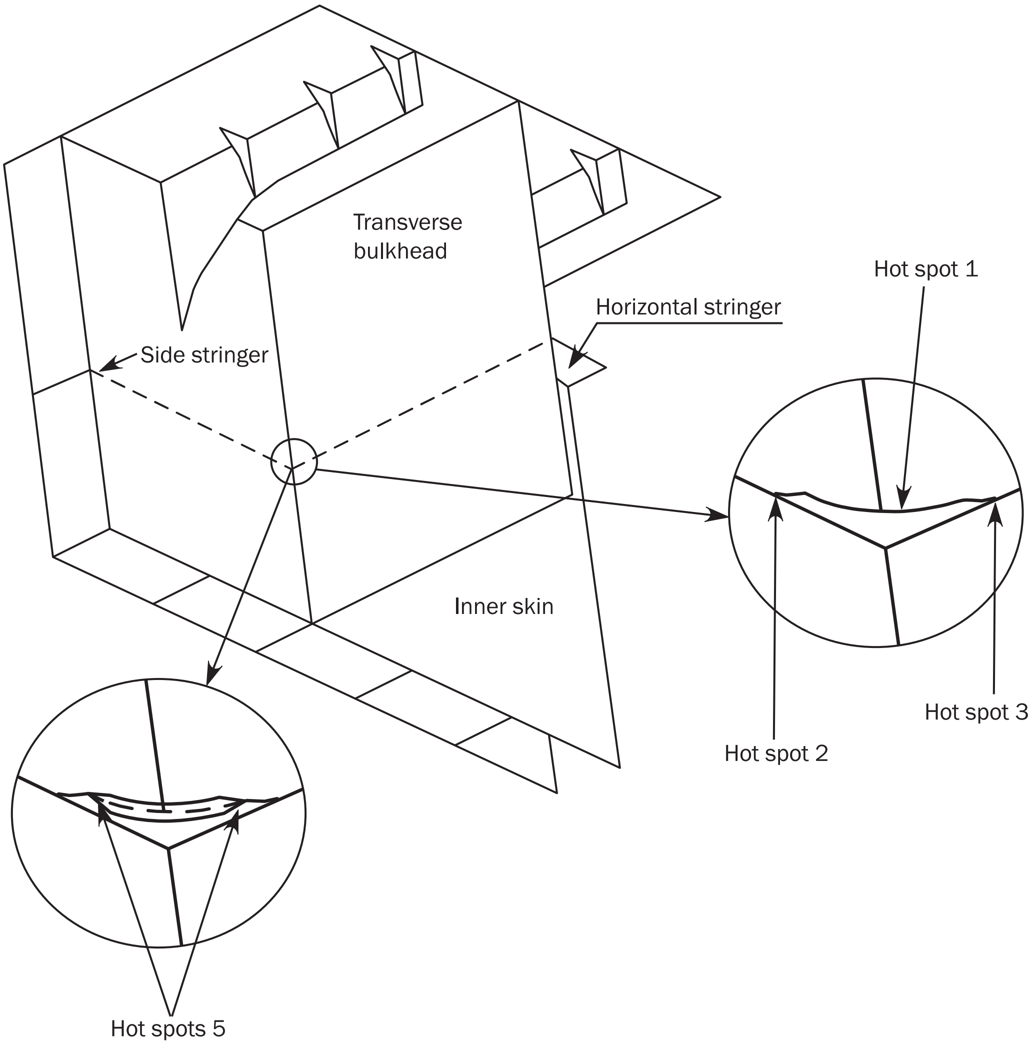

Table 15 : Hot spots for lower side frame bracket toe

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Hopper sloping plate in way of hold frame toe	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 2: Hold frame toe in way of face plate termination	Ch 9, Sec 5, [3.1], type '*b*'

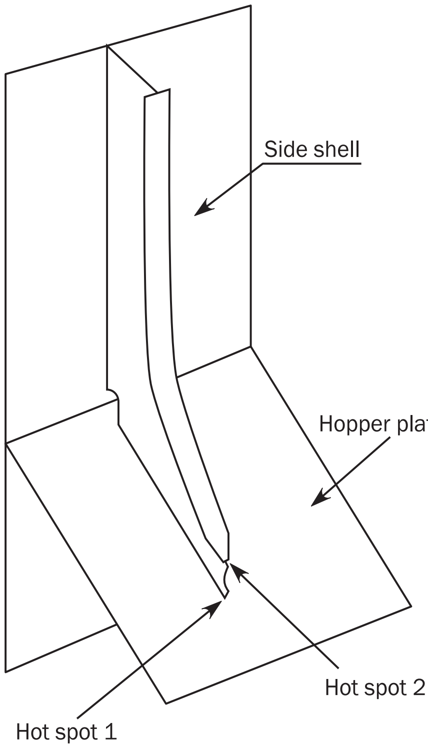

Table 16 : Hot spots for connection of longitudinal stiffener and transverse web including cut-outs and lug plates

Hot spot location	Procedure for calculation of hot spot stress
The critical hot spot has to be decided for each design in agreement with the Society. Typically the following three hot spot types are to be considered:	
Hot spot 1: Corners of the cut-out edge	Ch 9, Sec 5, [3.1].
Hot spot 2: Connection of transverse web/lug-plate to longitudinal stiffener web in way of slot Hot spot 3: Overlapping connection between transverse web and lug plate	Ch 9, Sec 5, [3.1], type '*b*'

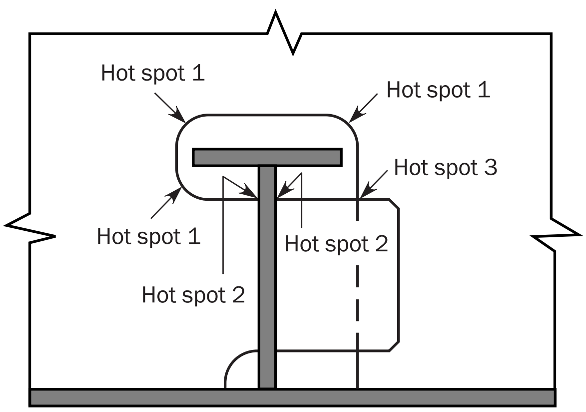

Table 17 : Hot spots for scallops in way of block connections joints at deck

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Butt weld in longitudinal stiffener web in way of scallop. Hot spot 2: Deck plate in way of scallop.	Ch 9, Sec 5, [3.1], type '*a*'

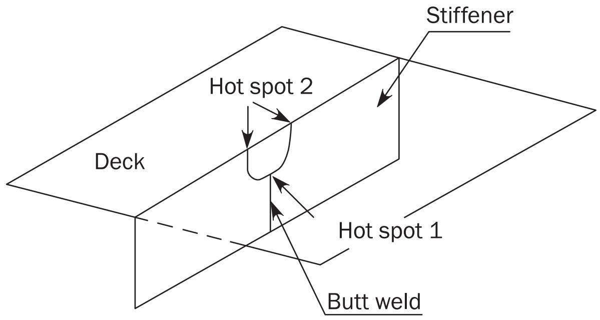

Table 18 : Hot spots for deck plating and longitudinal hatch coaming end bracket toe

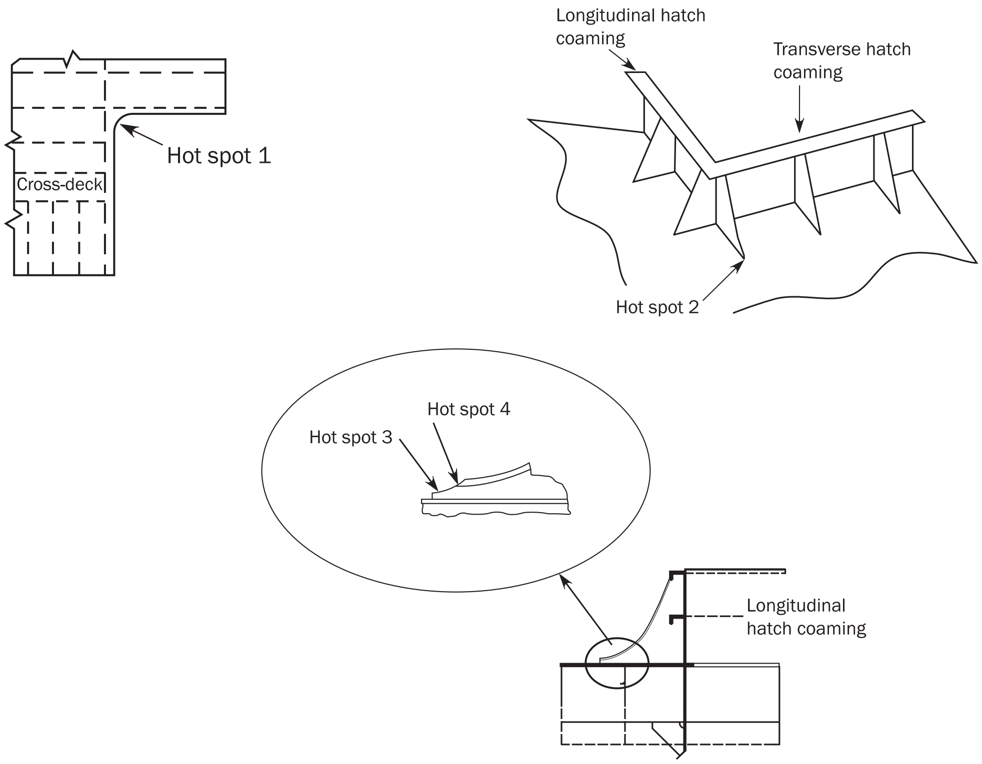
Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Hatch corner radiused edge Hot spot 3: Radius of hatch coaming bracket toe	Ch 9, Sec 5, [3.2]
Hot spot 2: Deck plating in way of hatch coaming bracket toe	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 4: Where a face plate is fitted to the bracket, the weld connection of face plate to bracket in way of the face plate termination	Ch 9, Sec 5, [3.1], type '*b*'



SECTION 3
FATIGUE EVALUATION

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

(i) : Suffix which denotes load case HSM, FSM, BSR-P, BSR-S, BSP-P, BSP-S, OST-P or OST-S specified in Ch 4, Sec 2, [3].

'*i1*' denotes load case: HSM-1, FSM-1, BSR-1P, BSR-1S, BSP-1P, BSP-1S, OST-1P or OST-1S.

'*i2*' denotes load case: HSM-2, FSM-2, BSR-2P, BSR-2S, BSP-2P, BSP-2S, OST-2P or OST-2S.

(j) : Suffix which denotes loading condition:

Full load or normal ballast for oil tankers as defined in Ch 9, Sec 1, [6.2].

Full load homogeneous, full load alternate, normal ballast or heavy ballast for bulk carriers as defined in Ch 9, Sec 1, [6.3].

T_C : Time in corrosive environment, in years, according to Table 5.

T_D : Design life, in years, to be taken as 25 years.

T_{DF} : Design fatigue life, in year, as defined in Ch 9, Sec 1.

T_F : Fatigue life, in year, calculated according to [5].

m : Inverse slope of the design S-N curve, as given in Table 2 for in-air environment and in Table 3 for corrosive environment.

The inverse slope for S-N curves in-air environment changes from m to m+2 at $N = 10^7$ cycles.

n_{LC} : Number of applicable loading conditions, as defined in Ch 9, Sec 1, [6.2] and Ch 9, Sec 1, [6.3].

f_c : Correction factor as defined in Ch 9, Sec 1, [5.1.2].

f_{thick} : Correction factor for plate thickness effect given in [3.3].

$f_{mean,\, i(j)}$: Correction factor for mean stress effect given in [3.2]

1 FATIGUE ANALYSIS METHODOLOGY

1.1 Cumulative damage

1.1.1

The fatigue assessment of the structure is based on the application of the Palmgren-Miner cumulative damage D taken as:

$$D = \sum_{i=1}^{n_{tot}} \frac{n_i}{N_i}$$

where:

n_i : Number of cycles at stress range $\Delta\sigma_i$.

N_i : Number of cycles to failure at stress range $\Delta\sigma_i$.

n_{tot} : Total number of stress range blocks.

i : Stress range block index.

1.1.2

As the long term stress range distribution of a structural detail in a ship can be described by a two-parameter Weibull distribution, as given in Ch 9, Sec 1, [3.1.1], fatigue damage can be obtained by means of a closed-form equation, as given in [5].

1.2 Fatigue strength assessment

1.2.1

Assessment of the fatigue strength of structural members according to [2] includes the following three steps:

a) Calculation of stress ranges, according to [3].

b) Selection of the design S-N curve, according to [4].

c) Calculation of the cumulative damage and the fatigue life calculation, according to [5].

2 ACCEPTANCE CRITERIA

2.1 Fatigue life and acceptance criteria

2.1.1

The calculated fatigue life, T_F, is to comply with the following formula:

$$T_F \geq T_{DF}$$

3 REFERENCE STRESSES FOR FATIGUE ASSESSMENT

3.1 Fatigue stress range

3.1.1

The fatigue stress range for each load case of each loading condition is defined in [3.1.2] for welded joints and in [3.1.3] for base material free edge.

The stress range of each loading condition *(j)* to be considered is the stress range obtained from the predominant load case, according to Ch 9, Sec 1, [7.1.2].

$$\Delta\sigma_{FS,\ (j)} = max_i\ (\Delta\sigma_{FS,\ i(j)})$$

where:

$\Delta\sigma_{FS,\ i(j)}$: Fatigue stress range, in N/mm², for load case *(i)* of loading condition *(j),* as defined in [3.1.2] for welded joints and in [3.1.3] for base material free edge.

3.1.2 Welded joints

For welded joints, the fatigue stress range $\Delta\sigma_{FS,i(j)}$, in N/mm², corrected for mean stress effect, thickness effect and warping effect, is taken as:

- For simplified stress analysis:

$$\Delta\sigma_{FS,\,i(j)} = f_{mean,\ i(j)} \cdot f_{thick} \cdot f_{warp} \cdot \Delta\sigma_{HS,\ i(j)}$$

- For FE analysis:
  - For web-stiffened cruciform joints:

    $$\Delta\sigma_{FS,\,i(j)} = max(\Delta\sigma_{FS1,\,i(j)},\,\Delta\sigma_{FS2,\,i(j)})$$

  - For other joints:

    $$\Delta\sigma_{FS,\,i(j)} = max_{(SideL,\,SideR)}[max(\Delta\sigma_{FS1,\,i(j)},\,\Delta\sigma_{FS2,\,i(j)})]$$

where:

$\Delta\sigma_{HS,i(j)}$: Hot spot stress range, in N/mm^2, due to dynamic loads in load case (*i*) of loading condition *(j)* given in Ch 9, Sec 4, [2.1.1].

$\Delta\sigma_{FS1,\,i(j)}$: Fatigue stress range, in N/mm^2,due to the principal hot spot stress range $\Delta\sigma_{HS1,\,i(j)}$

$$\Delta\sigma_{FS1,\,i(j)} = f_{mean1,\;i(j)} \cdot f_{thick} \cdot f_c \cdot \Delta\sigma_{HS1,\;i(j)}$$

$\Delta\sigma_{FS2,\,i(j)}$: Fatigue stress range, in N/mm^2,due to the principal hot spot stress range $\Delta\sigma_{HS2,\,i(j)}$

$$\Delta\sigma_{FS2,\,i(j)} = 0.9 \cdot f_{mean2,\;i(j)} \cdot f_{thick} \cdot f_c \cdot \Delta\sigma_{HS2,\;i(j)}$$

SideL, *SideR*: Left and right side respectively of the line A-A as shown in Ch 9, Sec 5, Figure 15 and Ch 9, Sec 5, Figure 16.

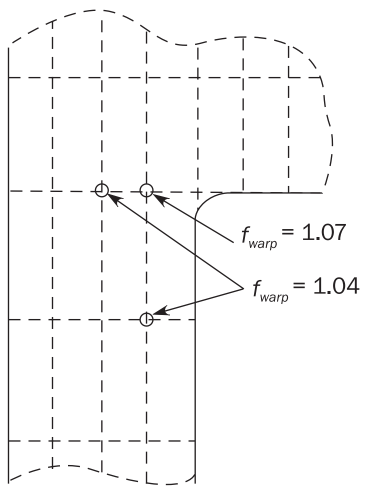
$f_{mean1,\,i(j)}$: Correction factor for mean stress effect given in [3.2].

$f_{mean2,\,i(j)}$: Correction factor for mean stress effect given in [3.2].

f_{warp} : Correction factor due to warping effect, taken as:

- f_{warp} = 1.07 for the deck longitudinal stiffener of bulk carrier, the closest to the longitudinal hatch coaming in way of the hatch corner as shown in Figure 1,
- f_{warp} = 1.04 for following deck longitudinal stiffeners of bulk carrier:
  - The closest stiffener to the longitudinal hatch coaming at one web frame away from the hatch corner, in way of the hatch opening as shown in Figure 1,
  - The second closest stiffener away from the longitudinal hatch coaming in way of the hatch corner as shown in Figure 1,
- f_{warp} = 1.0 for the other cases.

Figure 1 : Warping effect on deck longitudinal stiffeners of bulk carrier



$\Delta\sigma_{HS1,\,i(j)}$: Principal hot spot stress ranges, in N/mm^2, due to dynamic loads for load case (*i*) of loading condition *(j)* which acts within ±45° of the perpendicular to the weld toe, determined in Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [3.3.2] and Ch 9, Sec 5, [4.2.3] for the two types of shell elements (4-node or 8-node).

$\Delta\sigma_{HS2,\ i(j)}$: Principal hot spot stress ranges, in N/mm², due to dynamic loads for load case (*i*) of loading condition *(j)* which acts outside ±45° of the perpendicular to the weld toe, determined in Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [3.3.2] and Ch 9, Sec 5, [4.2.3] for the two types of shell elements (4-node or 8-node).

3.1.3 Base material free edge

For base material free edge, the fatigue stress range, $\Delta\sigma_{FS,i(j)}$ in N/mm², is taken as the local stress range at free edge, $\Delta\sigma_{BS,i(j)}$, as defined in Ch 9, Sec 1, [2.4] with correction factors:

$$\Delta\sigma_{FS,\ i(j)} = K_{sf} \cdot f_{material} \cdot f_{mean,\ i(j)} \cdot f_{thick} \cdot \Delta\sigma_{BS,\ i(j)}$$

where:

K_{sf} : Surface finishing factor for base material given in [4.2.3].

$f_{material}$: Correction factor for material strength, taken as:

$$f_{material} = \frac{1200}{965 + R_{eH}}$$

$\Delta\sigma_{BS,\ i(j)}$: Local stress range, in N/mm², due to dynamic loads in load case (*i*) of loading condition *(j)* taken as:

$$\Delta\sigma_{BS,\ i(j)} = |\sigma_{BS,\ i1(j)} - \sigma_{BS,\ i2(j)}|$$

$\sigma_{BS,\ i1(j)}$, $\sigma_{BS,\ i2(j)}$: Local stress, in N/mm², in load case '*i1*' and '*i2*' of loading condition *(j),* obtained by very fine mesh FE analysis specified in Ch 9, Sec 5.

3.2 Mean stress effect

3.2.1 Correction factor for mean stress effect

The mean stress correction factor to be considered for each principal hot spot stress range of welded joint, $\Delta\sigma_{HS,\ i(j)}$, or for local stress range at free edge, $\Delta\sigma_{BS,\ i(j)}$, is taken as:

a) For welded joint:

$$f_{mean,\ i(j)} = \begin{cases} min\left[1.0,\ 0.9 + 0.2\,\dfrac{\sigma_{mCor,\ i(j)}}{2\Delta\sigma_{HS,\ i(j)}}\right] & \text{for } \sigma_{mCor,\ i(j)} \geq 0 \\ max\left[0.3,\ 0.9 + 0.8\,\dfrac{\sigma_{mCor,\ i(j)}}{2\Delta\sigma_{HS,\ i(j)}}\right] & \text{for } \sigma_{mCor,\ i(j)} < 0 \end{cases}$$

b) For base material:

$$f_{mean,\ i(j)} = \begin{cases} min\left[1.0,\ 0.8 + 0.4\,\dfrac{\sigma_{mCor,\ i(j)}}{2\Delta\sigma_{BS,\ i(j)}}\right] & \text{for } \sigma_{mCor,\ i(j)} \geq 0 \\ max\left[0.3,\ 0.8 + \dfrac{\sigma_{mCor,\ i(j)}}{2\Delta\sigma_{BS,\ i(j)}}\right] & \text{for } \sigma_{mCor,\ i(j)} < 0 \end{cases}$$

where:

$$\sigma_{mCor,\ i(j)} = \begin{cases} \sigma_{mean,\ i(j)} & \text{for } \sigma_{max} \leq R_{eEq} \\ R_{eEq} - \sigma_{max} + \sigma_{mean,\ i(j)} & \text{for } \sigma_{max} > R_{eEq} \end{cases}$$

$$\sigma_{max} = \begin{cases} max_{i,\ (j)}(\Delta\sigma_{HS,\ i(j)} + \sigma_{mean,\ i(j)}) & \text{for welded joint} \\ max_{i,\ (j)}(\Delta\sigma_{BS,\ i(j)} + \sigma_{mean,\ i(j)}) & \text{for base material} \end{cases}$$

$$R_{eEq} = max(315;\ R_{eH})$$

$\sigma_{mean,\ i(j)}$: Fatigue mean stress, in N/mm², for base material or welded joint calculated according to [3.2.2].

3.2.2 Mean stress for base material free edge

The fatigue mean stress for base material free edge, $\sigma_{mean,i(j)}$, in N/mm^2, due to static and dynamic loads case '*i1*' and '*i2*' of loading condition *(j)* is calculated by the following formula based on local stress:

$$\sigma_{mean,\ i(j)} = \frac{\sigma_{BS,\ i1(j)} + \sigma_{BS,\ i2(j)}}{2}$$

3.2.3 Mean stress for simplified method

The fatigue mean stress to be considered for welded joint assessed by the simplified stress analysis is to be obtained from Ch 9, Sec 4, [2.2].

3.2.4 Mean stress for FE analysis

The fatigue mean stresses for welded joint due to static and dynamic loads, $\sigma_{mean,\ i(j),pX}$ and $\sigma_{mean,\ i(j),pY}$, in N/mm^2, for load cases '*i1*' and '*i2*' of loading condition (j) ,belonging to the two principal hot spot stress range directions, *pX* and *pY*, is calculated by the following formula based on hot spot stress components as defined in Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [3.3.2] and Ch 9, Sec 5, [4.2.3]:

$$\sigma_{mean,\ i(j)pX} = \frac{(\sigma_{HS,\ i1(j)})_{xx} + (\sigma_{HS,\ i2(j)})_{xx} + (\sigma_{HS,\ i1(j)})_{yy} + (\sigma_{HS,\ i2(j)})_{yy}}{4} +$$
$$\left(\frac{(\sigma_{HS,\ i1(j)})_{xx} + (\sigma_{HS,\ i2(j)})_{xx} - (\sigma_{HS,\ i1(j)})_{yy} - (\sigma_{HS,\ i2(j)})_{yy}}{4}\right) \cdot \cos 2\theta + \left(\frac{(\sigma_{HS,\ i1(j)})_{xy} + (\sigma_{HS,\ i2(j)})_{xy}}{2}\right) \cdot \sin 2\theta$$

$$\sigma_{mean,\ i(j)pY} = \frac{(\sigma_{HS,\ i1(j)})_{xx} + (\sigma_{HS,\ i2(j)})_{xx} + (\sigma_{HS,\ i1(j)})_{yy} + (\sigma_{HS,\ i2(j)})_{yy}}{4} -$$
$$\frac{(\sigma_{HS,\ i1(j)})_{xx} + (\sigma_{HS,\ i2(j)})_{xx} - (\sigma_{HS,\ i1(j)})_{yy} - (\sigma_{HS,\ i2(j)})_{yy}}{4} \cdot \cos 2\theta - \left(\frac{(\sigma_{HS,\ i1(j)})_{xy} + (\sigma_{HS,\ i2(j)})_{xy}}{2}\right) \cdot \sin 2\theta$$

θ : Angle between the direction x of the element coordinate system and the principal direction *pX* of the principal hot spot stress range coordinate system (Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [4.2.3]). The direction x of the element coordinate system is defined as the normal to the weld toe.

The one of the two mean stresses $\sigma_{mean,\ i(j),pX}$ and $\sigma_{mean,\ i(j),pY}$ which has a principal stress direction with an absolute value less than 45° is defined as $\sigma_{mean1,\ i(j)}$, belonging to $\Delta\sigma_{HS1,\ i(j)}$. The other mean stress is defined as $\sigma_{mean2,\ i(j)}$ belonging to $\Delta\sigma_{HS2,\ i(j)}$.

3.3 Thickness effect

3.3.1

Plate thickness primarily influences the fatigue strength of welded joints through the effect of geometry, and through-thickness stress distribution. The correction factor, f_{thick}, for plate thickness effect is taken as:

- For $t_{n50} \leq 22$ mm, $f_{thick} = 1.0$.
- For $t_{n50} > 22$ mm, $f_{thick} = (t_{n50}/22)^n$

where:

t_{n50} : Net thickness of the considered member in way of the hot spot for welded joints or base material free edge, in mm.

- For simplified stress analysis, the net thickness to be considered for stiffeners is as follows:
  - Flat bar and Bulb profile: no correction,
  - Angle bar and T-bar: flange net thickness.
- For FE analysis, the net thickness to be considered is the net thickness of the member where the crack is likely to initiate and propagate.

For 90° attachments, i.e. cruciform welded joints, transverse T-joints and plates with transverse attachment, the net thickness to be considered is to be taken as:

$$t_{n50} = min\left(\frac{d}{2}, t_{1n50}\right)$$

n : Thickness exponent provided in Table 1 and Table 4 respectively for welded and non-welded joints. n is to be selected according to the considered stress direction. For this selection, $\Delta\sigma_{HS1}$ and $\Delta\sigma_{HS2}$ are considered perpendicular and parallel to the weld respectively.

d : Toe distance, in mm, as shown in Figure 2, taken as:

$$d = t_{2n50} + 2\ell_{leg}$$

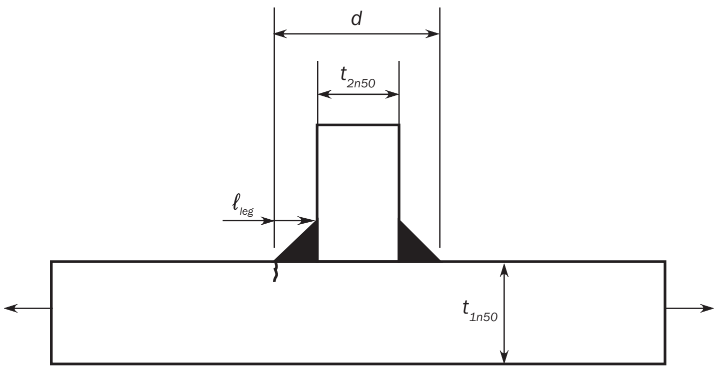
t_{1n50} : Net thickness, in mm, of the continuous plate as shown in Figure 2.

t_{2n50} : Net thickness, in mm, of the transverse attach plate where the hot spot is assessed, as shown in Figure 2.

ℓ_{leg} : Fillet weld leg length, in mm.

When post-weld treatment methods are applied to improve the fatigue life of considered welded joint, the thickness exponent is provided in [6].

Figure 2 : Toe distance for cruciform welded joints, transverse T-joints and plates with transverse attachment



4 S-N CURVES

4.1 Basic S-N curves

4.1.1 Capacity

The capacity of welded steel joints and steel base material with respect to fatigue strength is defined by S-N curves which provide the relationship between the stress range applied to the detail and the number of constant amplitude load cycles to failure.

4.1.2 Design S-N curves

The fatigue assessment is based on use of S-N curves which are obtained from fatigue tests. The design S-N curves are established at two standard deviations below the mean S-N curves corresponding to 50% of probability of survival for relevant experimental data. Design S-N curves given in Table 2 and Table 3 correspond to a probability of survival of 97.7%.

4.1.3 S-N curve scope of application

The S-N curves are applicable to normal and high strength steels up to a specified minimum yield stress equal to 390 N/mm².

Table 1 : Welded joints: thickness exponents

No	Joint category description	Geometry	Condition	*n*
1	Cruciform joints, transverse T-joints, plates with transverse attachments		As-welded	0.25
			Weld toe treated by post-weld improvement method	0.2
2	Transverse butt welds		As-welded	0.2
			Ground flush or weld toe treated by post-weld improvement method	0.1
3	Longitudinal welds or attachments to plate edges		Any	0.1
		 	Weld toe treated by post-weld improvement method	0.1
(1)	No benefit applicable for post-weld treatment of longitudinal end connections.			

No	Joint category description	Geometry	Condition	*n*
4	Longitudinal attachments on the flat bar or bulb profile		Any	0
			Weld toe treated by post-weld improvement method (1)	0
5	Longitudinal attachments and doubling plates		As-welded	0.2
			Weld toe treated by post-weld improvement method	0.1
6	Longitudinal attachments and doubling plates supported longitudinally		As-welded	0.1
			Weld toe treated by post-weld improvement method (1)	0
(1)	No benefit applicable for post-weld treatment of longitudinal end connections.			

4.1.4 In-air environment

The basic design curves in-air environment shown in Figure 3 are represented by linear relationships between log ($\Delta\sigma$) and log (N) as follows:

$$\log(N) = \log(K_2) - m \cdot \log(\Delta\sigma)$$

where:

$\log(K_2) = \log(K_1) - 2\delta$.

K_1 : Constant related to mean S-N curve, as given in Table 2.

K_2 : Constant related to design S-N curve, as given in Table 2.

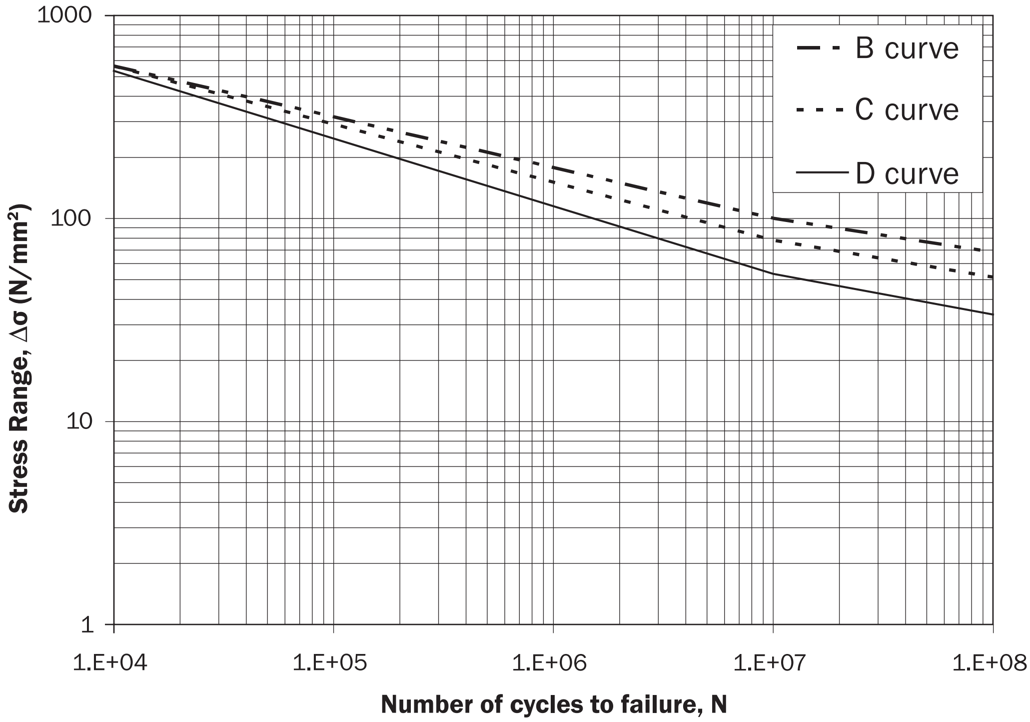
δ : Standard deviation of log (N), as given in Table 2.

$\Delta\sigma_q$: Stress range at $N = 10^7$ cycles related to design S-N curve, in N/mm², as given in Table 2.

Table 2 : Basic S-N curve data, in-air environment

Class	K_1		m	Standard deviation δ	K_2	Design stress range at 10^7 cycles	Design stress range at 2×10^6 cycles
	K_1	$\log_{10}K_1$		$\log_{10}\delta$	K_2	$\Delta\sigma_q$ N/mm²	N/mm²
B	2.343E15	15.3697	4.0	0.1821	1.01E15	100.2	149.9
C	1.082E14	14.0342	3.5	0.2041	4.23E13	78.2	123.9
D	3.988E12	12.6007	3.0	0.2095	1.52E12	53.4	91.3

Figure 3 : Basic design S-N curves, in-air environment



4.1.5 Corrosive environment

The basic design curves for corrosive environment shown in Figure 4 are represented by linear relationships between log($\Delta\sigma$) and log(N) as follows:

$$\log(N) = \log(K_2) - m \cdot \log(\Delta\sigma)$$

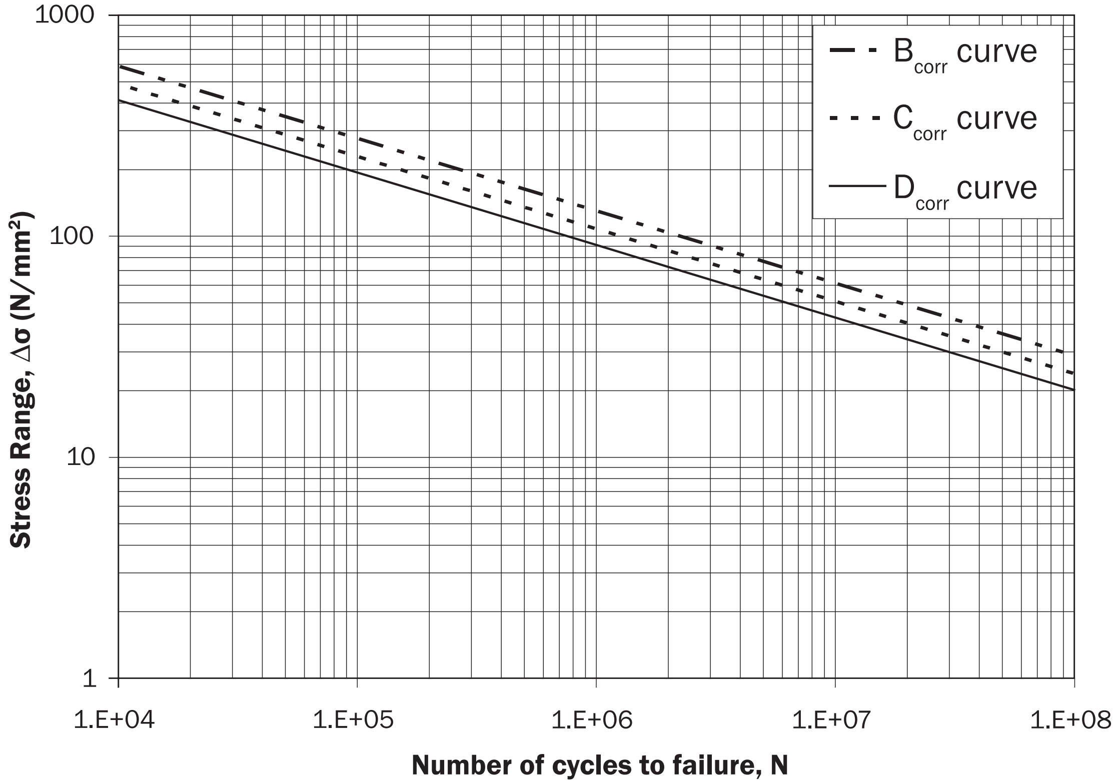
N : Predicted number of cycles to failure under stress range $\Delta\sigma$.

K_2 : Constant related to design S-N curve as given in Table 3.

Table 3 : Basic S-N curve data, corrosive environment

Class	K_2	m	Design stress range at 2×10^6 cycles, N/mm^2
B_{corr}	2.246E12	3.0	103.9
C_{corr}	1.267E12	3.0	85.9
D_{corr}	7.600E11	3.0	72.4

Figure 4 : Basic design S-N curves, corrosive environment



4.2 Selection of S-N curves

4.2.1 Welded joints

For fatigue assessment of welded joints exposed to in-air environment, S-N curve *D* as defined in Table 2 is to be used. For corrosive environment, S-N curve D_{corr} as defined in Table 3 is to be used.

4.2.2 Base material free edge

For fatigue assessment of base material at free edge exposed to in-air environment, S-N curves B or C as defined in Table 2 are to be used. For corrosive environment, S-N curves B_{corr} or C_{corr} as defined in Table 3 are to be used.

4.2.3 Surface finishing factor

The S-N curve *C* is applicable to most of non-welded locations taking into account the likelihood of some notching from corrosion, wear and tear in service with surface finishing factor as given in Table 4.

Higher surface finishing quality may be applied in using S-N curve *B* as given in Table 4, provided adequate protective measures are taken against wear, tear and corrosion.

Table 4 : Non-welded joints: thickness exponent and surface finishing factor

5 FATIGUE DAMAGE CALCULATION

5.1 General

5.1.1

The design fatigue life is divided into a number of time periods due to different loading conditions and due to limitation of the corrosion protection.

It is assumed that the corrosion protection (i.e. coating system) is only effective for a limited number of years during which the structural details are protected, i.e. in-air environment. During the remaining part of the design life as specified in Table 5, the structural details are unprotected i.e. exposed to corrosive environment.

5.1.2

The elementary fatigue damage, given in [5.2], is the damage accumulated during a specific loading condition *(j)* associated with a specific environmental condition either protected condition, i.e. in-air environment, or unprotected condition, i.e. corrosive environment.

The combined fatigue damage, given in [5.3], is the combination of damage accumulated for a specific loading condition *(j)* for the in-air and corrosive environment time.

Total fatigue damage, given in [5.4], is the sum of the combined fatigue damages obtained for all loading conditions.

5.2 Elementary fatigue damage

5.2.1

The elementary fatigue damage for each fatigue loading condition *(j)* is to be calculated independently for both protected in-air environment and unprotected corrosive environment, based on the fatigue stress range obtained for the predominant load case as follows:

$$D_{E(j)} = \frac{\alpha_{(j)} \cdot N_D}{K_2} \frac{\Delta\sigma_{FS,\ (j)}^m}{(\ln N_R)^{m/\xi}} \cdot \mu_{(j)} \cdot \Gamma\left(1 + \frac{m}{\xi}\right)$$

where:

N_D : Total number of wave cycles experienced by ship during the design fatigue life, taken as:
$N_D = 31.557 \times 10^6 (f_0 T_D) / (4 \log L)$

f_0 : Factor taking into account time in seagoing operations excluding time in loading and unloading, repairs, etc.

$f_0 = 0.85$.

$\alpha_{(j)}$: Fraction of time in each loading condition given in Ch 9, Sec 1, Table 1 for oil tanker and in Ch 9, Sec 1, Table 3 for bulk carrier.

$\Delta\sigma_{FS,\ (j)}$: Fatigue stress range at the reference probability level of exceedance of 10^{-2}, in N/mm^2.

N_R : Number of cycles corresponding to the reference probability of exceedance of 10^{-2}.

$N_R = 100$.

ξ : Weibull shape parameter,

$\xi = 1$.

$\Gamma(x)$: Complete Gamma function.

K_2 : Constant of the design S-N curve, as given in Table 2 for in-air environment and in Table 3 for corrosive environment.

$\mu_{(j)}$: Coefficient taking into account the change of inverse slope of the S-N curve, m,

- For in-air environment:

$$\mu_{(j)} = 1 - \frac{\left\{\gamma\left(1 + \frac{m}{\xi}, \nu_{(j)}\right) - \nu_{(j)}^{-\Delta m/\xi} \cdot \gamma\left(1 + \left(\frac{m + \Delta m}{\xi}\right), \nu_{(j)}\right)\right\}}{\Gamma\left(1 + \frac{m}{\xi}\right)}$$

$$\nu_{(j)} = \left(\frac{\Delta\sigma_q}{\Delta\sigma_{FS,\ (j)}}\right)^{\xi} \ln N_R$$

- For corrosive environment:

$\mu_{(j)} = 1.0$

$\gamma(a,x)$: Incomplete Gamma function.

$\Delta\sigma_q$: Stress range, in N/mm^2, corresponding to the intersection of the two segments of design S-N curve at $N = 10^7$ cycles, as given in Table 2.

Δm : Change in inverse slope of S-N curve at $N=10^7$ cycles.
$\Delta m = 2$

5.3 Combined fatigue damage

5.3.1

The combined fatigue damage in protected in-air environment and unprotected corrosive environment for each loading condition *(j)* is to be calculated as follows:

$$D_{(j)} = D_{E,\ air(j)} \cdot \frac{T_D - T_C}{T_D} + D_{E,\ corr(j)} \cdot \frac{T_C}{T_D}$$

where:

$D_{E,air(j)}$: The elementary fatigue damage for in-air environment for loading condition *(j)* given in [5.2.1].

$D_{E,corr(j)}$: The elementary fatigue damage for corrosive environment for loading condition *(j)* as calculated in [5.2.1].

Table 5 : Time in corrosive environment, T_C

Location of weld joint or structural detail	Time in corrosive environment T_C, in years
Water ballast tank	5
Oil cargo tank	
Lower part (1) of bulk cargo hold and water ballast cargo hold	
Bulk cargo hold and water ballast cargo hold except lower part (1)	2
Void space Other areas	
(1) Lower part means cargo hold part below a horizontal level located at a distance of 300 mm below the frame end bracket for holds of single side skin construction or 300 mm below the hopper tank upper end for holds of double side skin construction (see Pt 2, Ch 1, Sec 2, Figure 1).	

5.4 Total fatigue damage

5.4.1

The total fatigue damage for all applicable loading conditions is calculated as follows:

$$D = \sum_{j=1}^{n_{LC}} D_{(j)}$$

where:

$D_{(j)}$: Combined fatigue damage for each applicable loading condition, as given in [5.3].

5.5 Fatigue life calculation

5.5.1

The fatigue life, T_F, is taken as:

$$T_F = \frac{T_D}{D_{air}} \qquad \text{if } \frac{T_D}{D_{air}} \leq (T_D - T_C)$$

$$T_F = T_D - T_C + \left(\frac{T_D}{D_{air}} - T_D + T_C \right) \frac{D_{air}}{D_{corr}} \text{ otherwise.}$$

where:

D_{air} : Total fatigue damage for all loading conditions in-air environment taken as:

$$D_{air} = \sum_{j=1}^{n_{LC}} D_{E,\ air(j)}$$

D_{corr} : Total fatigue damage for all loading conditions in corrosive environment taken as:

$$D_{corr} = \sum_{j=1}^{n_{LC}} D_{E,\ corr(j)}$$

6 WELD IMPROVEMENT METHODS

6.1 General

6.1.1

Post-weld fatigue strength improvement methods are to be considered as a supplementary means of achieving the required fatigue life, and subjected to quality control procedures. The benefit from post-weld treatment can only be applied for corrosion free condition and may only be considered provided that a protective coating is applied after the post-weld treatment and maintained during the design life time.

6.1.2 Limitation of the benefit of post-weld treatment

For structural details where the benefit of post-weld treatment is applicable, the calculated fatigue life at the design stage for the considered structural detail excluding the post-weld treatment effects, is not to be less than T_{DF} / 1.47.

However, for structural details inside a bulk cargo hold the calculated fatigue life at design stage excluding post-weld treatment effects is not to be less than 25 years.

Note 1: When T_{DF} is taken equal to 25 years, the calculated fatigue life at the design stage for the considered structural detail excluding the post-weld treatment effects, is not to be less than 17 years.

6.1.3 Post-weld treatment at fabrication stage

There is one basic post-weld treatment method considered in these Rules to improve fatigue strength at the fabrication stage, i.e. weld geometry control and defect removal method by burr grinding.

6.1.4 Weld toe

The improvement method is applied to the weld toe. Thus, it is intended to increase the fatigue life of the weld from the viewpoint of a potential fatigue failure arising at the weld toe. The possibility of failure initiation at other locations is always to be considered. If the failure is shifted from the weld toe to the root by applying post-weld treatment, there may be no significant improvement in the overall fatigue performance of the joint. Improvements of the weld root cannot be expected from treatment applied to weld toe.

A brief description of the method and the degree of improvement which can be achieved is given in [6.2].

6.1.5 Weld type for post-weld treatment

When weld improvements are planned, full or partial penetration welds with a minimum root face according to Ch 12, Sec 3, [2.4] are to be used to mitigate or to eliminate the possibility of cracking at the weld root.

6.2 Weld toe burr grinding

6.2.1

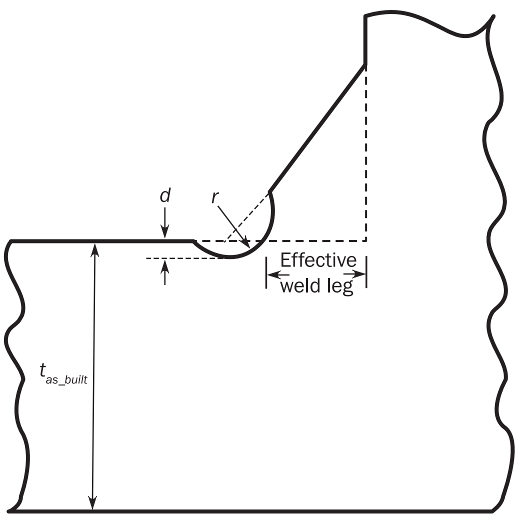
The weld may be machined using a burr grinding tool to produce a favourable shape to reduce stress concentrations and remove defects at the weld toe, see Figure 5. In order to eliminate defects, such as intrusions, undercuts and cold laps, the material in way of the weld toe is to be removed. The total depth of the burr grinding is not to be greater than the lesser of 2 mm and of 7% the local gross thickness of the machined plate. Any undercut not complying with this requirement is to be repaired by an approved method.

6.2.2

To avoid introducing a detrimental notch effect due to small radius grooves, the burr diameter is to be scaled to the plate thickness at the weld toe being ground. The diameter is to be in the 10 to 25 mm range for application to welded joints with plate thickness from 10 to 50 mm. The resulting root radius of the groove is to be no less than 0.25 t_{as_built}.The weld throat thickness and leg length after burr grinding must comply with the rule requirements or any increased weld sizes as indicated on the approved drawings.

The inspection procedure is to include a check of the weld toe radius, the depth of burr grinding, and confirmation that the weld toe undercut has been removed completely.

Figure 5 : Details of ground weld toe geometry



6.3 Fatigue improvement factor

6.3.1

The benefit of burr grinding corresponds to an increase in fatigue strength by a factor of 1.3 (i.e. a reduction of the effective stress range by 1.3), reducing the damage in air to D_{air}/ 2.2,

where:

D_{air} : Fatigue damage in air as given in Ch 9, Sec 3, [5.3.1].

6.4 Applicability

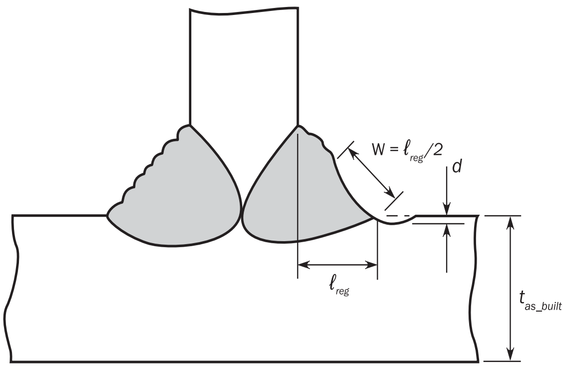
6.4.1

The application of post-weld improvement and fatigue improvement factor provided in this section is subject to following limitations:

- The weld type complies with [6.1.5].

- The weld improvement is effective in improving the fatigue strength of structural details under high cycle fatigue conditions therefore the fatigue improvements factors do not apply to low-cycle fatigue conditions, i.e. when $N \leq 5\times10^4$, where N is the number of life cycles to failure.
- Unless otherwise specifically stated, the fatigue improvement factor is to be used for welds, joining steel plates which are between 6 and 50 mm thick.
- This benefit can only be achieved in a corrosion free condition and may only be considered provided that a suitable protective coating is applied after the post-weld treatment and maintained during the design life time.
- Fatigue improvement factor is to be applied to as-welded transverse butt welds, as-welded T-joint and cruciform welds and as-welded longitudinal attachment welds excluding longitudinal end connections.
- In way of areas prone to mechanical damage, fatigue improvement may only be granted if these are adequately protected.
- Treatment of inter-bead toes is required for large multi-pass welds as shown in Figure 6.
- The builder is to provide the list of details and their locations on the ship for which the post-weld treatment has been applied.

Figure 6 : Extent of weld toe burr grinding to remove inter-bead toes on weld face



ℓ_{leg} : Weld leg length.
w : Width of groove.
d : Depth of grinding to be 0.5 mm $\leq d \leq$ 1 mm.

7 WORKMANSHIP

7.1 Application

7.1.1

In general, the fatigue performance of structural details can be improved by adopting enhanced workmanship standards, which include building alignment and weld control.

7.2 Workmanship control for construction details

7.2.1 Building alignment and tolerance control

Building alignment exceeding construction tolerance could introduce additional stress concentration for structural details, reducing the fatigue performance. The builder is responsible to comply with the construction requirements given in Ch 12, Sec 1.

7.2.2 Weld profile control

Poor weld geometry could introduce additional stress concentration; therefore special attention should be given to achieving a favourable geometry and smooth transition at the weld toe. Weld profile control, i.e. enhanced workmanship may be required by the Society in way of critical weld toe locations.

The weld notch stress concentration is a direct function of the weld flank angle and the weld toe radius.

The validity of the aforementioned S-N curves is based on a weld flank angle with a maximum mean value of 50 deg and on a weld toe radius with a minimum mean value of 0.5 mm. Welding details may be requested to be submitted for approval for some critical areas considering the calculated fatigue life.

7.2.3 Post-weld treatment methods

Post-weld treatment methods may be used to improve fatigue resistance of structural detail, as specified in [6].

At the design stage, the calculated fatigue life should not generally take into account any benefit that may be derived from such treatment. This benefit should only be considered in exceptional cases when the design fatigue life can not reasonably be achieved by adopting alternative design measures such as improvement of the shape of the cut-outs, soft brackets toes, local increase in thickness or other changes in geometry of the structural detail. This is to be considered on a case-by-case basis by the Society.

7.2.4 Detail design standard

Requirements for improved design of structural details are provided in Ch 9, Sec 6. The detail design standard also includes workmanship and welding requirements.

SECTION 4
SIMPLIFIED STRESS ANALYSIS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

(i) : Suffix which denotes dynamic load case HSM, FSM, BSR-P, BSR-S, BSP-P, BSP-S, OST-P or OST-S specified in Ch 4, Sec 2, [3.1].

'*i1*' denotes dynamic load case HSM-1, FSM-1, BSR-1P, BSR-1S, BSP-1P, BSP-1S, OST-1P or OST-1S

'*i2*' denotes dynamic load case HSM-2, FSM-2, BSR-2P, BSR-2S, BSP-2P, BSP-2S, OST-2P or OST-2S.

(j) : Suffix which denotes loading condition:

'Full load' or 'Normal ballast' for oil tankers, as defined in Ch 9, Sec 1, [6.2].

'Full load homogeneous', 'Full load alternate', 'Normal ballast' or 'Heavy ballast' for bulk carriers, as defined in Ch 9, Sec 1, [6.3].

ℓ_{bdg} : Effective bending span of stiffener, in m, as defined in Ch 3, Sec 7.

I_{y-n50} : Net vertical hull girder moment of inertia, at the longitudinal position being considered, in m^4.

I_{z-n50} : Net horizontal hull girder moment of inertia, at the longitudinal position being considered, in m^4.

y : Transverse coordinate of the load calculation point under consideration, in m.

z : Vertical coordinate of the load calculation point under consideration, in m.

z_n : Distance from the baseline to the horizontal neutral axis, in m.

f_c : Correction factor as defined in Ch 9, Sec 1, [5.1.2].

f_{NA} : Correction factor taken as:

- For bulk carrier:
  - $f_{NA} = 1.0$ for $0 < z \leq D/2$
  - $f_{NA} = 0.95$ for $z = D$
  - f_{NA} : linear interpolation for other values of z
- For oil tanker: $f_{NA} = 1.0$

K_a : Geometrical stress concentration factor for stress due to axial load given in [5.2].

K_b : Geometrical stress concentration factor for stress due to lateral pressure given in [5.2].

K_n : Stress concentration factor due to unsymmetrical stiffener geometry, as defined in [5.1].

1 GENERAL

1.1 Application

1.1.1

This section defines the procedure for a simplified stress assessment which is to be used to evaluate the fatigue strength of the longitudinal stiffener end connections.

1.1.2

The hot spot stress ranges and hot spot mean stresses in way of each end connection of longitudinal stiffener, as shown in Figure 2 are to be evaluated at the flange of the longitudinal stiffener in the following locations:

a) Transverse webs or floors other than those located
   - At transverse bulkhead including swash bulkhead of cargo hold or
   - In way of stool,

   such that additional hot spot stress due to the relative displacement is not to be considered.

b) Transverse webs or floors located
   - At transverse bulkhead including swash bulkhead of cargo hold or
   - In way of stool,

   such that additional hot spot stress due to the relative displacement are to be considered.

Stress concentration factors due to unsymmetrical stiffener geometry according [5.1] and due to the stiffener end connection geometry at point ‘A’ and ‘B’ according to [5.2] are to be applied.

1.2 Assumptions

1.2.1

The following assumptions are made in the fatigue assessment for longitudinal stiffener end connections:

a) The hot spot stress is based on:
   - Nominal stresses.
   - Stress concentration factors given in [5].
   - Loading conditions specified in Ch 9, Sec 1, [6].

b) The longitudinal stiffener end connection types are described in [5.2].

1.2.2

The end connections given in [5.2] are based on typical joint geometry under axial and lateral loadings. When a structural detail is different from those shown in Table 4, a finite element analysis is to be used to demonstrate the adequacy of the detail in terms of fatigue strength, according to [5.3].

2 HOT SPOT STRESS

2.1 Hot spot stress range

2.1.1

The hot spot stress range, in N/mm², due to dynamic loads for load case (*i*) of loading condition (*j*) is obtained from the following formula:

$$\Delta\sigma_{HS,\ i(j)} = \left|(\sigma_{GD,\ i1(j)} + \sigma_{LD,\ i1(j)} + \sigma_{dD,\ i1(j)}) - (\sigma_{GD,\ i2(j)} + \sigma_{LD,\ i2(j)} + \sigma_{dD,\ i2(j)})\right|$$

where:

$\sigma_{GD,i1(j)}$, $\sigma_{GD,i2(j)}$: Stresses due to global hull girder wave bending moments, in N/mm², as defined in [3.1.1].

$\sigma_{LD,i1(j)}$, $\sigma_{LD,i2(j)}$: Stresses due to local dynamic pressure, in N/mm², as defined in [4.1.1].

$\sigma_{dD,i1(j)}$, $\sigma_{dD,i2(j)}$: Stresses due to relative displacement in wave, in N/mm², as defined in [4.2.4] and [4.2.5].

2.2 Hot spot mean stress

2.2.1

The hot spot mean stress, in N/mm^2, due to static and dynamic loads for load case (i) of loading condition (j) is obtained from the following formula:

$$\sigma_{mean,\ i(j)} = \sigma_{GS,\ (j)} + \sigma_{LS,\ (j)} + \sigma_{dS,\ (j)} + \sigma_{mLD,\ i(j)} + \sigma_{mGD,\ i(j)}$$

where for the load case (i) of loading condition (j):

$\sigma_{GS,\ (j)}$: Stress due to still water hull girder bending moment, in N/mm², as defined in [3.2.1].

$\sigma_{LS,\ (j)}$: Stress due to local static pressure, in N/mm², as defined in [4.1.2].

$\sigma_{dS,\ (j)}$: Stress due to relative displacement in still water, in N/mm², as defined in [4.2.7].

$\sigma_{mLD,\ i(j)}$: Mean stress due to local dynamic pressure, in N/mm², as defined as:

$$\sigma_{mLD,\ i(j)} = \frac{\sigma_{LD,\ i1(j)} + \sigma_{LD,\ i2(j)}}{2}$$

$\sigma_{LD,i1(j)}$, $\sigma_{LD,i2(j)}$: Stress due to local dynamic pressure, in N/mm², as defined in [4.1.1].

$\sigma_{mGD,\ i(j)}$: Mean stress due to global wave bending moment, in N/mm², as defined as:

$$\sigma_{mGD,\ i(j)} = \frac{\sigma_{GD,\ i1(j)} + \sigma_{GD,\ i2(j)}}{2}$$

$\sigma_{GD,i1(j)}$, $\sigma_{GD,i2(j)}$: Stress due to global wave bending moment, in N/mm², as defined in [3.1.1].

3 HULL GIRDER STRESS

3.1 Stress due to hull girder wave bending moments

3.1.1

The hull girder hot spot stress, in N/mm^2, for load cases $i1$ and $i2$ of loading condition (j) is obtained from the following formula:

$$\sigma_{GD,\ ik(j)} = f_c \cdot K_a \left(\frac{M_{wv-LC,\ ik}}{I_{y-n50}} (z - z_n) \cdot f_{NA} - \frac{M_{wh-LC,\ ik}}{I_{z-n50}} y \right) 10^{-3}$$

where:

$M_{wv\text{-}LC,\ ik}$: Vertical wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, at the hull girder load calculation point of the considered longitudinal position for the loading condition (j) for ik being equal to $i1$ and $i2$.

$M_{wh\text{-}LC,\ ik}$: Horizontal wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, at the hull girder load calculation point of the considered longitudinal position for the loading condition (j) for ik being equal to $i1$ and $i2$.

3.2 Stress due to still water hull girder bending moment

3.2.1

The hull girder hot spot stress due to still water bending moment, in N/mm^2, in loading condition (j) is obtained from the following formula:

$$\sigma_{GS,\ (j)} = \frac{f_c \cdot f_{NA} \cdot K_a \cdot \beta_{(j)} \cdot M_{sw} \cdot (z - z_n)}{I_{y-n50}} 10^{-3}$$

where:

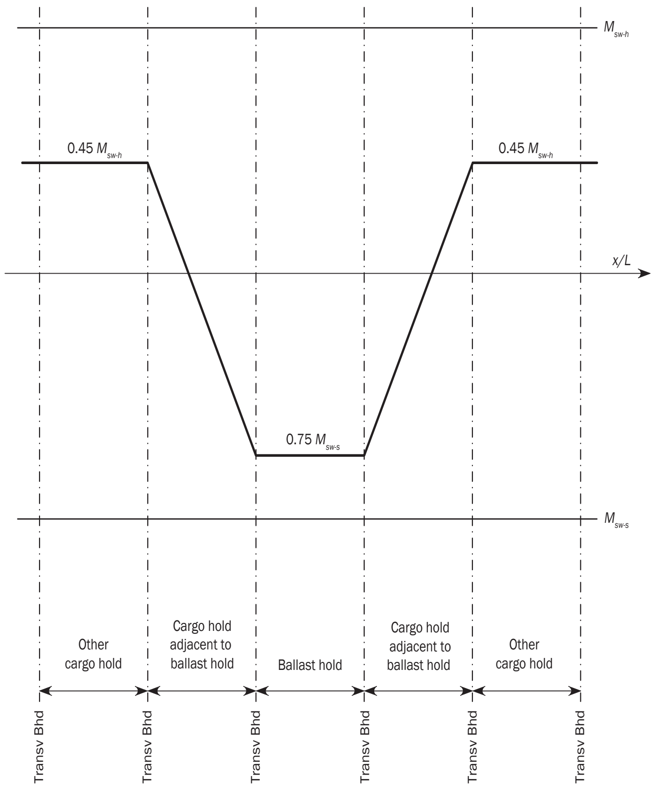
M_{sw} : Permissible still water vertical bending moment, in kNm, as defined in Ch 4, Sec 4 at the hull girder load calculation point of the considered longitudinal position.

$\beta_{(j)}$: Fraction of permissible still water vertical bending moment, as defined in Table 1.

Table 1 : Fraction of permissible still water vertical bending moments, $\beta_{(j)}$

Ship type	Loading conditions	Longitudinal position on the considered section	$\beta_{(j)}$
Oil tankers	Homogeneous	N/A	0.60 in sagging condition
	Normal ballast		0.80 in hogging condition
Bulk carriers	Homogeneous		0.40 in sagging condition
	Alternate		0.75 in hogging condition
	Normal ballast		0.80 in hogging condition
	Heavy ballast (See Figure 1)	Ballast hold	0.75 in sagging condition
		Cargo holds adjacent to ballast hold	Linear interpolation between 0.75 in sagging condition and 0.45 in hogging condition
		Other cargo holds	0.45 in hogging condition

Figure 1 : Distribution of still water bending moment for fatigue assessment in way of ballast hold



4 LOCAL STIFFENER STRESS

4.1 Stress due to stiffener bending

4.1.1 Stress due to dynamic pressure

The hot spot stress, in N/mm^2, due to local dynamic pressure in load case *i1* and *i2* for loading condition (*j*) is obtained from the following formula:

$$\sigma_{LD,\ ik(j)} = \frac{K_b\ K_n\ s\ \ell_{bdg}^2\ (\eta_W\ f_{NL}\ P_{W,\ ik(j)} + \eta_{ld}\ P_{ld,\ ik(j)} + \eta_{bd}\ P_{bd,\ ik(j)})\left(1 - \dfrac{6x_e}{\ell_{bdg}} + \dfrac{6{x_e}^2}{\ell_{bdg}^2}\right)}{12\ Z_{eff-n50}}$$

where:

$P_{W,\ ik(j)}$: Dynamic wave pressure, at the mid span, in kN/m^2, specified in Ch 4, Sec 5, [1.4], in load case *i1* and *i2* for loading condition (*j*).

$P_{ld,\ ik(j)}$: Dynamic liquid tank pressure, at the mid span, in kN/m^2, as specified in Ch 4, Sec 6, [1.1.1], in load case *i1* and *i2* for loading condition (*j*).

Pressure acting on both sides of the stiffener, i.e. applied on the attached plate on stiffener side or on opposite side to the stiffener, could be simultaneously considered if relevant in the loading condition.

$P_{bd,\ ik(j)}$: Dynamic dry bulk cargo pressure at the mid span, in kN/m^2, as specified in Ch 4, Sec 6, [2.4.1], in load case *i1* and *i2* for loading condition (*j*).

η_W, η_{ld}, η_{bd}: Pressure normal coefficients, taken as:

η = 1 when the considered pressure is applied on the stiffener side,

η = -1 otherwise.

f_{NL} : Correction factor for the non-linearity of the wave pressure taken as:

$f_{NL} = 1$ for $z > T_{LC} + 2h_w$

$f_{NL} = 2.5\,\dfrac{z - T_{LC}}{h_w} - 4$ for $T_{LC} + 1.8h_w < z \le T_{LC} + 2h_w$

$f_{NL} = 0.5\,\dfrac{z - T_{LC}}{h_w} - 0.4$ for $T_{LC} + 1.6h_w < z \le T_{LC} + 1.8h_w$

$f_{NL} = 0.4$ for $T_{LC} + 1.2h_w < z \le T_{LC} + 1.6h_w$

$f_{NL} = 0.7 - 0.25\,\dfrac{z - T_{LC}}{h_w}$ for $T_{LC} + 0.6h_w < z \le T_{LC} + 1.2h_w$

$f_{NL} = 1 - 0.75\,\dfrac{z - T_{LC}}{h_w}$ for $T_{LC} - 0.2h_w < z \le T_{LC} + 0.6h_w$

$f_{NL} = 0.1875\,\dfrac{z - T_{LC}}{h_w} + 1.1875$ for $T_{LC} - h_w < z \le T_{LC} - 0.2h_w$

$f_{NL} = 1$ for $z \le T_{LC} - h_w$

h_w : Water head equivalent to the pressure at waterline, in m, as defined in Ch 4, Sec 5.

x_e : Distance, in m, to the hot spot from the closest end of the span ℓ_{bdg}, as defined in Figure 2.

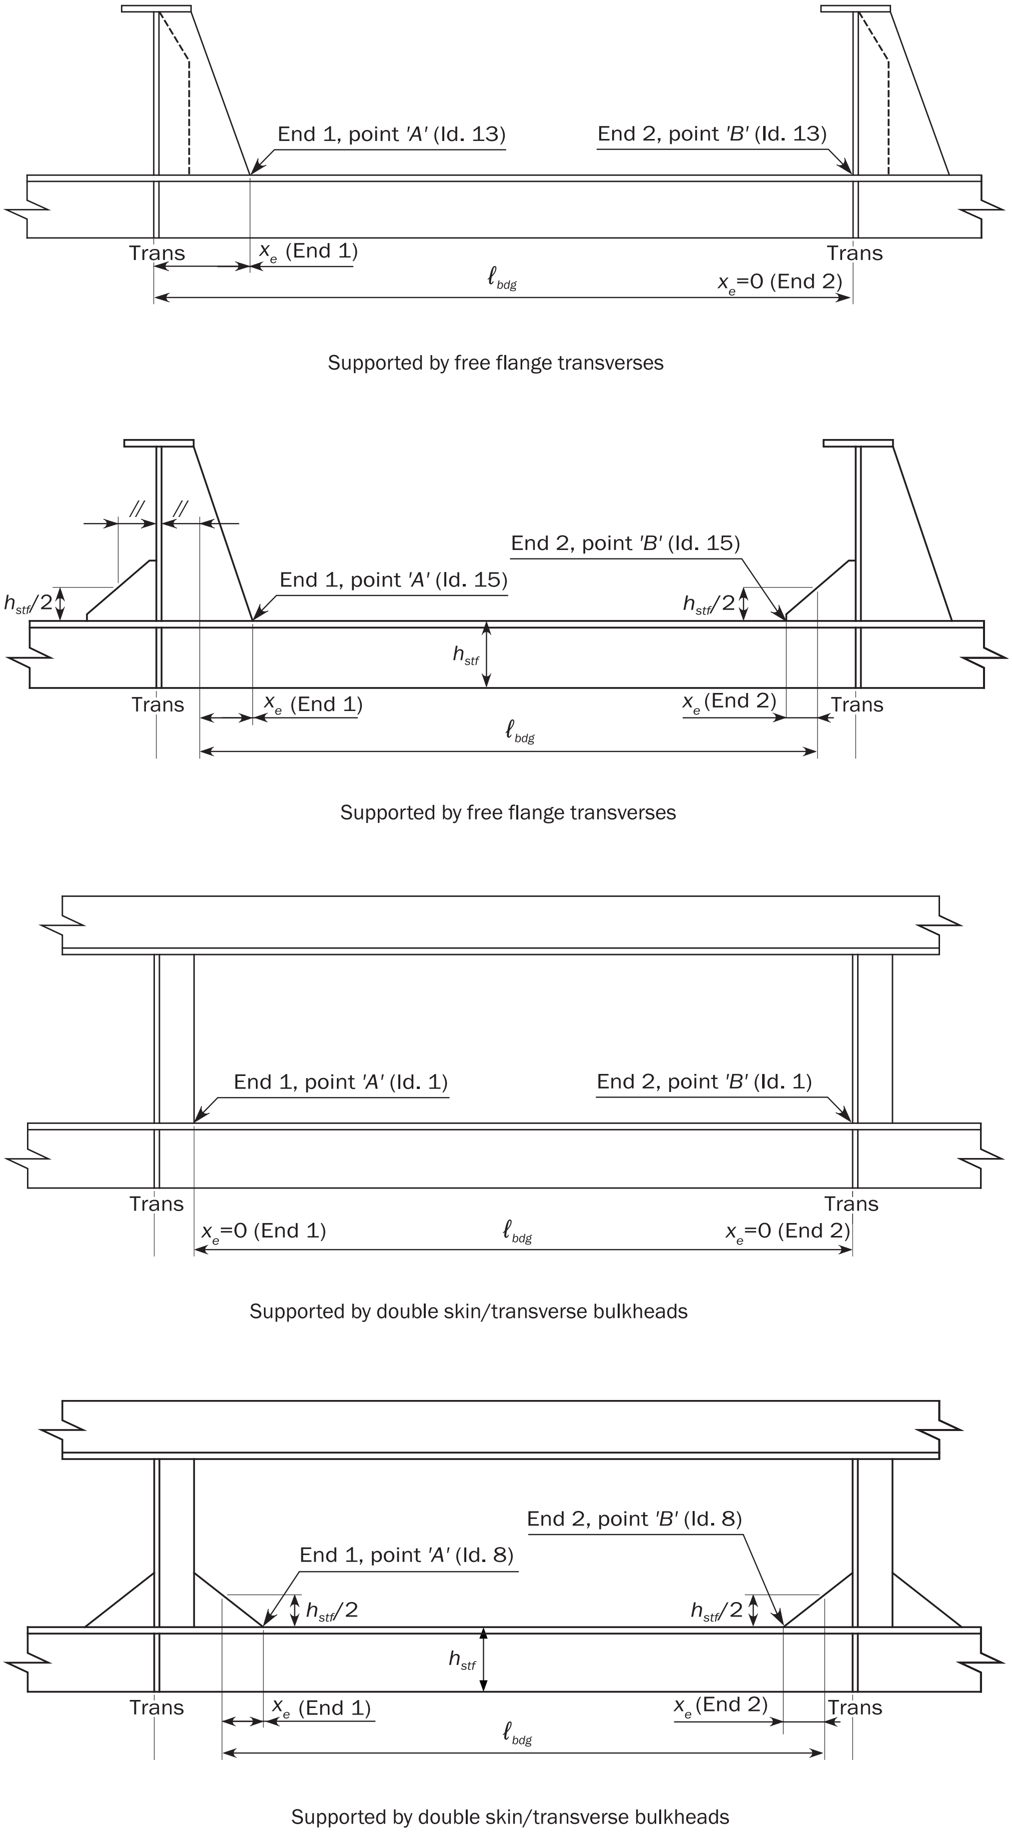
$Z_{eff-n50}$: Net section modulus, in cm^3, of the considered stiffener calculated considering an effective breadth b_{eff} of attached plating.

b_{eff} : Effective breadth, in mm, of attached plating specified at the ends of the span and in way of end brackets and supports, taken as:

$$b_{eff} = s \cdot min\left(\frac{1.04}{1 + \dfrac{3}{\left(\dfrac{\ell_{bdg}}{s}\left(1 - \dfrac{1}{\sqrt{3}}\right) \cdot 10^3\right)^{1.35}}};1.0\right) \quad \text{for} \quad \frac{\ell_{bdg}}{s}\left(1 - \frac{1}{\sqrt{3}}\right)\times 10^3 \ge 1$$

$$b_{eff} = 0.26\ell_{bdg}\left(1 - \frac{1}{\sqrt{3}}\right)\times 10^3 \quad \text{for} \quad \frac{\ell_{bdg}}{s}\left(1 - \frac{1}{\sqrt{3}}\right)\times 10^3 < 1$$

Figure 2 : Definition of effective span and x_e for hot spot



4.1.2 Stress due to static pressure

The hot spot stress due to local static pressure, in N/mm^2, for loading condition (j) is obtained from the following formula:

$$\sigma_{LS,(j)} = \frac{K_b\, K_n\, s\, \ell_{bdg}^2\, (\eta_S\, P_{S,\ (j)} + \eta_{ls}\, P_{ls,\ (j)} + \eta_{bs}\, P_{bs,\ (j)}) \left(1 - \frac{6x_e}{\ell_{bdg}} + \frac{6{x_e}^2}{\ell_{bdg}^2}\right)}{12\, Z_{eff-n50}}$$

where:

$P_{S,(j)}$: Static external pressure, in kN/m^2, in loading condition (j) specified in Ch 4, Sec 5, [1.2].

$P_{ls,(j)}$: Static liquid tank pressure, in kN/m^2, in loading condition (j) specified in Ch 4, Sec 6, [1.1.1].

Pressure acting on both sides could be simultaneously considered if relevant in the loading condition.

$P_{bs,(j)}$: Static dry bulk cargo pressure, in kN/m^2, in loading condition (j) specified in Ch 4, Sec 6, [2.4.1].

η_S, η_{ls}, η_{bs}:Pressure normal coefficients, taken as:

η = 1 when the considered pressure is applied on the stiffener side,

η = -1 otherwise.

4.2 Stress due to relative displacement

4.2.1 General

For longitudinal stiffener end connections fitted on transverse web or floor located

- At transverse bulkhead including swash bulkhead of cargo hold or
- In way of stool,

the additional hot spot stress due to the relative displacement is to be considered.

4.2.2 Relative displacement definition

The relative displacement is defined as follows.

- For longitudinals penetrating floors in way of stool the relative displacement is defined as the displacement of the longitudinal measured at the first floor forward (*Fwd*) or afterward (*Aft*) relative to the displacement of the longitudinal at the floor in way of stool.
- For other longitudinals, the relative displacement is defined as the displacement of the longitudinal measured at the first transverse web frame (or floor) forward (*Fwd*) or afterward (*Aft*) relative to the displacement of the longitudinal at the transverse bulkhead including swash bulkhead.

4.2.3 Sign convention

Where the stress at the hot spot location, i.e. at the flange of longitudinal, due to relative displacement is in tension, the sign of the relative displacement is positive.

4.2.4 Oil tankers

The additional hot spot stress due to relative displacement for load case *i1* and *i2* of loading condition (j) for an oil tanker is to be accounted for either using finite element method as described in [4.2.6] or by applying a stress factor on the local dynamic stress component as described in the following:

$$\sigma_{dD,\ ik(j)} = (K_d - 1) \cdot |\sigma_{LD,\ ik(j)}|$$

where:

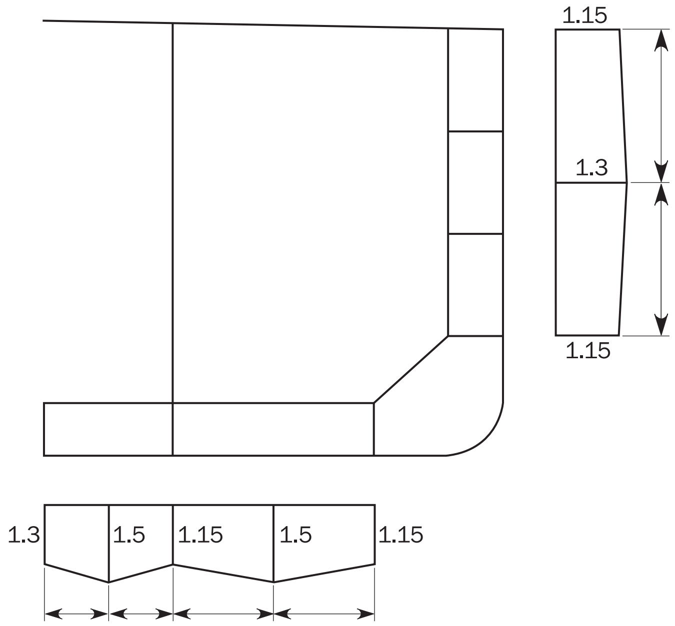
$\sigma_{LD,\,ik(j)}$: Local dynamic stress defined in [4.1.1].

K_d : Bending stress factor for longitudinal stiffeners caused by relative displacement between supports, shown on Figure 3, as given in Table 2.

Table 2 : Bending stress factor of longitudinals due to relative displacement between transverse bulkhead (including swash bulkhead) and adjacent web frames (floors)

Location		K_d factor Full load condition	K_d factor Ballast condition
Bottom longitudinal	Mid position between longitudinal bulkhead, bottom girders or buttress structure	1.50	
	At longitudinal bulkhead, bottom girders (except centre line girder) or buttress structure	1.15	
	At centre line girder	1.30	
	Intermediate position between above bottom positions	Linear interpolation	
Side longitudinals	Mid position between lowest side stringer and deck at side	1.30	1.15
	Lowest side stringer and deck at side	1.15	1.15
	Intermediate positions	Linear interpolation	1.15
Other longitudinals		1.15	

Figure 3 : K_d factor in full load condition for oil tanker with two longitudinal bulkheads



4.2.5 Bulk carriers

The additional hot spot stress due to relative displacement for load case *i1* and *i2* of loading condition (*j*) for a bulk carrier is to be calculated using finite element method as described in [4.2.6].

4.2.6 Stress due to relative displacement derived using FE method

The following procedure is based on a cargo hold model complying with Ch 7, Sec 2, [2] to calculate the stress due to relative displacements. The stress due to relative displacements, in N/mm², for load case *i1* and *i2* of loading condition (*j*) for both locations "*a*" and "*f*" is to be calculated directly using the following expression:

$$\sigma_{dD,\ ik(j)} = \begin{cases} K_b\ \sigma_{dFwd-a,\ ik(j)} + K_b\ \sigma_{dAft-a,\ ik(j)} & for\ location\ "a" \\ K_b\ \sigma_{dFwd-f,\ ik(j)} + K_b\ \sigma_{dAft-f,\ ik(j)} & for\ location\ "f" \end{cases} \qquad (k = 1, 2)$$

where:

a, f : Suffix which denotes the location as indicated in Figure 4.

Aft, *Fwd*: Suffix which denotes the direction, afterward (*Aft*) or forward (*Fwd*), from the transverse bulkhead. as shown in Figure 4.

K_b : Stress concentration factor due to bending for the location '*a*' or '*f*' which may correspond to points '*A*' or '*B*' as defined in Table 4.

$\sigma_{dFwd-a,ik(j)}$, $\sigma_{dAft-a,ik(j)}$, $\sigma_{dFwd-f,ik(j)}$, $\sigma_{dAft-f,ik(j)}$: Additional stress at location '*a*' and '*f*', in N/mm², due to the relative displacement between the transverse bulkhead including swash bulkhead or floors in way of stool and the forward (*Fwd*) and afterward (*Aft*) transverse web or floor respectively for load case *i1* and *i2* of loading condition (*j*), taken as:

$$\sigma_{dFwd-a,\ ik(j)} = \frac{3.9\delta_{Fwd,\ ik(j)}\ EI_{Aft-n50}\ I_{Fwd-n50}}{Z_{Aft-n50}\ \ell_{Fwd}\ (\ell_{Aft}\ I_{Fwd-n50} + \ell_{Fwd}\ I_{Aft-n50})}\left(1 - 1.15\ \frac{|x_{eAft}|}{\ell_{Aft}}\right) 10^{-5}$$

$$\sigma_{dAft-a,\ ik(j)} = \left[\frac{3.9\delta_{Aft,\ ik(j)}\ EI_{Aft-n50}\ I_{Fwd-n50}}{Z_{Aft-n50}\ \ell_{Aft}\ (\ell_{Aft}\ I_{Fwd-n50} + \ell_{Fwd}\ I_{Aft-n50})}\left(1 - 1.15\ \frac{|x_{eAft}|}{\ell_{Aft}}\right) - \frac{0.9\delta_{Aft,\ ik(j)}\ EI_{Aft-n50}\ |x_{eAft}|}{Z_{Aft-n50}\ \ell_{Aft}^{\ 3}}\right] 10^{-5}$$

$$\sigma_{dFwd-f,\ ik(j)} = \left[\frac{3.9\delta_{Fwd,\ ik(j)}\ EI_{Aft-n50}\ I_{Fwd-n50}}{Z_{Fwd-n50}\ \ell_{Fwd}\ (\ell_{Aft}\ I_{Fwd} + \ell_{Fwd}\ I_{Aft-n50})}\left(1 - 1.15\ \frac{|x_{eFwd}|}{\ell_{Fwd}}\right) - \frac{0.9\delta_{Fwd,\ ik(j)}\ EI_{Fwd-n50}\ |x_{eFwd}|}{Z_{Fwd-n50}\ \ell_{Fwd}^{\ 3}}\right] 10^{-5}$$

$$\sigma_{dAft-f,\ ik(j)} = \frac{3.9\delta_{Aft,\ ik(j)}\ EI_{Aft-n50}\ I_{Fwd-n50}}{Z_{Fwd-n50}\ \ell_{Aft}\ (\ell_{Aft}\ I_{Fwd-n50} + \ell_{Fwd}\ I_{Aft-n50})}\left(1 - 1.15\ \frac{|x_{eFwd}|}{\ell_{Fwd}}\right) 10^{-5}$$

$I_{Fwd-n50}$, $I_{Aft-n50}$: Net moment of inertia, in cm⁴, of forward (*Fwd*) and afterward (*Aft*) longitudinal.

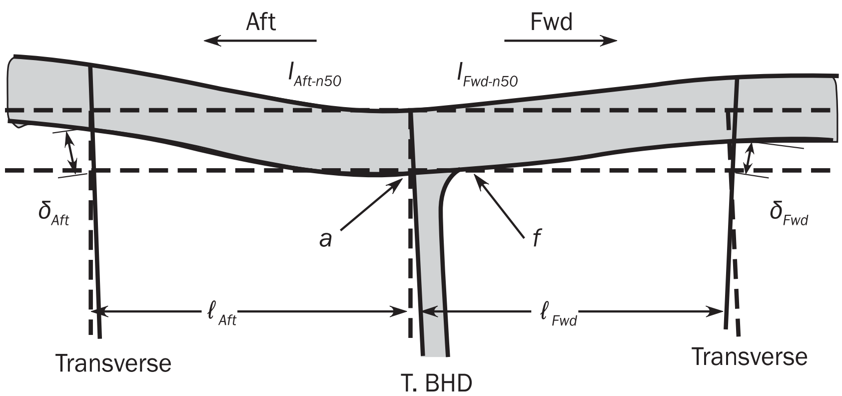
$Z_{Fwd-n50}$, $Z_{Aft-n50}$: Net section modulus of forward (*Fwd*) and afterward (*Aft*) stiffener, in cm³.

ℓ_{Fwd}, ℓ_{Aft} : Span, in m, of forward (*Fwd*) and afterward (*Aft*) longitudinal, as shown in Figure 4.

x_{eFwd}, x_{eAft}: Distance, in m, as shown in Figure 2, to the hot spot in location '*a*' or '*f*' from the closest end of ℓ_{Fwd} and ℓ_{Aft} respectively.

$\delta_{Fwd,ik(j)}$, $\delta_{Aft,ik(j)}$: Relative displacement in the direction perpendicular to the attached plate, in mm, between the transverse bulkhead (including swash bulkhead or floor in way of stools) and the forward (*Fwd*) or afterward (*Aft*) transverse web (or floor) as shown in Figure 4.

Figure 4 : Definition of the relative displacement (example of the side longitudinal)



4.2.7 Stress due to relative displacement in still water

The additional hot spot stress, in N/mm², in still water, due to the relative displacement in the direction perpendicular to the attached plate between the transverse bulkhead including swash bulkhead or floor in way of stools and the adjacent transverse web or floor is to be obtained according to procedures of [4.2.4] and [4.2.5] for oil tankers and bulk carriers respectively, replacing dynamic local stress σ_{LD} and dynamic pressure with static local stress σ_{LS} and static pressure.

5 STRESS CONCENTRATION FACTORS

5.1 Unsymmetrical stiffener

5.1.1

The stress concentration factor K_n for unsymmetrical flange of built-up and rolled angle stiffeners under lateral load, calculated at the web's mid-thickness position, as shown in Figure 5, is to be taken as:

$$K_n = \frac{1 + \lambda\ \beta^2}{1 + \lambda\ \beta^2\ \psi_z}$$

where:

$$\lambda = \frac{3\left(1 + \dfrac{\eta}{280}\right)}{1 + \dfrac{\eta}{40}}$$

$$\eta = \frac{\ell_{bdg}{}^4 10^{12}}{b_{f-n50}{}^3 \cdot t_{f-n50} \cdot h_{stf-n50}{}^2 \left(\dfrac{4 \cdot h_{stf-n50}}{t_{w-n50}{}^3} + \dfrac{s}{t_{p-n50}{}^3}\right)}$$

$$\beta = 1 - \frac{2 b_{g-n50}}{b_{f-n50}}$$ for built-up profiles.

$$\beta = 1 - \frac{t_{w-n50}}{b_{f-n50}}$$ for rolled angle profiles.

$b_{g\text{-}n50}$: Eccentricity of the stiffener equal to the distance from flange's edge to web's centreline, in mm, as shown in Figure 6.

$b_{f\text{-}n50}$: Net breadth of flange, in mm, as shown in Figure 6.

$t_{f\text{-}n50}$: Net flange thickness, in mm, as shown in Figure 6.

$h_{stf\text{-}n50}$: Net stiffener height, including face plate, in mm, as shown in Figure 6.

$t_{w\text{-}n50}$: Net web thickness, in mm, as shown in Figure 6.

$h_{w\text{-}n50}$: Net web's height stiffener, in mm, as shown in Figure 6.

$t_{p\text{-}n50}$: Net thickness of attached plating, in mm, as shown in Figure 6.

ψ_z : Coefficient given as:

$$\psi_z = \frac{h_{w-n50}^2\ t_{w-n50}}{4\ Z_{n50}} 10^{-3}$$

Z_{n50} : Net section modulus, in cm^3, of stiffener with an attached plating breadth equal to the stiffener spacing.

Figure 5 : Bending stress in stiffener with symmetrical and unsymmetrical flange

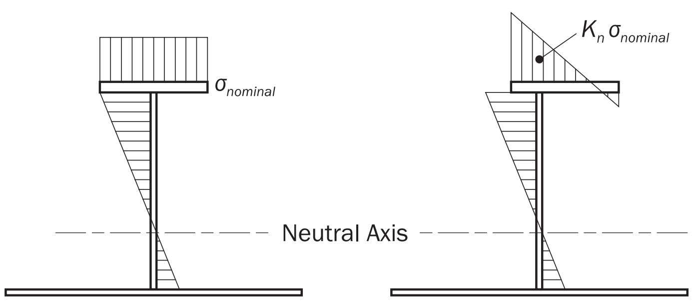


Figure 6 : Stiffener - net scantling

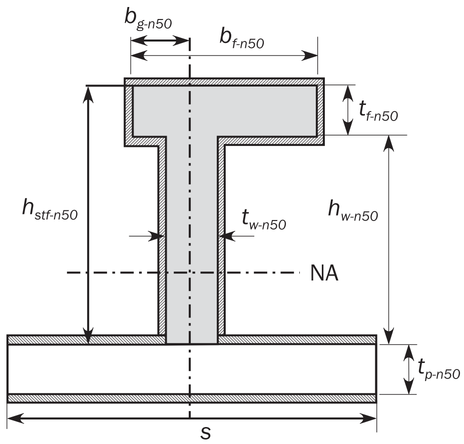

5.1.2 Bulb profiles

For bulb profiles K_n factor is to be calculated using the equivalent built-up profile as shown in Figure 7. The flange of the equivalent built-up profile is to have the same properties as the bulb flange, i.e. same cross sectional area and moment of inertia about the vertical axis and neutral axis position.

For HP bulb profiles, examples of the equivalent built up profile dimensions are listed in Table 3.

Figure 7 : Bulb profile and equivalent built-up profile

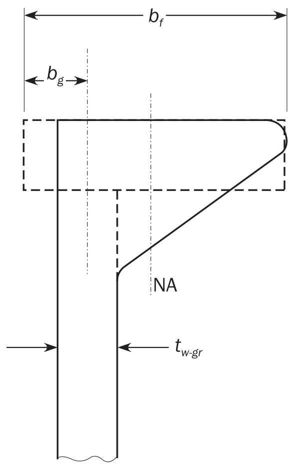

Table 3 : HP equivalent built-up profile dimensions

HP-bulb		Equivalent built-up flange in gross thickness		
Height (mm)	Gross web thickness, $t_{w\text{-}gr}$ (mm)	b_f (mm)	$t_{f\text{-}gr}$ (mm)	b_g (mm)
200	9 – 13	$t_{w\text{-}gr}$ + 24.5	22.9	($t_{w\text{-}gr}$ + 0.9)/2
220	9 – 13	$t_{w\text{-}gr}$ + 27.6	25.4	($t_{w\text{-}gr}$ + 1.0)/2
240	10 – 14	$t_{w\text{-}gr}$ + 30.3	28.0	($t_{w\text{-}gr}$ + 1.1)/2
260	10 – 14	$t_{w\text{-}gr}$ + 33.0	30.6	($t_{w\text{-}gr}$ + 1.3)/2
280	10 – 14	$t_{w\text{-}gr}$ + 35.4	33.3	($t_{w\text{-}gr}$ + 1.4)/2
300	11 – 16	$t_{w\text{-}gr}$ + 38.4	35.9	($t_{w\text{-}gr}$ + 1.5)/2
320	11 – 16	$t_{w\text{-}gr}$ + 41.0	38.5	($t_{w\text{-}gr}$ + 1.6)/2
340	12 – 17	$t_{w\text{-}gr}$ + 43.3	41.3	($t_{w\text{-}gr}$ + 1.7)/2
370	13 – 19	$t_{w\text{-}gr}$ + 47.5	45.2	($t_{w\text{-}gr}$ + 1.9)/2
400	14 – 19	$t_{w\text{-}gr}$ + 51.7	49.1	($t_{w\text{-}gr}$ + 2.1)/2
430	15 – 21	$t_{w\text{-}gr}$ + 55.8	53.1	($t_{w\text{-}gr}$ + 2.3)/2

5.2 Longitudinal stiffener end connections

5.2.1

The stress concentration factors K_a and K_b are given in Table 4 for end connection of stiffeners subjected to axial and lateral loads. The values given in Table 4 for soft toe are valid provided the toe geometry complies with the requirements given in [5.2.5]. The stress concentration factor K_b given for lateral loads are to be used also for stress due to relative displacements.

5.2.2 Other connection types

When connection types other than those given in Table 4 are proposed, the fatigue strength for the proposed connection type is to be assessed either by performing a very fine mesh FE analysis as described in Ch 9, Sec 5 to obtain directly the hot spot stress, or by calculating the stress concentration factor using FE analysis according to [5.3].

5.2.3 Overlapped connection

Overlapped connection types for longitudinal stiffeners, i.e. attachments welded to the web of the longitudinals, are not to be used in the cargo hold region.

5.2.4 End stiffener without connection to web stiffener

Where the web stiffener is omitted or not connected to the longitudinal flange in way of:

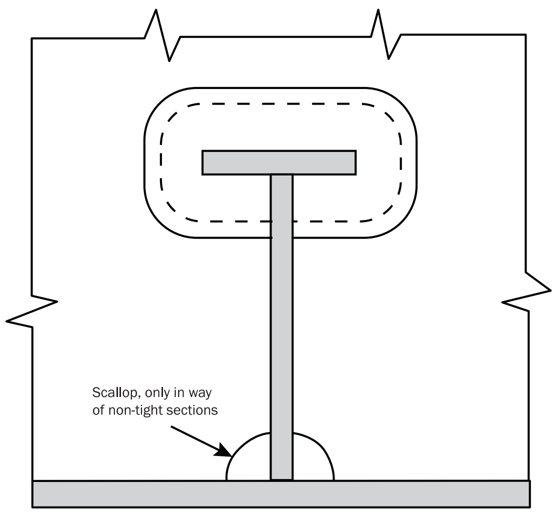
- Side shell below 1.1 T_{sc}.
- Bottom.
- Inner hull longitudinal bulkhead below 1.1 T_{sc}.
- Hopper.
- Topside tank sloping plating below 1.1 T_{sc}.
- Inner bottom.

the following is required:

- A complete collar as defined in Figure 8 (i.e. connection type ID 31 of Table 4), or,
- A detail design for cut-outs as described in Ch 9, Sec 6, [2.1].

Equivalence to cut-outs given in Ch 9, Sec 6, [2.1] may be accepted provided it is assessed for fatigue by using comparative FE analysis which is based on hot spot stress around the cut-out in the web plate of the primary supporting member inclusive of the collar, as given in Ch 9, Sec 6, [2.2].

Figure 8 : Complete collar



5.2.5 Soft toe of web stiffener and backing bracket

The toe geometry end connection of web stiffener and backing bracket is to comply with the following:

$\theta \leq 20$

$h_{toe} \leq \max(t_{bkt\text{-}gr}; 15)$

where:

θ : Angle of the toe, in deg, as shown in Figure 9.

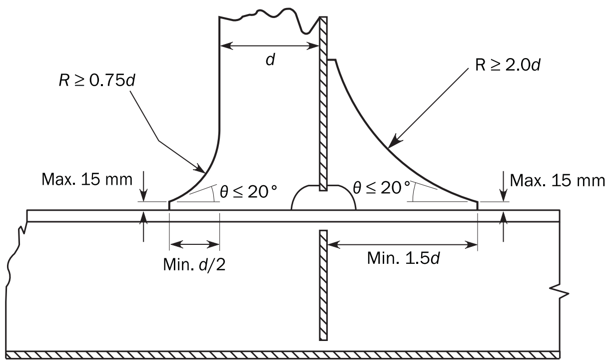
h_{toe} : Height of the toe, in mm, as shown in Figure 9.

$t_{bkt\text{-}gr}$: Gross thickness of the bracket, in mm.

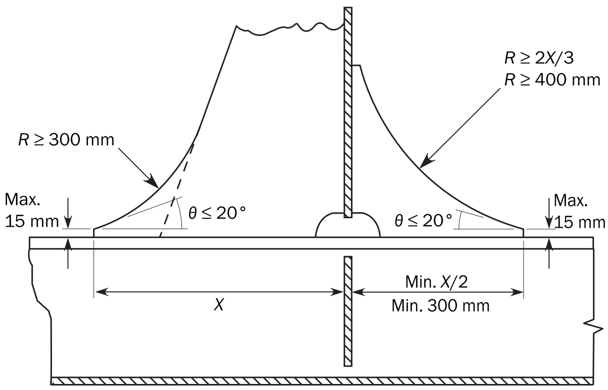
5.2.6 Recommended detail designs

Recommended detail designs for longitudinal end connections with soft toes and backing brackets are given in Figure 9.

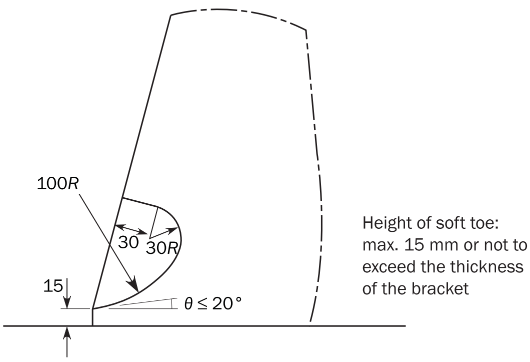
Figure 9 : Detail design for soft toes and backing brackets



Recommended design of soft toes and backing bracket of pillar stiffeners



Recommended design of soft toes and backing bracket of tripping brackets



Recommended alternative design of soft toes of tripping brackets

(1) The attachment length *d*, in mm, is defined as the length of the welded attachment on the longitudinal stiffener flange without deduction of scallop.

(2) Where the longitudinal stiffener is a flat bar and there is a web stiffener/bracket welded to the flat bar stiffener, the stress concentration factor listed in the table is to be multiplied by a factor of 1.12. This also applies to unsymmetrical profiles where there is less than 8 mm clearance between the edge of the stiffener flange and the attachment, e.g. bulb or angle profiles where the clearance of 8 mm cannot be achieved.

(3) Designs with overlapped connection / attachments, see [5.2.3].

(4) ID. 31 and 32 refer to details where web stiffeners are omitted or not connected to the longitudinal stiffener flange. See [5.2.4]

(5) For connection type ID. 32 with no collar and/or web plate welded to the flange, the stress concentration factors provided in this table are to be used irrespective of slot configuration.

(6) The fatigue assessment point 'A' is located at the connection between the stiffener web and the transverse web frame or lug plate.

5.3 Alternative design

5.3.1

Upon agreement by the Society, the geometrical stress concentration factors for alternative designs are to be calculated by a very fine mesh FE analysis according to the requirements given in Ch 9, Sec 5. Additional requirements for derivation of geometrical stress concentration factors for stiffener end connections using very fine mesh FE analysis are given below:

a) FE model extent: the FE model, as shown in Figure 10, is to cover at least four web frame spacings in the longitudinal stiffener direction with the detail to be considered located at the middle frame. The same type of end connection is to be modelled at all the web frames. In the transverse direction, the model may be limited to one stiffener spacing.

b) Load application: in general, two loading cases are to be considered:

- Axial loading by enforced displacement applied to the model ends and
- Lateral loading by unit pressure load applied to the shell plating.

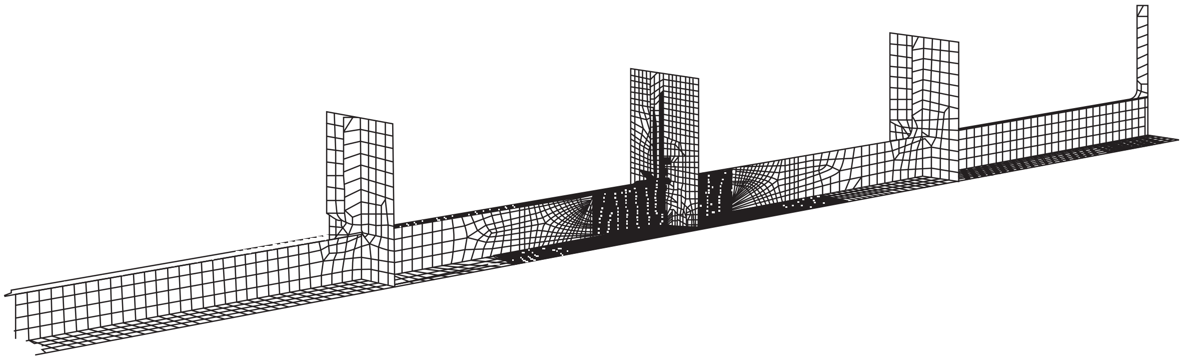
c) Boundary conditions:

- Symmetry conditions are applied along the longitudinal cut of the plate flange, along transverse and vertical cuts on web frames and on top of the web stiffener.

- For lateral pressure loading: the model is to be fixed in all degrees of freedom at both forward and aft ends.
- For axial loading: the model is to be fixed for displacement in the longitudinal direction at the aft end of the model while enforced axial displacement is applied at the forward end, or vice versa.

d) FE mesh density: At the location of the hot spots under consideration, the element size is to be in the order of the thickness of the stiffener flange. In the remaining part of the model, the element size is to be in the order of $s/10$, where s is the stiffener spacing.

Figure 10 : Fine mesh finite element model for derivation of geometrical stress concentration factor



For the 2 loading cases specified above, the stress concentration factors are determined as follows:

- For the axial loading case:

$$K_a = \frac{\sigma_{HSAx}}{\sigma_{NomAx}}$$

- For the bending loading case:

$$K_b = \frac{\sigma_{HSBd}}{\sigma_{NomBd}}$$

σ_{HSAx} : Hot spot stress, in N/mm^2, determined at the stiffener flange for the axial load.

σ_{NomAx} : Nominal axial stress, in N/mm^2, calculated at the stiffener flange according to [3.1] for the axial load applied for the FE calculation.

σ_{HSBd} : Hot spot stress, in N/mm^2, determined at the stiffener flange for the unit pressure load.

σ_{NomBd} : Nominal bending stress, in N/mm^2, calculated at the stiffener flange according to [4.1] in way of the hot spot for the unit pressure load applied for the FE calculation.

The derivation of geometrical stress concentration factors for alternative designs is to be documented and provided to the Society.

SECTION 5
FINITE ELEMENT STRESS ANALYSIS

1 GENERAL

1.1 Applicability

1.1.1

This section applies to fatigue assessment by finite element stress analysis. The methods are based on the hot spot stress approach and requirements are given for both welded and non-welded hot spots. The hot spot stress takes into account structural discontinuities due to the structural detail of the welded joint, but not taking into account the notch effect at the weld toe.

1.1.2

The hot spot stress is generally highly dependent on the finite element model used for representation of the structure and the procedure used to calculate the hot spot stress. No other methods than those described in this Section is to be adopted for calculation of FE based hot spot stress.

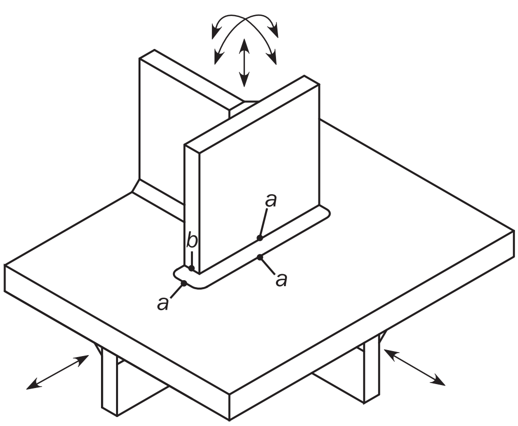
1.1.3

Two types of hot spots, denoted '*a*' and '*b*' are described in Table 1. These are defined according to their location on the plate and their orientation to the weld toe as illustrated in Figure 1.

Table 1 : Types of hot spots

Type	Description
a	Hot spot at the weld toe on plate surface
b	Hot spot at the weld toe around the plate edge

Figure 1 : Types of hot spots



1.1.4

The method for calculation of hot spot stress at weld toe for any welded details is given in [3.1] except for web-stiffened cruciform joints. The method for calculation of local stress for non-welded area is given in [3.2].

1.1.5

The method for calculation of hot spot stress at web-stiffened cruciform joints such as hopper knuckle connection, transverse bulkhead lower stool to inner bottom connection and horizontal stringer heel is given in [4].

1.1.6

Attention is to be given to limitations of the hot spot stress methodology for simple connections given in [5].

2 FE MODELLING

2.1 General

2.1.1

Evaluation of hot spot stresses for fatigue assessment requires the use of very fine finite element meshes in way of areas of high stress concentration. These very fine mesh zones may be incorporated into the global model as shown in Figure 2. The coarse mesh model of the cargo holds is to be made according to Ch 7, Sec 2, [2.4]. Alternatively, this very fine mesh analysis can be carried out by means of separate local finite element models with very fine mesh zones in conjunction with the boundary conditions obtained from a global model of the cargo holds. Typical local finite element models of a hopper knuckle with very fine mesh are shown in Figure 3, Figure 4, and Figure 5.

2.1.2 Corrosion model

The very fine mesh finite element models used for fatigue assessment are to be made using net thickness, t_{n50}, in accordance with Ch 9, Sec 1, [5.1].

2.1.3 Separate local FE model

Where a separate local finite element model is used, the extent of the local model is to be such that the calculated stresses are not significantly affected by the imposed boundary conditions and application of loads. The boundary of the fine mesh model is to be taken at adjacent primary supporting members such as girders, stringers and floors in the cargo hold model as far as practicable. Transverse web frames, stringer plates and girders at the boundaries of the local model need not be represented in the local model.

2.1.4

The evaluation of hot spot stress for '*a*' type hot spot is to be based on shell element of mesh size $t_{n50} \times t_{n50}$, where t_{n50} is the net thickness of the plate in way of the considered hot spot. The evaluation of hot spot stress for a '*b*' type hot spot is to be based on shell element of mesh size 10×10 mm. The aforementioned mesh size is to be maintained within the very fine mesh zone, extending over at least 10 elements in all directions from the fatigue hot spot position. The transition of element size between the coarser mesh and the very fine mesh zone is to be done gradually and an acceptable mesh quality is to be maintained. This transition mesh is to be such that a uniform mesh with regular shape gradually transitions from smaller elements to larger ones. An example of the mesh transition in way of the side frame bracket toe is shown in Figure 6.

2.1.5

Four-node shell elements with adequate bending and membrane properties are to be used inside the very fine mesh zone. The four node element is to have a complete linear field of in-plane stresses and hence pure in-plane bending of the element can be exactly represented. In case of steep stress gradients, 8 node thin shell elements are to be used if deemed practical. The shell elements are to represent the mid plane of the plating. For practical purposes, adjoining plates of different thickness may be assumed to be median line aligned, i.e. no staggering in way of thickness change is required. The geometry of the weld and construction misalignment is not required to be modelled.

2.1.6

All structure in close proximity to the very fine mesh zones is to be modelled explicitly with shell elements. Triangular elements are to be avoided where possible. Use of extreme aspect ratio (e.g. aspect ratio greater than 3) and distorted elements (e.g. element's corner angle less than 60 deg or greater than 120 deg) are to be avoided.

2.1.7

Where stresses are to be evaluated on a free edge, such as cut-outs for stiffener connections at web frames, edge of plating and hatch corners, beam elements having the same depth as the adjoining plate thickness and negligible width is to be used to obtain the required local edge stress values.

2.2 Hopper knuckle welded connection

2.2.1

In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of bilge hopper lower-knuckle and upper-knuckle welded connections.

2.2.2

Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the transverse web frame of interest). Transverse web frames at the end of the local model need not be represented in the local model.

b) Vertically, the model is to extend from the baseline to the lower stringer in the double side water ballast tank for tankers and double skin bulk carriers. For single skin bulk carriers, the model is to extend from the baseline to the top of the hopper ballast tank. Where a fatigue assessment is also carried out for the upper knuckle connection, the model is to be extended to four longitudinal spaces above the lower stringer in the double side ballast tank.

c) Transversely, for the hopper lower knuckle, the model is to extend from the ship side to 4 longitudinal spaces inboard of the double bottom side girder. For the upper hopper knuckle, the model is to extend from the ship side to the double bottom side girder.

2.2.3

Any scarfing brackets on the web frame adjoining the inner bottom plating, the first longitudinal stiffeners away from the knuckle hot spot as well as any carlings and brackets offset from the main frames are to be modelled explicitly using shell elements. Longitudinal stiffeners further away from the knuckle may be modelled by beam elements. The inner bottom plate 'overhang' outboard of the girder is to be modelled using shell elements up to the extent of the scarfing bracket. Away from the scarfing bracket in longitudinal direction, the inner bottom plate 'overhang' may be modelled using line elements of equivalent the area. Any perforations, such as cut-outs for cabling, pipes and access that are within one stiffener space from the knuckle point are to be modelled explicitly.

2.2.4

Figure 3, Figure 4 and Figure 5 show typical local finite element models of the hopper knuckle connection and close-up views of the $t_{n50} \times t_{n50}$ mesh zone.

2.3 Horizontal stringer heel connection

2.3.1

In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of horizontal stringer heel connections.

2.3.2

Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover one web frame space away from the stringer heel to at least one web frame space ahead of the stringer toe. Transverse web frames at the end of the local model need not be represented in the local model.

b) Vertically, the model is to extend at least to the next stringer level above and below the concerned stringer heel location.

c) Transversely, the model is to extend from the ship side to a half of the tank width in case of a stringer heel located at the inner hull longitudinal bulkhead. In case of stringer heel located at other longitudinal bulkheads the model is to extend transversely up to half the tank width on either side of the concerned stringer heel.

2.3.3

Shell elements are to be used for modelling the stringer heel connection and adjacent stiffeners. The first longitudinal and vertical stiffeners away from the heel hot spot are to be modelled explicitly using shell elements. Longitudinal and vertical stiffeners further away from the hot spot may be modelled by beam elements. Figure 7 shows a typical finite element model of the stringer heel connection with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.4 Lower stool – inner bottom connection

2.4.1

In addition to [2.1], the modelling requirements in this sub-article are applicable to the assessment of the connection between lower stool plate and inner bottom plate.

2.4.2

The minimum extent of the local model is as follows:

a) Vertically, from the bottom shell to a level at least 2 m above the inner bottom or up to the connection of the corrugation to the upper shelf plate of the lower stool, whichever is greater.

b) The local model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. to the adjacent double bottom girder). The end diaphragms need not be modelled.

c) Longitudinally, the model is to cover one floor space aft of the aft lower stool – inner bottom connection and one floor space forward of the forward lower stool – inner bottom connection.

2.4.3

Diaphragm webs, brackets inside the lower stool and stiffeners on the stool plates are to be modelled at their actual positions within the extent of the local model. Shell elements are to be used for modelling of diaphragms and brackets. The first vertical or horizontal stiffeners on the lower stool plate and the first longitudinal stiffeners on the inner bottom are to be represented by shell elements, other stiffeners may be represented by beam elements. Figure 8 shows a typical finite element model of the lower stool - inner bottom connection with very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.5 Lower stool – corrugated bulkhead connection

2.5.1

In addition to [2.1], the modelling requirements in this sub-article are applicable to the assessment of the connection between lower stool plate and corrugated bulkhead.

2.5.2

The minimum extent of the local model is as follows:

a) Vertically, from the bottom of the lower stool to a level at least 2 m above the upper shelf plate of the lower stool.

b) The local model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. to the adjacent double bottom girder). The end diaphragms need not be modelled.

c) Longitudinally, the model is to cover one floor space aft of the aft lower stool – inner bottom connection and one floor space forward of the forward lower stool – inner bottom connection.

2.5.3

Diaphragm webs, brackets inside the lower stool and stiffeners on the stool plates are to be modelled at their actual positions within the extent of the local model. Shell elements are to be used for modelling of diaphragms, and bracket. The first vertical or horizontal stiffeners on the lower stool plate are to be represented by shell elements, other stiffeners may be represented by beam elements. Figure 9 shows a typical finite element model of the lower stool - corrugated bulkhead connection with very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.6 Side frame bracket to hopper sloping plate connections

2.6.1

In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of a side frame to hopper sloping plate bracket connections.

2.6.2

Shell elements are to be used for modelling the side frame bracket, hopper tank sloping plate and adjacent stiffeners. Figure 10 shows a typical finite element model of the side frame bracket to hopper sloping plate connection with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.6.3

Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the bracket connection of interest). Transverse web frames at the end of the local model need not be represented in the local model.

b) Vertically, the model is to extend from the baseline to the bottom of the topside tank sloping plate.

c) Transversely, the model is to extend from the ship side to the adjacent double bottom side girder.

2.7 Side frame bracket to the upper sloping / flat bottom wing tank connections

2.7.1

In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of a side frame bracket to upper sloping/flat bottom wing tank connections.

2.7.2

Shell elements are to be used for modelling the side frame bracket, upper sloping or flat bottom plate and adjacent stiffeners. Figure 11 shows a typical finite element model of the side frame bracket to upper sloping wing tank with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.7.3

Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the bracket connection of interest). Transverse web frames at the end of the local model need not be represented in the local model.

b) Vertically, the model is to extend from the deck level to the top of the hopper sloping plate.

c) Transversely, the model is to extend from the ship side to the end of upper sloping/flat bottom wing tank.

2.8 Hatch corners and hatch coaming end bracket

2.8.1

In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of hatch corners/hatch coaming end bracket. The selection of hatch corners / hatch coaming end bracket for fatigue analysis is to be determined based on the level of stresses obtained from the cargo hold FE analysis.

2.8.2

Where separate local finite element models are used, the model extents are to be according to the following:

a) Transversely, over the half-breadth of the ship,

b) Longitudinally, from the midpoint of the cargo hold in which the concerned hatch corners/hatch coaming end bracket is located to the adjacent cargo hold up to and including the full width of the cross deck nearest to the concerned hatch corners/hatch coaming end bracket.

c) Vertically, from the top plate of coaming to the intersection of the topside tank sloping plate with the side or inner side shell.

2.8.3

The primary supporting members and coaming stays are to be represented by shell finite elements having both membrane and bending properties. Figure 12 shows a typical FE model of the toe connection of a longitudinal hatch coaming end bracket to the deck plating with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.8.4

The level of FE mesh refinement is to be such as to enable stress concentrations arising from the hatch corner geometry to be captured in the hot spot stress. The plate edge of hatch opening corners at the level of upper deck and cross deck structure is to be assessed. The free edge of hatch coaming end bracket and bracket toe welded connection to the deck plating are also to be assessed. Beam elements having the same depth as the adjoining plate thickness and negligible width are to be used at a plate edge of hatch opening corners or free edge of the hatch coaming end bracket to obtain the required local edge stress values as outlined in [2.1.7].

2.8.5

The local structural geometry, particularly in the areas of concern, is to be represented. The hatch corner area is to be meshed using elements with a sufficiently small size to capture the local stress on the edge. In general, a minimum of 15 elements in a 90 degree arc are to be used to describe the curvature of the hatchway radius plating for a rounded corner (see Figure 13). For an elliptical or parabolic corner, a minimum of 15 elements are to be used from the inboard radius end to a point on the edge located at half the longitudinal distance of the semi- major axis. A total of 20 elements are to be used at the elliptical edge of the hatch corner (see Figure 14). However, the element edge dimensions along the free edge of the radius need not be less than the thickness of the plating being represented and also should not be greater than 5 times the thickness of the plating being represented. Except where necessary from practical meshing

considerations, this level of idealisation is to be maintained over the bracket plating and is to extend into the stringer plating, deck plating and coaming. Mesh transitions should not be arranged close to bracket toes.

2.9 Boundary conditions

2.9.1 Cargo hold model

The boundary conditions to be applied to the ends of the cargo hold model are to be in accordance with Ch 7, Sec 2, [2.5].

2.9.2 Separate local finite element model

Where a separate local finite element model is used for evaluating the hot spot stress range, the boundary conditions and application of loads are to be in accordance with Ch 7, Sec 3, [4.2].

3 HOT SPOT STRESS FOR DETAILS DIFFERENT FROM WEB-STIFFENED CRUCIFORM JOINTS

3.1 Welded details

3.1.1

For hot spot type 'a', the structural hot spot stress, σ_{HS}, is calculated from a finite element analysis with $t_{n50} \times t_{n50}$ mesh density and is obtained by the following formula:

$$\sigma_{HS} = 1.12 \cdot \sigma$$

where:

σ : Surface principal stress, in N/mm^2, read out at a distance $t_{n50}/2$ away from the intersection line.

t_{n50} : Plate net thickness, in mm, in way of the weld toe.

At structural details where the hot spot type 'a' is classified as a web-stiffened cruciform joint, the stress read out procedure of [4.2] is to be applied.

For hot spot type 'b', the stress distribution is not dependent on the plate thickness; the structural hot spot stress, σ_{HS}, is derived from a finite element analysis with mesh density 10×10 mm and is obtained by the following formula:

$$\sigma_{HS} = 1.12 \cdot \sigma$$

where:

σ : Surface principal stress, in N/mm^2, read out at an absolute distance from the intersection line of 5 mm.

3.1.2 Stress read out methods

Depending on the element type, one of the following stress read out method is to be used:

- With 4-node shell element:

  Element surface stress components at the centre points are linearly extrapolated to the line A-A as shown in Figure 15 to determine the stress components for load case '*i1*' and '*i2*' at the stress read out point located at a distance $t_{n50}/2$ from the intersection line for type 'a' hot spot. Two principal hot spot stress ranges are determined at the stress read out point from the stress components tensor differences (between load case '*i1*' and '*i2*') calculated from each side (side L, side R) of line A-A. The angle θ between the direction x of the element co-ordinate system and the principal direction *pX* of the principal hot spot stress range co-ordinate system has to be determined.

- With 8-node shell element:

  With a $t_{n50} \times t_{n50}$ element mesh using 8-node element type, the element mid-side node is located on the line A-A at a distance $t_{n50}/2$ for type 'a' hot spots. This node coincides with the stress read out point. The element surface stress components for load case '*i1*' and '*i2*' can be used directly without extrapolation within each adjacent element located on each side (side L, side R) of the line A-A as illustrated in Figure 16. Two principal hot spot stress ranges are determined at the stress read out point from the stress components tensor difference (between load case '*i1*' and '*i2*') calculated from each side of line A-A. The angle θ between the direction x of the element coordinate system and the principal direction *pX* of the principal hot spot stress range coordinate system has to be determined.

For fatigue assessment of type 'b' hot spots, a beam element is to be used to obtain the fatigue stress range. The stress range is to be based on axial and bending stress in the beam element. The beam element is to have the same depth as the connecting plate thickness while the in-plane width is negligible.

Figure 15 : Determination of stress read out points and hot spot stress for 4-node element

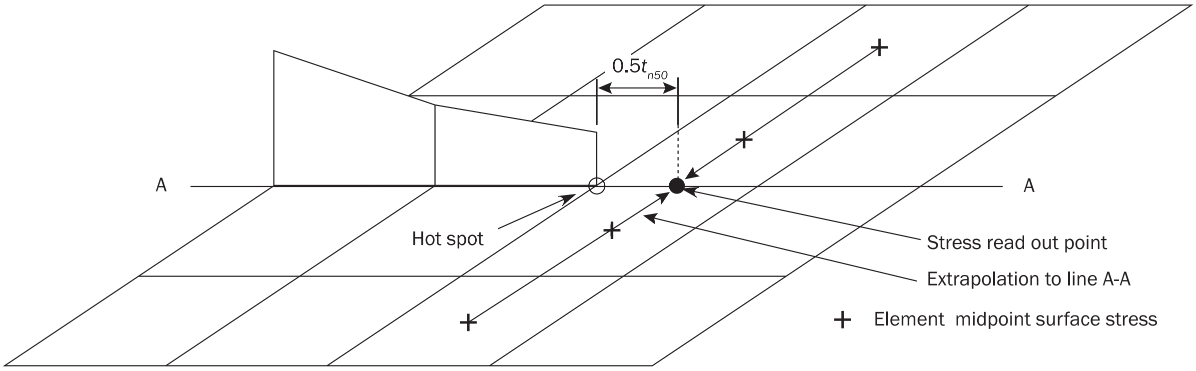

Figure 16 : Determination of stress read out points and hot spot stress for 8-node element

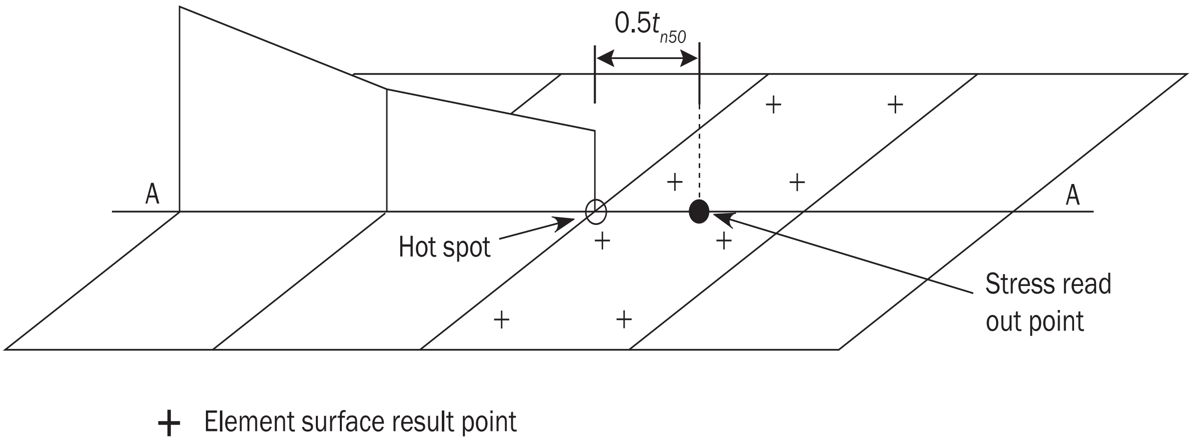


3.1.3

The above read out procedure is based on element surface stresses. Generally, in FE software the element stresses are calculated at the Gaussian integration points located inside the element. Depending on the element type implemented in the FE software, it may be necessary to perform several interpolations in order to determine the actual stress at the considered stress read out point at the surface of the element mid-point or element edge.

3.2 Base material

3.2.1

For fatigue assessment at a free plate edge, a beam element is to be used to obtain the fatigue stress range. The beam element is to have the same depth as the connecting plate thickness while the in-plane width should be negligible.

3.3 Bent hopper knuckle

3.3.1

The hot spot stress at the inner bottom/hopper sloping plate in transverse and longitudinal directions (i.e. hot spots 1, 2 and 3 defined in Ch 9, Sec 2, Table 5) of a bent hopper knuckle is to be taken as the surface principal stress read out from a point shifted away from the intersection line between the considered member and abutting member by the weld leg length.

The hot spot stress, in N/mm^2, is obtained by the following formula:

$$\sigma_{HS} = \sigma_{shift}$$

where:

σ_{shift} : Surface principal stress, in N/mm², at the shifted read out position as defined in [4.2.1] and taken as:

$$\sigma_{shift} = \sigma_{membrane}(x_{shift}) + \sigma_{bending}(x_{shift})$$

$\sigma_{bending}(x_{shift})$: Bending stress, in N/mm², at x_{shift} position.

$\sigma_{membrane}(x_{shift})$: Membrane stress at x_{shift} position, in N/mm².

3.3.2

The procedure for calculation of hot spot stress at flange such as inner bottom /hopper sloping plate is the same that for web-stiffened cruciform joints as described in [4.2.1]. The procedure that applies for hot spots on the ballast tank side of the inner bottom/hopper plate in way of a bent hopper knuckle is in principal the same as that applied on the cargo tank side of the inner bottom plate for welded knuckle in Figure 18 and Figure 19. The intersection line is taken at the mid-thickness of the joint assuming median alignment. The plate angle correction factor and the reduction of bending stress as applied for a web-stiffened cruciform joint in [4.2.2] are not to be applied for the bent hopper knuckle type.

3.3.3

The stress at hot spots located in way of the web such as transverse web and side girder (i.e. hot spots 4, 5 and 6 defined in Ch 9, Sec 2, Table 5) at a bent hopper knuckle type is to be derived as described for web-stiffened cruciform joints in [4.3.1].

4 HOT SPOT STRESS FOR WEB-STIFFENED CRUCIFORM JOINT

4.1 Applicability

4.1.1

Among the structural details to be assessed listed in Ch 9, Sec 2, Table 3 the following structural details are considered as a web-stiffened cruciform joint:

a) Welded hopper knuckle connection, shown in Figure 17.

b) Heel of horizontal stringer, shown in Figure 17.

c) Lower stool – inner bottom connection.

Two kinds of hot spots relative to the web-stiffened cruciform joints are to be assessed:

- Hot spots at the flange of web-stiffened cruciform joint,
- Hot spots in way of the web of web-stiffened cruciform joint.

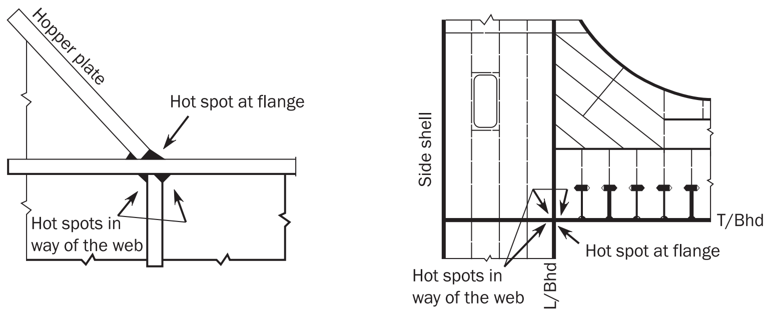
4.1.2

The procedure for calculating hot spot stress at flange of web-stiffened cruciform joint is given in [4.2].

4.1.3

The procedure for calculating hot spot stress in way of the web of the web-stiffened cruciform joint is given in [4.3].

Figure 17 : Web-stiffened cruciform joints



4.2 Calculation of hot spot stress at the flange

4.2.1

For hot spot at the flange of web-stiffened cruciform joints, the surface principal stress is to be read out from a point shifted away from the intersection line between the considered member and abutting member to the position of the actual weld toe and multiplied by 1.12. The intersection line is taken at the mid-thickness of the cruciform joint assuming a median alignment.

The hot spot stress, in N/mm^2, is to be obtained as:

$\sigma_{HS} = 1.12\ \sigma_{shift}$

where:

σ_{shift} : Surface principal stress, in N/mm^2, at shifted stress read out position.

The stress read out point shifted away from the intersection line is obtained as:

$$x_{shift} = \frac{t_{1-n50}}{2} + x_{wt}$$

where:

$t_{1\text{-}n50}$: Net plate thickness of the plate number 1, in mm, as shown in Figure 18

x_{wt} : Extended fillet weld leg length, in mm, as defined in Figure 18, not taken larger than $t_{1\text{-}n50}/2$.

4.2.2

The stress at the shifted position is derived according to the following formula and illustrated in Figure 19:

$$\sigma_{shift} = [\sigma_{membrane}(x_{shift}) + 0.60 \cdot \sigma_{bending}(x_{shift})] \cdot \beta$$

where:

$\sigma_{bending}(x_{shift})$:Bending stress, in N/mm^2, at the shifted position taken as:

$$\sigma_{bending}(x_{shift}) = \sigma_{surface}(x_{shift}) - \sigma_{membrane}(x_{shift})$$

$\sigma_{surface}(x_{shift})$: Total surface stress at x_{shift} position (including membrane stress and bending stress), in N/mm^2.

$\sigma_{membrane}(x_{shift})$: Membrane stress at x_{shift} position, in N/mm^2.

β : Plate angle hot spot stress correction factor, taken as:

- For $\alpha = 135°$:

$$\beta = 0.96 - 0.13\frac{x_{wt}}{t_{1-n50}} + 0.20\left(\frac{x_{wt}}{t_{1-n50}}\right)^2$$

- For $\alpha = 120°$:

$$\beta = 0.97 - 0.14\frac{x_{wt}}{t_{1-n50}} + 0.32\left(\frac{x_{wt}}{t_{1-n50}}\right)^2$$

- For $\alpha = 90°$:

$$\beta = 0.96 + 0.031 \frac{x_{wt}}{t_{1-n50}} + 0.24 \left(\frac{x_{wt}}{t_{1-n50}}\right)^2$$

α : Angle, in deg, between the plates forming a web-stiffened cruciform joint as shown in Figure 19.

Correction factors for connections with plate angles intermediate to those given should be derived based on a linear interpolation of the above values. The calculated hot spot stress is to be used in conjunction with the hot spot S-N curve for weld toe connections according to Ch 9, Sec 3, [4.2].

Figure 18 : Geometrical parameters of web-stiffened cruciform connections

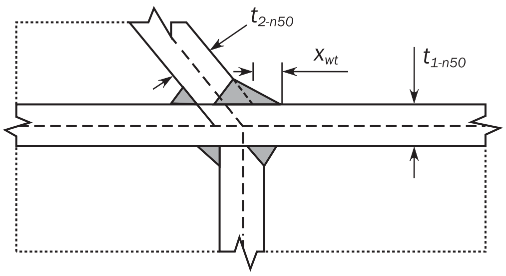


Figure 19 : Procedure for calculation of hot spot stress at web-stiffened cruciform connections

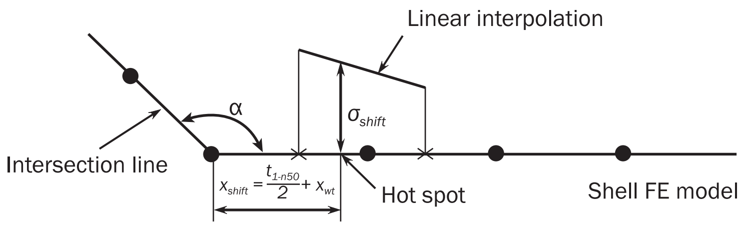

Figure 20 : Determination of stress read out points for web-stiffened cruciform connections

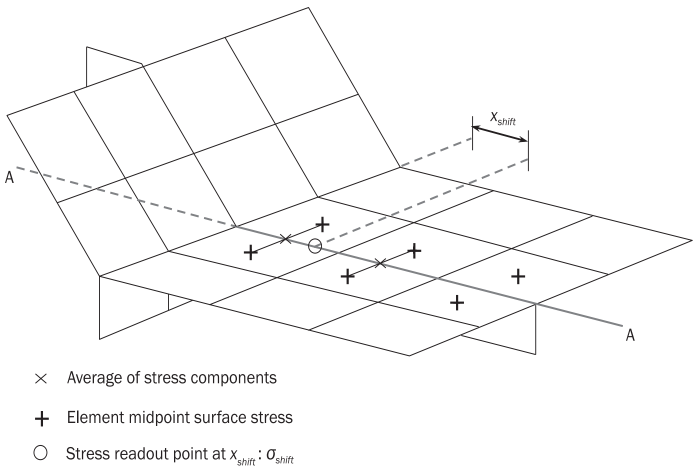


4.2.3

Surface principal stresses at the centre point of the two first elements on left and right side of the line A-A are averaged and taken as the surface principal stresses in way of the web position (line A-A). The surface principal stresses for load case '*i1*' and '*i2*' are linearly interpolated along the line A-A in order to determine hot spot principal stresses at the stress read out point located at the x_{shift} position as shown in Figure 20. The two principal hot spot stress ranges are determined at the stress read out point between load case '*i1*' and '*i2*'.

4.3 Calculation of hot spot stress in the web

4.3.1

Hot spots located in way of the web as indicated in Figure 21 are to be checked with the hot spot stress defined from the maximum principal surface stress at the intersection offset by the distance x_{shift} from the vertical and horizontal element intersection lines as illustrated in Figure 21. The intersection line is taken at the mid thickness of the cruciform joint assuming a median alignment. The hot spot stress, in N/mm^2, is to be obtained as:

$\sigma_{HS} = \sigma_{shift}$

where:

σ_{shift} : Maximum principal surface stress, in N/mm^2, at the intersection offset by the distance x_{shift}.

The stress read out point at the intersection offset is obtained as:

$$x_{shift} = \frac{t_{3-n50}}{2} + x_{wt}$$

where:

$t_{3\text{-}n50}$: Net plate thickness of the web, in mm, as shown in Figure 21

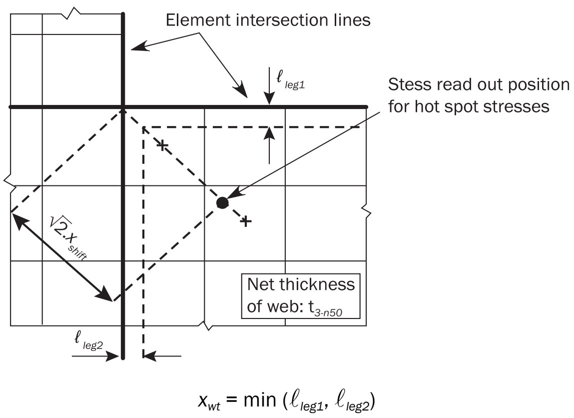
x_{wt} : Extended fillet weld leg length, in mm, , taken as:

$x_{wt} = \min(\ell_{leg1}, \ell_{leg2})$

ℓ_{leg1}, ℓ_{leg2}: Leg length, in mm, of the vertical and horizontal weld lines as shown in Figure 21.

.

Figure 21 : Hot spots in way of web



5 LIMITATIONS OF HOT SPOT STRESS APPROACH

5.1 Scope of application of hot spot stress approach

5.1.1

The hot spot stress approach given in Ch 9, Sec 1, [2.3.1] is not applicable for simple cruciform joints and simple T-joints when the stress flow in direction I as shown in Figure 22 is considered. For stresses in the direction normal to the weld at hot spot location "c" (direction I) there is no stress flow into the transverse plating as it is represented only by one plane in the shell model. However, it attracts stresses for in-plane direction (direction II) at hot spot location "*a*".

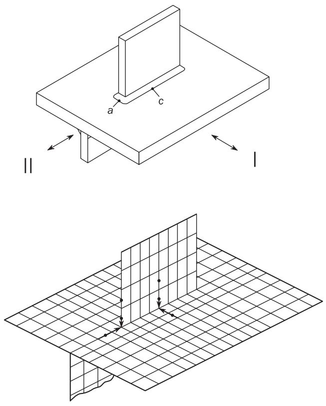
In situations where a bracket is fitted behind the transverse plate as shown in Figure 1, acting with stiffness in the direction normal to the transverse plate, stresses flow also into the transverse plate and the hot spot methodology is considered applicable.

5.1.2

The hot spot stress at position '*c*' for simple cruciform joints and simple T-joints is to be determined by the stress read out procedure given in [3.1] multiplied by a geometrical stress concentration factor of 1.3 and is taken as:

$$\sigma_{HS} = 1.3 \cdot 1.12\sigma$$

Figure 22 : Illustration of check points in way of a welded attachment under orthogonal applied in plane loads



6 SCREENING FATIGUE ASSESSMENT

6.1 Screening procedure

6.1.1 Assumptions

The screening fatigue procedure is based on:

- Screening hot spot stress obtained by multiplying the stresses calculated from fine mesh analysis according to Ch 7, Sec 3 by the stress magnification factor of the considered structural detail.
- Mean stress effect and thickness effect are used according to Ch 9, Sec 3, [3.2] and Ch 9, Sec 3, [3.3].

6.1.2 Procedure

The screening fatigue procedure includes the following three phases:

a) Phase 1: Calculation of fatigue stress.

   - Stresses are calculated at the stress read out point from the fine mesh element analysis with elements size of 50 × 50 mm, according to Ch 7, Sec 3 for all fatigue load cases defined in Ch 9, Sec 1, [7], for all loading conditions. Stresses to be used are element average membrane components stress defined in [6.2.3].
   - Hot- spot surface stress components are calculated for each load case '*i1*' and '*i2*' from the stresses multiplied by the stress magnification factor η, taken as:
     - $\sigma_{HS,\, i1(j)} = \eta\ \sigma_{S,\, i1(j)}$
     - $\sigma_{HS,\, i2(j)} = \eta\ \sigma_{S,\, i2(j)}$
   - Hot spot principal surface stress ranges are the difference of hot spot stress components obtained for each load case '*i1*' and '*i2*'.
   - Fatigue stress ranges for welded joints are determined from hot spot principal surface stress ranges with correction factor for mean stress and thickness effect.

   where:

   $\sigma_{S,\, i1(j)}$: Stress calculated from the fine mesh analysis in load case '*i1*' of loading condition (*j*) defined in [6.2].

   $\sigma_{S,\, i2(j)}$: Stress calculated from the fine mesh analysis in load case '*i2*' of loading condition (*j*) defined in [6.2].

η : Stress magnification factor given in Table 2.

b) Phase 2: Selection of S-N curve.

The S-N curve D defined in Ch 9, Sec 3, [4] is to be used with the fatigue stress range of weld toe in screening fatigue procedure.

c) Phase 3: Calculation of fatigue damage and fatigue life according to [6.1.3].

Table 2 : Stress magnification factor

Ship type	Structural details category	Stress magnification factor, η
Oil tanker	Toe of stringer	2.45
	Bracket toe of transverse web frame	1.65
Bulk carrier	Lower hopper knuckle	2.10 for FA (1) 2.00 for EA (1)
	Lower stool – inner bottom (for knuckle angle = 90 deg)	1.66
	Lower stool – inner bottom (for knuckle angle > 90 deg)	1.45 for FA (1) 1.75 for EA (1)
(1) FA and EA mean full and empty cargo hold in alternate loading condition respectively.		

6.1.3 Screening fatigue criteria

The total fatigue damage and the fatigue life of screened details are to comply with the criteria given in Ch 9, Sec 3, [2].

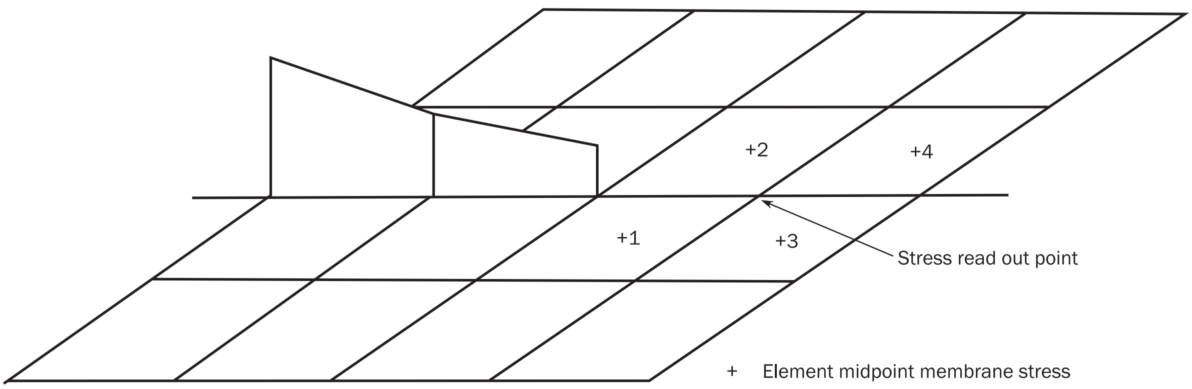
Structural details that do not comply with the acceptance criteria are to be checked with respect to fatigue strength using a very fine mesh finite element analysis as described in Ch 9, Sec 5.

6.2 Stress read out procedure

6.2.1 Bracket toe

For bracket toe, the stress read out point is located at a 50 mm distance away from the bracket toe as shown in Figure 23.

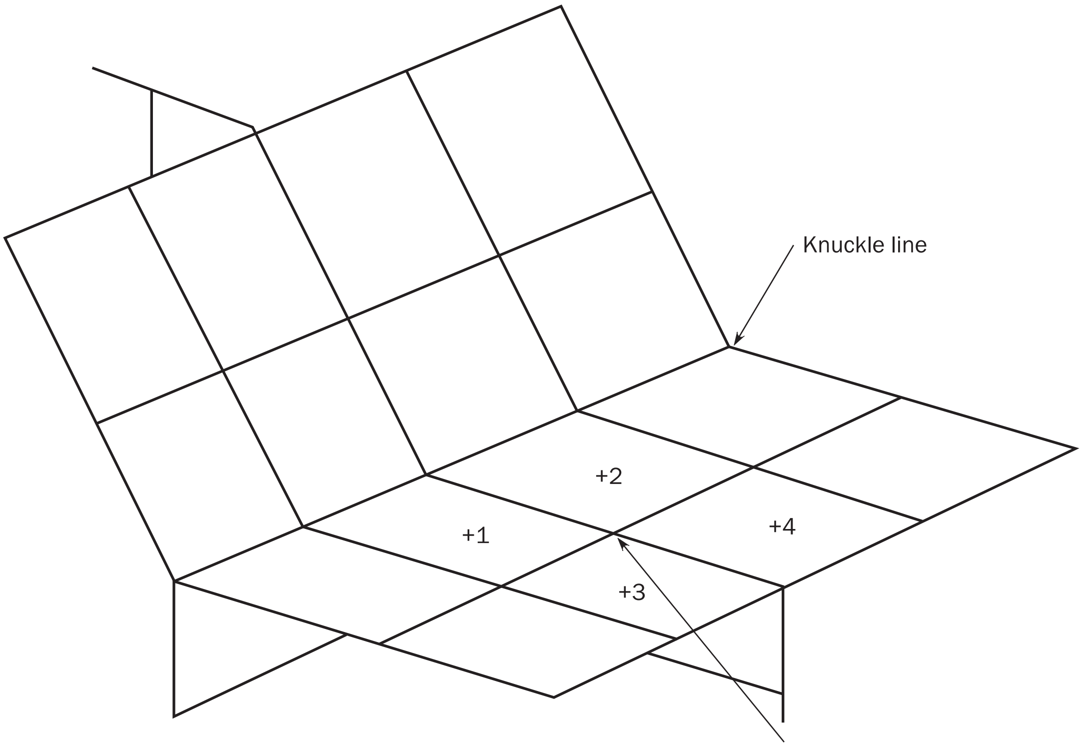
Figure 23 : Stress read out point at bracket toe



6.2.2 Knuckle detail

For the lower hopper knuckle and for the connection between transverse bulkhead lower stool and inner bottom, the stress read out point is located at a 50 mm distance away from the knuckle line (i.e. model intersection line) as shown in Figure 24.

Figure 24 : Stress read out point of knuckle detail

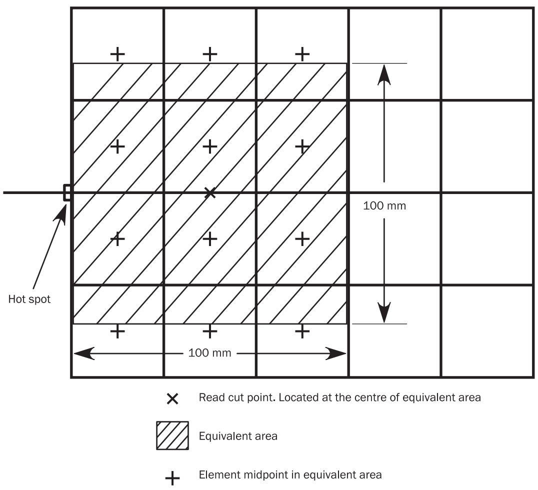


6.2.3 Read out point stress

The average of membrane stress components at the centre of four elements, modelled with elements size of 50 × 50 mm connected to the stress read out point (or node) can be used as read out point stress.

When the element size is less than 50 x 50 mm, the stress of read out point can be derived using elements in an equivalent area as shown in Figure 25.

Figure 25 : Equivalent area for element size less than 50 × 50 mm



SECTION 6
DETAIL DESIGN STANDARD

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Purpose

1.1.1

Design standard provides fatigue resistant detail design at an early stage in the structural design process by giving consideration to the following aspects:

- Application of fatigue design principles.
- Construction tolerances and other practical considerations.
- In-service experience and fatigue performance.

1.1.2

The design standard is to be applied to the design of ship structural details in following steps:

- Highlighting potential critical areas within the ship structure.
- Identification of the fatigue hot spot locations for each of the critical structural details.
- Provision of a set of alternative improved configurations from which a suitable solution can be selected.
- Requirements on geometrical configurations, scantlings, welding requirements and construction tolerances.
- Post fabrication method of improving fatigue life, such as weld toe grinding.

1.2 Application

1.2.1

The structural details described in this section are to be designed according to the given design standard but alternative detail design configurations may be accepted subject to demonstration of satisfactory fatigue performance.

For the details given in Ch 9, Sec 2, Table 3, the fatigue assessment by very fine mesh finite element analysis may be omitted if the detail is designed in accordance with the design standard given in this section.

2 STIFFENER-FRAME CONNECTIONS

2.1 Design standard A

2.1.1

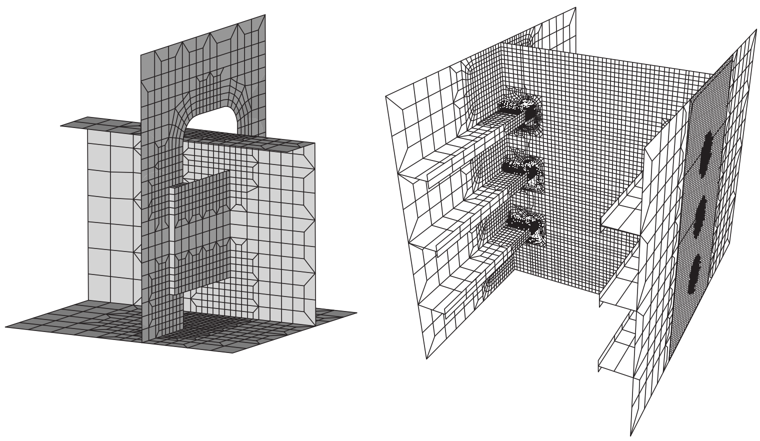
Designs for cut outs in cases where web stiffeners are omitted or not connected to the longitudinals are required to adopt tight collar or the improved design standard "*A*" as shown in Table 1 or equivalent, for the following members:

- Side shell below $1.1T_{sc}$.
- Bottom.
- Inner hull longitudinal bulkhead below $1.1T_{sc}$.
- Topside tank sloping plating below $1.1T_{sc}$.
- Hopper.
- Inner bottom.

2.1.2

Designs that are different from those shown in Table 1 are acceptable subject to demonstration of satisfactory fatigue performance, e.g. by using comparative finite element analysis. The comparative FE analysis is to be performed following the modelling guidance given in Figure 1.

Figure 1 : Finite element model for verification of equivalent design



2.2 Equivalent design of stiffener-frame connections

2.2.1

If the required designs for stiffener-frame connections in [2.1] are not followed, the alternative design is to be verified to have equivalent fatigue strength to the design standard "A" or to be verified to have satisfactory fatigue performance. The alternative design is to be verified according to the procedure given in [2.2.2] to [2.2.5] and documentation of results is to be submitted to the Society.

2.2.2

The procedure of [2.2.3] and [2.2.4] is provided to verify the alternative design to have equivalent fatigue strength with respect to any position in the transverse ring, i.e. double bottom and double side. The hot spot stress of the alternative design and that of the required design is to be compared to the critical hot spots in way of the cut-out. The critical hot spots depend on the detail design and are to be selected in agreement with the Society. The hot spot stress is to be derived according to Ch 9, Sec 5, [3.1] and Ch 9, Sec 5, [3.2]. It is to be

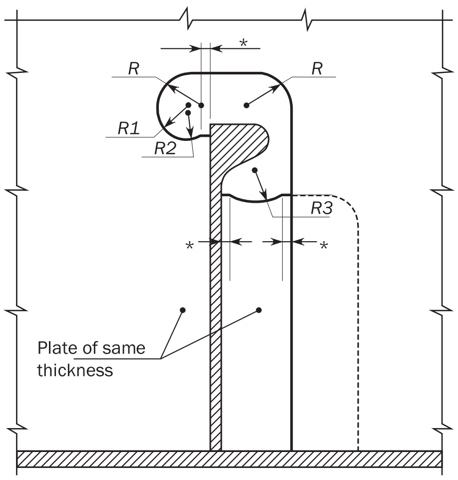
noted that welded hot spots at the free edge are classified as hot spot type “*b*”. Example of typical hot spots for checking is shown in Ch 9, Sec 2, [2].

Table 1 : Design standard A – stiffener-frame connection

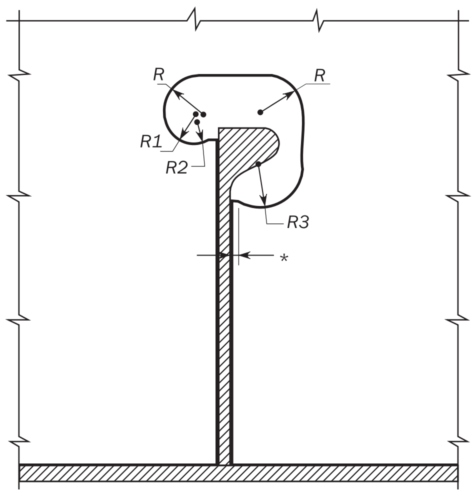
Cut outs for longitudinals in transverse webs where web stiffeners are omitted or not connected to the longitudinal flange

Design standard *A*

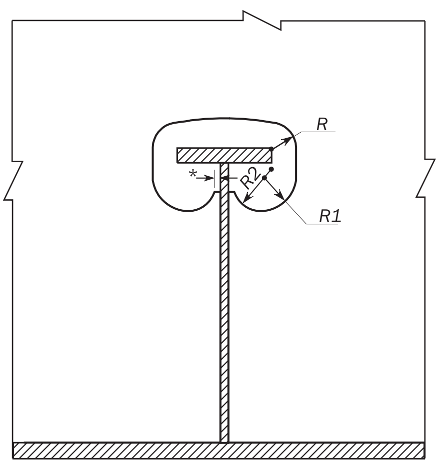
1



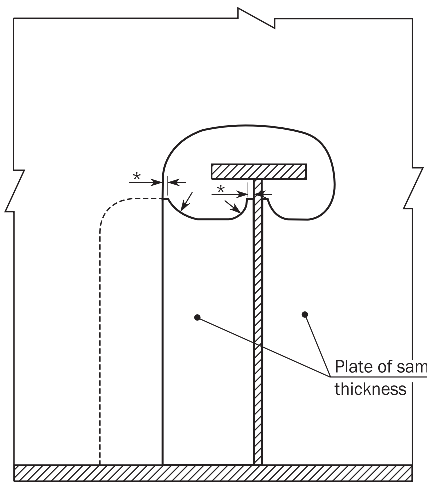
2



3



4



Note 1: Soft toes marked ‘*’ are to be dimensioned to suit the weld leg length such that smooth transition from the weld to the curved part can be achieved. Maximum 15 mm or thickness of transverse web/collar plates/lug plates whichever is the greater.

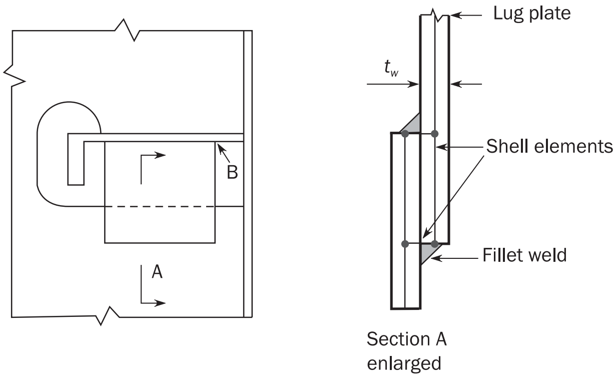
Note 2: Configurations 1 and 4 indicate acceptable lapped lug plate connections.

Critical location	Locations around cut-out with high stress concentration and locations in way of weld terminations.
Detail design standard	Improved slot shape to avoid high stress concentrations in transverse webs due to shear loads and local pressure loads transmitted via welded joints.
Building tolerances	Ensure alignment of all connecting members and accurate dimensional control of cut-outs according to IACS Recommendation No. 47.
Welding requirements	A wraparound weld, free of undercut or notches, around the transverse web connection to longitudinal stiffener web.

2.2.3

The very fine mesh finite element models are made to analyse the behaviour in way of double side or double bottom. The models should have an extent of 3 stiffeners in cross section, i.e. 4 stiffener spacings, and the longitudinal extent is to be one half frame spacing in both forward and aft direction. A typical model is shown in Figure 1. No cut-outs for access openings are to be included in the models. Connection between the lug or the web-frame to the longitudinal stiffener web, connections of the lug to the web-frame and free edges on lugs and cut-outs in web-frame are to be modelled with elements of net plate thickness size (t_{n50} × t_{n50}). The mesh with net plate thickness size should extend at least five elements in all directions. Outside this area, the mesh size may gradually be increased in accordance with the requirements in Ch 9, Sec 5, [2]. The eccentricity of the lapped lug plates is to be included in the model. Transverse web and lug plates are to be connected by eccentricity elements (transverse plate elements). The height of eccentricity element is to be the distance between mid-layers of transverse web and lug plates having a thickness equal to 2 times the net thickness of web-frame plate $t_{w\text{-}n50}$. Eccentricity elements representing fillet welds are shown in Figure 2.

Figure 2 : Modelling of eccentric lug plate by shell elements



2.2.4

Three load cases are to be applied to the models of the design standard and alternative designs:

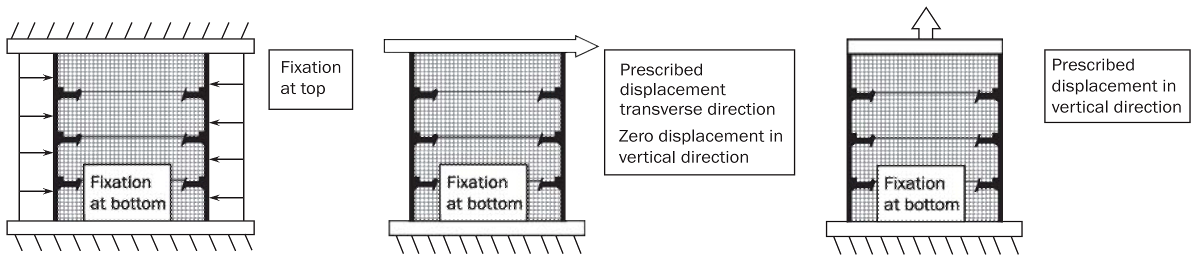
- External pressure of unit value, fixed boundary conditions at top and bottom of model.
- Shear stress by prescribed unit displacement at the model top and fixed boundary conditions at the model bottom.
- Axial load by prescribed unit displacement at the model top and fixed boundary conditions at the model bottom.

The forward and aft part of the model should have symmetry condition describing the behaviour in a double hull structure. Load application and boundary conditions are provided in Figure 3.

2.2.5

The alternative design may also be verified to have satisfactory fatigue performance using sub-modelling technique where a very fine mesh model of the alternative design located at the actual position of the stiffener-frame connection is analysed. The alternative design is considered acceptable if the fatigue acceptance criterion of Ch 9, Sec 1 is achieved. The fatigue acceptance criterion is checked by applying the methodology described in Ch 9, Sec 1, Ch 9, Sec 3 and Ch 9, Sec 5. The alternative design is considered acceptable only for the particular position where it is analysed.

Figure 3 : Load application and boundary conditions – FE model for verification of alternative design



3 SCALLOPS IN WAY OF BLOCK JOINTS

3.1 Design standard B

3.1.1

Scallops in way of block joints in the cargo tank/hold region, located on the stiffeners fitted on strength deck, and side above 0.9 *D* from the baseline, are required to be designed according to the design standard B as shown in Table 2.

4 HOPPER KNUCKLE CONNECTION

4.1 Design standard C to H

4.1.1

The welded knuckle between hopper plating and inner bottom plating for double-hull oil tankers is to be designed according to the design standard C in Table 3. The design standard D in Table 4 may be used as an alternative to increase fatigue strength at the hopper connection.

4.1.2

The welded knuckle between hopper plating and inner bottom plating for bulk carriers is to be designed according to the design standard E in Table 5.

4.1.3

The radiused knuckle between hopper plating and inner bottom plating is to be designed according to the design standard F in Table 6 for double hull oil tankers.

Alternative structural arrangements may be accepted based on verification in accordance with Ch 9, Sec 5, [3.3].

4.1.4

The radiused knuckle between hopper plating and inner bottom plating for bulk carriers is to be designed according to the design standard G in Table 7.

4.1.5

The radiused knuckle between hopper plating and inner side plating for oil tankers and double side bulk carriers is to be designed according to the design standard H in Table 8.

4.1.6

In general, the prescribed minimum requirements for welding, weld dressing and building tolerances as given in Table 3 to Table 8 are to be followed. Alternative positioning and/or dispensation of some support structure, such as transverse and longitudinal brackets may be accepted subject to demonstration of acceptable fatigue lives. Inserts and/or weld dressing additional to those prescribed may be required as a consequence of hot spot fatigue analysis.

<tr><td></td></tr>
</table>

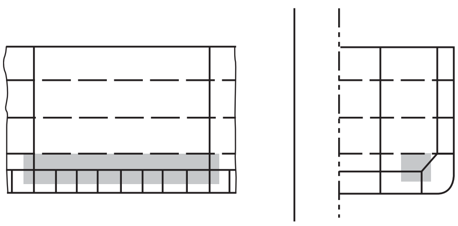
Minimum requirement	As a minimum, detail design standard C or D is to be fitted. The ground surface is to be protected by a stripe coat of suitable paint composition, where the lower hopper knuckle region of cargo tanks is not coated.
Critical location	Hopper sloping plating connections to inner bottom plating in way of floors. Floor connections to inner bottom plating and side girder in way of hopper corners.
Detail design standard	Elimination of scallops in way of hopper corners, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket thickness is to be close to that of the inner bottom in way of the knuckle.
Building tolerances	Median line of hopper sloping plate is to be in line with the median line of the girder with an allowable tolerance of $t_{as\text{-}built}/3$ or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the as-built side girder thickness. The allowable tolerance is to be measured parallel to the inner bottom.
Welding requirements	Full or partial penetration welding is to be applied to hopper sloping plating and inner bottom plating connection. Partial penetration welding is to be applied to connections of side girder to inner bottom plating, to connections of floors to inner bottom plating and to side girder, to connections of hopper transverse webs to sloping plating, to inner bottom and to side girder in way of the hopper knuckle. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3 Weld between hopper plating and inner bottom plating to be enlarged and ground smooth. Visible undercuts are to be removed, see Ch 9, Sec 3, [6]. Weld enlargement and grinding are applicable to minimum 200 mm on each side of the floor.

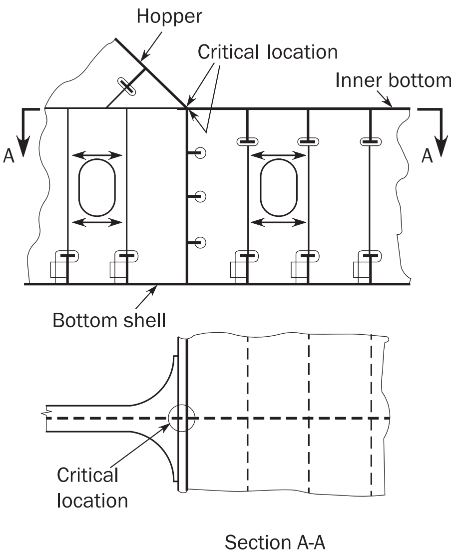
Table 4 : Design standard D – hopper knuckle connection detail, welded, with bracket, double hull oil tanker

Connections of floors in double bottom tanks to hopper tanks
Hopper corner connections employing welded inner bottom and hopper sloping plating

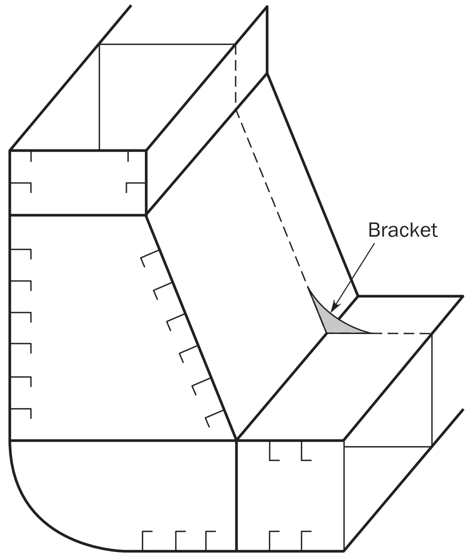
Critical areas



Critical locations



Design standard D



Note 1: Bracket to be fitted inside cargo tank.
Note 2: Bracket to extend approximately to the first longitudinal.
Note 3: The bracket toes are to have a soft nose design.
Note 4: Bracket material to be same as that of inner bottom.
Note 5: Slenderness of bracket to be in accordance with Ch 8, Sec 2, [5.2].

Minimum requirement	As a minimum, detail design standard C or D is to be applied.
Critical location	Hopper sloping plating connections to inner bottom plating in way of floors. Floor connections to inner bottom plating and side girder in way of hopper corners. The bracket connection to inner bottom and hopper sloping plate.
Detail design standard	Elimination of scallops in way of hopper corners, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket thickness similar to that of the inner bottom in way of the knuckle.
Building tolerances	Median line of hopper sloping plate is to be in line with the median line of girder with an allowable tolerance of $t_{as\text{-}built}$ /3 or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the as-built side girder thickness.
Welding requirements	Partial penetration welding is to be applied to hopper sloping plating and inner bottom plating connection, to connections of side girder to inner bottom plating, to connections of floors to inner bottom plating and to side girder, to connections of hopper transverse webs to sloping plating, to inner bottom and to side girder in way of the hopper knuckle. Partial penetration welding is to be applied to the bracket connections to inner bottom and hopper sloping plate, full penetration welding is to be applied at bracket toes. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.

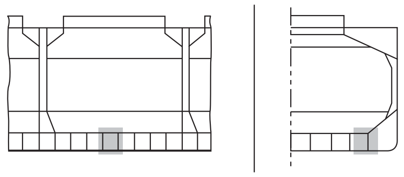
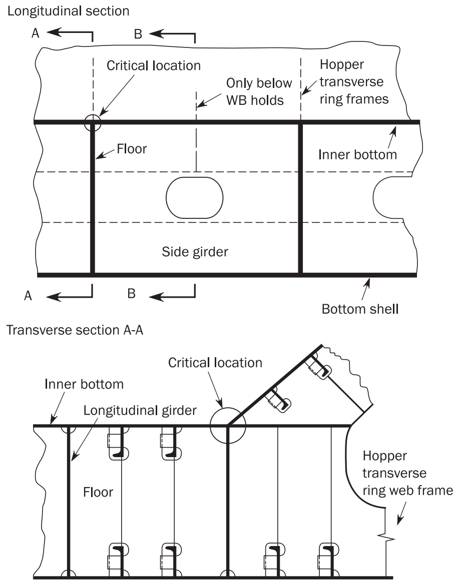
Connections of floors in double bottom tanks to hopper tanks Welded knuckle connection of hopper tank sloping plating to inner bottom plating	
Critical areas	**Design standard E**

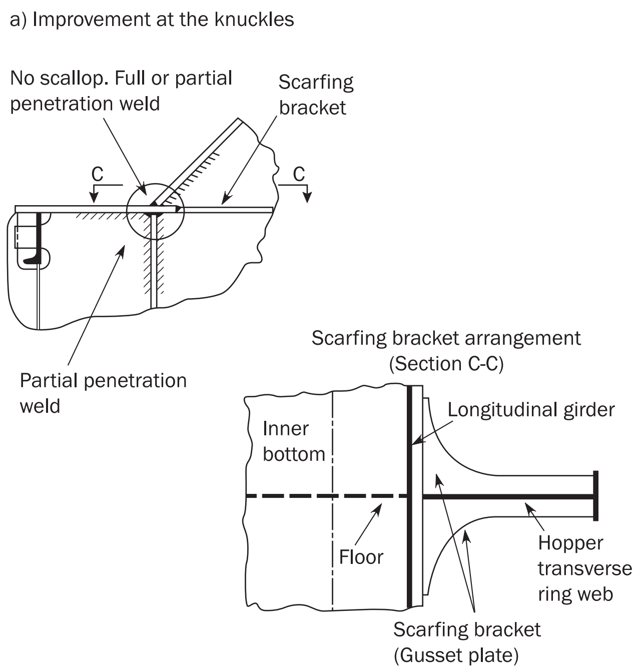
Critical areas



Critical locations



Design standard E



Minimum requirement	As a minimum, detail design standard E is to be fitted. Ballast holds: No scallops or close scallops with collars; scarfing bracket; intermediate bracket if floor spacing greater than 2.5 m. Dry holds: No scallop or close scallops with collars and scarfing bracket.
Critical location	Hopper sloping plating connections to inner bottom plating in way of the floors. Floor connections to inner bottom plating and side girder in way of the hopper knuckle.
Detail design standard	Elimination of scallops in way of hopper knuckle, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket net thickness is to be minimum 80% of that of the inner bottom in way of knuckle and steel material to be of the same yield strength.
Building tolerances	Median line of hopper sloping plate is to be in line with the median line of girder with an allowable tolerance of $t_{as\text{-}built}/3$ or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the as-built side girder thickness.
Welding requirements	Full or partial penetration welding is to be applied to hopper sloping plating and inner bottom plating connection for the length of the cargo hold. Partial penetration welding is to be applied to connections of side girder to inner bottom plating, to connections of floors to inner bottom plating and to side girder, to connections of hopper transverse webs to sloping plating, to inner bottom and to side girder in way of the hopper knuckle. Weld between hopper plating and inner bottom plating is to be enlarged and ground smooth. Visible undercuts are to be removed. Weld enlargement and grinding are applicable to minimum 200 mm on each side of the floor. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.

Connections of floors in double bottom tanks to hopper tanks Hopper corner connections employing radiused knuckle between inner bottom and hopper sloping plating	
Detail design standard	Elimination of scallops in way of hopper/girder connection and additional transverse and longitudinal brackets to reduce peak and range of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure, and hull girder global loading, and provide additional support to sloping plate.
Building tolerances	The nominal distance between the centres of thickness of the two abutting members (e.g. floor and hopper web plate) is not to exceed 1/3 of the as-built thickness of the side girder.
Welding requirements	Full penetration welding is to be applied to connections of floors to hopper/inner bottom plating in way of radiused hopper knuckle. Partial penetration welding is to be applied to connections of floors/hopper transverse webs to the side girder in way of hopper corner, and to connections of side girder to hopper/inner bottom plating. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3. In order to improve the fatigue strength, weld enlargement and grinding are applicable to full and partial penetration welds with a minimum distance of 300 mm from the intersection point between the radiused knuckle, the floor and the side girder.

Table 7 : Design standard G – hopper knuckle connection detail, radiused type, bulk carrier

Critical areas	**Design standard G**
	Critical locations	Intermediate bracket arrangement (Section B-B). Two intermediate brackets at both sides of floor/transverse web.
 	 Note 1: Distance from side girder to centre of knuckle is to be as small as practicable, but is not to exceed 50 mm. Note 2: The knuckle radius is not to be less than 4.5 $t_{as\text{-}built}$ or 100 mm, whichever is the greater, in cases where $t_{as\text{-}built}$ is the as-built thickness of the knuckle part. Note 3: Additional transverse brackets on both side of transverse floor/hopper connection. Note 4: Transverse brackets may be omitted if it can be demonstrated that the girder provides sufficient support at the knuckle line, i.e. that fatigue requirements according to Ch 9, Sec 5 and local strength analysis requirements according to Ch 7, Sec 3 are fulfilled.
Critical location	Side girder connections to inner bottom plating in way of floors. Floor and hopper transverse web connections to inner bottom plating and hopper sloping plate, respectively, and to side girder in way of hopper corners.
Detail design standard	Elimination of scallops in way of hopper/girder connection. Ballast holds: Intermediate brackets fitted at approximately 0.5 floor space from floor/hopper web. Dry holds: Intermediate brackets fitted at 0.5 floor space from floor/hopper web if floor spacing is equal to or greater than 2.5 m.

Connections of floors in double bottom tanks to hopper tanks Hopper corner connections employing radiused knuckle between inner bottom and hopper sloping plating	
Building tolerances	The nominal distance between the centres of thickness of the two abutting members (e.g. floor and hopper web plate and additional supporting brackets) should not exceed 1/3 of the as-built thickness of the side girder.
Welding requirements	Full penetration welding is to be applied to connections of floors to hopper /inner bottom plating in way of radiused hopper knuckle. Partial penetration welding is to be applied to connections of floors/hopper transverse webs to side girder in way of hopper corners, to connections of side girder to hopper /inner bottom plating. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.

Critical location	Side stringer connections to side longitudinal bulkhead in way of transverse webs. Double side tank transverse web and hopper transverse web connections to side longitudinal bulkhead and to side stringers in way of hopper corners.
Detail design standard	Elimination of scallops in way of hopper corners, closer knuckle distance from side stringers. Additional longitudinal/transverse brackets to reduce peak and range of resultant stresses arising from cyclic external hydrodynamic pressure and cargo inertia pressure.

Connections of transverse webs in double side tanks to hopper tanks Hopper corner connections employing radiused knuckle between side longitudinal bulkhead and hopper sloping plating	
Building tolerances	The nominal distance between the centres of thickness of the two abutting members should not exceed 1/3 of the as-built thickness of the side stringer.
Welding requirements	Partial penetration welding is applied to connection of side stringers to side longitudinal bulkhead, connection of double side tank transverse webs to side longitudinal bulkhead and to side stringers, connection of hopper transverse webs to sloped side longitudinal bulkhead and to side stringers in way of hopper corners. Small scallops of suitable shape, which are to be closed by welding after completion of the continuous welding of side stringers to longitudinal bulkhead, are to be provided where scallops are eliminated. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.

5 HORIZONTAL STRINGER HEEL

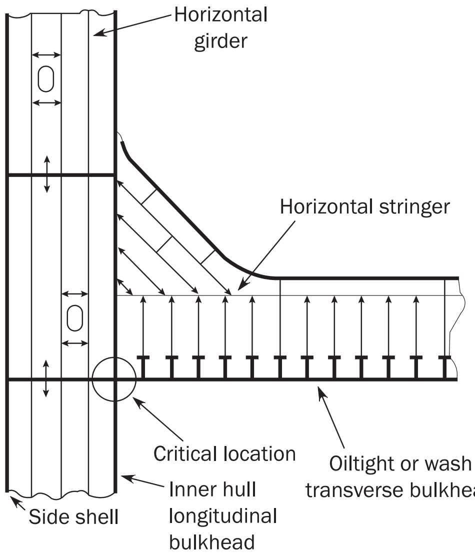
5.1 Design standard I

5.1.1

The horizontal stringer heel location between transverse oil-tight/swash bulkhead plating and inner hull longitudinal bulkhead plating for double hull oil tankers are required to be designed according to design standard I, as shown in Table 9.

Table 9 : Design Standard I – transverse bulkhead horizontal stringer heel

Connections of horizontal stringer on plane oil-tight transverse bulkheads or wash bulkheads to inner hull longitudinal bulkheads	
Critical areas	**Design standard I**
 	 Note 1: Where a face plate is considered necessary, it is recommended that design features be adopted to reduce the stress concentration at the face plate termination (e.g. taper and soft nose). Adequate fatigue life of the weld on the bracket edge in way of such terminations is to be confirmed. Note 2: 'Slit type cut-outs are to be adopted in way of the bracket toe as shown. Alternatively, cut-outs with insert type collars will be accepted. Scallops are to be avoided.'
Critical locations	
	



Connections of horizontal stringer on plane oil-tight transverse bulkheads or wash bulkheads to inner hull longitudinal bulkheads	
Critical location	Intersections of webs of transverse bulkhead horizontal stringer and double side tank horizontal girder forming square corners.
Detail design standard	A soft toe backing bracket is to be fitted. The following bracket sizes are recommended: • VLCC: 800×800×30, *R*600 with soft toe as shown in figure above, • Other tankers: 800×600×25, *R*550 with soft toe as shown in figure above, where the longer arm length is in way of the inner skin. The specified minimum yield stress for the bracket is not to be less than 315 N/mm². The free edge is to be ground smooth with corners rounded.
Building tolerances	The nominal distance between the centres of thickness of the two abutting members should not exceed 1/3 of the as-built plate thickness of the inner hull longitudinal bulkhead.
Welding requirements	Vertical weld between the inner hull plating and transverse bulkhead plating, fillet welding having minimum weld factor 0.44. Welding between the backing bracket and the adjoining plates is to be double sided fillet welding having minimum weld factor 0.44 except in way of the bracket toes. Full penetration welding is to be used for the connection of bracket toes to the inner hull and transverse bulkhead plating for a distance of 200 mm from the toes and the weld toes are to be ground smooth in way.

6 BULKHEAD CONNECTION TO LOWER AND UPPER STOOL

6.1 Design standard J, K and L

6.1.1

The welded connection of bulkhead to lower stool of bulk carriers and oil tankers are to be designed according to the design standard J and K respectively, as shown in Table 10 and Table 11.

6.1.2

The welded connection of bulkhead to upper stool of bulk carriers are to be designed according to the design standard M, as shown in Table 12.

Table 10 : Design standard J – transverse bulkhead connection detail, bulk carrier

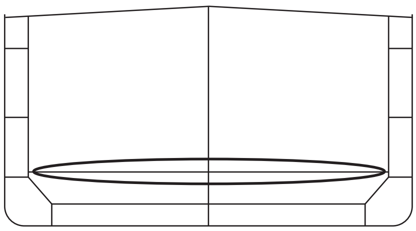
</table>

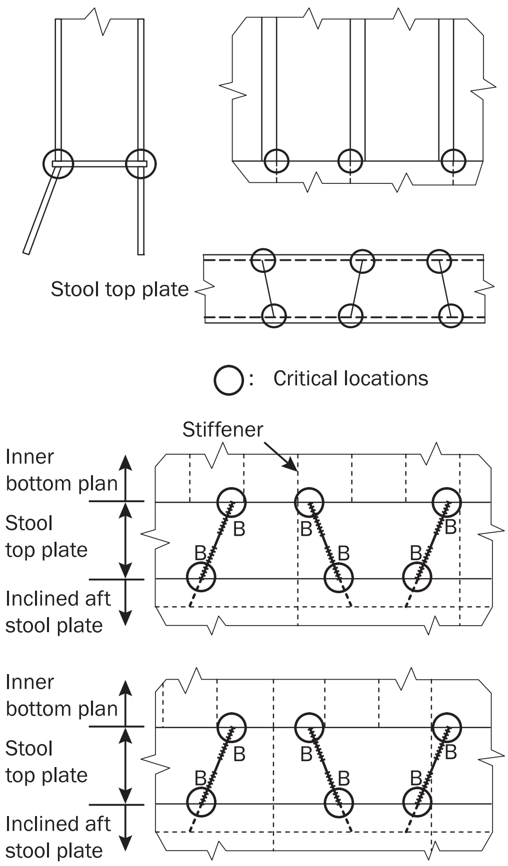
Critical location	Connections of lower stool shelf plate to lower stool and corrugated transverse bulkheads. Connections of shedder plates to corrugated transverse bulkhead.
Detail design standard	The use of scallops is to be avoided on diaphragms/web at lower stool top plates. Gusset plates are to be fitted to corrugated bulkheads. Gusset plates are to be made out of the same material and have the same as-built thickness as corrugated bulkheads; and, the height of gusset plates is to be greater than half of breadth of the corrugation. To reduce stress concentrations at the crossing of the shedder plates one plate is to be moved higher than the other (as shown in Figure). Alternatively, bracketed stiffener can be fitted at the crossing points underneath the shedder plating facing the ballast hold.
Building tolerances	Ensure alignment between lower stool sloping plates and corrugation faces according to IACS Recommendation No. 47.
Welding requirement	Full penetration welding is to be applied between lower stool top plates and the side plating of lower stools and corrugated bulkheads. Partial or full penetration welding is to be applied around gusset plates. However, full penetration welding is to be applied between lower stool top plates and gusset plates. Partial or full penetration welding is to be applied between lower stool top plates and diaphragms/web rings. Ensure start and stop of welding is as far away as practicable from the critical corners.

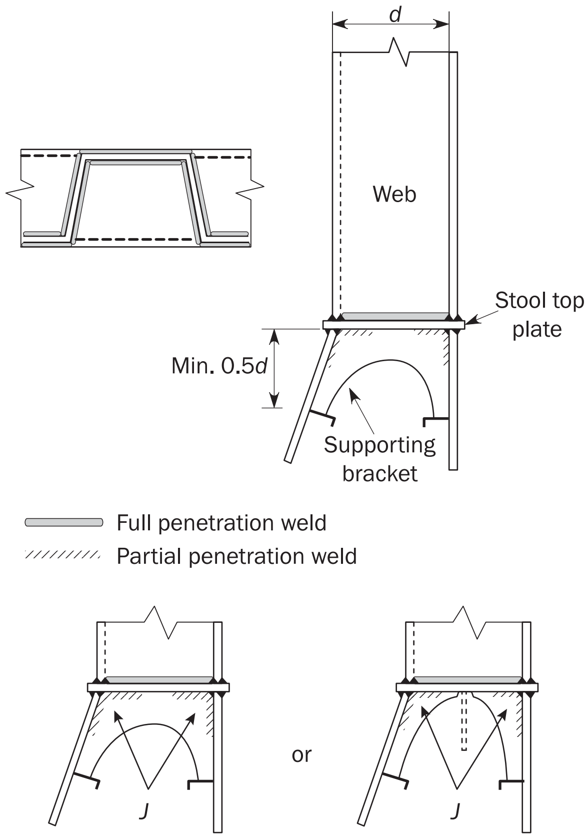
Table 11 : Design standard K – transverse bulkhead connection detail, oil tanker

Connections of transverse bulkhead with lower stool - oil tanker	
Critical areas	**Design standard K**



Critical locations





Critical location	Connections of lower stool top plate to corrugated transverse bulkheads.
Detail design standard	The use of scallops is to be avoided on diaphragms/web at lower stool top plates. Supporting brackets are to be fitted in line with corrugation web as required in Ch 6, Sec 4, [2.6.2]. Scallop is not permitted in the supporting bracket.
Building tolerances	Ensure alignment between lower stool side plates and corrugation faces according to IACS Recommendation No. 47.

Connections of transverse bulkhead with lower stool - oil tanker	
Welding requirement	Full or partial penetration welding is to be applied between lower stool top plates and the side plating of lower stools. Full penetration welding is to be applied between lower stool top plates and vertical corrugated bulkheads. Full or partial penetration welding is to be applied between lower stool top plates and supporting brackets. Ensure start and stop of welding is as far away as practicable from the critical corners. Connection 'J', as shown in the figure, of in line supporting bracket to stool top plate and side plate of lower stool is to be full or partial penetration welding, on minimum 300 mm from the corner.

Table 12 : Design standard L – transverse bulkhead connection detail, bulk carrier

<tr><td></td><td rowspan="3"></td></tr>
<tr><th>Critical locations</th></tr>
<tr><td></td></tr>
</table>

Critical location	Connections of corrugated transverse bulkhead to the topside tank sloping plating and upper stool.
Detail design standard	The use of scallops is to be avoided on diaphragms/web at upper stool bottom plates. Gusset plates are to be fitted between the face plates of corrugated bulkheads in way of heavy ballast hold. In way of heavy ballast hold, a deep transverse web or well-stiffened backing stiffener is to be provided in the topside tank in line with the face plate of the bulkhead corrugations to ensure that the loads are effectively dissipated. Gusset plates are to have a thickness and material properties not less than those required for corrugation flanges.
Building tolerances	Ensure alignment between the face plates of corrugated bulkheads with the stool side plates as well as the watertight bulkheads and deep transverse web (or well-stiffened backing stiffener) in the topside tanks according to IACS Recommendation No. 47.
Welding requirement	In the case of ballast holds: • Partial or full penetration welding is to be applied between upper stool bottom plates and corrugation. • Fillet welding having minimum weld factor of 0.44 is to be applied between upper stool bottom plates and upper stool side plating. • Fillet welding having minimum weld factor of 0.44 is to be applied between upper stool bottom plates and diaphragms/web rings. Ensure start and stop of welding is as far away as practicable from the critical corners in all holds.

<tr><th>Critical locations</th></tr>
<tr><td></td></tr>
</table>

Critical location	-
Material and scantling requirement	Inner bottom and hopper tank plating in way of corrugations is to be in accordance to Ch 6, Sec 4, [2.6.4]. Floors/girders and hopper web that support corrugation flange is to be in accordance to Ch 6, Sec 4, [2.6.4]. Supporting bracket aligned with corrugation web is to be in accordance with Ch 8, Sec 2, [5.2] and Ch 6, Sec 4, [2.6.4].
Detail design standard	Supporting brackets are to be fitted in line with corrugation web as required in Ch 6, Sec 4, [2.6.2]. Scallop is not permitted in the supporting bracket.
Building tolerances	Median line of corrugation is to be in line with the median line of the supporting members with an allowable tolerance of $t_{as\text{-}built}$ /3 or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the inner bottom thickness.
Welding requirement	For the connection of vertically corrugated bulkheads to the inner bottom/hopper plating, full penetration welding is to be provided in according to Ch 12, Sec 3, [2.4] For the connection of supporting structures to inner bottom/hopper plating, partial or full penetration welding is to be provided in accordance with Ch 12, Sec 3, [2.4]. Partial or full penetration welding is also to be applied for the connection of in line brackets below corrugation web in accordance with Ch 12, Sec 3, [2.4] on minimum 300 mm from the corner.

7 BULKHEAD CONNECTION TO INNER BOTTOM

7.1 Design standard M

7.1.1

The connection of vertically corrugated bulkhead to inner bottom/hopper plating of cargo tanks and heavy ballast hold are to be designed according to the design standard M, as shown in Table 13.

8 LOWER AND UPPER TOE OF HOLD FRAME

8.1 Design standard N

8.1.1

The welded connections of lower and upper bracket toes of hold frame of bulk carriers are to be designed according to design standard N, as shown in Table 14

Table 14 : Design standard N – lower and upper toe detail of hold frame - bulk carrier

<table>
<tr><th colspan="2">Lower and upper hold frame connections</th></tr>
<tr><th>Critical areas</th><th>Design standard N</th></tr>
<tr><td></td><td rowspan="3">

Connection of lower and upper end bracket of hold frame.</td></tr>
<tr><th>Critical locations</th></tr>
<tr><td></td></tr>
<tr><td>Minimum requirement</td><td>As a minimum the detail design standard N is to be applied. Tapered extended toes are more effective and are to be considered for high tensile steel side shell frame.</td></tr>
</table>

Lower and upper hold frame connections	
Critical location	Toe connection of side shell frame lower and upper brackets to the hopper and topside sloping plates, including face plate terminations.
Detail design standard	Alternative geometries than stipulated above are permissible subject to demonstration of satisfactory fatigue performance. However, the maximum angles shown on the figures for thickness chamfering and face width tapering are not to be exceeded. Bracket toe height and the distance between the face plate termination and start of the toe radius (or toe taper) are to be kept to a minimum. The face plates of hold frames at lower or upper brackets are to be tapered and chamfered as shown. While chamfering may be dispensed with if the thickness of the face plates is less than 25 mm, it is nevertheless a recommended practice, with a larger gradient if necessary. Frames are to be built-up symmetrical sections with integral upper and lower brackets and are to be arranged with soft or elongated toes as shown. The side frame flange is to be curved (not knuckled) at the connection with the end brackets. Where the frame upper brackets are not positioned directly below a ring web, supporting brackets are to be provided. In the design ensure that if a topside tank stiffener is positioned above the end of frame upper bracket, the stiffener cut-out is avoided or closed with a full collar. Increasing the size of supporting brackets will reduce stress concentrations in the critical area. Where the frame lower brackets are not positioned directly above a ring web, supporting brackets are to be provided. In the design ensure that if a hopper tank stiffener is positioned below the end of the frame lower bracket, the stiffener cut-out is avoided or closed with a full collar. Increasing the size of supporting brackets will reduce stress concentrations in the critical area.
Building tolerances	Ensure alignment between side shell frame lower and upper bracket and transverse ring webs or supporting brackets according to IACS Recommendation No. 47. Maximum misalignment is to be not greater than $t_{as\text{-}built}/3$ where $t_{as\text{-}built}$ is the thinner as-built thickness of the webs to be aligned and misalignment is the overhang of the as-built thinner thickness.
Welding requirement	Welding is to comply with Ch 12, Sec 3, [3]. In way of the wrap around weld at the face plate termination, care should be taken to ensure no over- run onto the radius part and the toe is free from notches and undercut.

9 HATCH CORNER

9.1 Design standard O

9.1.1

Hatch corners in the cargo hold region, located on the strength deck of bulk carriers are required to be designed according to design standard O, as shown in Table 15.

Table 15 : Design standard O – hatch corner of bulk carriers

Hatch corner (bulk carriers)

Design standard O

	without insert plate	**with insert plate**
Critical location	Hatch corner curve	Curved Radius Transition insert plate to deck plating
Detail design standard	Shape of hatch corner as required by Pt 2, Ch 1, Sec 2	Radius and insert plate dimensions and thickness as required by Pt 2, Ch 1, Sec 2. Insert plate has to be tapered for smooth thickness transition to deck plating, the transition taper length has to be not less than 3 times the offset.
Post-treatment	Grinding of cut edge within the radius	Grinding of cut edge within the radius

PART 1 CHAPTER 10

OTHER STRUCTURES

Table of Contents

SECTION 1
FORE PART

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

α_p : Correction factor for the panel aspect ratio to be taken as:

$$\alpha_p = 1.2 - \frac{b}{2.1\ a}$$ but not to be taken as greater than 1.0.

f_{bdg} : Bending moment factor taken as:

$$f_{bdg} = 8\left(1 + \frac{n_s}{2}\right)$$

n_s : End fixation factor taken as:

n_s = 0 for both ends with low end fixity (simply supported).

n_s = 1 for one end equivalent to built in and one end simply supported.

n_s = 2 for continuous members or members with bracketed fitted at both ends

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the following structures of the fore part as defined in Ch 1, Sec 1, [2.4.2]:

- Fore peak structures.
- Stem.

In addition, the requirements of this section apply to structure subjected to impact loads:

- Flat bottom forward, according to [3.2].
- Bow area, according to [3.3].

2 STRUCTURAL ARRANGEMENT

2.1 Floors and bottom girders

2.1.1 Floors

In case of transverse framing, solid floors are to be fitted at each web frame location.

In case of longitudinal framing, the spacing of solid floors is not to be greater than 3.5 m or four transverse frame spaces, whichever is smaller.

The minimum depth of the floor at the centreline is not to be less than the required depth of the double bottom of the foremost cargo hold. See Ch 2, Sec 3, [2.3].

2.1.2 Bottom girders

A supporting structure is to be provided at the centreline either by extending the centreline girder to the stem or by providing a deep girder or centreline bulkhead.

Where a centreline girder is fitted, the minimum depth and thickness is not to be less than that required for the depth of the double bottom in the neighbouring cargo tank region, and the upper edge is to be stiffened.

In case of transverse framing, the spacing of bottom girders is not to exceed 2.5 m.

In case of longitudinal framing, the spacing of bottom girders is not to exceed 3.5 m.

2.1.3 Alternative design verification

This spacing, defined in [2.1.1] and [2.1.2] may be increased, if the designer performs a verification of the bottom structure by means of grillage analysis or FE analysis and provides their full documentation. The acceptance criteria to be applied are defined in Ch 6, Sec 6, [3]. A FE analysis is to be performed under consideration of the requirements provided in Ch 7.

2.2 Wash bulkheads

2.2.1

Where a centreline wash bulkhead is fitted, the lowest strake is to have thickness not less than required for a centreline girder.

Where a longitudinal wash bulkhead supports bottom transverses, the details and arrangements of openings in the bulkhead are to be configured to avoid areas of high stresses in way of the connection of the wash bulkhead with bottom transverses.

2.3 Side shell supporting structure

2.3.1 Web frames

The spacing of web frames, S, in m as defined in Ch 1, Sec 4, Table 5, is to be taken as:

$S = 2.6 + 0.005\,L$, but not to be taken greater than 3.5 m.

Perforated flats are to be fitted to limit the effective span of web frames to not greater than 10 m.

2.3.2 Stringers

The transverse framing forward of the collision bulkhead stringers are to be spaced approximately 3.5 m apart. Stringers are to have an effective span not greater than 10 m, and are to be adequately supported by web frame structures.

2.3.3 Alternative design verification

The spacing of web frames and stringers may be increased, if the designer performs a verification of the side shell supporting structure by means of beam analysis or FE analysis and provides their full documentation.

The acceptance criteria to be applied are defined in Ch 6, Sec 6, [3]. A FE analysis is to be performed under consideration of the requirements provided in Ch 7.

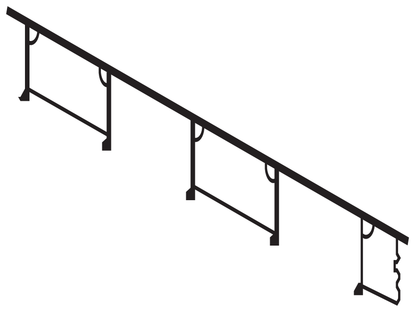
2.4 Tripping brackets

2.4.1

For side shell and tank walls, located forward of the collision bulkhead and vertically framed, tripping brackets spaced not more than 2.6 m are to be fitted, according to Figure 1, between primary supporting members, decks and/or platforms.

The as-built thickness of the tripping brackets is not to be less than the as-built thickness of the side frame webs to which they are connected.

Figure 1 : Tripping brackets



2.5 Bulbous bow

2.5.1 General

Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

2.5.2 Diaphragm plates

At the forward end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1m apart in conjunction with a deep centreline web.

In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.

2.5.3 Special bulbous bow designs

In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.

In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames is to be fitted.

2.5.4 Strengthening for anchor and chain cable contact

The shell plating is to be increased in thickness at the forward end of the bulb and also in areas likely to be subjected to contact with anchors and chain cables during anchor handling. The increased plate thickness is to be the same as that required for plated stems given in [4.1.1].

3 STRUCTURE SUBJECTED TO IMPACT LOADS

3.1 General

3.1.1 Application

The requirements of this sub-section cover the strengthening requirements for local impact loads that may occur in the forward structure. The impact loads to be applied in [3.2] and [3.3] are described in Ch 4, Sec 5, [3].

3.1.2 General scantling requirements

The requirements of [3.2] and [3.3] are to be applied in addition to applicable scantling requirements in Ch 6. Local scantling increases due to impact loads are to be made with due consideration given to details and avoidance of hard spots, notches and other harmful stress concentrations.

3.2 Bottom slamming

3.2.1 Application

Where the minimum draughts forward, T_{F-e} or T_{F-f}, as specified in Ch 4, Sec 5, [3.2.1], are less than 0.045 L, the bottom forward is to be additionally strengthened to resist bottom slamming pressures.

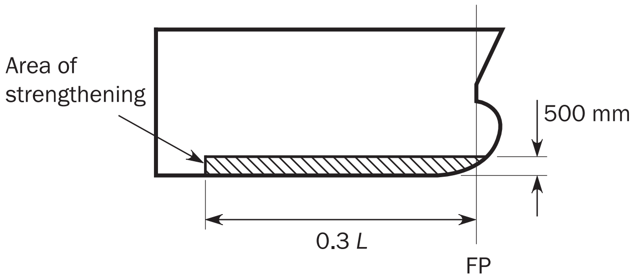
The draughts for which the bottom has been strengthened are to be indicated on the shell expansion plan and loading guidance information, as required in Ch 1, Sec 5.

The load calculation point of the primary supporting members is specified in Ch 3, Sec 7, [4].

3.2.2 Extent of strengthening

The strengthening is to extend forward of 0.3 L from the FP over the flat of bottom and adjacent plating with attached stiffeners up to a height of 500 mm above the baseline, see Figure 2.

Figure 2 : Extent of strengthening against bottom slamming



Outside the region strengthened to resist bottom slamming the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

3.2.3 Design to resist bottom slamming loads

The design of end connections of stiffeners in the bottom slamming region is to provide end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with Ch 3, Sec 6, [3.2]. Where it is not practical to comply with this requirement, the net plastic section modulus, $Z_{pl\text{-}alt}$, in cm^3, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt} = \frac{16 Z_{pl}}{f_{bdg}}$$

where:

Z_{pl} : Net plastic section modulus, in cm^3, as required by [3.2.5].

Scantlings and arrangements of primary supporting members, including bulkheads in way of stiffeners, are to comply with [3.2.7].

3.2.4 Shell plating

The net thickness of the hull envelope plating, t, in mm, is not to be less than:

$$t = \frac{0.0158 \alpha_p\, b}{C_d} \sqrt{\frac{P_{SL}}{C_a\, R_{eH}}}$$

where:

C_d : Plate capacity correction coefficient taken as:

$C_d = 1.3$.

C_a : Permissible bending stress coefficient taken as:

$C_a = 1.0$ for acceptance criteria set AC-I.

3.2.5 Shell stiffeners

The shell stiffeners within the strengthening area defined in [3.2.2] are to comply with the following criteria:

a) The net plastic section modulus, Z_{pl}, in cm^3, is not to be less than:

$$Z_{pl} = \frac{P_{SL}\, s\, \ell_{bdg}^{\ 2}}{f_{bdg}\, C_s\, R_{eH}}$$

where:

C_s : Permissible bending stress coefficient taken as:

$C_s = 0.9$ for acceptance criteria set AC-I.

b) The net web thickness, t_w, in mm, is not to be less than:

$$t_w = \frac{P_{SL}\, s\, \ell_{shr}}{2 d_{shr}\, C_t\, \tau_{eH}}$$

where:

C_t : Permissible shear stress coefficient taken as:

$C_t = 1.0$ for acceptance criteria set AC-I.

c) The slenderness ratio is to comply with Ch 8, Sec 2.

3.2.6 Bottom slamming load area for primary supporting members

The scantlings of primary supporting members according to [3.2.7] are based on the application of the slamming pressure defined in Ch 4, Sec 5, [3.2] to an idealised slamming load area of hull envelope plating, A_{SL}, in m^2, given by:

$$A_{SL} = \frac{1.1\ L\ B\ C_b}{1000}$$

3.2.7 Primary supporting members

The size and number of openings in web plating of the floors and girders is to be minimised considering the required shear area as given in a):

a) Net shear area

The net shear area, $A_{shr\text{-}n50}$, in cm^2, of each primary supporting member web at any position along its span is not to be less than:

$$A_{shr-n50} = 10\frac{Q_{SL}}{C_t\, \tau_{eH}}$$

where:

Q_{SL} : The greatest shear force due to slamming for the position being considered, in kN, based on the application of a patch load, F_{SL} to the most onerous location, as determined in accordance with b) or c).

C_t : Permissible shear stress coefficient taken as:

$C_t = 0.9$ for acceptance criteria set AC-I.

b) Simplified calculation of slamming shear force

For simple arrangements of primary supporting members, where the grillage affect may be ignored, the shear force, Q_{SL}, in kN, is given by:

$$Q_{SL} = f_{pt}\, f_{dist}\, F_{SL}$$

where:

f_{pt} : Correction factor for the proportion of patch load acting on a single primary supporting member, taken as

$$f_{pt} = 0.5\ (f_{SL}^{\ 3} - 2\ f_{SL}^{\ 2} + 2)$$

f_{SL} : Patch load modification factor taken as:

$$f_{SL} = 0.5\ \frac{b_{SL}}{S}$$

f_{dist} : Factor for the greatest shear force distribution along the span, according to Figure 3.

F_{SL} : Patch load, in kN, taken as:

$$F_{SL} = P_{SL}\ \ell_{SL}\ b_{SL}$$

ℓ_{SL} : Extent of slamming load area along the span, in m, taken as:

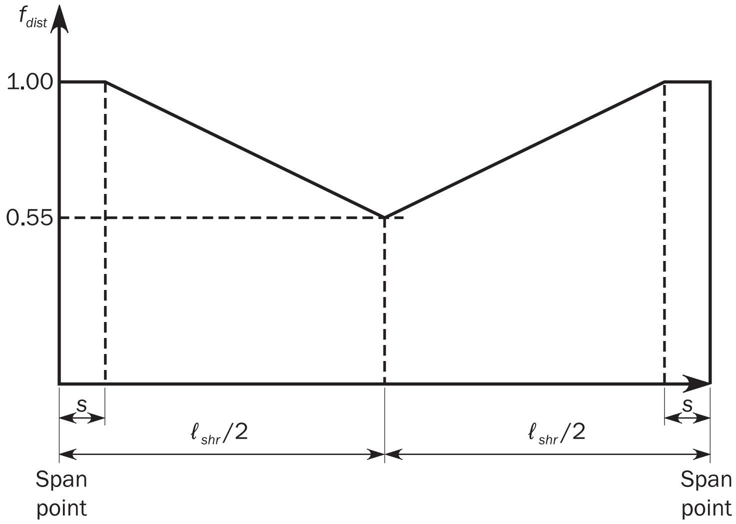
$\ell_{SL} = \sqrt{A_{SL}}$ but not to be greater than $0.5\ell_{shr}$.

b_{SL} : Breadth of impact area supported by primary supporting member, in m, taken as:

$b_{SL} = \sqrt{A_{SL}}$ but not to be greater than S.

A_{SL} : Surface defined in [3.2.6].

Figure 3 : Distribution of f_{dist} along the span of simple primary supporting members



c) Direct calculation method for slamming shear force

For complex arrangements of primary supporting members, the greatest shear force, Q_{SL}, at any location along the span of each primary supporting member is to be derived by direct calculation in accordance with Table 1.

d) Web thickness of primary supporting member

The net web thickness, t_w, in mm, of primary supporting members adjacent to the shell is not to be less than:

$$t_w = \frac{s_W}{70}\sqrt{\frac{R_{eH}}{235}}$$

where:

s_W : Plate breadth, in mm, taken as the spacing between the web stiffening.

Table 1 : Direct calculation methods for derivation of Q_{SL}

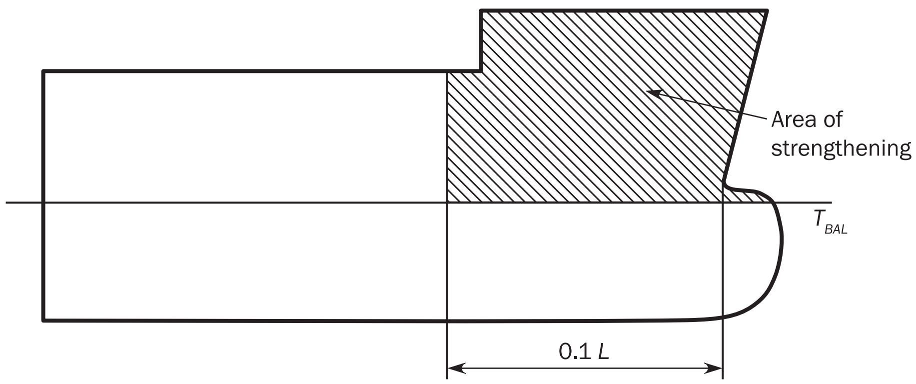
Type of analysis	Model extent	Assumed end fixity of floors
Beam theory	Overall span of member between effective bending supports.	Fixed at ends
Double bottom grillage	Longitudinal extent to be one cargo tank length. Transverse extent to be between inner hopper knuckle and centreline.	Floors and girders to be fixed at boundaries of the model.
Note 1: The envelope of greatest shear force along each primary supporting member is to be derived by applying the load patch on a square area as defined in [3.2.6], to a number of locations along the span. Note 2: A more extensive model in length and breadth can be considered.		

3.3 Bow impact

3.3.1 Application

The side structure in the ship forward area is to be strengthened against bow impact pressures. The strengthening is to extend forward of 0.1 L from the FP and vertically above the minimum design ballast draught, T_{BAL}, defined in Ch 1, Sec 4, [3.1.5] and forecastle deck if any. See Figure 4.

Figure 4 : Extent of strengthening against bow impact



Outside the strengthening area the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

3.3.2 Design to resist bow impact loads

a) In the bow impact strengthening area, longitudinal framing is to be carried as far forward as practicable.

The design of end connections of stiffeners in the bow impact region are to ensure end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with Ch 3, Sec 6, [3.2]. Where it is not practical to comply with this requirement, the net plastic section modulus, $Z_{pl\text{-}alt}$, in cm^3, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt} = \frac{16Z_{pl}}{f_{bdg}}$$

where:

Z_{pl} : Effective net plastic section modulus, in cm^3, required by [3.3.4].

b) Scantlings and arrangements of primary supporting members, including decks and bulkheads, in way of the stiffeners, are to comply with [3.3.6]. In areas of the greatest bow impact load, the web stiffeners arranged perpendicular to the hull envelope plating and the double sided lug connections are to be provided.

The main stiffening direction of decks and bulkheads supporting shell framing is to be arranged parallel to the span direction of the supported shell frames, to protect against buckling.

3.3.3 Side shell plating

The net thickness of the side shell plating, t, in mm is not to be less than:

$$t = 0.0158\alpha_p\, b \sqrt{\frac{P_{FB}}{C_a\, R_{eH}}}$$

where:

C_a : Permissible bending stress coefficient taken as:

$C_a = 1.0$ for acceptance criteria set AC-I.

3.3.4 Side shell stiffeners

The side shell stiffeners within the strengthening area defined in [3.3.1] are to comply with the following criteria:

a) The effective net plastic section modulus, Z_{pl}, in cm^3 in association with the effective

plating to which it is attached, is not to be less than:

$$Z_{pl} = \frac{P_{FB}\, s\, \ell_{bdg}{}^2}{f_{bdg}\, C_s\, R_{eH}}$$

where:

C_s : Permissible bending stress coefficient taken as:

$C_s = 0.9$ for acceptance criteria set AC-I.

b) The net web thickness, t_w, in mm, is not to be less than:

$$t_w = \frac{P_{FB}\, s\, \ell_{shr}}{2d_{shr}\, C_t\, \tau_{eH}}$$

where:

d_{shr} : Effective web depth of stiffener, in mm, as defined in Ch 3, Sec 7, [1.4.3].

C_t : Permissible shear stress coefficient taken as:

$C_t = 1.0$ for acceptance criteria set AC-I.

c) The slenderness ratio is to comply with Ch 8, Sec 2.

d) The minimum net thickness of breasthooks/diaphragm plates, t_w, in mm, is not to be less than:

$$t_w = \frac{s}{70}\sqrt{\frac{R_{eH}}{235}}$$

where:

s : Spacing of stiffeners on the web, as defined in Ch 1, Sec 4, Table 5, in mm. Where no stiffeners are fitted, s is to be taken as the depth of the web.

3.3.5 Bow impact load area for primary supporting members

The scantlings of primary supporting members according to [3.3.6] are based on the application of the bow impact pressure, as defined in Ch 4, Sec 5, [3.3.1], to an idealised bow impact load area of hull envelope plating, A_{BI}, in m^2, is given by:

$$A_{BI} = \frac{1.1\, L\, B\, C_b}{1000}$$

3.3.6 Primary supporting members

a) The section modulus of the primary supporting member is to apply along the bending span clear of end brackets and cross sectional areas of the primary supporting member are to be applied at the ends/supports and may be gradually reduced along the span and clear of the ends/supports following the distribution of f_{dist} indicated in Figure 3.

b) Primary supporting members in the bow impact strengthening area are to be configured to provide effective continuity of strength and the avoidance of hard spots.

c) End brackets of primary supporting members are to be suitably stiffened along their edge. Consideration is to be given to the design of bracket toes to minimise abrupt changes of cross section.

d) Tripping arrangements are to comply with Ch 8, Sec 2, [5.1.1]. In addition, tripping brackets are to be fitted at the toes of end brackets and at locations where the primary supporting member flange is knuckled or curved.

e) The net section modulus of each primary supporting member, Z_{n50}, in cm^3, is not to be less than:

$$Z_{n50} = 1000 \frac{f_{bdg-pt} \, P_{FB} \, b_{BI} \, f_{BI} \, \ell_{bdg}^2}{f_{bdg} \, C_s \, R_{eH}}$$

where:

$f_{bdg\text{-}pt}$: Correction factor for the bending moment at the ends and considering the patch load taken as:

$$f_{bdg-pt} = 3 \, f_{BI}^3 - 8 \, f_{BI}^2 + 6 \, f_{BI}$$

f_{BI} : Patch load modification factor taken as:

$$f_{BI} = \frac{\ell_{BI}}{\ell_{bdg}}$$

ℓ_{BI} : Extent of bow impact load area, in m, along the span:

$\ell_{BI} = \sqrt{A_{BI}}$ but not to be taken as greater than ℓ_{bdg}.

b_{BI} : Breadth of impact load area, in m, supported by the primary supporting member, to be taken as the spacing between primary supporting members, S, as defined in Ch 1, Sec 4, Table 5, but not to be taken as greater than ℓ_{BI}.

A_{BI} : Bow impact load area, in m^2, as defined in [3.3.5].

f_{bdg} : Bending moment factor taken as:

f_{bdg} = 12 for primary supporting members with end fixed continuous flange or where brackets at both ends are fitted in accordance with Ch 3, Sec 6, [4.4].

C_s : Permissible bending stress coefficient taken as:

C_s = 0.8 for acceptance criteria set AC-I.

f) The net shear area of the web, $A_{shr\text{-}n50}$, in cm^2, of each primary supporting member at the support/toe of end brackets is not to be less than:

$$A_{shr-n50} = \frac{5 f_{PL} \, P_{FB} \, b_{BI} \, \ell_{shr}}{C_t \, \tau_{eH}}$$

where:

f_{PL} : Patch load modification factor taken as:

$$f_{PL} = \frac{\ell_{BI}}{\ell_{shr}}$$

ℓ_{BI} : Extent of bow impact load area, in m, along the span taken as,

$$\ell_{BI} = \sqrt{A_{BI}} \text{ but not greater than } \ell_{shr}.$$

C_t : Permissible shear stress coefficient taken as:

$C_t = 0.75$ for acceptance criteria set AC-I.

g) The net web thickness of each primary supporting member, t_w, in mm including decks/bulkheads in way of the side shell is not to be less than:

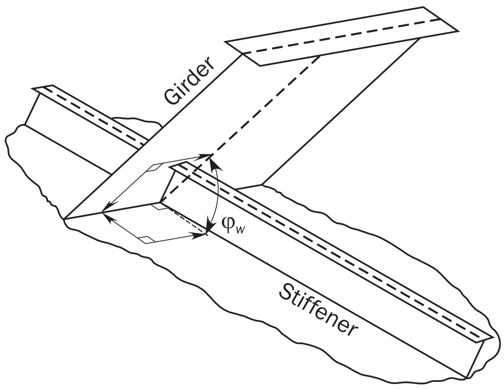
$$t_w = \frac{P_{FB}\, b_{BI}}{\sin\varphi_w\, \sigma_{crb}}$$

where:

φ_w : Angle, in deg, between the primary supporting member web and the shell plate, see Figure 5.

σ_{cr} : Critical buckling stress in compression of the web of the primary supporting member or deck/bulkhead panel in way of the applied load given by Ch 8, Sec 5, [3.1.1], in N/mm^2.

Figure 5 : Angle between shell primary member and shell plate



4 ADDITIONAL SCANTLING REQUIREMENTS

4.1 Plate stem

4.1.1

The net thickness, t_{Stm} in mm, is not to be less than:

$$t_{Stm} = (0.6 + 0.4S_B)\,(0.08\,L + 2.7)\,\sqrt{k} \text{ but need not be greater than } 22\sqrt{k} - 1$$

where:

S_B : Spacing, in m, between horizontal stringers (partial or not), breasthooks, or equivalent horizontal stiffening members.

Starting from 0.6 m above the summer load waterline up to $T_{SC} + C_w$, the net thickness may gradually be reduced to 0.8 t_{Stm}.

4.1.2 Breasthooks and diaphragm plating

The net thickness of breasthooks/diaphragm plates, t_w, in mm, is not to be less than:

$$t_w = \frac{s}{70}\sqrt{\frac{R_{eH}}{235}}$$

where:

s : Spacing of stiffeners on the web, as defined in Ch 1, Sec 4, Table 5, in mm. Where no stiffeners are fitted, s is to be taken as the depth of the web.

4.2 Thruster tunnel

4.2.1

The net thickness of the tunnel plating, t_{tun}, in mm, is not to be less than the net required thickness for the shell plating in the vicinity of the bow thruster.

In addition, t_{tun} is not to be taken less than:

$$t_{tun} = 0.008\ d_{tun} + 1.8$$

where:

d_{tun} : Inside diameter of the tunnel, in mm, but not to be taken less than 970 mm.

Where the outboard ends of the tunnel are provided with bars or grids, the bars or grids are to be effectively secured.

SECTION 2
MACHINERY SPACE

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the scantlings and arrangement of structures located in the machinery space. It is the shipyard responsibility to design the ship in accordance with the machinery manufacturer's requirements.

2 MACHINERY SPACE ARRANGEMENT

2.1 Structural arrangement

2.1.1

Where openings in decks/bulkheads are provided in the machinery space, the arrangements are to support the deck, side, and bottom structure.

2.1.2

All parts of the machinery, shafting, etc, are to be supported to distribute the loads into the ship's structure. The adjacent structure is to be suitably stiffened.

2.1.3

Primary supporting members are to be positioned giving consideration to the provision of through stiffeners and in line pillar supports to achieve an efficient structural design.

2.1.4

The spacing of web frames in way of transversely framed machinery spaces is generally not to exceed five transverse frame spaces. Web frames are to be connected at the top and bottom to members of suitable stiffness, and supported by deck transverses.

2.1.5

End connections of side longitudinals at transverse bulkheads are to provide fixity, lateral support, and when not continuous are to be provided with soft-toe brackets. Brackets lapped onto the longitudinals are not to be fitted.

2.1.6

Where a transverse framing system is adopted, deck stiffeners are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Where fitted, deck transverses are to be arranged in line with web frames to provide end fixity and transverse continuity of strength.

Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in line with web frames in association with pillars or pillar bulkheads.

2.1.7

Machinery casings are to be supported by a suitable arrangement of deck transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required. These are to be arranged in line with deck transverses.

2.1.8

The foundations for main propulsion units, reduction gears, shaft and thrust bearings, and the structure supporting those foundations are to maintain the required alignment and rigidity under all anticipated conditions of loading. Consideration is to be given to the submittal of the following plans to the machinery manufacturer for review:

a) Foundations for main propulsion units.

b) Foundations for reduction gears.

c) Foundations for thrust bearings.

d) Structure supporting a), b) and c).

2.2 Double bottom

2.2.1 Double bottom height

The double bottom height at the centreline, irrespective of the location of the machinery space, is to be not less than the value defined in Ch 2, Sec 3, [2.3.1]. This depth may need to be considerably increased in relation to the type and depth of main machinery seatings.

The above height is to be increased by the shipyard where the machinery space is very large and where there is a considerable variation in draught between light ballast and full load conditions.

Where the double bottom height in the machinery space differs from that in adjacent spaces, structural continuity of longitudinal members is to be provided by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the sloped inner bottom are to be located in way of floors. Lesser double bottom height may be accepted in local areas provided that the overall strength of the double bottom structure is not thereby impaired.

2.2.2 Centreline girder

The double bottom is to be arranged with a centreline girder. In way of any openings for manholes on the centreline girder, permitted only where absolutely necessary for double bottom access and maintenance, local strengthening is to be arranged.

2.2.3 Side bottom girders

In the machinery space, the number of side bottom girders is to be adequately increased, with respect to the adjacent areas, to provide adequate rigidity of the structure. The side bottom girders in longitudinal stiffened double bottom, are to be a continuation of any bottom longitudinals in the areas adjacent to the machinery space and are generally to have a spacing not greater than 3 times that of longitudinals and in no case greater than 3 m.

2.2.4 Girders in way of machinery seatings

Additional side bottom girders are to be fitted in way of machinery seating.

2.2.5 Floors in longitudinally stiffened double bottom

Where the double bottom is longitudinally stiffened, plate floors are to be fitted at every frame under the main engine and thrust bearing. Outboard of the engine and bearing seatings, the floors may be fitted at alternate frames.

2.2.6 Floors in transversely framed double bottom

Where the double bottom in the machinery space is transversely stiffened, floors are to be arranged at every frame.

2.2.7 Manholes and wells

The number and size of manholes in floors located in way of seatings and adjacent areas are to be kept to the minimum necessary for double bottom access and maintenance.

In general, manhole edges are to be stiffened with flanges; failing this, the floor plate is to be adequately stiffened with flat bars at manhole sides.

Manholes with perforated portable plates are to be fitted in the inner bottom in the vicinity of wells arranged close to the aft bulkhead of the engine room.

Drainage of the tunnel is to be arranged through a well located at the aft end of the tunnel.

2.2.8 Inner bottom plating

Where main engines or thrust bearings are bolted directly to the inner bottom, the net thickness of the inner bottom plating is to be at least 19 mm. Hold-down bolts are to be arranged as close as possible to floors and longitudinal girders. Plating thickness and the arrangements of hold-down bolts are also to consider the manufacturer's recommendations.

2.2.9 Heavy equipment

Where heavy equipment is mounted directly on the inner bottom, the thickness of the floors and girders is to be suitably increased.

3 MACHINERY FOUNDATIONS

3.1 General

3.1.1

Main engines and thrust bearings are to be effectively secured to the hull structure by foundations of strength that is sufficient to resist the various gravitational, thrust, torque, dynamic, and vibratory forces which may be imposed on them.

3.1.2

In the case of higher power internal combustion engines or turbine installations, the foundations are generally to be integral with the double bottom structure. Consideration is to be given to substantially increase the inner bottom plating thickness in way of the engine foundation plate or the turbine gear case and the thrust bearing, see Type 1 of Figure 1.

3.1.3

For main machinery supported on foundations of Type 2, as shown in Figure 2, the forces from the engine into the adjacent structure are to be distributed as uniformly as possible. Longitudinal members supporting the foundation are to be aligned with girders in the double bottom, and transverse stiffening is to be arranged in line with the floors, see Type 2 of Figure 2.

Figure 1 : Machinery foundations Type 1

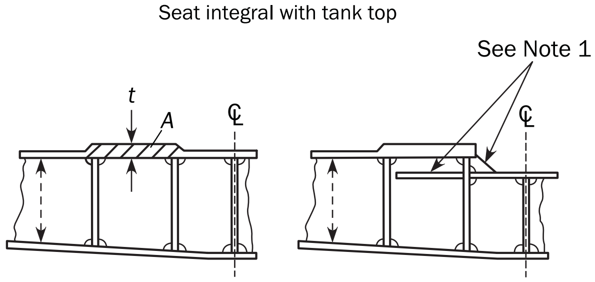


Figure 2 : Machinery foundations Type 2

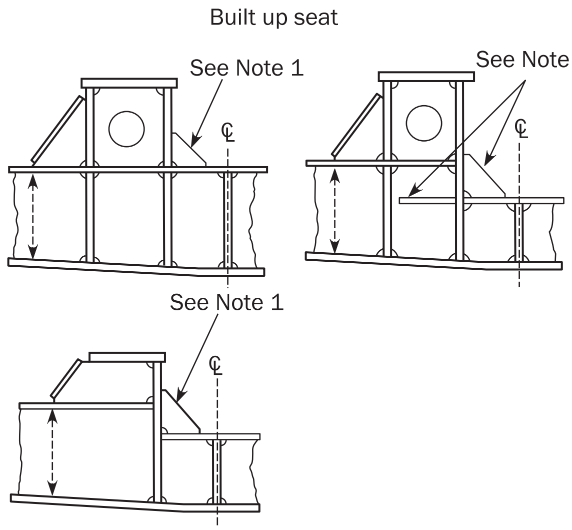


Note 1: Brackets are to be as large as possible. Brackets may be omitted to avoid interference with the girders of the engine foundation, in accordance with recommendations of the engine manufacturer.

3.2 Foundations for internal combustion engines and thrust bearings

3.2.1

In determining the scantlings of foundations for internal combustion engines and thrust bearings, consideration is to be given to the general rigidity of the engine and to its design characteristics with regard to out of balance forces.

3.2.2

Generally, two girders are to be fitted in way of the foundation for internal combustion engines and thrust bearings.

3.3 Auxiliary foundations

3.3.1

Auxiliary machinery is to be secured on foundations that are of suitable size and arrangement to distribute the loads from the machinery evenly into the supporting structure.

SECTION 3
AFT PART

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply for the scantlings and arrangement of structures located aft of the aft peak bulkhead.

2 AFT PEAK

2.1 Structural arrangement

2.1.1 Floors

Floors are to be fitted at each frame space in the aft peak and carried to a height at least above the stern tube. Where floors do not extend to flats or decks, they are to be stiffened by flanges at their upper end.

Heavy plate floors are to be fitted in way of the aft face of the horn and in line with the webs in the rudder horn. They may be required to be carried up to the first deck or flat. In this area, cut outs, scallops or other openings are to be kept to a minimum.

2.1.2 Platforms and side girders

Platforms and side girders within the peak are to be arranged in line with those located in the area immediately forward.

Where this arrangement is not possible due to the shape of the hull and access needs, structural continuity between the peak and the structures of the area immediately forward is to be ensured by adopting wide tapering brackets.

Where the aft peak is adjacent to a machinery space whose side is longitudinally framed, the side girders in the aft peak are to be fitted with tapering brackets.

Where the depth from the peak tank top to the weather deck is greater than 2.6 m and the side is transversely framed, one or more side girders are to be fitted, preferably in line with similar structures existing forward.

2.1.3 Longitudinal bulkheads

A longitudinal non-tight bulkhead is to be fitted on the centreline of the ship, in general in the upper part of the peak, and stiffened at each frame spacing.

Where either the stern overhang is very large or the maximum breadth of the space divided by watertight and wash bulkheads is greater than 20 m, additional longitudinal wash bulkheads may be required.

2.1.4 Alternative design verification

The spacing and arrangement requirements, defined in [2.1.1], [2.1.2] and [2.1.3] may be increased, if the designer performs a verification by means of grillage analysis or FE analysis and provides their full documentation. The acceptance criteria to be applied are defined in Ch 6, Sec 6, [3]. A FE analysis is to be performed under consideration of the requirements provided in Ch 7.

2.2 Stiffening of floors and girders in aft peak

2.2.1

The height of stiffeners, h_{stf}, in mm, on the floors and girders are not to be less than:

$h_{stf} = 80\ \ell_{stf}$ for flat bar stiffeners.

$h_{stf} = 70\ \ell_{stf}$ for bulb profiles and flanged stiffeners.

where:

ℓ_{stf} : Length of stiffener, in m, as shown in Figure 1. Length need not be taken greater than 5 m.

2.2.2

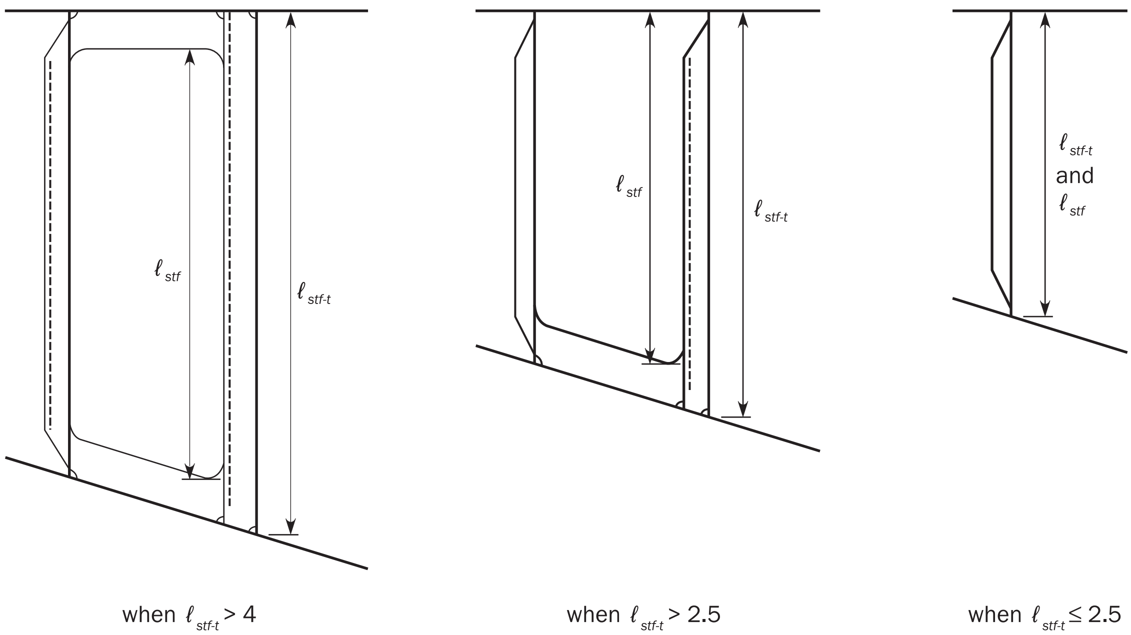
Stiffeners on the floors and girders in aft peak ballast or fresh water tanks above propeller are to be arranged with brackets. This apply for stiffeners located in an area extending longitudinally between the forward edge of the rudder and the after end of the propeller boss and transversely within the diameter of the propeller. End brackets are to be provided as follows:

- Brackets are to be fitted at the lower and upper ends when $\ell_{stf\text{-}t}$ exceeds 4 m.
- Brackets are to be fitted at the lower end when $\ell_{stf\text{-}t}$ exceeds 2.5 m.

  where:

  $\ell_{stf\text{-}t}$: Total length of stiffener, in m, as shown in Figure 1.

Figure 1 : Stiffening of floors and girders in the aft peak tank



3 STERN FRAMES

3.1 General

3.1.1

Stern frames may be fabricated from steel plates or made of cast steel with a hollow section. For applicable material specifications and steel grades, see Ch 3, Sec 1. Stern frames of other material or construction will be specially considered.

3.1.2

Cast steel and fabricated stern frames are to be strengthened by adequately spaced plates with gross thickness not less than 80% of required thickness for stern frames. Abrupt changes of section are to be avoided in castings; all sections are to have adequate tapering radius.

3.1.3

In the upper part of the propeller aperture, where the hull form is full and centreline supports are provided, the thickness of stern frames may be reduced to 80% of the applicable requirement in [3.2.1].

3.2 Propeller posts

3.2.1 Gross scantlings of propeller posts

The gross scantlings of propeller posts are not to be less than those obtained from the formulae in Table 1 for single screw ships and Table 2 for twin screw ships.

Scantlings and proportions of the propeller post which differ from those above may be considered acceptable provided that the section modulus of the propeller post section about its longitudinal axis is not less than that calculated with the propeller post scantlings in Table 1 or Table 2, as applicable.

Table 1 : Single screw ships - Gross scantlings of propeller posts

Gross scantlings of propeller posts, in mm	Fabricated propeller post 	Cast propeller post 	Bar propeller post, cast or forged, having rectangular section a	$50\ L_1^{1/2}$	$33\ L_1^{1/2}$	$10\sqrt{7.2L-256}$
b	$35\ L_1^{1/2}$	$23\ L_1^{1/2}$	$10\sqrt{4.6L-164}$
t_1	$2.5\ L_1^{1/2}$	$3.2\ L_1^{1/2}$	-
t_2	-	$4.4\ L_1^{1/2}$	-
t_d	$1.3\ L_1^{1/2}$	$2.0\ L_1^{1/2}$	-
R	-	50 mm	-

Table 2 : Twin screw ships - Gross scantlings of propeller posts

Gross scantlings of propeller posts, in mm	Fabricated propeller post 	Cast propeller post 	Bar propeller post, cast or forged, having rectangular section a	$25\ L_1^{1/2}$	$12.5\ L_1^{1/2}$	$2.4\ L + 6$
b	$25\ L_1^{1/2}$	$25\ L_1^{1/2}$	$0.8\ L + 2$
t_1	$2.5\ L_1^{1/2}$	$2.5\ L_1^{1/2}$	-
t_2	$3.2\ L_1^{1/2}$	$3.2\ L_1^{1/2}$	-
t_3	-	$4.4\ L_1^{1/2}$	-
t_d	$1.3\ L_1^{1/2}$	$2.0\ L_1^{1/2}$	-

3.2.2 Section modulus below the propeller shaft bossing

In the case of a propeller post without a sole piece, the section modulus of the propeller post may be gradually reduced below the propeller shaft bossing down to 85% of the value calculated with the scantlings in Table 1 or Table 2, as applicable.

In any case, the thicknesses of the propeller posts are not to be less than those obtained from the formulae in the Table 1 and Table 2.

3.2.3 Propeller shaft bossing

In single screw ships, the thickness of the propeller shaft bossing, included in the propeller post, is not to be less than 60% of the dimension *b* required in [3.2.1] for bar propeller posts with a rectangular section.

3.3 Connections

3.3.1 Connections with hull structure

Stern frames are to be effectively attached to the aft structure and the lower part of the stern frame is to be extended forward of the propeller post to a length not less than 1500 + 6 L_2 mm, in order to provide an effective connection with the keel. However, the stern frame need not extend beyond the aft peak bulkhead.

3.3.2 Connection with keel plate

The thickness of the lower part of the stern frames is to be gradually tapered to that of the solid bar keel or keel plate.

Where a keel plate is fitted, the lower part of the stern frame is to be designed to ensure an effective connection with the keel.

3.3.3 Connection with transom floors

Rudder posts and propeller posts are to be connected with transom floors having height not less than that of the double bottom height and a net thickness not less than that obtained, in mm, from the following formula:

$$t = 9 + 0.023\ L_1$$

3.3.4 Connection with centre keelson

Where the stern frame is made of cast steel, the lower part of the stern frame is to be fitted, as far as practicable, with a longitudinal web for connection with the centre keelson.

4 SPECIAL SCANTLING REQUIREMENTS FOR SHELL STRUCTURE

4.1 Shell plating

4.1.1 Shell plating connected with stern frame

The net thickness of shell plating connected with the stern frame is not to be less than that obtained, in mm, from the following formula:

$$t = 0.094\ (L_2 - 43) + 0.009\, b$$

In way of the boss and heel plate, the net thickness, t, of shell plating, in mm, is not to be less than:

$$t = 0.105\ (L_2 - 47) + 0.011\ b$$

where:

b : Breadth of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

4.1.2 Heavy shell plates

Heavy shell plates are to be fitted locally in way of the heavy plate floors as required by [2.1.1]. Outboard of the heavy floors, the heavy shell plates may be reduced in thickness in as gradual a manner as practicable. Where the horn plating is radiused into the shell plating, the radius at the shell connection, r in mm, is not to be less than:

$$r = 150 + 0.8\ L_2$$

4.1.3 Thruster tunnel plating

The net thickness of the tunnel plating, t_{tun} in mm, is to comply with the requirements in Ch 10, Sec 1, [4.2.1].

SECTION 4
TANKS SUBJECT TO SLOSHING

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

α_p : Correction factor for the panel aspect ratio to be taken as:

$$\alpha_p = 1.2 - \frac{b}{2.1\ a} \quad \text{but not to be taken as greater than 1.0.}$$

a : Length of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

b : Breadth of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

ℓ_{bdg} : Effective bending span, as defined in Ch 3, Sec 7, [1.1.2], in m.

ℓ_{slh} : Effective sloshing length, in m, as defined in Ch 4, Sec 6, [6.3.2].

b_{slh} : Effective sloshing breadth, in m, as defined in Ch 4, Sec 6, [6.4.2].

$I_{y\text{-}n50}$: Net horizontal hull girder moment of inertia, at the longitudinal position being considered, as defined in Ch 5, Sec 1, [1.5], in m^4.

M_{sw} : Permissible hull girder hogging and sagging still water bending moment for seagoing operation at the location being considered, in kNm, as defined in Ch 4, Sec 4, [2.2.2].

z_n : Distance from the baseline to the horizontal neutral axis, as defined in Ch 5, Sec 1, in m.

z : Vertical coordinate of the load calculation point or at the reference point under consideration, in m.

σ_{hg} : Hull girder bending stress, in N/mm^2, calculated at the load calculation point defined in Ch 3, Sec 7, [2.2] or in Ch 3, Sec 7, [3.2], as the case may be:

$$\sigma_{hg} = \left(\frac{(z - z_n)\ M_{sw}}{I_{y-n50}}\right)10^{-3}$$

1 GENERAL

1.1 Application

1.1.1

The requirements of this section cover the strengthening requirements for localised sloshing loads that may occur in tanks carrying liquid.

Sloshing loads due to the free movement of liquid in tanks are given in Ch 4, Sec 6, [6].

1.2 General requirements

1.2.1 Filling heights of cargo and ballast tanks

The scantlings of all cargo and ballast tanks are to comply with the sloshing requirements given in this section for the following cases:

- Unrestricted filling height for ballast tanks,

- Unrestricted filling height for cargo tanks with cargo density equal to ρ_L, as defined in Ch 4, Sec 6,
- All filling levels up to h_{part} for cargo tanks with cargo density equal to ρ_{part} taken as:

$$h_{part} = \frac{h_{tk} \cdot \rho_L \cdot f_{CD}}{\rho_{part}}$$

where:

h_{part} : Maximum permissible filling height, in m, associated with a partial filling of the considered cargo tank with a high liquid density equal to ρ_{part}.

h_{tk} : Maximum tank height, in m.

ρ_L : Cargo density as defined in Ch 4, Sec 6.

f_{cd} : Factor defined in Ch 4, Sec 6.

ρ_{part} : Maximum permissible high liquid density as defined in Ch 4, Sec 6.

1.2.2 Cargo holds of bulk carrier intended for the carriage of ballast water

Cargo holds of bulk carrier intended for the carriage of ballast water are assumed either full or empty in seagoing condition and are not required to be assessed for sloshing pressures.

1.2.3 Structural details

Local scantling increases due to sloshing loads are to be made with due consideration given to details and avoidance of hard spots, notches and other harmful stress concentrations.

1.3 Application of sloshing pressure

1.3.1 General

The structural members of the following tanks are to be assessed for the design sloshing pressures $P_{slh\text{-}lng}$ and $P_{slh\text{-}t}$ in accordance with [1.3.4] and [1.3.5].

a) Cargo and slop tanks of oil tankers.

b) Fore peak and aft peak ballast tanks.

c) Other tanks which allow free movement of liquid, e.g. ballast tanks, fuel oil bunkering tanks and fresh water tanks, etc.

Where the effective sloshing length, ℓ_{slh} is less than 0.03 L, calculations involving $P_{slh\text{-}lng}$ are not required and where the effective sloshing breadth b_{slh} is less than 0.32 B, calculations involving $P_{slh\text{-}t}$ are not required.

1.3.2 Minimum sloshing pressure

The minimum sloshing pressure, $P_{slh\text{-}min}$, as defined in Ch 4, Sec 6, [6.2] is to apply to tanks in which the effective sloshing length, ℓ_{slh} or breadth b_{slh}, is less than defined in [1.3.1].

1.3.3 Structural members to be assessed

The following structural members are to be assessed:

a) Plates and stiffeners forming boundaries of tanks.

b) Plates and stiffeners on wash bulkheads.

c) Web plates and web stiffeners of primary supporting members located in tanks.

d) Tripping brackets supporting primary supporting members in tanks.

1.3.4 Application of design sloshing pressure due to longitudinal liquid motion

The design sloshing pressure due to longitudinal liquid motion, $P_{slh-lng}$, as defined in Ch 4, Sec 6, [6.3.3] is to be applied to the following members as shown in Figure 1.

a) Transverse tight bulkheads.

b) Transverse wash bulkheads.

c) Stringers on transverse tight and wash bulkheads.

d) Plating and stiffeners on the longitudinal bulkheads, deck and inner hull within a distance from the transverse bulkhead taken as:

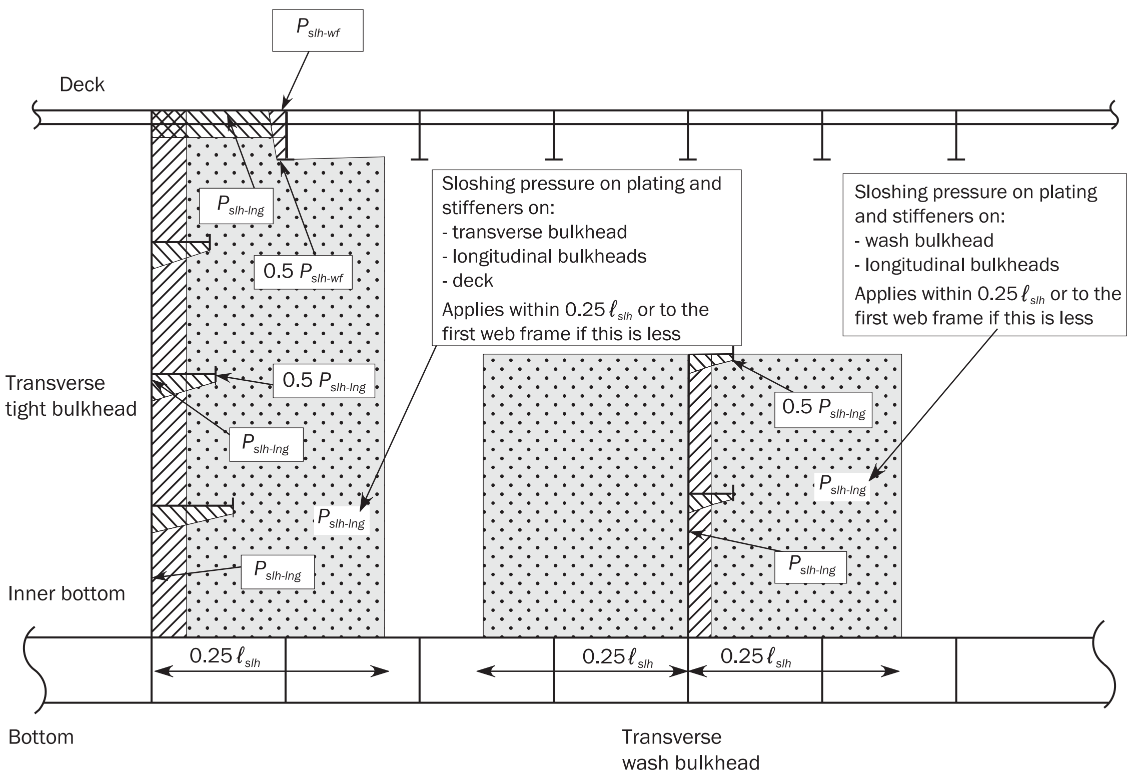
- 0.25 ℓ_{slh},
- The distance between the transverse bulkhead and the first web frame if located inside the tank at the considered level,

whichever is less.

In addition, the first web frame next to a transverse tight or wash bulkhead if the web frame is located within 0.25 ℓ_{slh} from the bulkhead, as shown in Figure 1, is to be assessed for the web frame reflected sloshing pressure, P_{slh-wf}, as defined in Ch 4, Sec 6, [6.3.4].

The minimum sloshing pressure, $P_{slh-min}$, as defined in Ch 4, Sec 6, [6.2] is to be applied to all other members.

Figure 1 : Application of sloshing loads due to longitudinal liquid motion



1.3.5 Application of design sloshing pressure due to transverse liquid motion

The design sloshing pressure due to transverse liquid motion, P_{shl-t}, as defined in Ch 4, Sec 6, [6.4.3], is to be applied to the following members as shown in Figure 2.

a) Longitudinal tight bulkhead.

b) Longitudinal wash bulkhead.

c) Horizontal stringers and vertical webs on longitudinal tight and wash bulkheads.

d) Plating and stiffeners on the transverse tight bulkheads including stringers and deck within a distance from the longitudinal bulkhead taken as:

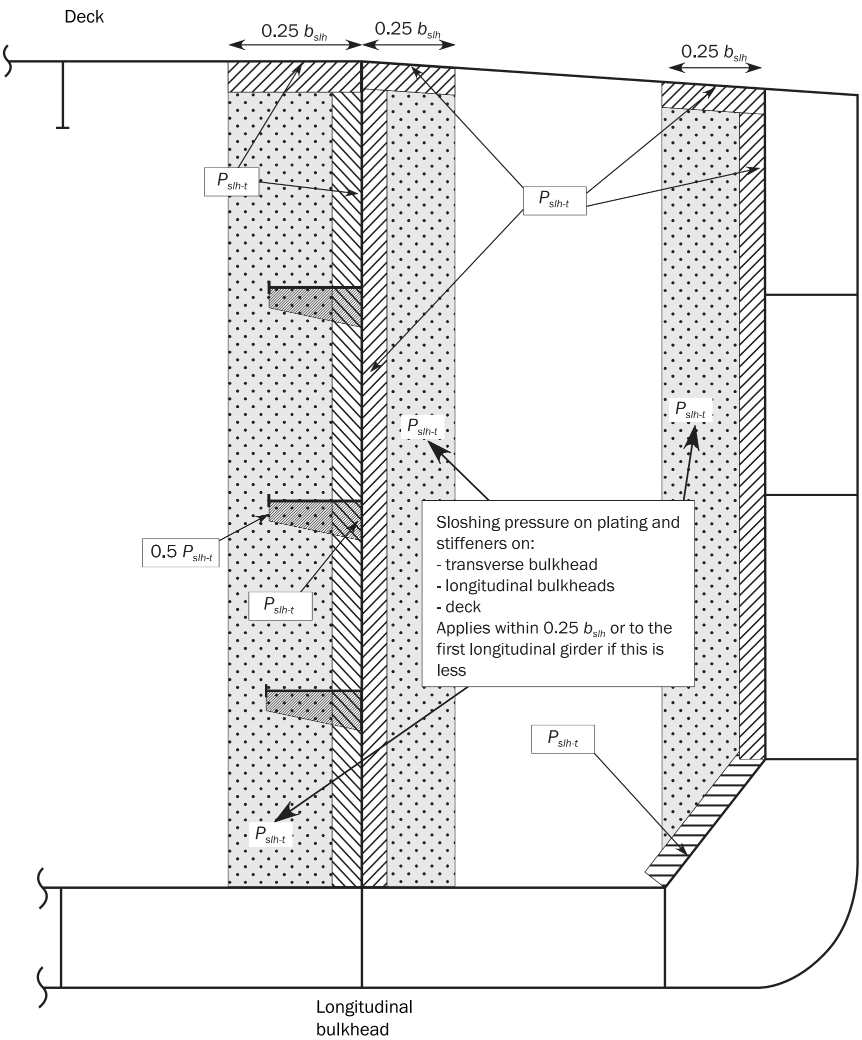
- $0.25\ b_{slh}$,
- The distance between the longitudinal bulkhead and the first girder if located inside the tank at the considered level,

whichever is less.

In addition, the first girder next to the longitudinal tight or wash bulkhead if the girder is located within $0.25\ b_{slh}$ from the longitudinal bulkhead, as shown in Figure 2, is to be assessed for the reflected sloshing pressure, $P_{slh-grd}$ as defined in Ch 4, Sec 6, [6.4.4].

The minimum sloshing pressure, $P_{slh-min}$, as defined in Ch 4, Sec 6, [6.2], is to be applied to all other members.

Figure 2 : Application of sloshing loads due to transverse liquid motion



1.3.6 Combination of transverse and longitudinal fluid motion

The sloshing pressures due to transverse and longitudinal fluid motion are assumed to act independently. Structural members are therefore to be evaluated based on the greatest sloshing pressure due to longitudinal and transverse fluid motion.

1.3.7 Additional sloshing impact assessment

For tanks with effective sloshing breadth, b_{slh}, greater than 0.56 B or effective sloshing length, ℓ_{slh}, greater than 0.13 L, an additional sloshing impact assessment is to be carried out in accordance with the individual Society's procedures.

2 SCANTLING REQUIREMENTS

2.1 Plating

2.1.1 Net thickness

The net thickness of plating, *t* in mm, subjected to sloshing pressures is not to be less than:

$$t = 0.0158\ \alpha_p\ b \sqrt{\frac{P_{slh}}{C_a\ R_{eH}}}$$

where:

C_a : Permissible bending stress coefficient to be taken as:

$$C_a = \beta_a - \alpha_a \frac{|\sigma_{hg}|}{R_{eH}}$$ with coefficients defined in Table 1, but not to be taken greater than $C_{a\text{-}max}$.

σ_{hg} : Hull girder bending stress, in N/mm^2, corresponding to the greatest of the sagging and hogging bending moment in absolute value.

P_{slh} : The greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$ or $P_{slh\text{-}min}$ as specified in [1.3].

Table 1 : Definition β_a, α_a and $C_{a\text{-}max}$

<table>

</table>

2.2 Stiffeners

2.2.1 Net section modulus

The net section modulus, *Z* in cm^3, of stiffeners subjected to sloshing pressures is not to be less than:

$$Z = \frac{P_{slh}\ s\ \ell_{bdg}^{\ 2}}{f_{bdg}\ C_s\ R_{eH}}$$

where:

f_{bdg} : Bending moment factor:

f_{bdg} = 12 for stiffeners fixed against rotation at each end. This is generally to be applied for scantlings of all continuous stiffeners.

f_{bdg} = 8 for stiffeners with one or both ends not fixed against rotation. This is generally to be applied to discontinuous stiffeners.

C_s : Permissible bending stress coefficient to be taken as defined in Table 2.

P_{slh} : The greater of $P_{slh\text{-}ing}$, $P_{slh\text{-}t}$ or $P_{slh\text{-}min}$ as specified in [1.3].

Table 2 : Permissible bending stress coefficient C_s

Sign of hull girder bending stress, σ_{hg} (1)	Lateral pressure acting on (2)	Stiffener boundary condition (3)	f_{bdg}	Coefficient C_s
Tension (positive)	Stiffener side	F - F	12	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		F - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		S - S	8	$C_s = C_{s\text{-}max}$
	Plate side	F - F	12	$C_s = C_{s\text{-}max}$
		F - S	8	$C_s = C_{s\text{-}max}$
		S - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
Compression (negative)	Stiffener side	F - F	12	$C_s = C_{s\text{-}max}$
		F - S	8	$C_s = C_{s\text{-}max}$
		S - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
	Plate side	F - F	12	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		F - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		S - S	8	$C_s = C_{s\text{-}max}$

(1) σ_{hg} is to be considered for the hogging and sagging situations.

(2) For primary supporting members located inside the considered tank and for wash bulkheads, the sloshing pressure is to be applied both on stiffener and plate sides.

(3) F - F stands for both ends of the stiffener fixed against rotation
F - S stands for one end of the stiffener fixed and the other not fixed against rotation
S - S stands for both ends of the stiffener not fixed against rotation

Table 3 : Definition β_s, α_s and C_{s-max}

Acceptance criteria set	Structural member		β_s	α_s	C_{s-max}
AC-S	Longitudinal strength members in the cargo hold region including but not limited to: • Deck stiffeners. • Stiffeners on longitudinal bulkheads. • Stiffeners on longitudinal girders and stringers.	Longitudinal stiffeners	0.85	1.0	0.75
		Transverse or vertical stiffeners	0.7	0	0.7
	Other strength members including: • Stiffeners on transverse bulkheads. • Stiffeners on transverse stringers and web frames. • Stiffeners on tank boundaries and primary supporting members outside the cargo hold region.		0.75	0	0.75

2.3 Primary supporting members

2.3.1 Web plating

The web plating net thickness of primary supporting members, t in mm, is not to be less than:

$$t = 0.0158\,\alpha_p\,b\sqrt{\frac{P_{slh}}{C_a\,R_{eH}}}$$

where:

P_{slh} : The greater of $P_{slh-lng}$, P_{slh-t}, P_{slh-wf}, $P_{slh-grd}$ and $P_{slh-min}$ as specified in [1.3]. The pressure is to be calculated at the load application point, defined in Ch 3, Sec 7, [4.1], taking into account the distribution over the height of the member, as shown in Figure 1 and Figure 2.

C_a : Permissible plate bending stress coefficient, as given in [2.1.1].

2.3.2 Stiffeners on web plating

The net section modulus, Z in cm^3, of each individual stiffener on the web plating of primary supporting members subjected to sloshing pressures is not to be less than:

$$Z = \frac{P_{slh}\,s\,\ell_{bdg}^{\;2}}{f_{bdg}\,C_s\,R_{eH}}$$

where:

P_{slh} : The greater of $P_{slh-lng}$, P_{slh-t}, P_{slh-wf}, $P_{slh-grd}$ and $P_{slh-min}$ as specified in [1.3]. The pressure is to be calculated at the load application point, defined in Ch 3, Sec 7, [3.2], taking into account the distribution over the height of the member, as shown in Figure 1 and Figure 2.

C_s : Permissible bending stress coefficient as given in [2.2.1].

f_{bdg} : Bending moment factor as given in [2.2.1].

2.3.3 Tripping brackets supporting primary supporting members

The net section modulus, Z in cm^3 in way of the base within the effective length, d, of tripping brackets and net shear area, A_{shr} in cm^2, after deduction of cut-outs and slots, of tripping brackets supporting primary supporting members is not to be less than:

$$Z = \frac{1000\,P_{slh}\,s_{trip}\,h^2}{2\,C_s\,R_{eH}}$$

$$A_{shr} = 10\,\frac{P_{slh}\,s_{trip}\,h}{C_t\,\tau_{eH}}$$

where:

P_{slh} : The greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$, $P_{slh\text{-}wf}$, $P_{slh\text{-}grd}$ and $P_{slh\text{-}min}$ as specified in [1.3]. The average pressure may be calculated at mid point of the tripping bracket taking into account the distribution as shown Figure 1 and Figure 2.

s_{trip} : Mean spacing, between tripping brackets or other primary supporting members or bulkheads, in m.

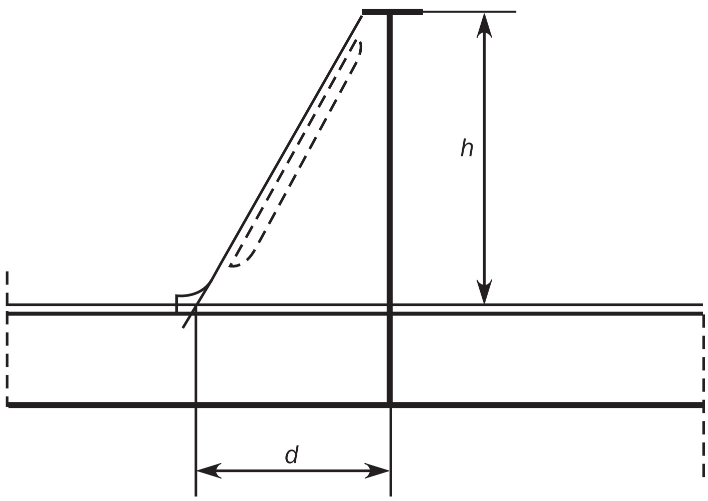
h : Height of tripping bracket, see Figure 3, in m.

C_s : Permissible bending stress coefficient for tripping brackets to be taken as 0.75.

C_t : Permissible shear stress coefficient for tripping brackets to be taken as 0.75.

The effective breadth of the attached plate to be used for calculating the section modulus of the tripping bracket is to be taken as $h/3$.

Figure 3 : Effective length of tripping bracket



PART 1 CHAPTER 11

SUPERSTRUCTURE, DECKHOUSES AND HULL OUTFITTING

Table of Contents

SECTION 1
SUPERSTRUCTURES, DECKHOUSES AND COMPANIONWAYS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

P : Pressure applied on the considered superstructure side or deck, in kN/m²

$P = P_D$ for external decks,
$P = P_{dl}$ for unexposed deck,
$P = P_{Sl}$ for superstructure side.

P_D : Lateral pressure for exposed decks, in kN/m², as defined in Ch 4, Sec 5, [2] and in Ch 4, Sec 5, [4.2].

P_{dl} : Lateral pressure for unexposed decks, in kN/m², as defined in Ch 4, Sec 6, [5].

P_{Sl} : Lateral pressure for superstructure side, in kN/m², as defined in Ch 4, Sec 5, [4.3].

P_{FB} : Lateral pressure for side shell plating, in kN/m², affected by bow impact requirements according to Ch 4, Sec 5, [3.3.1].

P_A : External pressure for end bulkheads of superstructure and deckhouse walls, in kN/m² according to Ch 4, Sec 5, [4.4.1].

ℓ_{bdg} : Effective bending span, in m, as defined in Ch 3, Sec 7.

ℓ_{shr} : Effective shear span, in m, as defined in Ch 3, Sec 7.

c : Coefficient taken as:

c = 0.75 for beams, girders and transverses which are simply supported in one or both ends.

c = 0.55 in other cases.

m_a : Coefficient taken as:

$$m_a = 0.204 \frac{s}{1000\ell_{bdg}}\left[4-\left(\frac{s}{1000\ell_{bdg}}\right)^2\right] \quad \text{with} \quad \frac{s}{1000\ell_{bdg}} \le 1$$

1 GENERAL

1.1 Application

1.1.1

The requirements of this section are applicable to superstructures, deckhouses and companionways, made of steel.

The requirements of Pt 1, Ch 6 apply in addition to those of this section for exposed decks of superstructure and the side of superstructure or deckhouse when this side is part of the side shell.

1.1.2

For the application of this section, a superstructure is considered being located aft or forward 0.4 *L* amidships or having a length of less than 0.15 *L*.

1.1.3

For the application of this section, the length of a deckhouse located within 0.4 *L* amidships is considered not exceeding 0.2 *L*.

1.2 Gross scantlings

1.2.1

With reference to Ch 3, Sec 2, [1.1.3], all scantlings and dimensions referred to in [3] are gross.

2 STRUCTURAL ARRANGEMENT

2.1 Structural continuity

2.1.1 Bulkheads and sides of deckhouses

The aft, front and side bulkheads are to be effectively supported by under deck structures such as bulkheads, girders and pillars.

Sides and main longitudinal and transverse bulkheads are to be in line in the various tiers of deckhouses. Where such arrangement in line is not possible, other effective support is to be provided.

Arrangements are to be made to minimise the effect of discontinuities in erections. All openings cut in the sides are to be framed and have well-rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings.

2.1.2 Deckhouse corners

At the corners where the deckhouse is attached to the strength deck, attention is to be given to the arrangements to transmit load into the under deck supporting structure.

2.2 End connections

2.2.1 Deck stiffeners

Transverse beams are to be connected to side frames by brackets according to Ch 3, Sec 6, [3.2]. Beams crossing longitudinal walls and girders may be attached to the stiffeners of longitudinal walls and the webs of girders respectively by welding without brackets.

2.2.2 Longitudinal and transverse deck girders

Face plates are to be stiffened by tripping brackets according to Ch 3, Sec 6, [4.3].

2.2.3 End connections of superstructure frames

Vertical frames are to be welded to the main frames below, or to the deck under provision of a sufficient supporting structure.

2.3 Local reinforcement on bulkheads

2.3.1

Local reinforcement is to be provided in way of large openings and areas supporting life saving appliances or high loads from other equipment, fittings, etc.

3 SCANTLINGS

3.1 Superstructures sides and decks

3.1.1 Exposed sides and exposed deck plating

Exposed sides and exposed deck plating inclusive their supporting structure are to comply with the requirements given in [3.2.1] to [3.2.5] and bow impact requirements in Ch 10, Sec 1, [3.3], if applicable.

3.1.2 Deck plating of unexposed decks

The deck plating and supporting structures of unexposed decks of superstructures are to comply with requirements given in [3.2.2] to [3.2.5].

3.2 Deckhouses

3.2.1 Plating

The gross thickness of the plating, $t_{gr\text{-}exp}$, in mm, is not to be less than

$$t_{gr-exp} = 7.5\sqrt{\frac{ks}{s_{std}}}$$, on first tier.

$$t_{gr-exp} = 7.0\sqrt{\frac{ks}{s_{std}}}$$, on second tier.

$$t_{gr-exp} = 6.5\sqrt{\frac{ks}{s_{std}}}$$, on third tier and above.

where:

s_{std} : Standard reference spacing of stiffeners or beams, in mm, taken as:

$$s_{std} = 470 + 1.67\ L_1$$

Where deck is protected by sheathing, the gross thickness of the deck plating may be reduced by 1.5 mm, without being less than 5 mm.

Where sheathing other than wood is used, attention is to be paid that the sheathing does not affect the steel. The sheathing is to be effectively fitted to the deck.

3.2.2 Deck plating of unexposed decks

The gross thickness of the unexposed deck plating, $t_{gr\text{-}unexp}$, in mm, is not to be less than the greater value of:

$$t_{gr-unexp} = 0.9\ t_{gr-exp}$$ at the tier considered, and

$$t_{gr-unexp} = \left(5.8\frac{s}{1000} + 1\right)\sqrt{k}$$ but not less than 5.5 mm.

3.2.3 Beams and stiffeners

The gross section modulus Z_{gr}, in cm^3, and the gross shear area $A_{gr\text{-}sh}$, in cm^2, of transverse beams and of stiffeners are not to be less than:

$$Z_{gr} = c\ k\ P\frac{s}{1000}\ell_{bdg}^{\ 2}$$

$$A_{gr-sh} = 0.05\ (1 - 0.817\ m_a)\ k\ P\frac{s}{1000}\ell_{shr}$$

3.2.4 Girders and transverses

The gross section modulus Z_{gr}, in cm^3, and the gross shear area $A_{gr\text{-}sh}$, in cm^2, of girders and transverses are not to be less than:

$Z_{gr} = c\ k\ P\ S\ \ell_{bdg}^{\ 2}$

$A_{gr-sh} = 0.05\ k\ P\ S\ \ell_{shr}$

The girder depth is not to be less than $\ell/25$. The web depth of girders scalloped for continuous deck beams is to be at least 1.5 times the depth of the deck beams.

3.2.5 Alternative grillage analysis for girders and transverses

Where arrangements of deck girders and transverses are such that these members act as a grillage structure, additional analysis may be carried out with a structural model based on the gross scantling.

The resulting stresses are not to exceed the following permissible bending, shear and equivalent stresses, in N/mm², taken as:

$\sigma_b = 150/k$

$\tau = 100/k$

$\sigma_{eqv} = 180/k$

3.3 Deckhouse walls and end bulkheads of superstructure

3.3.1 Application

The requirements in [3.3] apply to end bulkhead of superstructure and deckhouse walls forming the only protection for openings and for accommodations.

Special consideration may be given to the bulkhead scantlings of deckhouses which do not protect openings in the freeboard deck, superstructure deck or in the top of a lowest tier deckhouse. Special consideration may also be given to the bulkhead scantlings of deckhouses which do not protect machinery casings, provided they do not contain accommodation or do not protect equipment essential to the operation of the ship.

3.3.2 Plate thickness

The gross thickness of the plating t_{gr}, in mm, is not to be less than the greater of:

$$t_{gr} = 0.9\ \frac{s}{1000}\sqrt{kP_A} + 1.5$$

$t_{gr} = \left(5.0 + \dfrac{L_2}{100}\right)\sqrt{k}$, for the lowest tier.

$t_{gr} = \left(4.0 + \dfrac{L_2}{100}\right)\sqrt{k}$, for the upper tiers, without being less than 5.0 mm.

3.3.3 Stiffeners

The gross section modulus Z_{gr}, in cm³, of the stiffeners is not to be less than:

$$Z_{gr} = 0.35\ k\ P_A\ \frac{s}{1000}\ \ell^2$$

This requirement assumes the webs of lowest tier stiffeners to be efficiently welded to the decks. Scantlings for other types of end connections are to be specially considered.

The section modulus of deckhouse side stiffeners needs not to be greater than that of side frames on the deck situated directly below, taking account of spacing s and span ℓ.

3.4 Companionways

3.4.1

The scantlings of companionways are to be determined in accordance with [3.2] and [3.3].

SECTION 2
BULWARK AND GUARD RAILS

1 GENERAL REQUIREMENTS

1.1 Application

1.1.1

Bulwarks or guard rails are to be provided at the boundaries of exposed freeboard and superstructure decks, at the boundary of first tier of deckhouses and at the ends of superstructures.

1.2 Minimum height

1.2.1

Bulwarks, or guard rails, are to be a minimum of 1.0 m in height, measured above sheathing, and are to be constructed as required in [2.2] and [3.2]. Where this height would interfere with the normal operation of the ship, a lesser height may be accepted, on the basis of justifying information to be submitted.

2 BULWARKS

2.1 General

2.1.1

Plate bulwarks are to be stiffened at the upper edge by a suitable rail and supported either by stays or plate brackets spaced not more than 2.0 m apart.

The free edge of the stay or the plate bracket is to be stiffened.

2.1.2

Within 0.6 *L* amidships, bulwarks are to be arranged to ensure that they are free from hull girder stresses.

2.1.3

Bulwarks are to be adequately strengthened and increased in thickness in way of mooring pipes.

Cut-outs in bulwarks for gangways or other openings are to be kept clear of breaks of superstructures.

2.1.4

Bulwark plating and stays are to be adequately strengthened in way of eye plates used for shrouds or other tackles in use for cargo gear operation, as well as in way of hawser holes or fairleads provided for mooring or towing.

2.1.5

Openings in bulwarks are to be arranged so that the protection of the crew is to be at least equivalent to that provided by the horizontal courses in [3.1.2].

For this purpose, vertical rails or bars spaced approximately 230 mm apart may be accepted in lieu of rails or bars arranged horizontally.

2.1.6

In the case of ships intended for the carriage of timber deck cargoes, the specific provisions of the freeboard regulations are to be complied with.

2.1.7

Where mooring fittings subject the bulwark to large forces, the stays are to be adequately strengthened.

2.2 Construction of bulwarks

2.2.1 Plating

The gross thickness of bulwark plating, at the boundaries of exposed freeboard and superstructure decks, is not to be less than that given in Table 1.

Table 1 : Thickness of bulwark plates

Height of bulwark	Gross thickness
1.8 m or more	Thickness required for a superstructure in the same position, obtained from Ch 11, Sec 1, [3.1]
1.0 m	6.5 mm
Intermediate height	To be determined by linear interpolation

2.2.2 Stays

The gross section modulus of stays, $Z_{stay\text{-}gr}$, in cm^3, is not to be less than:

$$Z_{stay-gr} = 77\ h_{blwk}{}^2\ s_{stay}$$

where:

h_{blwk} : Height of bulwark from the top of the deck plating to the top of the rail, in m.

s_{stay} : Spacing of the stays, in m.

In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck. Where the bulwark plating is connected to the sheer strake, a width of attached plating, not exceeding 600 mm, may also be included.

2.2.3

Where bulwarks are cut completely, stays or plate brackets of increased strength are to be fitted at the ends of openings.

Bulwark stays are to be supported by, or are to be in line with, suitable under deck stiffening. The stiffening is to be connected by double continuous fillet welds in way of bulwark stay connections.

2.2.4

At the ends of superstructures and for the distance over which their side plating is tapered into the bulwark, the latter is to have the same thickness as the side plating. Where openings are cut in the bulwark at these positions, adequate compensation is to be provided either by increasing the thickness of the plating or by other suitable means.

3 GUARD RAILS

3.1 General

3.1.1

Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

3.1.2

In Type B-100 and Type A ships, open rails on the weather parts of the freeboard deck for at least half the length of the exposed parts are to be fitted.

Alternatively, freeing ports complying with ICLL are to be fitted.

3.2 Construction of guard rails

3.2.1

Stanchions of guard rails are to comply with the following requirements:

a) Fixed, removable or hinged stanchions are to be fitted approximately 1.5 m apart.

b) At least every third stanchion is to be supported by a bracket or stay.

c) Removable or hinged stanchions are to be capable of being locked in the upright position.

d) In the case of ships with rounded sheer strake, the stanchions are to be placed on the flat of the deck.

e) In the case of ships with welded sheer strake, the stanchions are not to be attached to the sheer strake, upstand or a continuous gutter bar.

3.2.2

The size of openings, below the lowest course of rails and the deck or upstand, is to be a maximum of 230 mm. The distance between other courses is not to be greater than 380 mm.

3.2.3

Wire ropes may be accepted, in lieu of guard rails, only in special circumstances and then only in limited lengths. In such cases, they are to be made taut by means of turnbuckles.

3.2.4

Chains may be accepted, in lieu of guard rails, only where they are fitted between two fixed stanchions and/or bulwarks. if the opening is wide, the chains are to be fitted with vertical courses to prevent the horizontal courses from spreading apart.

SECTION 3
EQUIPMENT

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Application

1.1.1

The anchoring equipment specified in this section is intended for temporary mooring of a ship within a harbour or sheltered area when the ship is awaiting berth, tide, etc.

1.1.2

The equipment specified is not intended to be adequate to hold a ship off fully exposed coasts in rough weather or to stop a ship that is moving or drifting. In such a condition, the loads on the anchoring equipment increase to such a degree that its components may be damaged or lost.

1.1.3

The Equipment Number (*EN*) formula for the required anchoring equipment is based on an assumed current speed of 2.5 m/s, wind speed of 25 m/s and a scope of chain cable between 6 and 10. The scope of chain cable is defined as the ratio between the length of chain paid out and the waters depth.

It is assumed that under normal circumstances a ship will use only one bow anchor and chain cable at a time.

2 EQUIPMENT NUMBER CALCULATION

2.1 Requirements

2.1.1

Anchors and chains are to be in accordance with Table 1 and the quantity, mass and sizes of these are to be determined by the equipment number (EN), given by:

$$EN = \Delta^{2/3} + 2\ B\ h + 0.1\ A$$

where:

h : Effective height, in m, from the summer load waterline to the top of the uppermost house, to be obtained in accordance with the following formula:

$$h = h_{FB} + \Sigma h_n$$

When calculating h, sheer and trim are to be disregarded.

h_{FB} : Freeboard amidships from the summer load waterline to the upper deck, in m.

h_n : Height, in m, at the centreline of superstructure or of deckhouse tier 'n' having a breadth greater than $B/4$. Where a house having a breadth greater than $B/4$ is above a house with a breadth of $B/4$ or less, the upper house is to be included and the lower ignored (see in Figure 1).

A : Area, in m^2, in profile view, of the parts of the hull, superstructures and houses above the summer load waterline which are within the length L and also have a breadth greater than $B/4$.

Fixed screens or bulwarks 1.5 m or more in height are to be regarded as parts of houses when determining h and A. In particular, the hatched area shown in Figure 2 is to be included.

The height of hatch coamings and that of any deck cargo, such as containers, may be disregarded when determining h and A.

2.1.2

For ships with EN greater than 16000, the determination of the equipment will be considered by the Society on a case-by-case basis.

Figure 1 : Effective heights of deckhouses

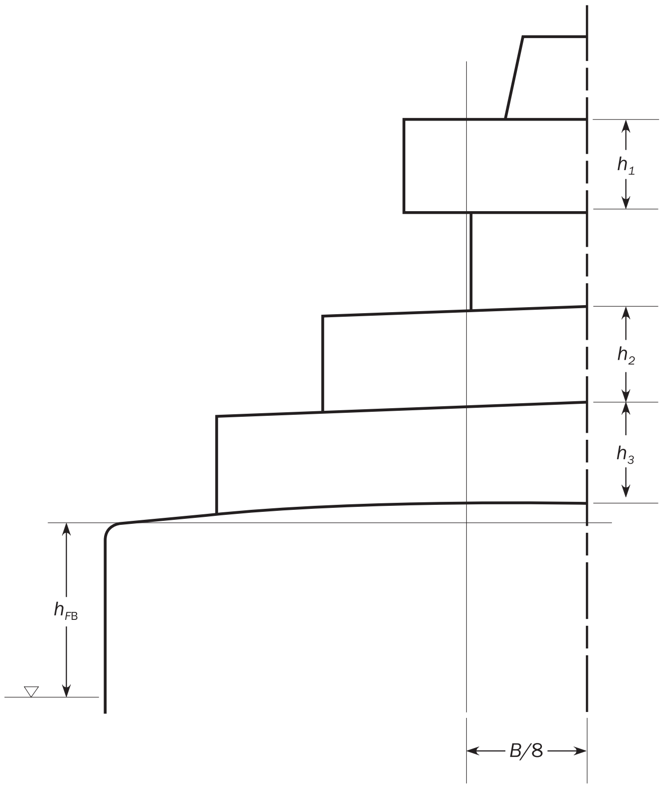


Figure 2 : Profile areas of screens and bulwarks

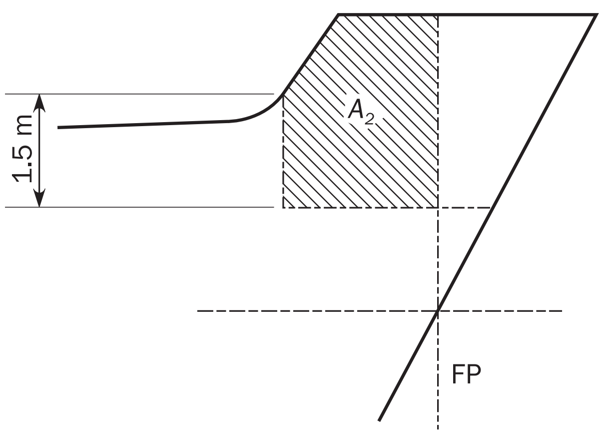

Table 1 : Equipment - Bower anchors and chain cables

(1) Spare anchors are not included in the number of required anchors.

Note 1: '*' chain grade not to be used at this diameter.

3 ANCHORING EQUIPMENT

3.1 General

3.1.1 General

Two bower anchors are to be connected to chain cable and stowed in position ready for use.

A third anchor is recommended to be provided as a spare bower anchor and is listed for guidance only; it is not required as a condition of classification.

3.1.2 Design

Anchors are to be of an approved design. The design of anchor heads is to be such as to minimise stress concentrations. In particular, the radii, on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.

If the anchor design is different from standard or approved anchor types, drawing of the anchor, including material specification, is to be submitted for approval.

3.1.3 Testing

All anchors and chain cables are to be tested at establishments and on machines recognised by the Society, under the supervision of surveyors or other representatives of the Society and in accordance with the relevant requirements for materials of the Society.

Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads applied are to be available. These certificates are to be examined by the surveyor when the anchors and cables are placed onboard the ship.

3.2 Ordinary anchors

3.2.1 Anchor mass

The mass per anchor of bower anchors given in Table 1 is for anchors of equal mass. The mass of individual anchors may vary 7% above or below the tabulated value, provided that the combined mass of all anchors is not less than that required for anchors of equal mass.

Anchors are to be of the stockless type. The mass of the head of anchor, including pins and fittings, is not to be less than 60% of the total mass of the anchor.

3.3 High and Super High Holding power anchors

3.3.1 General

Where agreed by the owner, consideration will be given to the use of special types of anchors. High Holding Power (HHP) and Super High Holding Power (SHHP) anchors, i.e. anchors for which a holding power higher than that of ordinary anchors has been proved according to the applicable requirements of the Society's Rules for Materials, do not require prior adjustment or special placement on the sea bottom.

3.3.2 HHP or SHHP anchor mass

Where HHP or SHHP anchors are used as bower anchors, the mass of each anchor is to be not less than 75% or 50%, respectively, of that required for ordinary stockless anchors in Table 1.

The mass of SHHP anchors is to be, in general, less than or equal to 1500 kg.

3.3.3 Application

High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by [3.3.4], irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. A demonstration of these abilities may be required.

The design approval of high holding power anchors may be given as a general/type approval, and listed in a published document by the Society.

3.3.4 Testing

An anchor for which approval is sought as a high holding power (HHP) anchor, is to be tested at sea to show that it has a holding power of twice that approved for a standard stockless anchor of the same mass.

If approval is sought for a range of sizes, then at least two are to be tested. The smaller of the two anchors is to have a mass not less than one-tenth of that of the larger anchor. The larger of the two anchors tested is to have a mass not less than one-tenth of that of the largest anchor for which approval is sought.

Each test is to comprise a comparison between at least two anchors: one ordinary stockless bower anchor and one HHP anchor. The masses of the anchors are to be approximately equal.

The tests are generally to be carried out by means of a tug. The pull is to be measured by a dynamometer or determined from recently verified data of the tug's bollard pull as a function of propeller rpm.

During the test, the length of the chain cable on each anchor is to be sufficient to obtain an approximately horizontal pull on the anchor. Generally, a horizontal distance between anchor and tug equal to 10 times the water depth will be sufficient.

For SHHP, the tests are to be conducted on at least three different types of bottom, which may be soft mud or silt, sand or gravel, and hard clay or similarly compacted material.

3.4 Chain cables

3.4.1 General

The chain cables are classified as Grade 1, 2 or 3 depending on the type of steel used and its manufacture.

The characteristics of the steel used and the method of manufacture of chain cables are to be approved by the Society for each manufacturer. The material from which chain cables are manufactured and the completed chain cables themselves are to be tested in accordance with the applicable requirements of the Society's Rules for Materials.

Chain cables which are intended to form part of the equipment are not to be used as check chains when the ship is launched.

3.4.2 Application

The total length of chain required to be carried onboard, as given in Table 1, is to be divided approximately equally between the two anchors.

Where the owner requires equipment for anchoring at depths greater than 82.5 m, it is the owner's responsibility to specify the appropriate total length of the chain cable required. In such a case, consideration can be given to dividing the chain cable into two unequal lengths.

3.5 Chain lockers

3.5.1 General

The chain locker is to have adequate capacity and be of a suitable form to provide for the proper stowage of the chain cable, allowing an easy direct lead for the cable into the chain pipes when the cable is fully stowed. Port and starboard cables are to have separate spaces.

The chain locker boundaries and access openings are to be watertight. Provisions are to be made to minimise the probability of the chain locker being flooded in bad weather. Adequate drainage facilities for the chain locker are to be provided.

Chain or spurling pipes are to be of suitable size and provided with chafing lips.

3.5.2 Application

Provisions are to be made for securing the inboard ends of the chain to the structure. This attachment and its supporting structure are to be able to withstand a force of not less than 15% or more than 30% of the minimum breaking strength of the fitted chain cable.

The fastening of the chain to the ship is to be arranged in such a way that in case of an emergency, when the anchor and chain have to be sacrificed, the chain can be readily released from an accessible position outside the chain locker.

3.6 Chain stoppers

3.6.1 General

Chain stoppers are to be provided to secure each chain cable once it is paid out.

3.6.2 Application

Securing arrangements of chain stoppers are to be capable of withstanding a load equal to 80% of the breaking load of the chain cable as required by [3.4.1], without undergoing permanent deformation.

3.7 Windlass

3.7.1 General

A windlass of sufficient power and suitable for the size of chain is to be fitted to the ship in accordance with the requirements of the Society. Where an owner requires equipment significantly in excess of Rule requirements, it is the owner's responsibility to specify increased windlass power.

The windlass is to be capable of heaving in either cable.

3.7.2 Application

The design of the windlass is to be such that access to the chain pipe is adequate to permit the fitting of a cover or seal of sufficient strength over the spurling pipe.

Special consideration will be given to the acceptance of equivalent arrangements that minimise the probability of the chain locker or forecastle being flooded.

3.7.3 Anchor windlass trial

Each windlass is to be tested under working conditions after installation onboard to demonstrate satisfactory operation. Each unit is to be independently tested for the following:

a) Braking.

b) Clutch functioning.

c) Lowering and hoisting of chain cable and anchor.

d) Proper riding of the chain over the chain lifter.

e) Proper transit of the chain through the hawse pipe and the chain pipe.

f) Effecting proper stowage of the chain and the anchor.

During trials onboard ship, the windlass is to be shown to:

a) For all specified design anchorage depths, raise the anchor from a depth of 82.5 m to a depth of 27.5 m at a mean speed of 9 m/min.

b) For specified design anchorage depths greater than 82.5 m, in addition to (a), raise the anchor from the specified design anchorage depth to a depth of 82.5 m at a mean speed of 3 m/min.

c) Where the depth of the water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative.

3.8 Hawse pipes

3.8.1 General

Hawse pipes are to be of a suitable size and configuration to ensure adequate clearance and an easy lead of the chain cable from the chain stopper through the ship's side.

Hawse pipes are to be of sufficient strength.

Their position and slope are to be so arranged as to create an easy lead for the chain cables and efficient housing for the anchors, where the latter are of the retractable type, avoiding damage to the hull during these operations.

For this purpose, chafing lips of suitable form with ample lay-up and radius adequate to the size of the chain cable are to be provided at the shell and deck. The shell plating in way of the hawse pipes is to be reinforced as necessary.

Where hawse pipes are not fitted, alternative arrangements will be specially considered.

3.8.2 Application

Hawse pipes are to be securely attached to thick, doubling or insert plates, by continuous welds.

3.8.3 Stowage and deployment arrangements for anchors

Hawse pipes and anchor pockets are to have full-rounded flanges or rubbing bars in order to minimise the nip on the cables and to minimise the probability of cable links being subjected to high bending stresses. The radius of curvature is to be such that at least three links of chain will bear simultaneously on the rounded parts of the upper and lower ends of the hawse pipes in those areas where the chain cable is supported during paying out and hoisting and when the ship is at anchor.

On ships provided with a bulbous bow, where it is not possible to obtain a suitable clearance between shell plating and the anchors during anchor handling, local reinforcements of the bulbous bow are to be provided in the form of increased shell plate thickness.

SECTION 4
SUPPORTING STRUCTURE FOR DECK EQUIPMENT AND FITTINGS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

SWL : Safe working load as defined in [4.1.4].

1 GENERAL

1.1 Application

1.1.1

Information pertaining to the supporting structure for deck equipment and fittings, as listed in this section, is to be submitted for approval.

This section includes scantling requirements to the supporting structure and foundations of the following pieces of equipment and fittings:

a) Anchor windlasses.

b) Anchoring chain stoppers.

c) Mooring winches.

d) Deck cranes, derricks and lifting masts.

e) Bollards and bitts, fairleads, stand rollers, chocks and capstans.

1.1.2

Where deck equipment is subject to multiple load cases, such as operational loads and green sea load, the loads are be applied independently for the evaluation of strength of foundations and support structure.

1.2 Documents to be submitted

1.2.1

The documents to be submitted are indicated in Ch 1, Sec 3.

2 ANCHORING WINDLASS AND CHAIN STOPPER

2.1 General

2.1.1

The windlass is to be efficiently bedded and secured to the deck.

2.1.2

The builder and the windlass manufacturer are to ensured that the foundation is suitable for the safe operation and maintenance of the windlass equipment.

2.1.3

The supporting structure is to be dimensioned to ensure that for each of the load scenarios specified in [2.1.5] and [2.1.6], the stresses do not exceed the permissible values given in [2.1.12] to [2.1.15].

2.1.4

These requirements are to be assessed based on gross scantlings.

2.1.5

The following load cases are to be examined for the anchoring operation, as appropriate:

a) Windlass where chain stopper is provided: 45% of *BS*.

b) Windlass where chain stopper is not provided: 80% of *BS*.

c) Chain stopper: 80% of *BS*.

where:

BS : Minimum breaking strength of the chain cable.

2.1.6

The following forces are to be applied in the independent load cases that are to be examined for the design loads due to green sea over the forward 0.25 *L*, see Figure 1:

$P_x = 200\ A_x$, in kN, acting normal to the shaft axis.

$P_y = 150\ A_y\ f$, in kN, acting parallel to the shaft axis (inboard and outboard directions to be examined separately).

where:

A_x : Projected frontal area, in m^2.

A_y : Projected side area, in m^2.

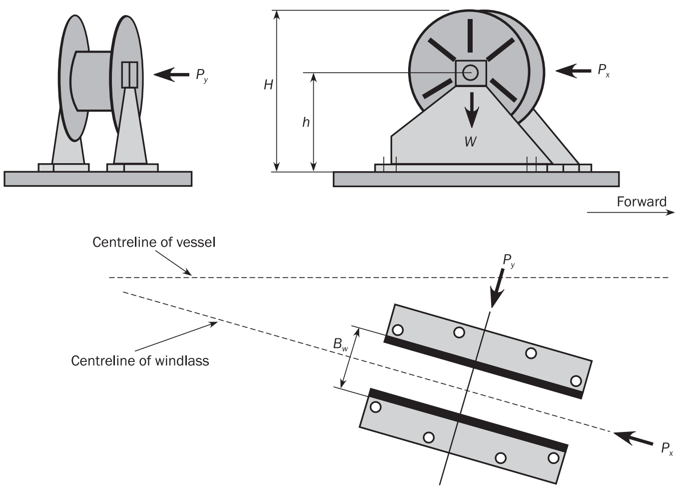
f : Coefficient taken as:

$f = 1 + B_w/H$, but not to be taken greater than 2.5.

B_W : Breadth of windlass measured parallel to the shaft axis, in m, see Figure 1.

H : Overall height of windlass, in m, see Figure 1.

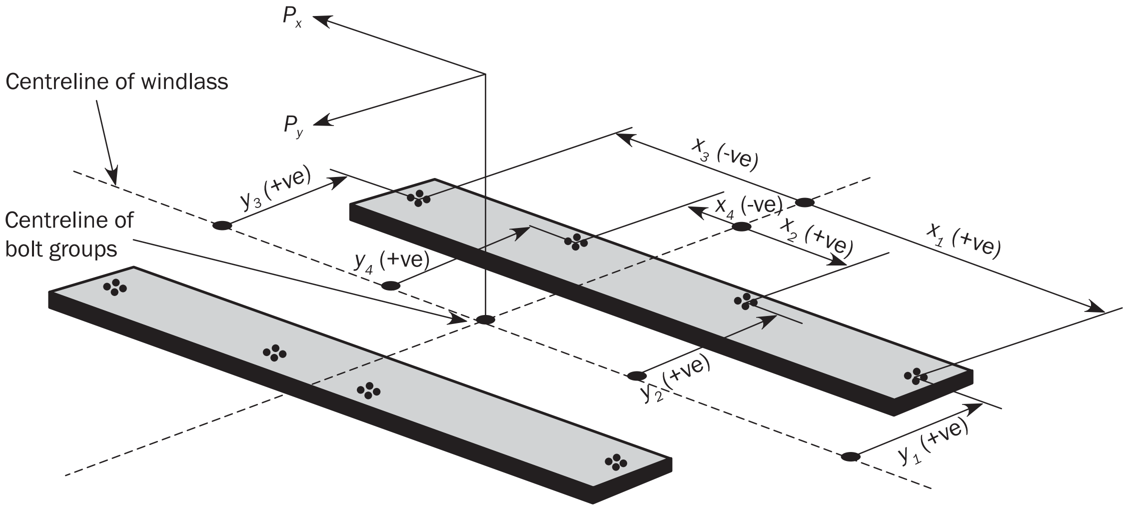
Figure 1 : Directions of forces and weight



2.1.7

Forces resulting from green sea design loads in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by a number of bolt groups, *N*, each containing one or more bolts. See Figure 2.

Figure 2 : Bolting arrangements and sign conventions



2.1.8

The axial forces, R_{xi} and R_{yi}, in bolt group (or bolt) *i*, positive in tension, are given by:

$$R_{xi} = P_x\ h\ x_i\ A_i / I_x$$

$$R_{yi} = P_y\ h\ y_i\ A_i / I_y$$

$$R_i = R_{xi} + R_{yi} - R_{si}$$

where:

P_x : Force acting normal to the shaft axis, in kN.

P_y : Force acting parallel to the shaft axis, either inboard or outboard, whichever gives the greater force in bolt group *i*, in kN.

h : Shaft centre height above the windlass mounting, in cm, see Figure 1.

x_i, y : *x* and *y* coordinates of bolt group *i* from the centroid of all *N* bolt groups, in cm. Positive in the direction opposite to that of the applied force.

A_i : Cross sectional area of all bolts in group *i*, in cm^2.

I_x : Inertia in x direction for *N* bolt groups, in cm^4, taken as:

$$I_x = \Sigma A_i\, x_i^2$$

I_y : Inertia in y direction for *N* bolt groups, in cm^4, taken as:

$$I_y = \Sigma A_i\, y_i^2$$

R_{si} : Static reaction at bolt group *i*, due to the weight of windlass, in kN.

2.1.9

The shear forces, F_{xi} and F_{yi}, applied to the bolt group i, and the resultant combined force F_i, are given by:

$$F_{xi} = (P_x - C_1\ mg)/N$$

$$F_{yi} = (P_y - C_1\ mg)/N$$

$$F_i = \sqrt{F_{xi}^{\ 2} + F_{yi}^{\ 2}}$$

where:

C_1 : Coefficient of friction, taken equal to 0.5.

m : Mass of windlass, in t.

g : Acceleration due to gravity, taken equal to 9.81 m/s^2.

N : Number of bolt groups.

2.1.10

The resultant forces from the application of the loads specified in [2.1.5] and [2.1.6] are to be considered in the design of the supporting structure.

2.1.11

Where a separate foundation is provided for the windlass brake, the distribution of resultant forces is to be calculated on the assumption that the brake is applied for load cases (a) and (b) defined in [2.1.5].

2.1.12

The stresses resulting from anchoring design loads induced in the supporting structure are not to be greater than the following permissible values:

- Normal stress, 1.00 R_{eH}
- Shear stress, 0.58 R_{eH}

2.1.13

The tensile axial stresses resulting from green sea design loads in the individual bolts in each bolt group i are not to exceed 50% of the bolt proof strength. The load is to be applied in the direction of the chain cable. Where fitted bolts are designed to support shear forces in one or both directions, the von Mises equivalent stresses are not to exceed 50% of the bolt proof strength.

2.1.14

The horizontal forces resulting from the green sea design loads, F_{xi} and F_{yi} may be supported by shear chocks. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculation.

2.1.15

The stresses resulting from green sea design loads induced in the supporting structure are not to be greater than the following permissible values:

- Normal stress, 1.00 R_{eH}.
- Shear stress, 0.58 R_{eH}.

3 MOORING WINCHES

3.1 General

3.1.1

Mooring winches are to be efficiently bedded and secured to the deck.

3.1.2 Foundation

The builder and mooring winch manufacturer are to ensured that the foundation is suitable for the safe operation and maintenance of the mooring winch equipment.

3.1.3 Rated pull

The Rated Pull is defined as the maximum load which the mooring winch is designed to exert during operation.

3.1.4 Holding load

The Holding Load is defined as the maximum load which the mooring winch is designed to resist during operation and is to be taken as the design brake holding load or equivalent.

3.1.5 Supporting structure

The supporting structure is to be dimensioned to ensure that for each of the load cases specified in [2.1.5], the stresses do not exceed the permissible values given in [2.1.12] to [2.1.15].

For mooring winches situated within the forward 0.25 *L*, the supporting structure is to be dimensioned to ensure that for the load case specified in [3.1.7], the stresses do not exceed the permissible values given in [2.1.12] to [2.1.15].

3.1.6 Corrosion model

These requirements are to be assessed based on gross scantlings.

3.1.7

Each of the following load cases are to be examined for design loads due to mooring operation:

a) Mooring winch at maximum pull: 100% of the Rated Pull.

b) Mooring winch with brake effective: 100% of the Holding Load.

c) Line strength: 125% of the breaking strength of the mooring line (hawser) according to Ch 11, Sec 3, Table 1 for the ship’s corresponding equipment number.

Rated pull and holding load are defined in [3.1.3] and [3.1.4]. The design load is to be applied through the mooring line according to the arrangement shown on the mooring arrangement plan.

3.1.8

For mooring winches situated within the forward 0.25 *L*, the resultant forces in the bolts obtained from green sea design loads are to be calculated in accordance with [2.1.6] to [2.1.9].

3.1.9

Where a separate foundation is provided for the mooring winch brake, the distribution of resultant forces is to take into account of the different load path. The brake is only to be considered in relation to the forces in [3.1.7] item (b).

4 CRANES, DERRICKS, LIFTING MASTS AND LIFE SAVING APPLIANCES

4.1 General

4.1.1

Supporting structure of life saving appliances and supporting structures of cranes, derricks and lifting masts with a Safe Working Load greater than 30 kN, or a maximum overturning moment to the supporting structure greater than 100 kNm, are to comply with these requirements.

4.1.2

These requirements apply to the connection to the deck and the supporting structure of cranes, derricks and lifting masts. Where the crane, derrick or lifting mast is to be certified by the Society, additional requirements may be applied by the Society.

4.1.3

These requirements do not cover the following items:

a) Supports of lifting appliances for personnel or passengers, except foundation for life saving appliances.

b) The structure of the lifting appliance pedestals or post above the area of the deck connection.

c) Holding down bolts and their arrangement, which are considered part of the lifting appliance.

The term 'lifting appliance' is defined as a crane, derrick or lifting mast.

4.1.4 SWL Definition

The Safe Working Load (SWL) is defined as the maximum load which the lifting appliance is certified to lift at any specified outreach.

4.1.5 Self weight

The self weight is the calculated gross self weight of the lifting appliance, including the weight of any lifting gear.

4.1.6 Overturning moment

The overturning moment is the maximum bending moment, calculated at the connection of the lifting appliance to the ship structure, due to the lifting appliance operating at Safe Working Load, taking into account outreach and self weight.

4.1.7

The crane pedestal and derrick mast are as defined in Figure 3.

4.1.8

Deck plating and under deck structure is to provide adequate support for derrick masts and crane pedestals against the loads and maximum overturning moment. Where the deck is penetrated, the deck plating is to be suitably strengthened.

4.1.9

Structural continuity of the deck structure is to be maintained.

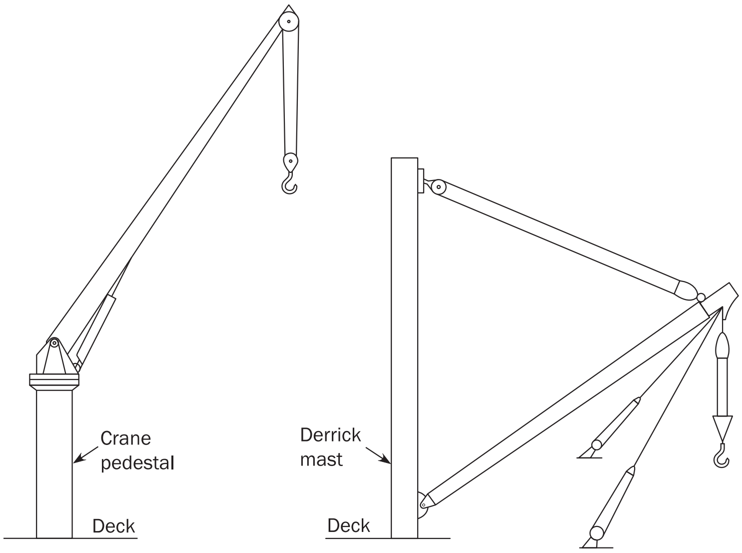
Under deck members are to be provided to support the crane pedestal and to comply with:

a) Where the pedestal is directly connected to the deck, without above deck brackets, adequate under deck structure directly in line with the crane pedestal is to be provided. Where the crane pedestal is attached to the deck without bracketing or where the crane pedestal is not continuous through the deck, welding to the deck of the crane pedestal and its under deck support structure is to be made by

suitable full penetration welding. The design of the weld connection is to be adequate for the calculated stress in the welded connection, in accordance with [4.1.15].

b) Where the pedestal is directly connected to the deck with brackets, under deck support structure is to be fitted to ensure a satisfactory transmission of the load, and to avoid structural hard spots. Above deck brackets may be fitted inside or outside of the pedestal and are to be aligned with deck girders and webs. The design is to avoid stress concentrations caused by an abrupt change of section. Brackets and other direct load carrying structure and under deck support structure are to be welded to the deck by suitable full penetration welding. The design of the connection is to be adequate for the calculated stress, in accordance with [4.1.15].

Figure 3 : Crane pedestal and derrick mast



4.1.10

Deck plating are to be of a material strength compatible with the crane pedestal. Where necessary, a thicker insert plate is to be fitted. In no case are doublers to be used where structures are subject to tension.

4.1.11

The supporting structure is to be dimensioned to ensure that for the load cases specified in [4.1.13] and [4.1.14], the stresses do not exceed those given in [4.1.15].

The capability of the supporting structure to resist buckling failure is to be assured.

4.1.12

These requirements are to be assessed based on gross scantlings.

4.1.13

For lifting appliances which are limited to use in harbour, design load is to be taken equal to 1.3 times SWL added to the lifting appliances self weight.

4.1.14

For life saving appliances, design load is to be taken as 2.2 times SWL.

4.1.15

The stresses induced in the supporting structure are not to exceed the following permissible values:

- Normal stress, 0.67 R_{eH}
- Shear stress, 0.39 R_{eH}

5 BOLLARDS AND BITTS, FAIRLEADS, STAND ROLLERS, CHOCKS AND CAPSTANS

5.1 General

5.1.1

Shipboard fittings (bollards and bitts, fairleads, stand rollers and chocks) and capstans used for mooring and towing operations are to be fitted to the deck or bulwark structures.

5.1.2

Where fairleads are fitted in bulwarks, the thickness of bulwarks may need to be increased. See Ch 11, Sec 2, [2.2].

5.1.3

The structural arrangement is to provide continuity of strength.

The structural arrangement of the ship's structure in way of the shipboard fittings and their seats and in way of capstans is to be such that abrupt changes of shape or section are to be avoided in order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in highly stressed areas.

5.1.4

The supporting structure is to be dimensioned to ensure that for the loads specified in [5.1.6] to [5.1.8], the stresses do not exceed the permissible values given in [5.1.9].

The capability of the structure to resist buckling failure is to be assured.

5.1.5

These requirements are to be assessed based on net scantlings.

5.1.6

Design loads for the supporting structure for shipboard fittings are to be according to:

a) In the case of normal towing in harbour or manoeuvring operations, 125% of the maximum towline load as indicated on the towing and mooring arrangement plan.

b) In the case of towing service other than that experienced in harbour or manoeuvring operations, such as escort service, the nominal breaking strength of towline.

c) In the case of mooring operations, 125% of the nominal breaking strength of the mooring line (hawser) or towline according to Ch 11, Sec 3, Table 1 for the ship's corresponding equipment number.

5.1.7

The design load for the supporting structure for capstans is to taken as 125% of the maximum hauling in force.

5.1.8

The assessment of the structure is to consider lines of action of the applied design load, taking into account the particular arrangements proposed; however, the total load applied for towing and mooring scenarios described in [5.1.6] need not be more than twice the design load on the mooring line or towline. The acting point for the force on the shipboard fittings is to be taken as the attachment point of the mooring line or towline, or at a change in its direction.

5.1.9

For the design load specified in [5.1.6] to [5.1.8], the stresses induced in the supporting structure and welds are not to exceed the following permissible values:

- Normal stress, 1.00 R_{eH}.
- Shear stress, 0.60 R_{eH}.

5.1.10

The following requirements on Safe Working Load apply for a single post basis (i.e. no more than one turn of one cable).

a) The SWL used for normal towing operations, e.g. harbour/manoeuvring is not to exceed 80% of the design load per [5.1.6] item (a); and the SWL used for other towing operations, e.g. escort is not to exceed the design load per [5.1.6] item (b). For deck fittings used for both normal and other towing operations, the greater of the design loads of [5.1.6] item (a) and [5.1.6] item (b) is to be used.

b) The SWL for mooring operations is not to exceed 80% of the design load per [5.1.6] item (c).

c) The SWL of each deck fitting is to be marked (by weld bead or equivalent) on the deck fittings used for towing and/or mooring.

d) The towing and mooring arrangements plan mentioned in [5.1.11] is to define the method of use of towing lines and/or mooring lines.

5.1.11

The SWL for the intended use for each deck fitting is to be stated in the towing and mooring arrangements plan available onboard for consistency for the guidance of the Master. For each deck fitting, the following is to be included:

a) Location on the ship.

b) Fitting type.

c) SWL.

d) Purpose (mooring/harbour towing/escort towing).

e) Manner of applying towing or mooring line load including limiting fleet angles.

This information is to be incorporated into the pilot card in order to provide the pilot with proper information on harbour/escorting operations.

6 MISCELLANEOUS DECK FITTINGS

6.1 Support and attachment

6.1.1

The following requirements are to be considered in the design of the support and attachment of miscellaneous fittings which impose relatively small loads on the ship's structure. The arrangement of such details and their approval is considered on a case-by-case basis by the Society.

6.1.2

Support positions are to be arranged so that the attachment to the ship structure is clear of deck openings and stress concentrations, such as the toes of end brackets. Design of supports is to be such that the attachment to the deck minimises the creation of hard points.

SECTION 5
SMALL HATCHWAYS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Application

1.1.1

The requirements in [1.2] to [1.6] apply to small hatchways at weather deck in positions 1 and 2 as defined in Ch 1, Sec 4, [3.2]. The requirements in [2] apply to small hatchways fitted on the exposed fore deck over the forward 0.25 *L*.

Hatchways of bulk carriers not covered by the definition of small hatchways in [1.4.1] are to comply with applicable requirements in Pt 2, Ch 1.

1.2 Materials

1.2.1

Materials used for the construction of steel hatch covers are to comply with the applicable requirements of the Society.

1.2.2

The use of materials other than steel is considered by the Society on a case-by-case basis.

1.3 Height of hatch coamings

1.3.1

The height above the deck of hatch coamings is not to be less than:

- 600 mm in position 1.
- 450 mm in position 2.

1.3.2

The height, given in [1.3.1], of hatch coamings closed by steel covers provided with gaskets and securing devices may be reduced or the coamings may be omitted entirely, on condition that the Flag Administration is satisfied that the safety of the ship is not thereby impaired in any sea conditions.

In such cases the scantlings of the covers, their gasketing, their securing arrangements and the drainage of recesses in the deck are considered by the Society on a case-by-case basis.

1.4 Small hatchways

1.4.1

Small hatches are hatches designed for access to spaces below the deck and are capable to be closed weathertight or watertight, as applicable. Their opening is generally equal to or less than 2.5 m^2.

Hatch covers on exposed decks are to be weathertight.

Hatch covers fitted in way of ballast tanks, fuel oil tanks or other tanks are to be watertight.

1.4.2

Securing arrangements and stiffening of hatch cover edges are to be such that weathertightness can be maintained in any sea condition. At least one securing device is to be fitted at each side. Circular hole hinges are considered equivalent to securing devices.

1.4.3

Hatchways of special design are considered by the Society on a case-by-case basis.

1.4.4

The gross thickness of covers is to be not less than 8 mm. This thickness is to be increased or an efficient stiffening is to be fitted where the greatest horizontal dimension of the cover exceeds 0.6 m.

1.4.5

The gross thickness of coaming plate is not to be less than the lesser of the following values:

- The gross thickness for the deck in way of hatch coaming, assuming as spacing of stiffeners the lesser of the values of the height of the coaming and the distance between its stiffeners.
- 10 mm.

Coamings are to be strengthened where their height exceeds 0.8 m or their greatest horizontal dimension exceeds 1.2 m, unless their shape ensures an adequate rigidity.

1.5 Cargo tank access hatchways

1.5.1

Requirements given in [1.2] to [1.4] have to be considered as minimum requirements for cargo tank hatchways.

The requirements of [1.5.4] do not apply to dished covers or covers of other specially approved design.

1.5.2

Covers for access hatches, tank cleaning and other openings for cargo tanks and adjacent spaces are to be manufactured from the following material:

a) Normal strength steel in accordance with Ch 3, Sec 1.

b) Non-ferrous material may be considered, such as bronze or brass. Aluminium alloy is not to be used for covers of any opening to cargo tanks and spaces adjacent thereto.

c) Synthetic materials may be considered, taking into account their fire resistance and their physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover, and the method of manufacture are to be submitted for approval.

The hatch cover packing material is to be compatible with the cargoes that are intended to be carried and is to be effectively held in place.

1.5.3

The height of the hatch coaming above the upper surface of the freeboard deck is not to be less than 600 mm. Lower heights may be permitted by the Flag Administration. In addition, the top of the hatch coaming is not to be lower than the highest point of the tank over which it is fitted and is to be of sufficient height for the purpose of damage stability.

The gross thickness of the coaming plate is not to be less than 10 mm. Where the coaming height, as fitted, exceeds 600 mm, the thickness may be required to be increased or edge stiffening fitted. The scantlings of coaming plates of tank access coamings that enclose an area of 1.2 m^2 or more, and/or those that are not configured with a well rounded shape, may be subject to additional requirements.

1.5.4

The gross thickness of unstiffened plate covers with an area less than 1.2 m^2 is not to be less than 12.5 mm. The gross thickness of covers of a larger area will need to be increased or the cover will require stiffening.

Flat and unstiffened covers on circular hatchways are to be secured by fastenings with a spacing of not more than 600 mm.

On rectangular hatchways, the spacing of fastenings is generally not to be greater than 450 mm and the distance between hatch corners and adjacent fastenings is not to be greater than 230 mm.

Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be considered securing devices for the cover and are to be designed so as to prevent the gasket from being over-tightened.

1.6 Gaskets

1.6.1

The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness.

1.6.2

Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

2 SMALL HATCHWAYS FITTED ON THE EXPOSED FORE DECK

2.1 General

2.1.1

These requirements apply to small hatchways (generally openings 2.5 m^2 or less) on the exposed deck within 0.25 L from the FP and located at a height less than 0.1 L or 22 m, whichever is less, from the summer load water line at the location of the hatch.

2.1.2

Hatchways designed for emergency escape need not comply with the requirements [2.3.1] items (a) and (b), [2.4.3] and [2.5.1].

2.1.3

Securing devices of hatches designed for emergency escape are to be of a quick-acting type (e.g. one action wheel handles are provided as central locking devices for latching/unlatching of hatch cover) operable from both sides of the hatch cover.

2.2 Strength

2.2.1

For small rectangular steel hatch covers, the gross plate thickness, stiffener arrangement and scantlings are to be not less than those obtained, in mm, from Table 1 and Figure 2. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in [2.4.1] and shown in Figure 2. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, see Figure 1.

Table 1 : Gross scantlings for small steel hatch covers on the fore deck

Nominal size, in mm	Cover plate thickness, in mm	Primary stiffeners	Secondary stiffeners
		Flat bar size, in mm ; number of stiffeners	
630 × 630	8	-	-
630 × 830	8	100 × 8 ; 1	-
830 × 630	8	100 × 8 ; 1	-
830 × 830	8	100 × 10 ; 1	-
1030 × 1030	8	120 × 12 ; 1	80 × 8 ; 2
1330 × 1330	8	150 × 12 ; 2	100 × 10 ; 2

2.2.2

The upper edge of the hatchway coaming is to be suitably reinforced by a horizontal member, normally not more than 190 mm from the upper edge of the coaming.

2.2.3

For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to provide strength and stiffness equivalent to the requirements for small rectangular hatches.

2.2.4

For small hatch covers constructed of materials other than normal strength steel, the required scantlings are to provide equivalent strength and stiffness.

2.3 Primary securing devices

2.3.1

The primary securing devices are to be fitted such that the hatch cover can be secured in place and be made weathertight by means of a closing mechanism employing any one of the following methods:

a) Butterfly nuts tightening onto forks (clamps),

b) Quick acting cleats, or

c) A central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

2.4 Requirement to primary securing

2.4.1

The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Figure 2 and of sufficient capacity to withstand the bearing force.

2.4.2

The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.

2.4.3

For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimise the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is to be not less than 16 mm. An example arrangement is shown in Figure 1.

2.4.4

For small hatch covers located on the exposed deck forward of the foremost cargo hatch, the hinges are to be fitted such that the predominant direction of green seas will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

2.4.5

On small hatches located between the main hatches, for example between No. 1 and No. 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

2.5 Secondary securing devices

2.5.1

Small hatches on the fore deck are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

PART 1 CHAPTER 12

CONSTRUCTION

Table of Contents

SECTION 1
CONSTRUCTION AND FABRICATION

1 GENERAL

1.1 Workmanship

1.1.1

All workmanship is to be of commercial marine quality and acceptable to the surveyor. Welding is to be in accordance with the requirements of Ch 12, Sec 2. Any defect is to be rectified to the satisfaction of the surveyor before the material is covered with paint, cement or any other composition.

1.2 Fabrication standard

1.2.1

Structural fabrication is to be carried out in accordance with IACS Recommendation No. 47 or with a recognised fabrication standard which has been accepted by the Society prior to the commencement of fabrication/construction.

1.2.2

The fabrication standard to be used during fabrication/construction is to be made available to the attending representative of the Society prior to the commencement of the fabrication/construction.

1.2.3

The fabrication standard is to include information, to establish the range and the tolerance limits, for the items specified as follows:

a) Cut edges: the slope of the cut edge and the roughness of the cut edges.

b) Flanged stiffeners and brackets and built-up sections: the breadth of flange and depth of web, angle between flange and web, and straightness in plane of flange or at the top of face plate.

c) Pillars: the straightness between decks and cylindrical structure diameter.

d) Brackets and flat bar stiffeners: the distortion at the free edge line of tripping brackets and flat bar stiffeners.

e) Sub-assembly stiffeners: details of sniped end of face plates and webs.

f) Plate assembly: for flat and curved blocks, the dimensions (length and breadth), distortion and squareness, and the deviation of interior members from the plate.

g) Cubic assembly: in addition to the criteria for plate assembly, twisting deviation between upper and lower plates, for flat and curved cubic blocks.

h) Special assembly: the distance between upper and lower gudgeons, distance between aft edge of propeller boss and aft peak bulkhead, twist of stern frame assembly, breadth and length of top plate of main engine bed. Where boring out of the propeller boss and stern frame, skeg or solepiece are to be carried out after completing the major part of the welding of the aft part of the ship. Where block boring is used, the shaft alignment is to be carried out using a method and sequence submitted to and recognised by the Society. The fit-up and alignment of the rudder, pintles and axles are to be carried out after completing the major parts of the welding of the aft part of the ship. The contacts between the conical surfaces of pintles, rudder stocks and rudder axles are to be checked before the final mounting.

i) Butt joints in plating: alignment of butt joint in plating.

j) Cruciform joints: alignment measured on the median line and measured on the heel line of cruciform joints.

k) Alignment of interior members: alignments of flange of T profiles, alignment of panel stiffeners, gaps in T joints and lap joints, and distance between scallop and cut-outs for continuous stiffeners in assembly and in erection joints.

l) Keel and bottom sighting: deflections for whole length of the ship, and for the distance between two adjacent bulkheads, cocking-up of fore body and of aft body, and rise of floor amidships.

m) Dimensions: length between perpendiculars, moulded breadth and depth at midship, and length between aft edge of propeller boss and main engine.

n) Fairness of plating between frames: deflections between frames of shell, tank top, bulkhead, upper deck, superstructure deck, deckhouse deck and wall plating.

o) Fairness of plating in way of frames: deflections of shell, tank top, bulkhead, strength deck plating and other structures measured in way of frames.

2 CUT-OUTS, PLATE EDGES

2.1 General

2.1.1

The free edges (cut surfaces) of cut-outs, hatch corners, etc are to be properly prepared and are to be free from notches. As a general rule, cutting draglines, etc are to be smoothly ground. All edges are to be broken or in cases of highly stressed parts, be rounded off.

Free edges on flame or machine cut plates or flanges are not to be sharp cornered and are to be finished off as specified above. This also applies to cutting drag lines, etc, in particular to the upper edge of sheer strake and analogously to weld joints, changes in sectional areas or similar discontinuities.

2.1.2

Corners in hatch opening are to be machine cut.

3 COLD FORMING

3.1 Special structural members

3.1.1

For highly stressed components of the hull girder where notch toughness is of particular concern (e.g. items required to be Class III in Ch 3, Sec 1, Table 3, such as radius gunwales (bent sheer plates) and bilge strakes), the inside bending radius, in cold formed plating, is not to be less than 10 times the as-built plate thickness for carbon-manganese steels (see Ch 3, Sec 1). The allowable inside bending radius may be reduced provided the requirements stated in [3.3] are complied with.

3.2 Corrugated bulkheads and hopper knuckles

3.2.1

For corrugated bulkheads and hopper knuckles, the inside bending radius, in cold formed plating, is not to be less than 4.5 times the as-built plate thickness for carbon-manganese steels (see Ch 3, Sec 1). The allowable inside bending radius may be reduced provided the requirements stated in [3.3] are complied with.

3.3 Low bending radius

3.3.1

When the inside bending radius is reduced below 10 times or 4.5 times the as-built plate thickness according to [3.1] and [3.2] respectively, supporting data is to be provided. The bending radius is in no case to be less than 2 times the as-built plate thickness. As a minimum, the following additional requirements are to be complied with:

a) For all bent plates:

- 100% visual inspection of the bent area is to be carried out.
- Random checks by magnetic particle testing are to be carried out.

b) In addition to a), for bent plates subject to lateral liquid pressure:

- The steel is to be of Grade D/DH or higher.
- The material is impact tested in the strain-aged condition and satisfies the requirements stated herein. The deformation is to be equal to the maximum deformation to be applied during production, calculated by the formula $t_{as\text{-}built} / (2r_{bdg} + t_{as\text{-}built})$, where $t_{as\text{-}built}$ is the as-built thickness of the plate material and r_{bdg} is the bending radius. One sample is to be plastically strained at the calculated deformation or 5%, whichever is greater and then artificially aged at 250°C for one hour then subject to Charpy V-notch testing. The average impact energy after strain ageing is to meet the impact requirements specified for the grade of steel used.

4 HOT FORMING

4.1 Temperature requirements

4.1.1

Steel is not to be formed between the upper and lower critical temperatures. If the forming temperature exceeds 650°C for as-rolled, controlled rolled, thermo-mechanical controlled rolled or normalised steels, or is not at least 28°C lower than the tempering temperature for quenched and tempered steels, mechanical tests are to be made to assure that these temperatures have not adversely affected both the tensile and impact properties of the steel. Where curve forming or fairing, by line or spot heating, is carried out in accordance with [4.2.1] these mechanical tests are not required.

4.1.2

After further heating, other than specified in [4.1.1], of Thermo-Mechanically Controlled Steels (TMCP plates) for forming and stress relieving, it is to be demonstrated that the mechanical properties meet the requirements specified by a procedure test using representative material.

4.2 Line or spot heating

4.2.1

Curve forming or fairing, by linear or spot heating, is to be carried out using approved procedures in order to ensure that the properties of the material are not adversely affected. Heating temperature on the surface is to be controlled so as not to exceed the maximum allowable limit applicable to the plate grade.

5 ASSEMBLY AND ALIGNMENT

5.1 General

5.1.1

The use of excessive force is to be avoided during the assembly of individual structural components or during the erection of sections. Major distortions of individual structural components are to be corrected before further assembly.

After completion of welding, straightening and aligning are to be carried out in such a manner that the material properties are not influenced significantly. In case of doubt, the Society may require a procedure test or a working test to be carried out.

5.1.2

Structural members are to be aligned following the provisions of IACS Recommendation No. 47, Tables 7 or according to the requirements of a recognised fabrication standard that has been accepted by the Society. In the case of critical components, control drillings are to be made where necessary, which are then to be welded up again on completion.

SECTION 2
FABRICATION BY WELDING

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the preparation, execution and inspection of welded connections in hull structures.

1.2 Limits of application to welding procedures

1.2.1 Weld type, size and materials

The requirements of this section for weld type, size and materials are based on the following considerations:

- Joint type.
- Criticality of the joint.
- Magnitude, type and direction of the stresses in the joint.
- Material properties of the parent and weld material.
- Weld gap size.

1.2.2 Preparation, execution and inspection

The requirements of this section are to be complemented by the general requirements relevant to fabrication by welding and qualification of welding procedures given by the Society when deemed appropriate by the Society.

2 WELDING PROCEDURES, WELDING CONSUMABLES AND WELDERS

2.1 General

2.1.1

All welding is to be carried out by approved welders, in accordance with approved welding procedures, using approved welding consumables, in compliance with the Rules of the Society.

Personnel manning automatic welding machines and equipment are to be competent, sufficiently trained and certified by the Society as specified in Society Rules or Guidelines for welding.

3 WELD JOINTS

3.1 General

3.1.1

Welding of connections is to be executed according to the approved plans.

3.1.2

The quality standard adopted by the shipyard is to be submitted to the Society and it applies to all welded connections unless otherwise specified on a case-by-case basis.

3.1.3

Consideration is to be given to the assembly sequence and the effect of the overall shrinkage of plate panels, assemblies, etc, resulting from the welding processes employed. Welding is to proceed systematically, with each welded joint being completed in correct sequence, without undue interruption. When practicable, welding is to commence at the centre of a joint and proceed outwards, or at the centre of assembly and progress outwards towards the perimeter so that each part has freedom to move in one or more directions.

3.1.4

Completed welded joints are to be to the satisfaction of the attending surveyor. Edge preparations and root gaps are to be in accordance with the approved welding procedure. The gap between the members being joined should not exceed the maximum values given in IACS Recommendation No. 47 or as specified in recognised fabrication standard approved by the Society. Where the gap between members being joined exceeds the specified values, corrective measures are to be taken in accordance with an approved welding procedure specification.

3.1.5

Where small fillets are used to attach heavy plates or sections, welding is to be based on approved welding procedure specifications. Special precautions, such as the use of preheating, low-hydrogen electrodes or low-hydrogen welding processes, are accepted.

3.1.6

When heavy structural members are attached to relatively light plating, the weld size and sequence may require modification.

3.1.7

Where quality control systems are in place which ensure that the grade of welding consumable used is higher than the minimum required for the particular strength steel being welded, the welding consumables that are used may have a weld deposit material yield strength that is greater than the minimum specified in Ch 12, Sec 3, [2.5.2] and the size of the weld may be determined based on the yield strength of the higher grade welding consumable.

3.1.8

In general, butt joints are to be welded from both sides. Before welding is carried out on the second side, unsound metal is to be removed at the root by a suitable method. Butt welding from one side will only be permitted for specific applications with an approved welding procedure specification.

3.1.9 Arrangements at junctions of welds

Welds are to be made flush in way of the faying surface where stiffening members, attached by continuous fillet welds, cross the completely finished butt or seam welds. Similarly, butt welds in webs of stiffening members are to be completed and made flush with the stiffening member before the fillet weld is made. The ends of the flush portion are to run out smoothly without notches or sudden changes of section. Where these conditions can not be complied with, a scallop is to be arranged in the web of the stiffening member. Scallops are to be of the size, and in a position, that a satisfactory return weld can be made.

3.1.10 Leak stoppers

Where structural members pass through the boundary of a tank, leakage into adjacent space could be hazardous or undesirable, and full penetration welding is to be adopted for the members for at least 150 mm on each side of the boundary. Alternatively, a small scallop of suitable shape may be cut in a member close to the boundary outside of the compartment, and carefully welded all around.

4 NON-DESTRUCTIVE EXAMINATION (NDE)

4.1 General

4.1.1

The NDE plan to be submitted for approval has to contain the necessary data relevant to the locations and number of examinations, welding procedures applied, method of NDE applied, etc. Visual inspection of finished welds is to be carried out by the shipyard to ensure that all welding has been satisfactory completed. In addition to visual inspection, welded joints are to be examined using any one or a combination of ultrasonic, radiographic, magnetic particle, eddy current, dye penetrant or other acceptable methods appropriate to the configuration of the weld. Above inspections are to be carried out as per the requirements of the Society.

4.1.2

NDE of welding is to be carried out at the positions indicated by the NDE plan in order to ensure that the welds are free from cracks and unacceptable internal defects with regards to the requirements of the Society. NDE is to be carried out by qualified personnel certified by recognised bodies in compliance with recognised standards.

SECTION 3
DESIGN OF WELD JOINTS

SYMBOLS

A_{weld} : Effective fillet weld area, in cm^2.

f : Root face, in mm.

f_{weld} : Weld factor.

f_{yd} : Correction factor taking into account the yield strength of the weld deposit as defined in [2.5.2].

ℓ_{dep} : Total length of deposit of weld metal, in mm.

ℓ_{leg} : Leg length of continuous, lapped or intermittent fillet weld, in mm.

ℓ_{weld} : Length of the welded connection in mm.

R_{eH_weld} : Minimum yield stress of weld deposit, in N/mm^2.

$t_{as\text{-}built}$: As-built thickness of the member being joined, in mm.

t_{gap} : Allowance for fillet weld gap, is to be taken equal to 2.0 mm.

t_{throat} : Throat thickness of fillet weld in mm, as defined in [2.5.3].

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the design of welded connections in hull structures and are based on the considerations mentioned in Ch 12, Sec 2, [1.2.1].

1.1.2

Plans and/or specifications showing weld sizes and weld details are to be submitted for approval.

1.1.3

The leg length of welds is to comply with the minimum leg length given in Table 1.

1.2 Alternatives

1.2.1

The requirements given in this section are considered minimum for electric-arc welding in hull construction, but alternative methods, arrangements and details will be specially considered for approval.

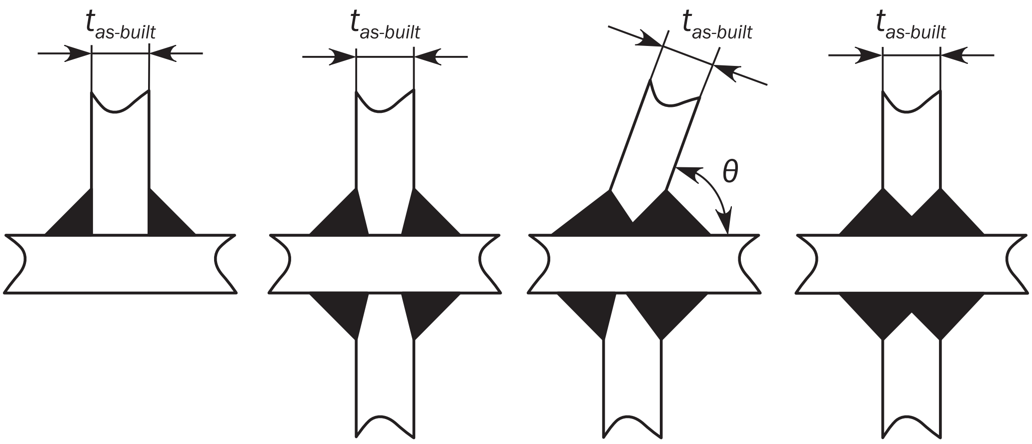
2 TEE OR CROSS JOINT

2.1 Application

2.1.1

The connection of primary supporting members, stiffener webs to plating as well as the plating abutting on another plating, are to be made by fillet or penetration welding, as shown on Figure 1.

Figure 1 : Tee or cross joints



$t_{as\text{-}built}$: As-built thickness of the member being attached, mm.

θ : Connecting angle, in deg.

2.1.2

Where the connection is highly stressed or otherwise considered critical, a partial or full penetration weld is to be achieved by bevelling the edge of the abutting plate.

2.2 Continuous fillet welds

2.2.1

Continuous welding is to be adopted in the following locations:

a) Connection of the web to the face plate for all members.

b) All fillet welds where higher strength steel is used.

c) Boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings.

d) Boundaries of tanks and watertight compartments.

e) All structures inside tanks and cargo holds.

f) Stiffeners and primary supporting members at tank boundaries.

g) All structures in the aft peak and stiffeners and primary supporting members of the aft peak bulkhead.

h) All structures in the fore peak.

i) Welding in way of all end connections of stiffeners and primary supporting members, including end brackets, lugs, scallops, and at orthogonal connections with other members.

j) All lap welds in the main hull.

k) Primary supporting members and stiffener members to bottom shell in the 0.3 L forward region.

l) Flat bar longitudinals to plating.

m) The attachment of minor fittings to higher strength steel plating and other connections or attachments.

n) Pillars to heads and heels.

o) Hatch coaming stay webs to deck plating, see [2.4.5].

2.3 Intermittent fillet welds

2.3.1

Where continuous welding is not required, intermittent welding may be applied.

2.3.2

Where beams, stiffeners, frames, etc, are intermittently welded and pass through slotted girders, shelves or stringers, there is to be a pair of matched intermittent welds on each side of every intersection. In addition, the beams, stiffeners and frames are to be efficiently attached to the girders, shelves and stringers.

Where intermittent welding or one side continuous welding is permitted, double continuous welds are to be applied for one-tenth of their shear span, in accordance with [2.5.2] and [2.5.3].

2.3.3 Deckhouses

One side continuous fillet welding is acceptable in the dry spaces of deckhouses.

2.3.4 Size for one side continuous weld

The size for one side continuous weld is to be of fillet required by [2.5.2] for intermittent welding, where f_2 factor is to be taken as 2.0.

2.4 Partial and full penetration welds

2.4.1 High stress area definition

For the application of this section, high stress area means an area where fine mesh finite element analysis is to be carried out and the fine mesh yield utilisation factor in elements adjacent to the weld is more than 90% of the fine mesh permissible utilisation factor, as defined in Ch 7, Sec 3, [6.2].

2.4.2 Partial or full penetration welding

In areas with high tensile stresses or areas considered critical, full or partial penetration welds are to be used.

In case of full penetration welding, the root face is to be removed, e.g. by gouging before welding of the back side.

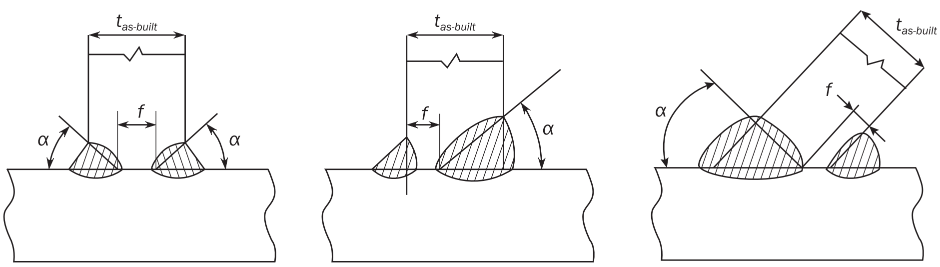
For partial penetration welds the root face, f, is, to be taken between 3 mm and $t_{as\text{-}built}/3$.

The groove angle made to ensure welding bead penetrating up to the root of the groove, α, is usually from 40° to 60°.

The welding bead of the full/partial penetration welds is to cover root of the groove.

Examples of partial penetration welds are given on Figure 2.

Figure 2 : Partial penetration welds



2.4.3 One side partial penetration weld

For partial penetration welds with one side bevelling the fillet weld at the opposite side of the bevel is to satisfy the requirements given in [2.5.2].

2.4.4 Extent of full or partial penetration welding

The extent of full or partial penetration welding in each particular location listed in [2.4.5] and [2.4.6] is to be approved by the Society. However, the minimum extent of full/partial penetration welding from the reference point (i.e. intersection point of structural members, end of bracket toe, etc.) is not to be taken less than 300 mm.

2.4.5 Locations required for full penetration welding

Full penetration welds are to be used in the following locations and elsewhere as required by the rules, see Figure 3:

a) Floors to hopper/inner bottom plating in way of radiused hopper knuckle.

b) Radiused hatch coaming plate at corners to deck.

c) Connection of vertical corrugated bulkhead to the lower hopper plate and to the inner bottom plate within the cargo hold region, when the vertical corrugated bulkhead is arranged without a lower stool.

d) Connection of vertical corrugated bulkhead to top plating of lower stool.

e) Edge reinforcement or pipe penetration both to strength deck, sheer strake and bottom plating within 0.6 L amidships, when the dimensions of the opening exceeds 300 mm.

f) Abutting plate panels with as-built thickness less than or equal to 12 mm, forming outer shell boundaries below the scantling draught, including but not limited to: sea chests, rudder trunks, and portions of transom. For as-built thickness greater than 12 mm, partial penetration in accordance with [2.4.2].

g) Crane pedestals and associated bracketing and support structure.

h) For toe connections of longitudinal hatch coaming end bracket to the deck plating, full penetration weld for a distance of 0.15 H_c from toe of side coaming termination bracket is required, where H_c is the hatch coaming height.

i) Rudder horns and shaft brackets to shell structure.

j) Thick flanges of long transverse web frames to side web frames. Thick flanges of long longitudinal girder to bulkhead web frames.

2.4.6 Locations required for full or partial penetration welding

Partial penetration welding as defined in [2.4.2], is to be used in the following locations. Additional locations may be required based on other criteria, such as fatigue assessment as given in Ch 9 (see Figure 3):

a) Connection of hopper sloping plate to longitudinal bulkhead (inner hull).

b) Longitudinal/transverse bulkhead primary supporting member end connections to the double bottom.

c) Corrugated bulkhead lower stool side plating to lower stool top plate.

d) Corrugated bulkhead lower stool side plating to inner bottom.

e) Corrugated bulkhead lower stool supporting floors to inner bottom.

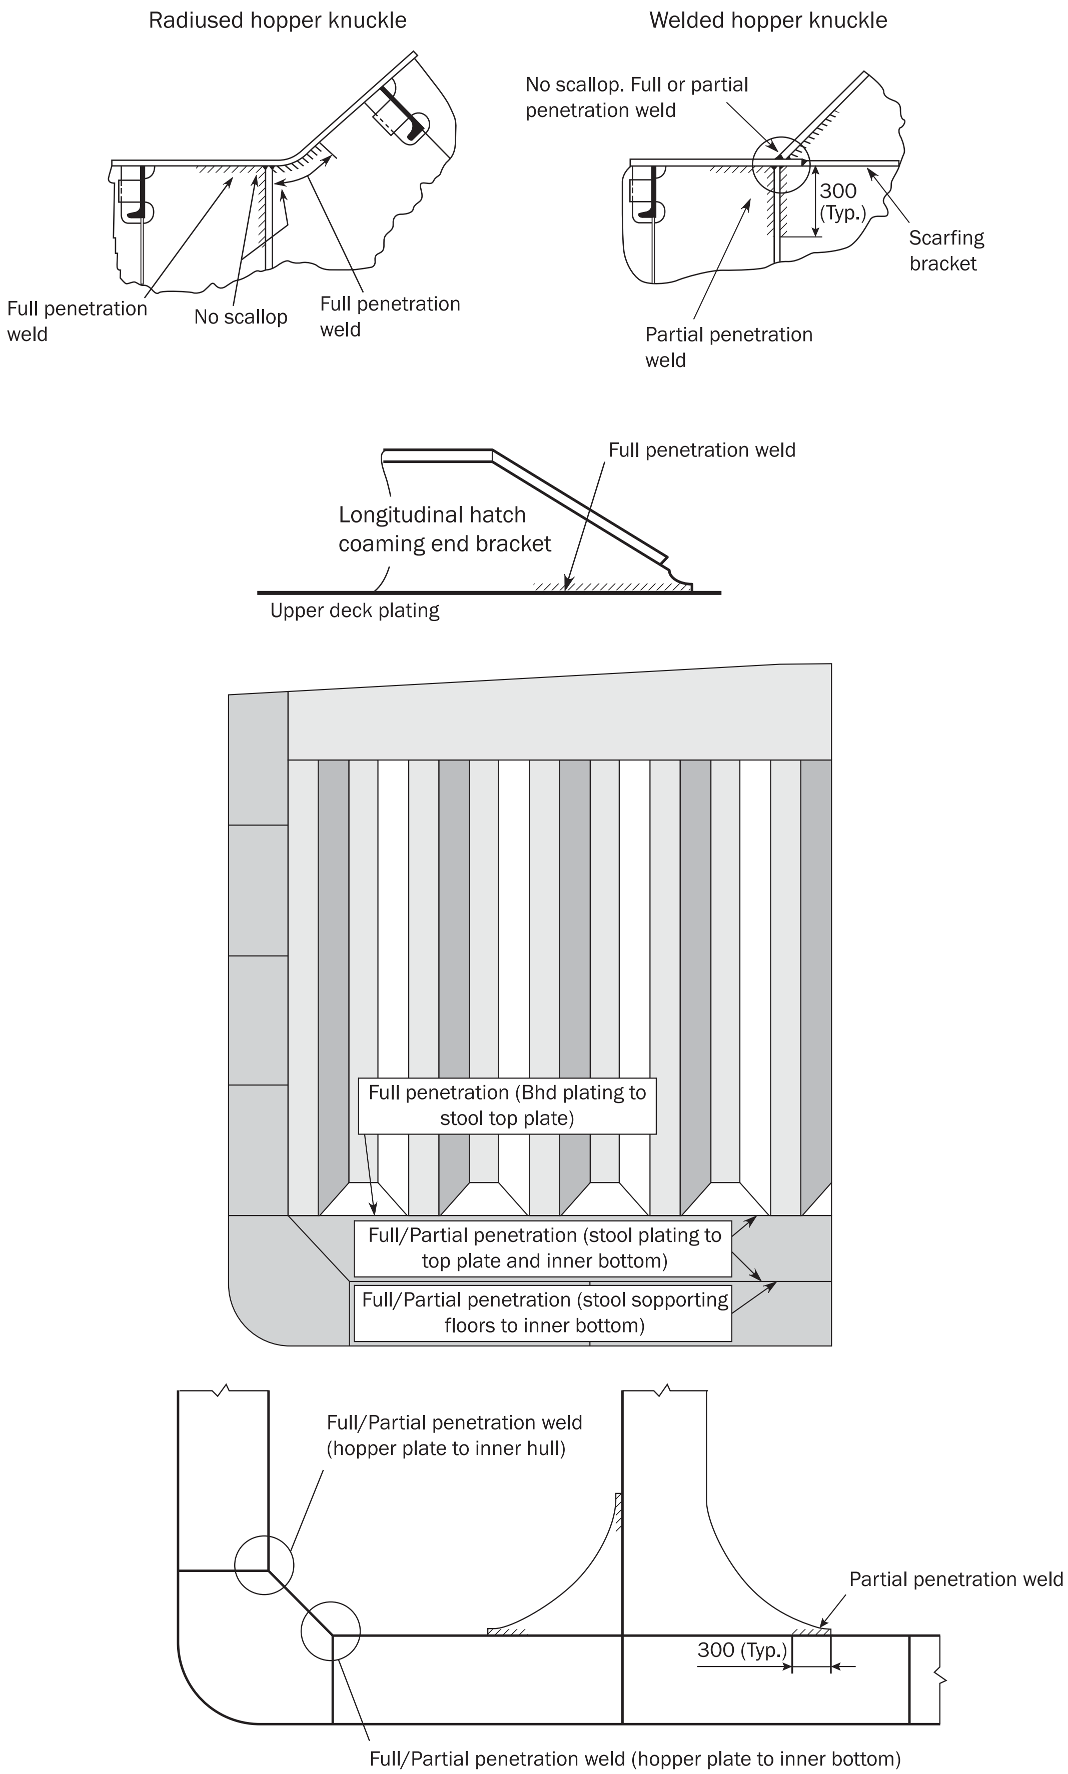
f) Corrugated bulkhead gusset and shedder plates.

g) Structural elements in double bottom below bulkhead primary supporting members and stool plates.

h) Lower hopper plate to inner bottom.

i) Horizontal stringers on bulkheads in way of their bracket toe and the heel.

Figure 3 : High stress areas welding (examples)



2.4.7 Fine mesh finite element analysis

In high stress area, at least partial penetration welds as defined in [2.4.2] are to be used. The minimum extent of full or partial penetration welding in that case is to be the greater of the following:

- 150 mm in either direction from the element with the highest yield utilisation factor.
- The extent covering all elements that exceed the above mentioned yield utilisation factor criteria.

2.4.8 Shedder plates

In case where shedder plates are fitted at the lower end of corrugated bulkhead, the shedder plates are to be welded to the corrugation and the top plate of the transverse lower stool by one side penetration welds.

2.5 Weld size criteria

2.5.1

The required weld sizes are to be rounded to the nearest half millimetre.

2.5.2

The leg length, ℓ_{leg} in mm, of continuous, lapped or intermittent fillet welds is not to be taken less than the greater of the following values:

$$\ell_{leg} = f_1 \, f_2 \, t_{as-built}$$

$$\ell_{leg} = f_{yd} \, f_{weld} \, f_2 \, f_3 \, t_{as-built} + t_{gap}$$

ℓ_{leg} as given in Table 1.

where:

f_1 : Coefficient depending on welding type:

$f_1 = 0.30$ for double continuous welding.

$f_1 = 0.38$ for intermittent welding.

f_2 : Coefficient depending on the edge preparation:

$f_2 = 1.0$ for double continuous welding without bevelling.

$f_2 = 0.85$ for partial penetration welds with one side bevelling and $f = t_{as\text{-}built}/2$.

$f_2 = 0.70$ for partial penetration welds with one side bevelling and $f = t_{as\text{-}built}/3$.

f_{yd} : Coefficient not to be taken less than the following:

$$f_{yd} = \left(\frac{1}{k}\right)^{0.5} \left(\frac{235}{R_{eH\_weld}}\right)^{0.75}$$

$f_{yd} = 0.71$.

R_{eH_weld} : Specified minimum yield stress for the weld deposit in N/mm^2, not to be less than:

: $R_{eH\_weld} = 305$ N/mm^2 for welding of normal strength steel with $R_{eH} = 235$N/mm^2.

: $R_{eH\_weld} = 375$ N/mm^2 for welding of higher strength steels with R_{eH} from 265 to 355 N/mm^2.

: $R_{eH\_weld} = 400$ N/mm^2 for welding of higher strength steel with $R_{eH} = 390$N/mm^2.

f_{weld} : Weld factor dependent on the type of the structural member, see Table 2 and Table 3.

k : Material factor of the abutting member.

f_3 : Correction factor for the type of weld:

f_3 = 1.0 for double continuous weld.

$f_3 = s_{ctr} / \ell_{weld}$ for intermittent or chain welding.

s_{ctr} : Distance between successive fillet welds, in mm.

2.5.3

The throat size t_{throat}, in mm, as shown in Figure 4, is not to be less than:

$$t_{throat} = \frac{\ell_{leg}}{\sqrt{2}}$$

Figure 4 : Weld scantlings definitions

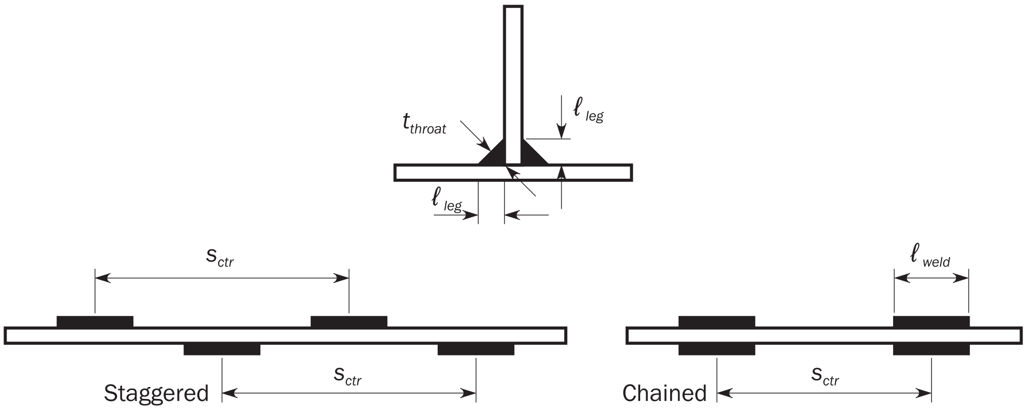


Table 1 : Minimum leg size

Area	Type of space		Minimum length, in mm
Cargo hold region	Cargo tanks and holds	Welds within 3m below top of compartment	6.5 (1)
		Elsewhere	6.0 (1)
	Water ballast and fresh water tanks	Welds within 3m below top of compartment	6.5 (1)
		Elsewhere	6.0 (1)
	Dry spaces and voids		5.0
	Other tanks		6.0 (1)
Other areas	Water ballast and fresh water tanks	Welds within 3m below top of compartment	6.0 (1)
		Elsewhere	5.5 (1)
	Fuel oil, diesel oil and other tanks	Welds within 3m below top of compartment	5.0
		Elsewhere	4.5
	Dry spaces and voids	Welds within 3m below top of compartment	4.5
		Elsewhere	4.0

(1) If the as-built thickness of the element is less than 12 mm, the minimum leg length may be reduced by 0.5 mm.

Table 2 : Weld factors for different structural members

</table>

Hull area	Connection Of	Connection To	f_{weld}
Machinery space	Centre girder	Keel and inner bottom	0.48
	Floor	Centre girder	0.48
	Engine foundation girders	Top plate and primary hull structure	PPW (4)
	Floors and girders	Inner bottom and shell plate	0.38
Super-structure	External bulkhead (first and second tier erections)	Deck, external bulkhead	0.48
	External bulkheads and internal bulkheads	Elsewhere	0.20
Hatch cover	Watertight/oil-tight joints		0.48
	Hatch cover	At ends of stiffeners	0.38 (1)
		Elsewhere	0.24 (1)
Ventilator	Coaming	Deck	0.48

(1) For bulk carrier hatch covers use weld factor of 0.38 for watertight joints and 0.24 at ends of stiffeners.
(2) f_{weld} =0.43 for hatch coaming other than in cargo holds.
(3) Continuous welding.
(4) PPW: Partial penetration welding in accordance with [2.4.2].
(5) FPW: Full penetration welding in accordance with [2.4.2].

2.5.4

For primary supporting members connections not listed in Table 2, the weld factors from Table 3 are to be used.

Table 3 : Weld factors for primary supporting members

Hull structural member	Connection Of	Connection To		f_{weld}
Primary supporting member	Web plate	Shell plating, deck plating, inner bottom plating, bulkhead	Within 15% of shear span at ends	0.48
			Elsewhere	0.38
		Face plate	In tanks/holds Members located within 0.125L from fore peak	0.38
			Elsewhere if cross section area of face plate exceeds 65 cm^2	0.38
			Elsewhere	0.24
	End connections		In way of boundaries of ballast and cargo tanks	0.48
			Elsewhere	0.38

2.5.5

Where the as-built web thickness of the abutting longitudinal stiffener is greater than 15 mm and exceeds the thickness of the attached plating, the welding is to be double continuous and the leg length of the weld is not to be less than the largest of the following:

a) 0.30 $t_{as\text{-}built}$, where $t_{as\text{-}built}$ is the as-built thickness of the attached plating without being taken greater than 30 mm.

b) 0.27 $t_{as\text{-}built}$ + 1, where $t_{as\text{-}built}$ is the as-built thickness of the abutting member. The leg size resulting of this formula needs not to be taken greater than 8.0 mm.

c) Leg length given in the Table 1.

2.5.6

Where the minimum weld size is determined by the requirements of second formula shown in [2.5.2], the weld connections to shell, decks or bulkheads are to take account of the material lost in the cut out, where stiffeners pass through the member. In cases where the width of the cut-out exceeds 15 % of the stiffener spacing, the size of weld leg length is to be multiplied by:

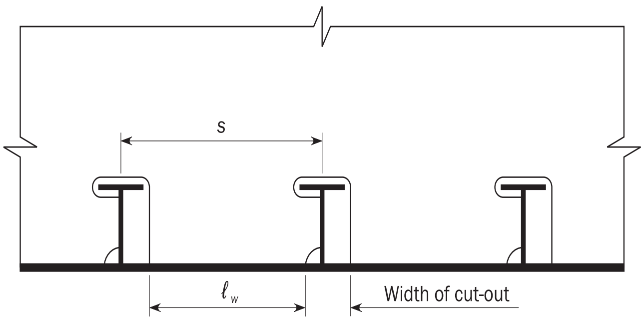
$$\frac{0.85\,s}{\ell_w}$$

where:

s : Stiffener spacing in mm, as shown in Figure 5.

ℓ_w : Length of web plating between notches, in mm, as shown in Figure 5.

Figure 5 : Effective material in web cut-outs for stiffeners



2.5.7 Shear area of primary supporting member end connections

Welding of the end connections, inclusive 10% of shear span, of primary supporting members is to be such that the weld area is to be equivalent to the gross cross sectional area of the member. The weld leg length in mm, ℓ_{leg}, is to be taken as:

$$\ell_{leg} = 1.41\ f_{yd}\ \frac{h_w\ t_{gr-req}}{\ell_{dep}}$$

where:

h_w : Web height of primary supporting members, in mm.

t_{gr_req} : Required gross thickness of the web in way of the end connection, including 10% of shear span, based on the highest average usage factor for yield from cargo hold FE analysis or the shear area requirement for PSM outside cargo hold region, in mm.

ℓ_{weld} : Length of the welded connection in mm, as shown in Figure 6.

ℓ_{dep} : Total length of deposit of weld metal, in mm, see Figure 6 taken as:

$$\ell_{dep} = 2\ \ell_{weld}$$

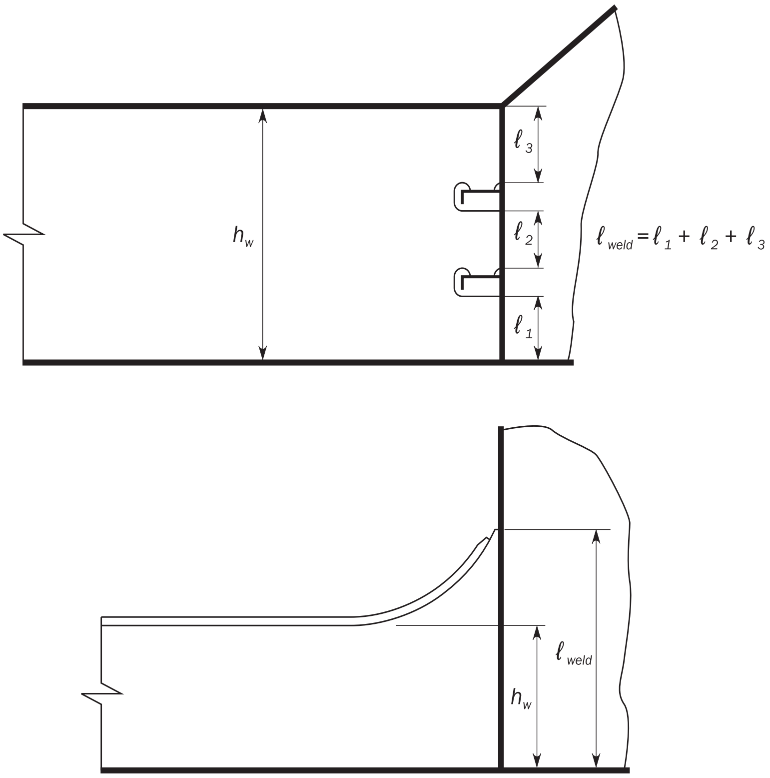
The size of weld is not to be less than the value calculated in accordance with [2.5.2].

2.5.8 Longitudinals

Welding of longitudinals to plating is to be doubled continuous at the ends of the longitudinals at the extent of 15 % of shear span as defined in Ch 3, Sec 7, [1.1.3].

In way of primary supporting members, the length of the double continuous weld is to be equal to the depth of the longitudinal or the end bracket, whichever is greater.

Figure 6 : Shear area of primary supporting member



Note 1: The length ℓ_{weld} is the length of the welded connection. The total length of the weld deposit ℓ_{dep} if welded with double continuous fillet welds is twice the length of the welded connection ℓ_{weld}.

2.5.9 Deck longitudinals

For deck longitudinals, a matched pair of welds is required at the intersection of longitudinals with primary supporting members.

2.5.10 Longitudinal continuity provided by brackets

Where a longitudinal strength member is to cut at a primary supporting structure and the continuity of strength is provided by brackets, the weld area A_{weld} is not to be less than the gross cross sectional area of the member. The weld area, A_{weld} in cm^2, is to be determined by the following formula:

$$A_{weld} = \frac{f_{yd}\ t_{throat}\ \ell_{dep}}{100}$$

2.5.11 Unbracketed stiffeners

Where intermittent welding is permitted, unbracketed stiffeners of shell, watertight and oil-tight bulkheads, and deckhouse fronts are to have double continuous welds for one-tenth of their length at each end. Unbracketed stiffeners of non-tight structural bulkheads, deckhouse sides and aft ends are to have a pair of matched intermittent welds at each end.

2.5.12 Reduced weld size

Where an approved automatic deep penetration procedure is used and quality control facilitates are working to a gap between members of 1 mm and less, the weld factors given in Table 2 may be reduced by 15% but not more than fillet weld leg size of 1.5 mm. Reductions of up to 20%, but not more than the fillet weld leg size of 1.5 mm, will be accepted provided that the shipyard is able to consistently meet the following requirements:

a) The welding is performed to a suitable process selection confirmed by welding procedure tests covering both minimum and maximum root gaps.

b) The penetration at the root is at least the same amount as the reduction into the members being attached.

c) Demonstrate that an established quality control system is in place.

2.5.13 Reduced weld size justification

Where any of the methods for reduction of the weld size are adopted, the specific requirements giving justification for the reduction are to be indicated on the drawings. The drawings are to document the weld design and dimensioning requirements for the reduced weld length and the required weld leg length given by [2.5.2] without the leg length reduction. Also, notes are to be added to the drawings to describe the difference in the two leg lengths and the requirements for their application.

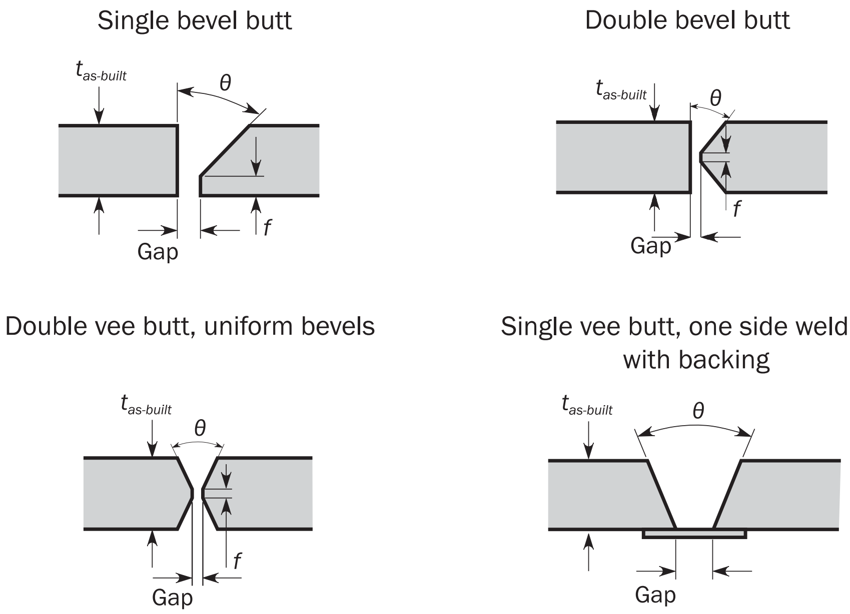
3 BUTT JOINT

3.1 General

3.1.1

Joints in the plate components of stiffened panel structures are generally to be joined by butt welds, see Figure 7.

Figure 7 : Typical butt welds



3.2 Thickness difference

3.2.1 Taper

In the case of welding of plates with difference in as-built thickness equal to or greater than 4 mm, the thicker plate is normally to be tapered. The taper has to have a length of not less than 3 times the difference in as-built thickness. If the width of groove is not less than 3 times the difference the transition taper is to be avoided.

4 OTHER TYPES OF JOINTS

4.1 Lapped joints

4.1.1 Areas

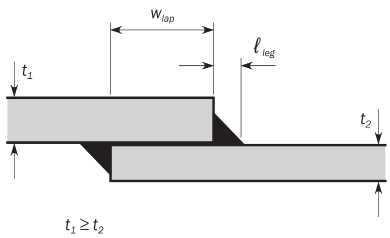
Lap joint welds may be adopted in very specific cases subject to the approval of the Society. Lap joint welds may be adopted for the following:

- Peripheral connections of doublers.
- Internal structural elements subject to very low stresses.

4.1.2 Overlap width

Where overlaps are adopted, the width of the overlap is not to be less than three times, but not greater than four times the as-built thickness of the plates being joined, see Figure 8. Where the as-built thickness of the thinner plate being joined has a thickness of 25 mm or more, the overlap will be subject to special consideration.

Figure 8 : Fillet weld in lapped joint



4.1.3 Overlaps for lugs

The overlaps for lugs and collars in way of cut-outs for the passage of stiffeners through webs and bulkhead plating are not to be less than three times the thickness of the lug but not be greater than 50 mm.

4.1.4 Lapped end connections

Lapped end connections are to have continuous welds on each edge with leg length, ℓ_{leg} in mm, as shown on Figure 8 such that the sum of the two leg lengths is not less than 1.5 times the as-built thickness of the thinner plate.

4.1.5 Overlapped seams

Overlapped seams are to have continuous welds on both edges, of the sizes required by [2.5.2] for the boundaries of tank/hold or watertight bulkheads. Seams for plates with as-built thickness of 12.5 mm or less, which are clear of tanks/holds, may have one edge with intermittent welds in accordance with [2.5.2] for watertight bulkhead boundaries.

4.2 Slot welds

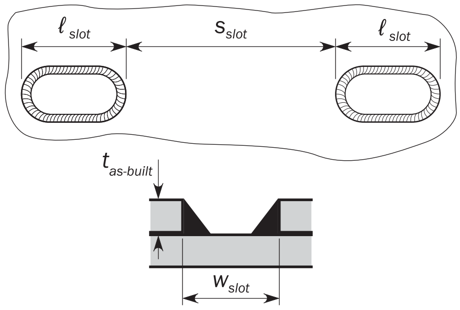
4.2.1

Slot welds may be adopted in very specific cases subject to the approval of the Society. However, slot welds of doublers on the outer shell and strength deck are not permitted within 0.6 *L* amidships.

4.2.2

Slots are to be well-rounded and have a minimum slot length, ℓ_{slot} of 75 mm and width, w_{slot} of twice the as-built plate thickness. Where used in the body of doublers and similar locations, such welds are in general to be spaced a distance, s_{slot} of 2 ℓ_{slot} to 3 ℓ_{slot} but not greater than 250 mm, see Figure 9. The size of the fillet welds is to be determined from second formula shown in [2.5.2] using $t_{as\text{-}built}$ of the thinner plate and a weld factor of 0.48.

Figure 9 : Slot welds



4.2.3 Closing plates

For the connection of plating to internal webs, where access for welding is not practicable, the closing plating may be attached by slot welds to face plates fitted to the webs.

4.2.4

Slots are to be well-rounded and have a minimum slot length, ℓ_{slot} of 90 mm and a minimum width, w_{slot} of twice the as-built plate thickness. Slots cut in plating are to have smooth, clean and square edges and are in general to be spaced a distance, s_{slot} not greater than 140 mm. Slots are not to be filled with welding.

4.3 Stud and lifting lug welds

4.3.1

Where permanent or temporary studs or lifting lugs are to be attached by welding to main structural parts in areas subject to high stress, the proposed locations are to be submitted for approval.

5 CONNECTION DETAILS

5.1 Bilge keels

5.1.1

The ground bar is to be connected to the shell with a continuous fillet weld, and the bilge keel to the ground bar with a continuous fillet weld in accordance with Table 4.

Table 4 : Connections of bilge keels

Structural items being joined	Leg length of weld, in mm	
	At ends	Elsewhere
Ground bar to the shell	0.62 t_{1as_built}	0.48 t_{1as_built}
Bilge keel web to ground bar	0.48 t_{2as_built}	0.30 t_{2as_built}

$t_{1as\text{-}built}$: As-built thickness of ground bar, in mm.
$t_{2as\text{-}built}$: As-built thickness of web of bilge keel, in mm.

5.1.2

Butt welds, in the bilge keel and ground bar, are to be well clear of each other and of butts in the shell plating as shown in Figure 10. In general, shell butts are to be flush in way of the ground bar and ground bar butts are to be flush in way of the bilge keel. Direct connection between ground bar butt welds and shell plating is not permitted. This may be obtained by use of removable backing.

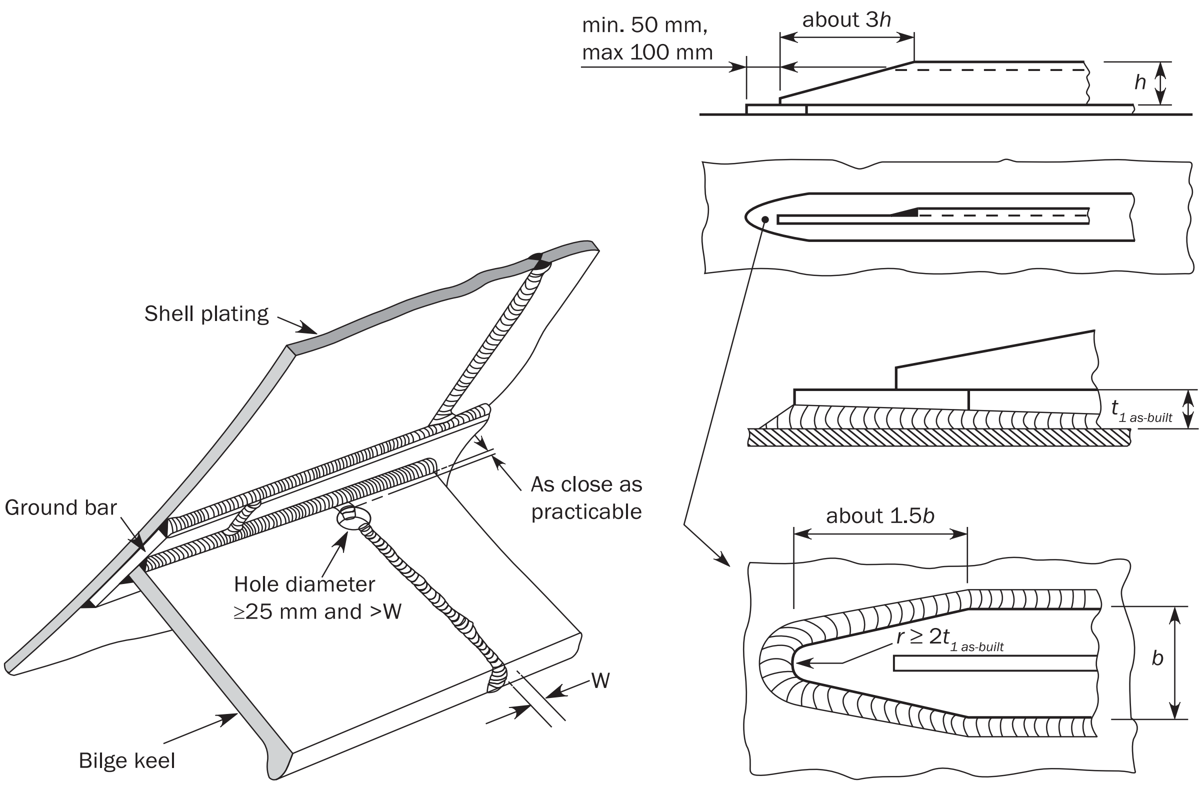
5.1.3

The ground bar is to be continuously fillet welded with a leg length as given in Table 4. At the ends of the ground bar, the leg length is to be increased as given in Table 4, without exceeding the as-built thickness of the ground bar as shown in Figure 10. The welded transition at the ends of the ground bar to the plating connection should be formed with the weld flank angle of 45 deg or less.

5.1.4

In general, scallops and cut-outs are not to be used. Crack arresting holes are to be drilled in the bilge keel butt welds as close as practicable to the ground bar. The diameter of the hole is to be greater than the width of the butt weld and is to be a minimum of 25 mm. Where the butt weld has been subject to non-destructive examination, the crack arresting hole may be omitted.

Figure 10 : Bilge keel



5.2 Bulk carrier side frames

5.2.1

The following requirements are applicable to side frames, end brackets and tripping brackets of single side skin bulk carriers.

5.2.2

For zones '*a*' and '*b*' as shown in Figure 11, double continuous fillet welding should be used with leg lengths of 0.62 $t_{as\text{-}built}$ and 0.57 $t_{as\text{-}built}$ respectively, where $t_{as\text{-}built}$ is the as-built thickness of the thinner of two connected members, in mm.

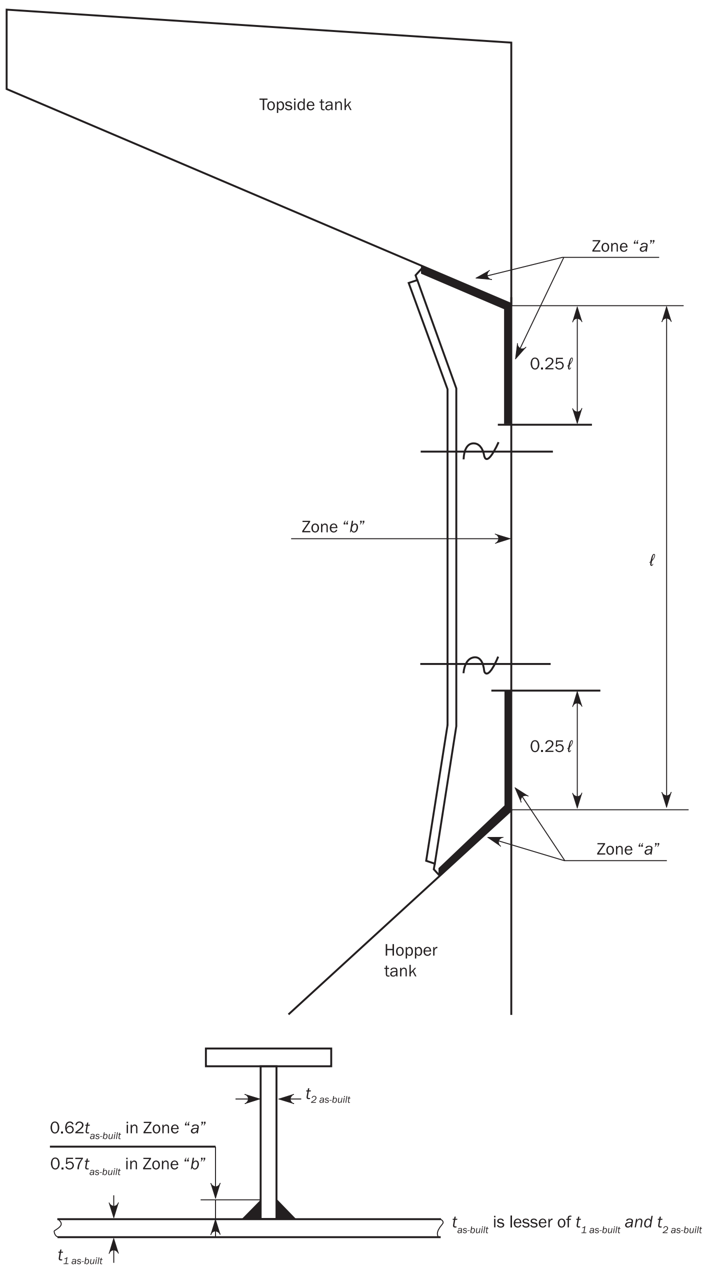
5.2.3

Double continuous welding is to be adopted for the connections of tripping brackets with side shell frames and plating. The leg length, ℓ_{leg} in mm, for these connections should be taken as:

- $0.5\ t_{as\_built} + 1.0$ if $t_{as\text{-}built} < 10$
- $0.4\ t_{as\_built} + 2.0$ if $10 \leq t_{as\text{-}built} < 20$
- $0.3\ t_{as\_built} + 4.0$ if $t_{as\text{-}built} \geq 20$.

In these formulas $t_{as\text{-}built}$ is as-built thickness of the abutting plate.

Figure 11 : Bulk carrier side frames



5.3 End connections of pillars and cross ties

5.3.1

The end connections of pillars and cross ties are to have an effective fillet weld area, in cm^2, (weld throat multiplied by weld length) not less than:

$$A_{weld} = f_3 \left(\frac{235}{R_{eH\_weld}} \right)^{0.75} F$$

where:

F : Design load, for the structure under consideration, in kN.

f_3 : Coefficient equal to:

f_3 = 0.05 when pillar or cross tie is in compression only.

f_3= 0.14 when pillar or cross tie is in tension.

5.4 Abutting plates with small angles

5.4.1

Where the angle θ between the abutting plate and the connected plate is less than 75 deg as shown in Figure 12, the size of fillet welds ℓ_θ, in mm, for the side of larger angle is to be increased in accordance with:

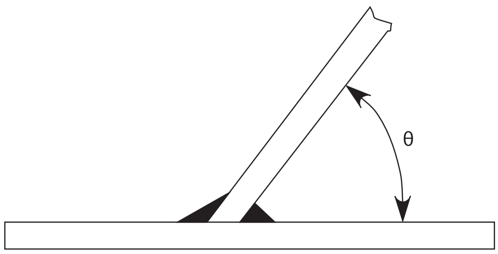
$$\ell_\theta = \frac{\ell_{leg}}{\sqrt{2}\sin\dfrac{\theta}{2}}$$

where:

ℓ_{leg} : Leg length of fillet weld, in mm, as defined in [2.5.2].

θ : Connecting angle, in deg, as shown in Figure 12.

Figure 12 : Connecting angle



5.4.2

Connections of main strength members where θ is less than 45 deg, see Figure 12, may be applied only in dry spaces and voids.

PART 1 CHAPTER 13

SHIP IN OPERATION - RENEWAL CRITERIA

Table of Contents

SECTION 1

PRINCIPLES AND SURVEY REQUIREMENTS

1 PRINCIPLES

1.1 Application

1.1.1

The purpose of this chapter is to provide criteria for the allowable thickness diminution of ships' hull structures.

1.1.2

The criteria apply only to ships in operation that are classed in accordance with these Rules.

1.1.3

Thickness measurement is to be used to assess ships' hull structures against the specified renewal criteria.

1.1.4

The hull survey requirements are those given, as applicable, in the Rules and/or documents of the individual Society which incorporate:

- UR Z10.2 for single side skin bulk carriers.
- UR Z10.4 for double hull oil tankers.
- UR Z10.5 for double side skin bulk carriers.

1.2 Corrosion allowance concept

1.2.1 Corrosion allowance

Corrosion allowance is comprised of two aspects: local and global corrosion, as defined in Ch 3, Sec 2, [1.1.2].

1.2.2 Assessment

Assessment against both local and global corrosion renewal criteria is required during the operational life of ships.

Assessment against the newbuilding requirements which incorporate corrosion additions, given in Ch 3, Sec 3, and which consider all relevant loads and limit states, e.g. yielding, buckling, and fatigue is not required during the operational life of ships, provided that the measured thickness of any structural members remain greater than the renewal thickness specified in Ch 13, Sec 2, [2].

1.2.3 Steel renewal

Steel renewal is required if either the local or global corrosion allowance is exceeded.

1.3 Requirements for documentation

1.3.1 Plans

The plans to be supplied onboard the ship, as required in Ch 1, Sec 3, are to include, for each structural element, both the as-built and renewal thickness as defined in Ch 13, Sec 2. Any thickness for voluntary addition is also to be clearly indicated on the plans.

For the list of plans and information to be supplied onboard the ship, reference is made to the Rules and/or documents of the individual Society which incorporate IACS UR Z10.2, Z10.4 or Z10.5 as applicable.

1.3.2 Hull girder sectional properties

The Midship section plan to be supplied onboard the ship is to include the minimum required hull girder sectional properties, as defined in Ch 5, Sec 1, for the transverse sections of all cargo holds.

2 HULL SURVEY REQUIREMENTS

2.1 General

2.1.1 Minimum hull survey requirements

The minimum hull survey requirements including thickness measurements for the maintenance of class are given in the Rules and/or documents of the individual Society which incorporate IACS UR Z10.2, Z10.4 and Z10.5.

SECTION 2
ACCEPTANCE CRITERIA

SYMBOLS

$t_{as\text{-}built}$: As built thickness, in mm.

t_c : Corrosion addition in mm, as defined in Ch 3, Sec 2.

t_{res} : Reserve thickness, taken equal to 0.5 mm.

t_{vol_add} : Thickness for voluntary addition, in mm.

1 GENERAL

1.1 Application

1.1.1

This section gives requirements for the application of the acceptance criteria.

1.2 Definition

1.2.1 Deck zone

The deck zone includes all the following items contributing to the hull girder strength:

- For bulk carriers: elements above or crossed by the 0.9 *D* level line above the baseline such as:
    - Strength deck plating.
    - Deck stringer.
    - Sheer strake.
    - Side shell plating.
    - Inner hull and other longitudinal bulkhead plating, if any.
    - Topside tank sloped plating, including horizontal and vertical strakes.
    - Longitudinal stiffeners, girders and stringers connected to the above mentioned plating.
- For oil tankers:
    - Strength deck plating.
    - Deck stringer.
    - Sheer strake.
    - Inner hull and other longitudinal bulkheads upper strake.
    - Longitudinal stiffeners, girders and stringers connected to the above mentioned plating.

1.2.2 Bottom zone

The bottom zone includes the following items contributing to the hull girder strength:

- For bulk carriers: elements up to the upper level of the hopper sloping plating or up to and including the inner bottom plating if there is no hopper tank:
  - Keel plate.
  - Bottom plating.
  - Bilge plating.
  - Bottom girders.
  - Inner bottom plating.
  - Hopper tank sloping plating, and horizontal plating, if any.
  - Longitudinal stiffeners connected to the above mentioned plating.
  - Side shell plating.
- For oil tankers:
  - Keel plate.
  - Bottom plating.
  - Bilge plating.
  - Longitudinal bulkheads lower strake.
  - Bottom girders.
  - Longitudinal stiffeners connected to the above mentioned plating.

1.2.3 Neutral axis zone

The neutral axis zone includes the following items between the deck zone and the bottom zone, as for example:

- Side shell plating.
- Inner hull plating and longitudinal bulkheads, if any.
- Topside tank sloped plating.

For the longitudinal strength members forming the web of the hull girder which are inclined to the vertical, the area of the member to be included in the zone area is to be based on the projected area onto the vertical plane.

2 RENEWAL CRITERIA

2.1 Local corrosion

2.1.1 Renewal thickness of local structural elements

Local structural elements include local supporting members and primary supporting members.

Steel renewal is required if the measured thickness, t_m in mm, is less than the renewal thickness, t_{ren} defined as:

$$t_{ren} = t_{as-built} - t_c - t_{vol\_add}$$

2.1.2 Renewed area

Areas which need to be renewed based on the renewal criteria in [2.1.1] are, in general, to be repaired with inserted material which is to have the same or greater grade and yield stress as the original, and to have a thickness, t_{repair} in mm, not less than:

$$t_{repair} = t_{as-built} - t_{vol\_add}$$

2.1.3 Alternative solutions

Alternative solutions may be adopted in accordance with the requirements of the Rules and/or documents of the individual Society which incorporate IACS UR Z10.2, Z10.4 and Z10.5, where the measured thickness, t_m is such as:

$t_{ren} \le t_m < t_{ren} + t_{res}$

2.2 Global corrosion

2.2.1 Application

The ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during special surveys, for ships over 10 years of age.

2.2.2 Renewal criteria

The hull girder strength criteria are given as detailed below.

a) Deck and bottom zones:
   The current hull girder section modulus at deck and at bottom determined with the thickness measurements are not to be less than 90% of the section modulus calculated according to Ch 5, Sec 1 with the gross offered thickness.
   Alternatively, the current sectional areas of the bottom zone and of the deck zone which are the sum of the measured item areas of the considered zones are not to be less than 90% of the sectional area of the corresponding zones determined with the gross offered thickness.

b) Neutral axis zone:
   The current sectional area of the neutral axis zone, which is the sum of the measured plating areas of this zone, is not to be less than the sectional area of the neutral axis zone calculated with the gross offered thickness minus 0.5 t_c.

If the actual reduction of the gross offered thickness of all items, of a given transverse section, which contribute to the hull girder strength is less than 10% for the deck and bottom zones and $0.5t_c$ for the neutral axis zone, the hull girder strength criteria of this transverse section is satisfied and the calculations of the different zone areas with measured thicknesses need not be carried out.

The gross offered thickness is defined in Ch 3, Sec 2.

PART 2
SHIP TYPES

Table of Contents

1 Jan 2014

Table of Contents

PART 2 CHAPTER 1

BULK CARRIERS

Table of Contents

SECTION 1
GENERAL ARRANGEMENT DESIGN

1 FORECASTLE

1.1 General

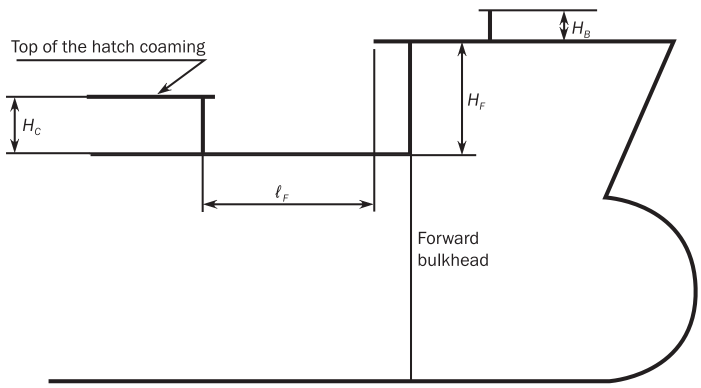
1.1.1

An enclosed forecastle is to be fitted on the freeboard deck.

The aft bulkhead of the enclosed forecastle is to be fitted in way or aft of the forward bulkhead of the foremost hold, as shown in Figure 1.

However, if this requirement hinders hatch cover operation, the aft bulkhead of forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7% of ship length for freeboard as specified in Pt 1, Ch 1, Sec 4, [3.1.2] abaft the fore side of stem.

Figure 1 : Forecastle arrangement



1.1.2

The forecastle height, H_F above the main deck is not to be less than the greater of the following values:

- The standard height of a superstructure as specified in Pt 1, Ch 1, Sec 4, [3.3].
- H_C + 0.5 m, where H_C is the height of the forward transverse hatch coaming of the foremost cargo hold, i.e. cargo hold No. 1.

1.1.3

All points of the aft edge of the forecastle deck are to be located at a distance less than or equal to ℓ_F, taken as:

$$\ell_F = 5\sqrt{H_F - H_C}$$

from the hatch coaming plate.

1.1.4

A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centreline is not less than $H_B / \tan 20°$ forward of the aft edge of the forecastle deck, where H_B is the height of the breakwater above the forecastle, see Figure 1.

SECTION 2
STRUCTURAL DESIGN PRINCIPLES

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

1 APPLICATION

1.1

1.1.1

This section applies to structures in all parts of bulk carriers, in addition to requirements given in Pt 1, Ch 3, Sec 6.

2 CORROSION PROTECTION

2.1 General

2.1.1 Void double side skin spaces

Void double side skin spaces are to have a corrosion protective system fitted in accordance with [2.2].

2.1.2 Cargo holds and ballast holds

Cargo holds and ballast holds are to have a corrosion protective system fitted in accordance with [2.3].

2.2 Protection of void double side skin spaces

2.2.1

Void double side skin spaces in the cargo area for ships having a freeboard length L_{LL} of not less than 150 m are to have an efficient corrosion prevention system, such as hard protective coatings or equivalent.

2.3 Protection of cargo hold spaces

2.3.1 Coating

It is the responsibility of the builder and of the owner to choose coatings suitable for the intended cargoes, in particular for the compatibility with the cargo.

2.3.2 Application

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of cargo holds (side and transverse bulkheads), excluding the inner bottom area and part of the hopper tank sloping plate and lower stool sloping plate, are to have an efficient protective coating, of an epoxy type or equivalent, applied in accordance with the manufacturer's recommendation.

The side and transverse bulkhead areas to be coated are specified in [2.3.3] and [2.3.4] respectively.

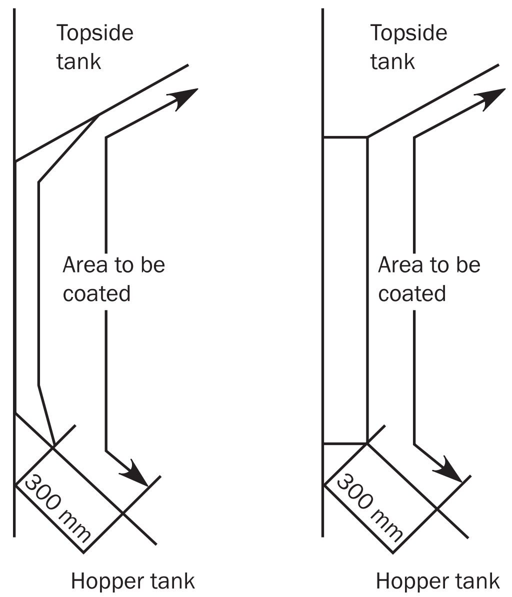
2.3.3 Side areas to be coated

The areas to be coated are the internal surfaces of:

- The inner side plating.
- The internal surfaces of the topside tank sloping plates.
- The internal surfaces of the hopper tank sloping plates for a distance of 300 mm below the frame end bracket for holds of single side skin construction, or below the hopper tank upper end for holds of double side skin construction.

These areas are shown in Figure 1.

Figure 1 : Side areas to be coated



2.3.4 Transverse bulkhead areas to be coated

The areas of transverse bulkheads to be coated are all the areas located above an horizontal level located at a distance of 300 mm below the frame end bracket for holds of single side skin construction or below the hopper tank upper end for holds of double side skin construction.

3 STRUCTURAL DETAIL PRINCIPLES

3.1 Double bottom structure

3.1.1 Application

In addition to the requirements provided in Pt 1, Ch 2, Sec 3, [2], the requirements of this sub-article are applicable to the following ships:

- All bulk carriers of less than 150 m in length,
- Bulk carriers with a length of 150 m or above, with one or more cargo holds arranged for carriage of water ballast.

3.1.2 Double bottom height

Height of double bottom in cargo area, d_{DB}, in m, measured from keel line at mid-length of each cargo hold is not to be less than:

$$d_{DB} = 0.032B + 0.19\sqrt{T_{SC}}$$

A lower double bottom height may be accepted, provided all of the following requirements are satisfied:

- The spacing of adjacent girders is not to be greater than 4.6 m or 5 times the spacing of bottom or inner bottom stiffeners, whichever is the smaller.
- The spacing of floors is not to be greater than 3.5 m or 4 times the side frame spacing, whichever is the smaller. Where side frames are not transverse, the nominal frame spacing as specified by the designer is to be used.

3.1.3 Girder spacing

The spacing of adjacent girders is generally not to be greater than 4.6 m or 5 times the spacing of bottom or inner bottom stiffeners, whichever is the smaller.

3.1.4 Floor spacing

The spacing of floors is generally not to be greater than 3.5 m or 4 times the side frame spacing, whichever is the smaller. Where side frames are not transverse, the nominal frame spacing as specified by the designer is to be used.

3.2 Single side structure

3.2.1 Application

This article applies to the single side structure with transverse framing of single side bulk carrier.

If single side structure is supported by transverse or longitudinal primary supporting members, the requirements in Pt 1, Ch 3, Sec 6, [8] apply to these primary supporting members as regarded to ones in double side skin.

3.2.2 General arrangement

Side frames are to be arranged at every frame space.

If air pipes are passing through the cargo hold, they are to be protected by appropriate measures to avoid a mechanical damage.

3.2.3 Side frames

Frames are to be built-up symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes.

The side frame flange is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature is not to be less than r, in mm, given by:

$$r = \frac{0.4\ b_f^2}{t_f + t_c}$$

where:

t_c : Corrosion addition, in mm, specified in Pt 1, Ch 3, Sec 3.

b_f, t_f : Flange width and net thickness of the curved flange, in mm. The end of the flange is to be sniped.

In ships less than 190 m in length, mild steel frames may be asymmetric and fitted with separate brackets. The face plate or flange of the bracket is to be sniped at both ends. Brackets are to be arranged with soft toes.

The dimensions of side frames are defined in Figure 2.

Figure 2 : Dimensions of side frames

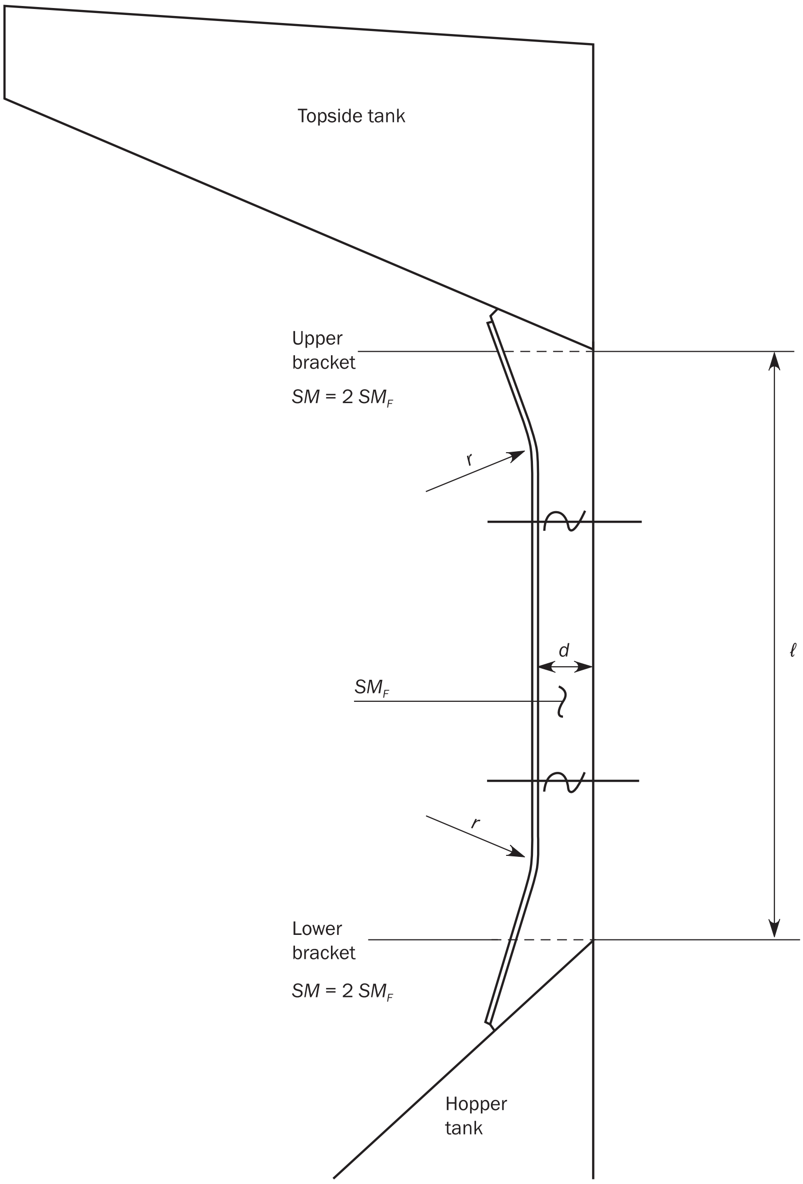


Figure 3 : Dimensions of lower and upper brackets

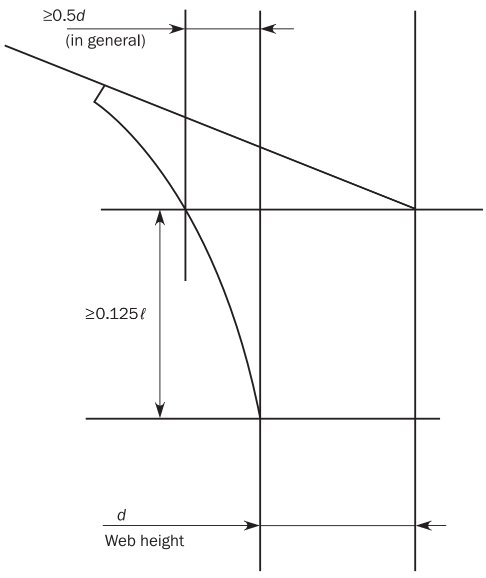


3.2.4 Upper and lower brackets

The face plates or flange of the brackets is to be sniped at both ends. Brackets are to be arranged with soft toes. The as-built thickness of the brackets is not to be less than the as-built thickness of the side frame webs to which they are connected.

The dimensions (in particular the height and length) of the lower brackets and upper brackets are not to be less than those shown in Figure 3.

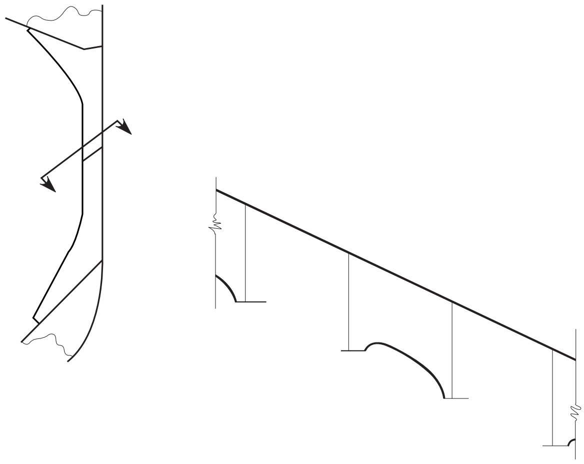
3.2.5 Tripping brackets

In way of the foremost hold and in the holds of BC-A ships, side frames of asymmetrical section are to be fitted with tripping brackets at every two frames, as shown in Figure 4.

The as-built thickness of the tripping brackets is not to be less than the as-built thickness of the side frame webs to which they are connected.

Double continuous welding is to be adopted for the connections of tripping brackets with side shell frames and plating.

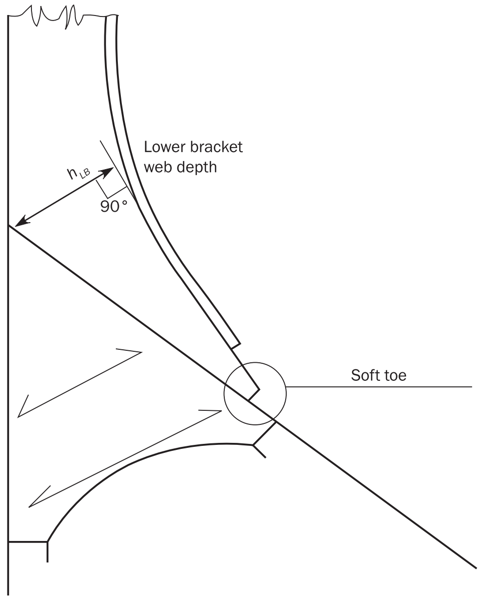
Figure 4 : Tripping brackets to be fitted in way of foremost hold



3.2.6 Support structure

Structural continuity with the lower and upper end connections of side frames is to be ensured within hopper and topside tanks by connecting brackets as shown in Figure 5.

Figure 5 : Example of support structure for lower end



3.3 Deck structures

3.3.1 Web frame spacing in topside tanks

For bulk carriers less than 150 m in length, the spacing of web frames in topside tanks is generally not to be greater than 6 frame spaces.

3.3.2 Cross deck between hatches of bulk carriers

Inside the line of openings, where a transversely framed structure is adopted for the cross deck structures, hatch end beams and cross deck beams are to be adequately supported by girders and extended outward to the second longitudinal from the hatch side girders towards the deck side. Where the extension of girders outward is impracticable, intercostal stiffeners are to be fitted between the hatch side girder and the second longitudinal and checks of the structure are to be performed in compliance with the requirements in Pt 1, Ch 7 or by means deemed appropriate by the Society.

The transverse primary members supporting the cross deck are to be supported by side or topside tank primary supporting members.

Smooth connection of the strength deck at side with the transversely framed cross deck is to be ensured by a plate of intermediate thickness.

3.3.3 Topside tank structures

The topside tank sloping plates are to be longitudinally framed.

Topside tank structures, where fitted, are to extend as far as possible within the machinery space and are to be adequately tapered.

Where a double side primary supporting member is fitted outside the plane of the topside tank web frame, special attention is to be paid to structural continuity.

3.3.4 Openings in strength deck - Corner of hatchways

For hatchways located within the cargo hold region, insert plates, whose thicknesses are to be determined according to the formula given after, are to be fitted in way of corners where the plating cut-out has a circular profile.

The radius of circular corners is not to be less than 5% of the hatch width, where a continuous longitudinal deck girder is fitted below the hatch coaming.

Corner radius, in the case of the arrangement of two or more hatchways athwartship, is considered by the Society on a case-by-case basis.

For hatchways located within the cargo hold region, insert plates are, in general, not required in way of corners where the plating cut-out has an elliptical or parabolic profile and the half axes of elliptical openings, or the half lengths of the parabolic arch, are not less than:

- 1/20 of the hatchway width or 600 mm, whichever is the lesser, in the transverse direction.
- Twice the transverse dimension, in the fore and aft direction.

Where insert plates are required, their net thickness is to be obtained, in mm, from the following formula:

$$t_{INS} = \left(0.8 + 0.4\frac{b}{\ell}\right) t_{off}$$

without being taken less than t_{off} or greater than 1.6 t_{off}.

where:

ℓ : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction, see Pt 1, Ch 3, Sec 6, Figure 15.

b : Width, in m, of the hatchway considered, measured in the transverse direction, see Pt 1, Ch 3, Sec 6, Figure 15.

t_{off} : Offered net thickness, in mm, of the deck at the side of the hatchways.

For the extreme corners of end hatchways, insert plates are required. The net thickness of these insert plates is to be 60% greater than the net offered thickness of the adjacent deck plating. A lower thickness may be accepted by the Society on the basis of calculations showing that stresses at hatch corners are lower than permissible values.

Where insert plates are required, the arrangement is shown in Pt 1, Ch 9, Sec 6, Table 15, in which d_1, d_2, d_3 and d_4 are to be greater than the stiffener spacing.

For hatchways located outside the cargo hold region, a reduction in the thickness of the insert plates in way of corners may be considered by the Society on a case-by-case basis.

For ships having length L of 150 m or above, the corner radius, the thickness and the extent of insert plate may be determined by the results of a direct strength assessment according to Pt 1, Ch 7, including buckling check and fatigue strength assessment of hatch corners according to Pt 1, Ch 8 and Pt 1, Ch 9 respectively.

3.3.5 Protection against wire rope

Wire rope grooving in way of cargo holds openings is to be prevented by fitting suitable protection such as half-round bar on the hatch side girders (i.e. upper portion of topside tank plates) or hatch end beams in cargo hold and upper portion of hatch coamings.

SECTION 3
HULL LOCAL SCANTLINGS

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

C_{XG}, C_{YS}, C_{YR}, C_{YG}, C_{ZP}, C_{ZR} : Load combination factors, as defined in Pt 1, Ch 4, Sec 2.

d_{shr} : Effective shear depth of the stiffener as defined in Pt 1, Ch 3, Sec 7, [1.4.3].

F_R : Resultant force, in kN, as defined in Pt 1, Ch 4, Sec 6, Table 7.

$F_{sc-ib-s}$: Static load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.3.1].

F_{sc-ib} : Total load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.2.1].

$F_{sc-hs-s}$: Static load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.3.2].

F_{sc-hs} : Total load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.2.2].

ℓ : Distance, in m, as defined in Pt 1, Ch 4, Sec 6.

ℓ_{lp} : Distance, in m, as defined in Pt 1, Ch 4, Sec 6.

ℓ_{SF} : Side frame span ℓ, in m, as defined in Ch 1, Sec 2, Figure 2, not to be taken less than 0.25 *D.*

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2] and calculated at the load calculation point defined in Pt 1, Ch 3, Sec 7, [3.2].

P_R : Resultant pressure, in kN/m^2, as defined in Pt 1, Ch 4, Sec 6, Table 7.

s_{CW} : Plate width, in mm, taken as the width of the corrugation flange *a* or the web *c*, whichever is greater, see Pt 1, Ch 3, Sec 6, Figure 21.

s_C : Half pitch, in mm, of the corrugation flange as defined in Pt 1, Ch 3, Sec 6, Figure 21.

1 CARGO HOLD SIDE FRAMES OF SINGLE SIDE BULK CARRIERS

1.1 Strength criteria

1.1.1 Net section modulus and net shear sectional area

The net section modulus Z, in cm^3, and the net shear sectional area A_{shr}, in cm^2, in the mid-span area of side frames subjected to lateral pressure are not to be taken less than:

$$Z = 1.125\alpha_m \frac{P\, s\ell_{SF}^2}{f_{bdg}\, C_s\, R_{eH}}$$

$$A_{shr} = 5.5 \cdot \alpha_S \frac{P \cdot s\ell_{SF}}{C_t\, \tau_{eH}} \left(\frac{\ell_{SF} - 2\ell_B}{\ell_{SF}}\right) 10^{-3}$$

where:

α_m : Coefficient taken as:

α_m = 0.42 for BC-A ships.

α_m = 0.36 for other ships.

f_{bdg} : Bending coefficient taken as 10.

C_s : Permissible bending stress coefficient for the design load set being considered taken as:

C_s = 0.75 for acceptance criteria set AC-S.

C_s = 0.90 for acceptance criteria set AC-SD.

α_S : Coefficient taken as:

α_S = 1.1 for side frames of empty holds in alternate condition of BC-A ships.

α_S = 1.0 for other side frames.

ℓ_B : Lower bracket length, in m, as defined in Figure 1.

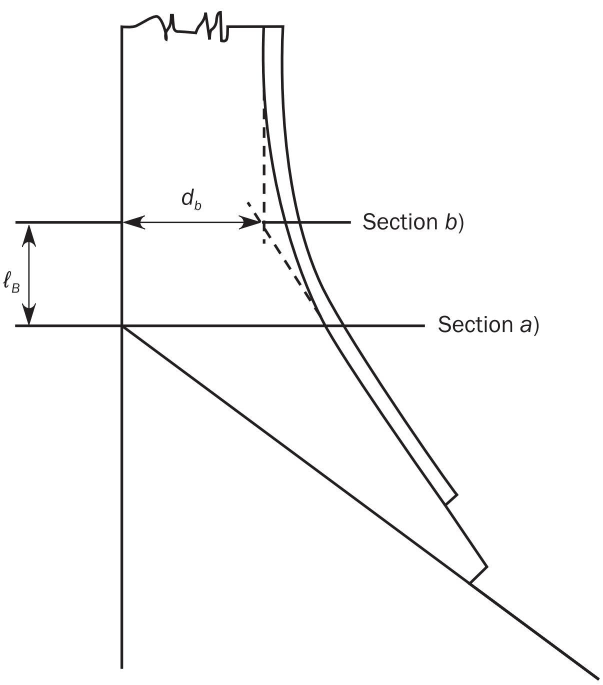
P : Design pressures, in kN/m², for design load sets as defined in Pt 1, Ch 6, Sec 2, Table 1, excluding the design load sets WB-4 to WB-6.

C_t : Permissible shear stress coefficient for the design load set being considered, taken as:

C_t = 0.75 for acceptance criteria set AC-S.

C_t = 0.90 for acceptance criteria set AC-SD.

Figure 1 : Side frame lower bracket length



1.1.2 Side frames in ballast holds

In addition to [1.1.1], for side frames in cargo holds designed to carry ballast water in heavy ballast condition, the net section modulus Z, in cm³, and the net web thickness, t_w, in mm, all along the span are to be in accordance with Pt 1, Ch 6, Sec 5 where the span of the side frame is ℓ as defined in Pt 1, Ch 3, Sec 7, [1.1] with consideration to brackets at ends.

1.1.3 Additional strength requirements

The net moment of inertia I, in cm⁴, of the three side frames located immediately abaft the collision bulkhead is not to be taken less than:

$$I = 0.18 \frac{P \, \ell_{SF}^4}{n}$$

where:

n : Frame number of considered side frame counted from the collision bulkhead to the frame in question, taken equal to 1, 2 or 3.

As an alternative, supporting structures, such as horizontal stringers, are to be fitted between the collision bulkhead and a side frame which is in line with transverse webs fitted in both the topside tank and hopper tank, maintaining the continuity of the forepeak stringers within the foremost hold.

1.2 Lower bracket of side frame

1.2.1

At the level of the lower bracket as shown in Ch 1, Sec 2, Figure 2, the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is not to be taken less than twice the required net section modulus Z, in cm^3,for the frame mid-span area obtained from [1.1.1].

1.2.2

For holds intended to carry ballast water in heavy ballast condition, the net section modulus Z, in cm^3, at the level of the lower bracket is not to be taken less than twice the greater of the required net section moduli given in [1.1.1] and [1.1.2].

1.2.3

The net thickness t_{LB}, in mm, of the lower bracket is not to be taken less than:

$t_{LB =} = t_w + 1.5$

where t_w is the net thickness of the side frame web, in mm.

1.2.4

The net thickness t_{LB} of the lower bracket is to comply with the following formula:

- For symmetrically flanged frames:

$$\frac{h_{LB}}{t_{LB}} \leq 87\sqrt{k}$$

- For asymmetrically flanged frames:

$$\frac{h_{LB}}{t_{LB}} \leq 73\sqrt{k}$$

The web depth h_{LB} of lower bracket is to be measured from the intersection between the hopper tank sloping plating and the side shell plate, perpendicularly to the face plate of the lower bracket as shown in Ch 1, Sec 2, Figure 5.

For the three side frames located immediately abaft the collision bulkhead, where the frames are strengthened in accordance with [1.1.2] and the offered t_{LB} is greater than 1.73 t_w, the t_{LB} applied in [1.2.4] may be taken as t'_{LB} given by:

$$t'_{LB} = (t_{LB}^2\ t_w)^{1/3}$$

where t_w is the net thickness of the side frame web, in mm, corresponding to A_{shr} determined in accordance to [1.1.1].

1.3 Upper bracket of side frame

1.3.1

At the level of the upper bracket as shown in Ch 1, Sec 2, Figure 2 the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is not to be taken less than twice the net section modulus Z required for the frame mid-span area obtained from [1.1.1].

1.3.2

For holds intended to carry ballast water in heavy ballast condition, the net section modulus Z, in cm3, at the level of the upper bracket is not to be taken less than twice the greater of the required net sections modulus obtained from [1.1.1] and [1.1.2].

The net thickness t_{UB} of the upper bracket, in mm, is not to be less than the net thickness of the side frame web.

1.4 Provided support at upper and lower connections of side frames

1.4.1 Net section modulus

The net section modulus of the:

- Side shell and hopper tank longitudinals supporting the lower connecting brackets.
- Side shell and topside tank longitudinals supporting the upper connecting brackets.

is to comply with the following formula:

$$\sum_{n} z_{pli}\ d_i \geq \alpha_T \frac{P\ \ell_{SF}^2\ \ell_1^2}{16 R_{eH}}$$

where:

n : Number of the longitudinal stiffeners on the side shell and hopper/topside tank supporting the lower/upper end connecting bracket of the side frame, as applicable.

$Z_{pl\,i}$: Net plastic section modulus, in cm^3, of the *i*-th longitudinal stiffener on the side shell or hopper/topside tank supporting the lower/upper end connecting bracket of the side frame, as applicable.

d_i : Distance, in m, of the above *i*-th longitudinal stiffener from the intersection point of the side shell and hopper/topside tank.

ℓ_1 : Spacing, in m, of transverse supporting webs in hopper/topside tank, as applicable.

R_{eH} : Lowest value of specified yield stress, in N/mm^2, among the materials of the longitudinal stiffeners of side shell and hopper/topside tanks that support the lower/upper end connecting bracket of the side frame.

α_T : Coefficient taken as:

α_T =150 for the longitudinal stiffeners supporting the lower connecting brackets.

α_T = 75 for the longitudinal stiffeners supporting the upper connecting brackets.

1.4.2 Net connection area of brackets

The net connection area, A_i, in cm^2, of the lower or upper connecting bracket to the *i*-th supporting longitudinal stiffener is not to be taken less than:

$$A_i = 0.4 \frac{z_i\ s\ k_{bkt}}{\ell_1^2\ k_{lg,\,i}} 10^{-3}$$

where:

Z_i : Net section modulus, in cm^3, of the i-th longitudinal stiffener on the side or hopper/topside tank supporting the lower/upper end connecting bracket of the side frame, as applicable.

ℓ_1 : As defined in [1.4.1].

k_{bkt} : Material factor for the bracket.

$k_{lg,i}$: Material factor for the i-th longitudinal stiffener.

2 STRUCTURE LOADED BY STEEL COILS ON WOODEN DUNNAGE

2.1 General

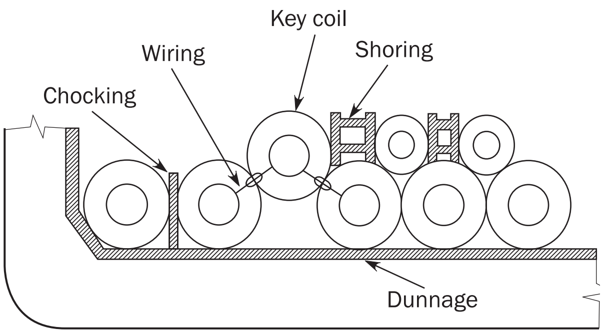
2.1.1

The net thickness of inner bottom plating, hopper side plating and inner hull plating for ships intended to carry steel coils is to comply with [2.3.1] and [2.4.1] up to a height not less than the one corresponding to the top of upper tier in touch with hopper or inner hull plating.

The net section modulus and the net shear sectional area of longitudinal stiffeners on inner bottom, hopper tank top and inner hull for ships intended to carry steel coils are to comply with [2.3.2] and [2.4.2] up to a height not less than the one corresponding to the top of upper tier in touch with hopper or inner hull plating.

Standard terminology and means for securing of steel coils is described in Figure 2.

Figure 2 : Inner bottom loaded by steel coils



2.2 Load application

2.2.1 Design load sets

The static and dynamic load components are to be determined in accordance with Pt 1, Ch 4, Sec 7, Table 1.

Radius of gyration, k_r, and metacentric height, GM, are to be in accordance with Pt 1, Ch 4, Sec 3, Table 2 for the considered loading condition specified in the design load set. The design load sets for steel coil loading is given in Table 1.

Table 1 : Design load sets

Item	Design load set	Load component	Draught	Design load	Loading condition
Inner bottom, hopper sloping plate and inner hull	BC-9	$F_{sc-ib-s}$ or $F_{sc-hs-s}$	T_{SC}	S	Steel Coil condition
Inner bottom, hopper sloping plate and inner hull	BC-10	F_{sc-ib} or F_{sc-hs}	T_{SC}	S+D	Steel Coil condition

2.3 Inner bottom

2.3.1 Inner bottom plating

The net thickness t, in mm, of plating of longitudinally framed inner bottom is not to be taken less than:

$$t = K_1\sqrt{\frac{F_{sc-ib-s}\times 10^3}{C_a\ R_{eH}}} \quad \text{for design load set BC-9}$$

$$t = K_1\sqrt{\frac{F_{sc-ib}\times 10^3}{C_a\ R_{eH}}} \quad \text{for design load set BC-10}$$

where:

K_1 : Coefficient taken as:

$$K_1 = \sqrt{\frac{1.7\frac{s}{1000}\ell K_2 - 0.73\left(\frac{s}{1000}\right)^2 K_2^2 - (\ell - \ell_{lp})^2}{2\ell_{lp}\left(2\frac{s}{1000} + 2\ell K_2\right)}}$$

K_2 : Coefficient taken as:

$$K_2 = -\frac{s}{1000\ell} + \sqrt{\left(\frac{s}{1000\ell}\right)^2 + 1.37\left(\frac{1000\ell}{s}\right)^2\left(1 - \frac{\ell_{lp}}{\ell}\right)^2 + 2.33}$$

C_a : Permissible bending stress coefficient, as defined in Pt 1, Ch 6, Sec 4, [1.1.1].

2.3.2 Stiffeners of inner bottom plating

The net section modulus Z, in cm^3, and the net web thickness, t_w, in mm, of single span stiffeners located on inner bottom plating are not to be taken less than:

$$Z = K_3\frac{F_{sc-ib-s}}{8\ C_s\ R_{eH}}10^3 \quad \text{and} \quad t_w = \frac{0.5\ F_{sc-ib-s}}{d_{shr}C_t\tau_{eH}}\times 10^3 \quad \text{for design load set BC-9.}$$

$$Z = K_3\frac{F_{sc-ib}}{8\ C_s\ R_{eH}}10^3 \quad \text{and} \quad t_w = \frac{0.5\ F_{sc-ib}}{d_{shr}C_t\tau_{eH}}\times 10^3 \quad \text{for design load set BC-10.}$$

where:

K_3 : Coefficient as defined in Table 2.

$K_3 = 2\ell/3$, when $n_2 > 10$.

C_s : Permissible bending stress coefficient, as defined in Pt 1, Ch 6, Sec 5, [1.1.2].

C_t : Permissible shear stress coefficient for the design load set being considered, to be taken as:

$C_t = 0.85$ for acceptance criteria set AC-S.

$C_t = 1.00$ for acceptance criteria set AC-SD.

n_2 : Number of load points per EPP of the inner bottom, see Pt 1, Ch 4, Sec 6, [4.1.3].

Table 2 : Coefficient K_3

n_2	1	2	3	4	5	6	7	8	9	10
K_3	ℓ	$\ell - \frac{\ell_{lp}^2}{\ell}$	$\ell - \frac{2\ell_{lp}^2}{3\ell}$	$\ell - \frac{5\ell_{lp}^2}{9\ell}$	$\ell - \frac{\ell_{lp}^2}{2\ell}$	$\ell - \frac{7\ell_{lp}^2}{15\ell}$	$\ell - \frac{4\ell_{lp}^2}{9\ell}$	$\ell - \frac{3\ell_{lp}^2}{7\ell}$	$\ell - \frac{5\ell_{lp}^2}{12\ell}$	$\ell - \frac{11\ell_{lp}^2}{27\ell}$

2.4 Hopper tank and inner hull

2.4.1 Hopper side plating and inner hull plating

The net thickness t, in mm, of plating of longitudinally framed bilge hopper sloping plate and inner hull is not to be taken less than:

$$t = K_1 \sqrt{\frac{F_{sc-hs-s}}{C_a R_{eH}} 10^3}$$, applicable for design load set BC-9.

$$t = K_1 \sqrt{\frac{F_{sc-hs}}{C_a R_{eH}} 10^3}$$, applicable for design load set BC-10.

where:

K_1 : Coefficient as defined in [2.3.1].

C_a : As defined in [2.3.1].

2.4.2 Stiffeners of hopper side plating and inner hull plating

The net section modulus Z, in cm^3, and the net web thickness, t_w, in mm, of single span ordinary stiffeners located on bilge hopper sloping plate and inner hull plate are not to be taken less than:

$$Z = K_3 \frac{F_{sc-hs-s}}{8\ C_s R_{eH}} 10^3 \quad \text{and} \quad t_w = \frac{0.5\ F_{sc-hs-s} \times 10^3}{d_{shr} C_t \tau_{eH}}$$, applicable for design load set BC-9.

$$Z = K_3 \frac{F_{sc-hs}}{8\ C_s\ R_{eH}} 10^3 \quad \text{and} \quad t_w = \frac{0.5\ F_{sc-hs} \times 10^3}{d_{shr} C_t \tau_{eH}}$$, applicable for design load set BC-10.

where:

K_3 : Coefficient as defined in Table 2.

$K_3 = 2\ell/3$ when $n_2 > 10$.

C_s, C_t : As defined in [2.3.2].

3 TRANSVERSE VERTICALLY CORRUGATED WATERTIGHT BULKHEADS SEPARATING CARGO HOLDS IN FLOODED CONDITION

3.1 Net thickness of corrugation

3.1.1 Cold formed corrugation

The net plate thickness t, in mm, of transverse vertically corrugated watertight bulkheads separating cargo holds is not to be taken less than:

$$t = 14.9 \cdot 10^{-3}\, s_{CW} \sqrt{\frac{1.05\ P_R}{R_{eH}}}$$

The net thicknesses is also to comply with the requirements given in Pt 1, Ch 6, Sec 4, [1.2.1].

3.1.2 Built-up corrugation

Where the thicknesses of the flange and web of built-up corrugations of transverse vertically corrugated watertight bulkheads separating cargo holds are different, the net plate thicknesses are not to be taken less than that obtained from the following formula.

The net thickness t_N, in mm, of the narrower plating is not to be taken less than:

$$t_N = 14.9 \cdot 10^{-3} s_N \sqrt{\frac{1.05\ P_R}{R_{eH}}}$$

s_N : Plate width, in mm, of the narrower plating.

The net thickness t_W, in mm, of the wider plating is not to be taken less than the greater of the following formulae:

$$t_W = 14.9 \cdot 10^{-3}\ s_{CW} \sqrt{\frac{1.05\ P_R}{R_{eH}}}$$

$$t_W = \sqrt{\frac{4.62\ s_{CW}^{\ 2}\ P_R}{R_{eH}\ 10^4} - t_{NO}^2}$$

where:

t_{NO} : Net offered thickness of the narrower plating, in mm, not to be taken greater than:

$$t_{NO} = 14.9 \cdot 10^{-3}\ s_{CW} \sqrt{\frac{1.05\ P_R}{R_{eH}}}$$

The net thicknesses is also to comply with the requirements given in Pt 1, Ch 6, Sec 4, [1.2.2].

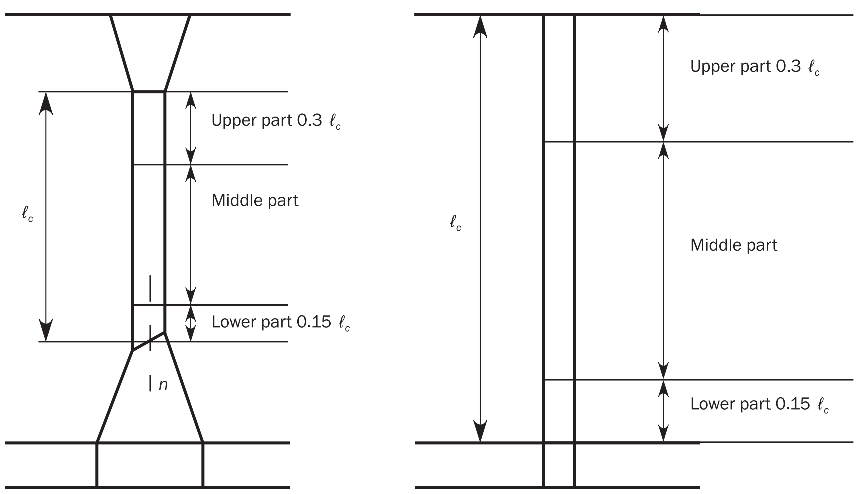
3.1.3 Lower part of corrugation

The net thickness of the lower part of corrugations is to be maintained for a distance of not less than 0.15 ℓ_C measured from the top of the lower stool, or from the inner bottom where no lower stool is fitted. The span of the corrugations ℓ_C, in m, is to be taken as given in Pt 1, Ch 3, Sec 6, [10.4.5].

3.1.4 Middle part of corrugation

The net thickness of the middle part of corrugations is to be maintained for a distance not greater than 0.3 ℓ_C from the bottom of the upper stool, or from the deck if no upper stool is fitted. The net thickness is also to comply with the requirements in [3.2.1] and Pt 1, Ch 6, Sec 4, [1.2].

Figure 3 : Parts of corrugation



3.2 Bending, shear and buckling check

3.2.1 Bending capacity and shear capacity

The bending capacity and the shear capacity of the corrugations of transverse watertight corrugated bulkheads separating cargo holds are to comply with the following formulae:

$$0.5 W_{LE} + W_M \geq \frac{M}{0.95\ R_{eH}}\ 10^3$$

$$\tau \leq \frac{R_{eH}}{2}$$

where:

M : Bending moment in a corrugation, in kNm, taken as:

$$M = \frac{F_R\ \ell_C}{8}$$

F_R : Resultant force, in kN, given in Pt 1, Ch 4, Sec 6, [3.1.7].

ℓ_C : Span of the corrugations, in m, as given in Pt 1, Ch 3, Sec 6, [10.4.5].

W_{LE} : Net section modulus, in cm^3, of one half pitch corrugation, to be calculated at the lower end of the corrugations according to [3.3], not to be taken greater than:

$$W_{LE,M} = W_G + \frac{Q\ h_G 10^3 - 0.5\ h_G^2\ s_C\ P_R}{R_{eH}}$$

W_G : Net section modulus, in cm^3, of one half pitch corrugation, to be calculated in way of the upper end of shedder or gusset plates, as applicable, according to [3.3].

Q : Shear force, in kN, at the lower end of a corrugation, to be taken as:

$$Q = 0.8\ F_R$$

h_G : Height, in m, of shedders or gusset plates, as applicable as shown in Figure 4 to Figure 6.

P_R : Resultant pressure, in kN/m^2, to be calculated in way of the middle of the shedders or gusset plates, as applicable, according to Pt 1, Ch 4, Sec 6, [3.1.7].

W_M : Net section modulus, in cm^3, of one half pitch corrugation, to be calculated at the mid-span of corrugations according to [3.3] without being taken greater than 1.15 W_{LE}.

τ : Shear stress, in N/mm^2, in the corrugation to be taken as:

$$\tau = 10\ \frac{Q}{A_{shr}}$$

A_{shr} : Net shear area, in cm^2, of one half pitch corrugation. The calculated net shear area is to consider possible reduced shear efficiency due to non-straight angles between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by sin φ.

φ : Angle between the web and the flange, see Pt 1, Ch 3, Sec 6, Figure 21.

The net section modulus of the corrugations in the upper part of the bulkhead, as defined in Figure 3, is not to be taken less than 75% of that of the middle part complying with this requirement and Pt 1, Ch 6, Sec 4, [1.2], corrected for different minimum yield stresses.

3.2.2 Shear buckling check of the bulkhead corrugation webs

The shear stress τ, calculated according to [3.2.1], is to comply with the following formula:

$$\tau \le \tau_C$$

where:

τ_C : Critical shear buckling stress, in N/mm², to be taken as:

$$\tau_C = \tau_E \qquad \text{for } \tau_E \le \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_C = \frac{R_{eH}}{\sqrt{3}}\left(1 - \frac{R_{eH}}{4\sqrt{3}\,\tau_E}\right) \qquad \text{for } \tau_E > \frac{R_{eH}}{2\sqrt{3}}$$

τ_E : Euler shear buckling stress, in N/mm², to be taken as:

$$\tau_E = 0.9\,k_t\,E\left(\frac{t_w}{c}\right)^2$$

k_t : Coefficient, to be taken equal to 6.34.

t_w : Net thickness, in mm, of the corrugation webs.

c : Width, in mm, of the corrugation webs as shown in Pt 1, Ch 3, Sec 6, Figure 21.

3.3 Net section modulus at the lower end of the corrugations

3.3.1 Effective flange width

The net section modulus at the lower end of the corrugations is to be calculated with the compression flange having an effective flange width b_{eff} not larger than the following formula:

$$b_{eff} = C_E\,a$$

where:

C_E : Coefficient to be taken equal to:

$$C_E = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \qquad \text{for } \beta > 1.25$$

$$C_E = 1.0 \qquad \text{for } \beta \le 1.25$$

β : Coefficient to be taken equal to:

$$\beta = \frac{a}{t_f}\sqrt{\frac{R_{eH}}{E}}$$

a : Width, in mm, of the corrugation flange as shown in Pt 1, Ch 3, Sec 6, Figure 21.

t_f : Net flange thickness, in mm.

3.3.2 Webs not supported by local brackets

Unless welded to a sloping stool top plate as defined in [3.3.5], if the corrugation webs are not supported by local brackets below the stool top plate (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30% effective.

3.3.3 Effective shedder plates

Provided that effective shedder plates are fitted as shown in Figure 4, when calculating the section modulus at the lower end of the corrugations (Sections '1' in Figure 4), the net area, in cm², of flange plates may be increased by the factor I_{SH} to be taken as:

$$I_{SH} = 2.5 \cdot 10^{-3} a \sqrt{t_f\, t_{SH}}$$ without being taken greater than $2.5\, a\, t_f\, 10^{-3}$

where:

a : Width, in mm, of the corrugation flange as shown in Pt 1, Ch 3, Sec 6, Figure 21.

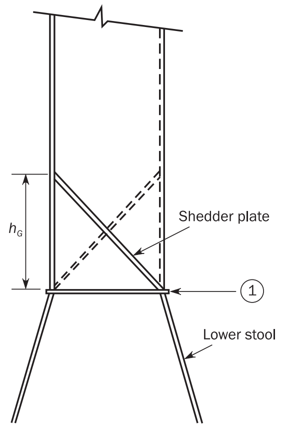
t_{SH} : Net shedder plate thickness, in mm.

t_f : Net flange thickness, in mm.

Effective shedder plates are those which:

- are not knuckled,
- are welded to the corrugations and the lower stool top plate according to Pt 1, Ch 12,
- are fitted with a minimum slope of 45°, their lower edge being in line with the lower stool side plating,
- have thickness not less than 75% of that required for the corrugation flanges,
- have material properties not less than those required for the flanges.

Figure 4 : Symmetrical and unsymmetrical shedder plates



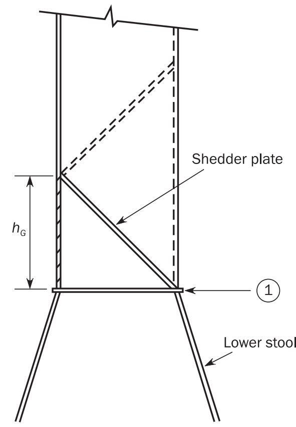


Figure 5 : Symmetrical and unsymmetrical gusset / shedder plates

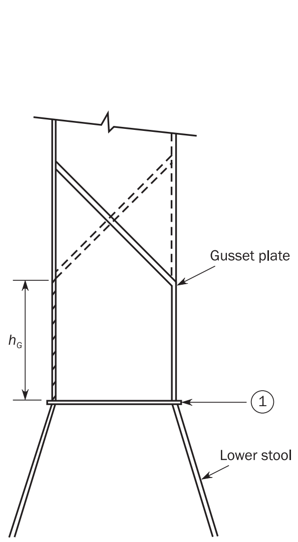

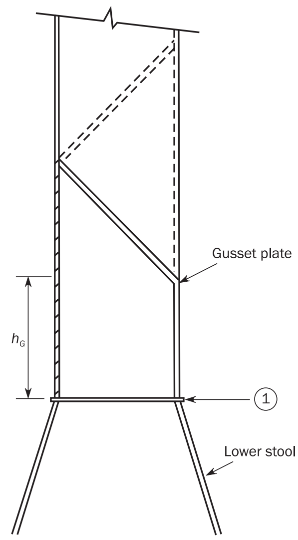

Figure 6 : Asymmetrical gusset / shedder plates

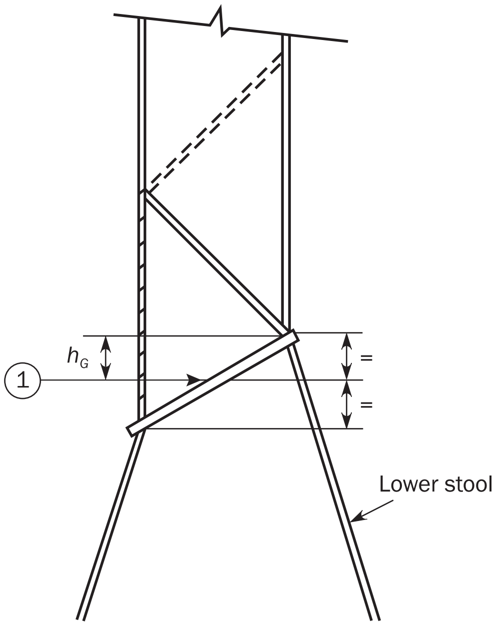

3.3.4 Effective gusset plates

Provided that effective gusset plates are fitted, when calculating the section modulus at the lower end of the corrugations (Sections '1' in Figure 5 and Figure 6), the net area, in cm^2, of flange plates may be increased by the factor I_G to be taken as:

$$I_G = 7\ h_G\ t_f$$

where:

h_G : Height, in m, of gusset plates as shown in Figure 5 and Figure 6 but not to be taken greater than:

$$\frac{10\ S_{GU}}{7}$$

S_{GU} : Width, in m, of gusset plates.

t_f : Net flange thickness, in mm.

Effective gusset plates are those which:

- are in combination with shedder plates having thickness, material properties and welded connections as requested for shedder plates in [3.3.3],
- have a height not less than half of the flange width,
- are fitted in line with the lower stool side plating,
- are welded to the lower stool top plate, corrugations and shedder plates according to Pt 1, Ch 12, Sec 3, [2.4.6],
- have thickness and material properties not less than those required for the flanges.

3.3.5 Sloping stool top plate

Where the corrugation webs are welded to a sloping stool top plate which has an angle not less than 45° with the horizontal plane, the section modulus at the lower end of the corrugations may be calculated considering the corrugation webs fully effective. For angles less than 45°, the effectiveness of the web may be obtained by linear interpolation between 30% efficient for 0° and 100% efficient for 45°.

Where effective gusset plates are fitted, when calculating the net section modulus of corrugations, the net area of flange plates may be increased as specified in [3.3.4] above. No credit may be given to shedder plates only.

4 ALLOWABLE HOLD LOADING FOR BC-A & BC-B SHIPS IN FLOODED CONDITIONS

4.1 Evaluation of double bottom capacity and allowable hold loading

4.1.1 Shear capacity of the double bottom

The shear capacity of the double bottom is to be calculated as the sum of the shear strength at each end of:

- Floors connected to hopper tanks, less one half of the shear strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted as shown in Figure 7. The shear strength of floors is to be calculated according to [4.1.2].
- Double bottom girders connected to stools, or transverse bulkheads if no stool is fitted. The shear strength of girders is to be calculated according to [4.1.3].

The floors and girders to be considered when calculating the shear capacity of the double bottom are those inside the hold boundaries formed by the hopper tanks and stools or transverse bulkheads if no stool is fitted. Where both ends of girders or floors are not directly connected to the hold boundaries, their strength is to be evaluated for the connected end only.

The hopper tank side girders and the floors directly below the connection of the stools or transverse bulkheads if no stool is fitted to the inner bottom may not be included.

For special double bottom designs, the shear capacity of the double bottom is to be calculated by means of direct calculations carried out in accordance with requirements specified in Pt 1, Ch 7, as applicable.

4.1.2 Floor shear strength

The floor shear strength, in kN, is to be taken as given in the following formulae:

- In way of the floor panel adjacent to the hopper tank:

$$S_{f1} = A_f \frac{\tau_A}{\eta_1} 10^{-3}$$

- In way of the openings in the outermost bay (i.e., that bay which is closer to the hopper tank):

$$S_{f2} = A_{f,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

where:

A_f : Net sectional area, in mm^2, of the floor panel adjacent to the hopper tank.

$A_{f,h}$: Net sectional area, in mm^2, of the floor panels in way of the openings in the outermost bay (i.e., the bay which is closer to the hopper tank).

τ_A : Allowable shear stress, in N/mm^2, to be taken as the lesser of:

$$\tau_A = 0.645 \frac{R_{eH}^{0.6}}{(s/t)^{0.8}} \quad \text{and} \quad \tau_A = \frac{R_{eH}}{\sqrt{3}}$$

For floors adjacent to the stools or transverse bulkheads, τ_A is taken as:

$$\frac{R_{eH}}{\sqrt{3}}$$

t : Floor web net thickness, in mm.

s : Spacing, in m, of stiffening members of the panel considered.

η_1 : Coefficient to be taken equal to 1.1.

η_2 : Coefficient to be taken equal to 1.2. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the openings in the outermost bay, to be examined by the Society on a case-by-case basis.

4.1.3 Girder shear strength

The girder shear strength, in kN, is to be taken as given in the following formulae:

- In way of the girder panel adjacent to the stool or transverse bulkhead, if no stool is fitted:

$$S_{g1} = A_g \frac{\tau_A}{\eta_1} 10^{-3}$$

- In way of the largest opening in the outermost bay (i.e., that bay which is closer to the stool) or transverse bulk-head, if no stool is fitted:

$$S_{g2} = A_{g,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

A_g : Net sectional area, in mm^2, of the girder panel adjacent to the stool (or transverse bulkhead, if no stool is fitted).

$A_{g,h}$: Net sectional area, in mm^2, of the girder panel in way of the largest opening in the outermost bay (i.e. that bay which is closer to the stool) or transverse bulkhead, if no stool is fitted.

τ_A : Allowable shear stress, in N/mm^2, as defined in [4.1.2] where t_N is the girder web net thickness.

η_1 : Coefficient to be taken equal to 1.1.

η_2 : Coefficient to be taken equal to 1.15. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the largest opening in the outermost bay, to be examined by the Society on a case-by-case basis.

4.1.4 Allowable hold loading

The allowable hold loading, in t, is to be taken as:

$$W = \rho_C V \frac{1}{F}$$

where:

ρ_C : Density of the dry bulk cargo, in t/m^3, as defined Pt 1, Ch 4, Sec 6, [2.3.3].

V : Volume, in m^3, occupied by the cargo up to the level h_B.

F : Coefficient to be taken as:

F = 1.1 in general.

F = 1.05 for steel mill products.

h_B : Level of cargo, in m, to be taken as:

$$h_B = \frac{P}{\rho_C g}$$

P : Pressure, in kN/m^2, to be taken as:

- For dry bulk cargoes, the lesser of:

$$P = \frac{Z + \rho g (z_F - 0.1 D_1 - h_F)}{1 + \frac{\rho}{\rho_C}(perm - 1)}$$

$$P = Z + \rho g (z_F - 0.1 D_1 - h_F \; perm)$$

- For steel mill products:

$$P = \frac{Z + \rho g\ (z_F - 0.1\ D_1 - h_F)}{1 - \frac{\rho}{\rho_C}}$$

D_1 : Distance, in m, from the baseline to the freeboard deck at side amidships.

h_F : Inner bottom flooded height, in m, measured vertically with the ship in the upright position, from the inner bottom to the flooded level z_F.

z_F : Flooded level, in m, as defined in Pt 1, Ch 4, Sec 6, [3.1.3].

perm : Permeability of cargo, which need not be taken greater than 0.3.

Z : Pressure, in kN/m^2, to be taken as the lesser of:

$$Z = \frac{C_H}{A_{DB,\,H}}$$

$$Z = \frac{C_E}{A_{DB,\,E}}$$

C_H : Shear capacity of the double bottom, in kN, to be calculated according to [4.1.1], considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} as defined in [4.1.2] and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} as defined in [4.1.3].

$A_{DB,H}$: Area, in m^2, taken as:

$$A_{DB,\,H} = \sum_{i=1}^{n} S_i\ B_{DB,\,i}$$

C_E : Shear capacity of the double bottom, in kN, to be calculated according to [4.1.1], considering, for each floor, the shear strength S_{f1} as defined in [4.1.2] and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} as defined in [4.1.3].

$A_{DB,E}$: Area, in m^2, taken as:

$$A_{DB,\,E} = \sum_{i=1}^{n} S_i\ (B_{DB} - s)$$

n : Number of floors between stools or transverse bulkheads, if no stool is fitted.

S_i : Space of *i*-th floor, in m.

$B_{DB,i}$: Length, in m, to be taken equal to:

$B_{DB,i} = B_{DB}$ - s for floors for which $S_{f1} < S_{f2}$.

$B_{DB,i} = B_{DB,h}$ for floors for which $S_{f1} \geq S_{f2}$.

B_{DB} : Breadth, in m, of double bottom between the hopper tanks as shown in Figure 8.

$B_{DB,h}$: Distance, in m, between the two openings considered as shown in Figure 8.

s : Spacing, in m, of inner bottom longitudinal ordinary stiffeners adjacent to the hopper tanks.

Figure 7 : Double bottom structure

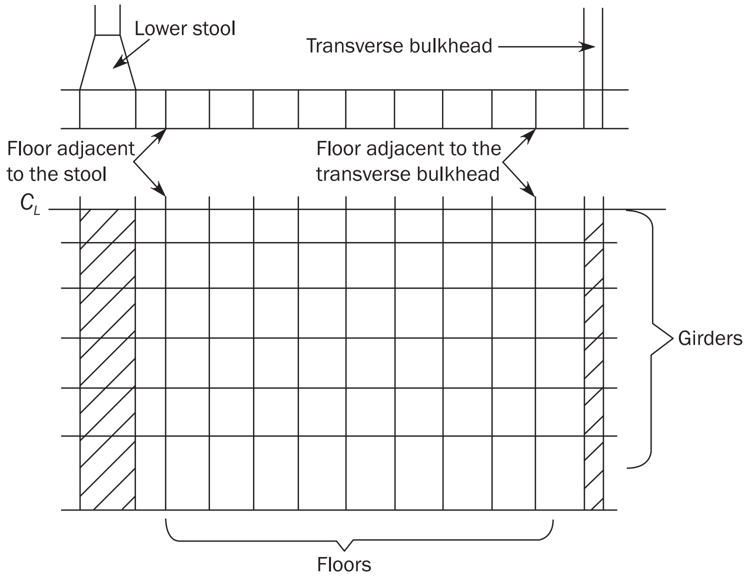

Figure 8 : Dimensions B_{DB} and $B_{DB,h}$

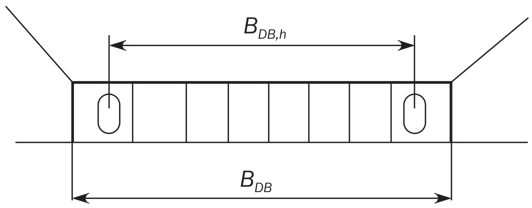


SECTION 4

HULL LOCAL SCANTLINGS FOR BULK CARRIERS *L*<150M

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

$C_{t\text{-}pr}$: Permissible shear stress coefficient for primary supporting members taken equal to:

$C_{t\text{-}pr}$ = 0.70 for AC-S.

$C_{t\text{-}pr}$ = 0.85 for AC-SD.

ℓ_{DB} : Length of the double bottom within hold under consideration, in m. Where stools are provided at transverse bulkheads, ℓ_{DB} may be taken as the distance between the toes.

B_{DB} : Distance between the toes of hopper tanks at centre of ℓ_{DB} within hold under consideration, in m.

x_c : *X* coordinate, in m, of the centre of double bottom structure under consideration with respect to the reference coordinate system, as defined in Pt 1, Ch 1, Sec 4, [3.6].

x, y, z : *X*, *Y* and *Z* coordinates, in m, of the evaluation point with respect to the reference coordinate system, as defined in Pt 1, Ch 1, Sec 4, [3.6].

ϕ : Major diameter of the openings, in m.

α : The greater of a or S_1, in m.

1 GENERAL

1.1 Application

1.1.1

Unless otherwise defined, the requirements of this section define the strength criteria applicable to bulk carriers of less than 150 m in length.

2 STRUTS CONNECTING STIFFENERS

2.1 Scantling requirements

2.1.1 Net sectional area and moment of inertia

The net sectional area A_{SR}, in cm^2, and the net moment of inertia I_{SR} about the main axes, in cm^4, of struts connecting stiffeners are not to be less than the values obtained from the following formulae:

$$A_{SR} = \frac{P_{SR}\, s\ell}{20000}$$

$$I_{SR} = \frac{0.75\, s\ell\, (P_{SR1} + P_{SR2})\, A_{ASR}\, \ell^2{}_{SR}}{47200\, A_{ASR} - s\ell\, (P_{SR1} + P_{SR2})}$$

where:

P_{SR} : Pressure to be taken as the greater of the following values, in kN/m²:

$$P_{SR} = 0.5\ (P_{SR1} + P_{SR2})$$
$$P_{SR} = P_{SR3}$$

P_{SR1} : External pressure in way of the strut, in kN/m², acting on one side, outside the compartment in which the strut is located.

P_{SR2} : External pressure in way of the strut, in kN/m², acting on the opposite side, outside the compartment in which the strut is located.

P_{SR3} : Internal pressure at mid-span of the strut, in kN/m², in the compartment in which the strut is located.

s : Spacing, in mm, of stiffeners, measured at mid-span along the chord.

ℓ : Span, in m, of stiffeners connected by the strut defined in Pt 1, Ch 3, Sec 7, [1.1.5].

ℓ_{SR} : Length of the strut, in m.

A_{ASR} : Actual net sectional area of the strut, in cm².

3 TRANSVERSE CORRUGATED BULKHEADS OF BALLAST HOLDS

3.1 Plate thickness

3.1.1

The net thickness of web and flange plating is not to be less than the values obtained in Pt 1, Ch 6, Sec 3, [1.1.1] and Pt 1, Ch 6, Sec 4, [1.2].

3.2 Net section modulus

3.2.1

The net section modulus Z, in cm³, of corrugated bulkhead of ballast holds, subjected to lateral pressure are not to be less than the values obtained from the following formula:

$$Z = K\frac{Ps_C\ \ell^2}{f_{bdg}\ C_s\ R_Y}$$

where:

K : Coefficient given in Table 1 and Table 2, according to the type of end connection. When $d_H < 2.5\ d_0$, both section modulus per half pitch of corrugated bulkhead and section modulus of lower stool at inner bottom are to be calculated.

P : Design pressure for the design load set as defined in Pt 1, Ch 6, Sec 2, Table 1 and calculated at the load calculation point defined in Pt 1, Ch 3, Sec 7, [3.2], in kN/m².

s_C : Half pitch length, in mm, of the corrugation, as defined in Pt 1, Ch 3, Sec 6, Figure 21.

ℓ : Length, in m, between the supports, as indicated in Figure 1.

C_s : Coefficient defined in Pt 1, Ch 6, Sec 5, [1.1.2].

f_{bdg} : Coefficient defined in Pt 1, Ch 6, Sec 5, [1.1.2].

The effective width of the corrugation flange in compression is to be considered according to Ch 1, Sec 3, [3.3.1] when the net section modulus of corrugated bulkhead is calculated.

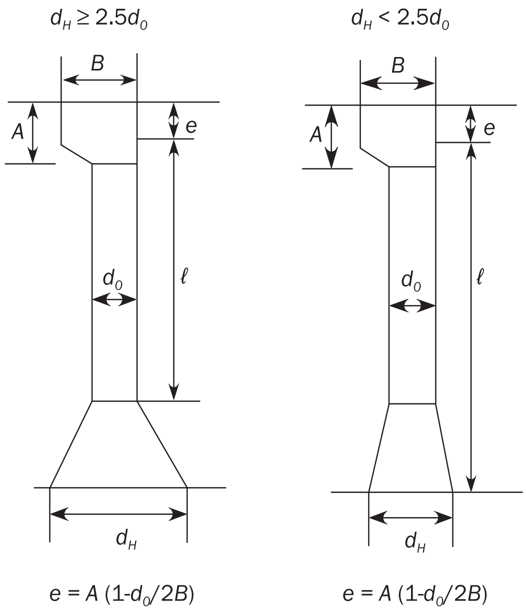
Table 1 : Values of K, in case $d_H \geq 2.5d_0$

Upper end support		
Supported by girders	**Welded directly to deck**	**Welded to stool efficiently supported by ship structure**
1.25	1.00	0.83

Table 2 : Values of K, in case $d_H < 2.5d_0$

Section modulus of	Upper end support		
	Supported by girders	**Connected to deck**	**Connected to stool**
Corrugated bulkhead	0.83	0.71	0.65
Stool at bottom	0.83	1.25	1.13

Figure 1 : Measurement of ℓ



4 PRIMARY SUPPORTING MEMBERS

4.1 Application

4.1.1

The requirements of this section apply to the strength check of primary supporting members in cargo hold structures, subjected to lateral pressure for ships having a length L less than 150 m.

4.1.2

As an alternative to [4.1.1], the strength check may be verified by direct strength assessment deemed as appropriate by the Society.

4.2 Design load sets

4.2.1 Application

Design load sets as given in Table 3 are to be considered for primary supporting members on cargo hold boundaries of bulk carriers less than 150 m in length.

4.2.2 Loading conditions

The severest loading conditions from the loading manual or otherwise specified by the designer are to be considered for the calculation of P_{in} in design load sets BC-9 to BC-10.

If primary supporting members support deck structure or tank/watertight boundaries, applicable design load sets in Pt 1, Ch 6, Sec 2, Table 1 are also to be considered.

Table 3 : Design load sets for primary supporting members in cargo hold region

Item	Design load set	Load component	Draught	Design load	Loading condition
Bulk cargo hold assigned as ballast hold	WB-4	$P_{in} - P_{ex}$ **(1)**	T_{BAL-H} **(3)**	S+D	Heavy ballast condition
	WB-6	P_{in}	-	S	Harbour/test condition
Bulk cargo hold	BC-9	$P_{in} - P_{ex}$ **(1)**	T_{SC}	S+D	Cargo loading condition
	BC-10	$P_{in} - P_{ex}$ **(1)**	-	S	Harbour condition
Compartments not carrying liquids	FD-1 **(2)**	P_{in}	T_{SC}	S+D	Flooded condition
	FD-2 **(2)**	P_{in}		S	Flooded condition

(1) P_{ex} is to be considered for external shell only.
(2) FD-1 and FD-2 are not applicable to external shell.
(3) Minimum draught among heavy ballast conditions is to be used.

4.3 Centre girders and side girders

4.3.1 Net web thickness

The net thickness of girders in double bottom structure, in mm, is not to be less than the greater of the value t_1 and t_2 specified in the followings according to each location:

$$t_1 = C_1 \frac{|P| S\,|x - x_c|}{(d_0 - d_1)\, C_{t-pr}\, \tau_{eH}} \left\{ 1 - 4 \left(\frac{y}{B_{DB}} \right)^2 \right\}$$

in which $|x - x_c|$ is to be taken less than or equal to 0.25 ℓ_{DB}.

$$t_2 = 1.75 \sqrt[3]{\frac{H^2\, a^2\, C_{t-pr}\, \tau_{eH}}{C_1'}} \cdot t_1$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], calculated at mid-point of a floor located midway between transverse bulkheads or transverse bulkhead and toe of stool, where fitted.

S : Distance between the centres of the two spaces adjacent to the centre or side girder under consideration, in m.

d_0 : Depth of the centre or side girder under consideration, in m.

d_1 : Depth of the opening, if any, at the point under consideration, in m.

C_1 : Coefficient given in Table 4 depending on B_{DB} / ℓ_{DB}. For intermediate values of B_{DB} / ℓ_{DB}, C_1 is to be obtained by linear interpolation.

a : Depth of girders at the point under consideration, in m. However, where horizontal stiffeners are fitted on the girder, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration.

S_1 : Spacing, in m, of vertical stiffeners or floors.

C'_1 : Coefficient given in Table 5 depending on S_1 /a. For intermediate values of S_1 /a, C'_1 is to be determined by linear interpolation.

H : Value obtained from the following formulae:

- Where the girder is provided with an unreinforced opening:

$$H = 1 + 0.5\frac{\phi}{\alpha}$$

- In other cases:

$H = 1.0$.

Table 4 : Coefficient C_1

B_{DB}/ℓ_{DB}	0.4 and under	0.6	0.8	1.0	1.2	1.4	1.6 and over
C_1	0.5	0.71	0.83	0.88	0.95	0.98	1.00

Table 5 : Coefficient C'_1

S_1/a	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C'_1	64	38	25	19	15	12	10	9	8	7

4.4 Floors

4.4.1 Net web thickness

The net thickness of floors in the double bottom structure, in mm, is not to be less than the greatest of values t_1 and t_2 specified in the following according to each location:

$$t_1 = C_2\frac{|P|\ S\ B_{DB}}{(d_0 - d_1)\ C_{t-pr}\ \tau_{eH}}\left(\frac{2\ |y|}{B'_{DB}}\right)\left\{1 - 2\left(\frac{x - x_c}{\ell_{DB}}\right)^2\right\}$$

in which $|x - x_c|$ is to be taken less than or equal to $0.25\ \ell_{DB}$ and $|y|$ is to be taken less than or equal to $B'_{DB}/4$.

$$t_2 = 1.75\sqrt[3]{\frac{H^2\ a^2\ C_{t-pr}\ \tau_{eH}}{C'_2}} - t_1$$

where:

P : Design pressure in kN/m², for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], calculated at mid-point of a floor located midway between transverse bulkheads or transverse bulkhead and toe of stool, where fitted.

S : Spacing of solid floors, in m.

d_0 : Depth of the solid floor at the point under consideration in m.

d_1 : Depth of the opening, if any, at the point under consideration in m.

B'_{DB} : Distance between toes of hopper tanks at the position of the solid floor under consideration, in m.

C_2 : Coefficient given in Table 6 depending on B_{DB}/ℓ_{DB}. For intermediate values of B_{DB}/ℓ_{DB}, C_2 is to be obtained by linear interpolation.

a : Depth of the solid floor at the point under consideration, in m. However, where horizontal stiffeners are fitted on the floor, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or the inner bottom plating or the distance between the horizontal stiffeners under consideration.

S_1 : Spacing, in m, of vertical stiffeners or girders.

C'_2 : Coefficient given in Table 7 depending on S_1 /d_0. For intermediate values of S_1 /d_0, C'_2 is to be determined by linear interpolation.

H : Value obtained from the following formulae:

Where openings with reinforcement or no opening are provided on solid floors:

- Where slots without reinforcement are provided:

$$H = \sqrt{4.0\frac{d_2}{S_1} - 1.0}$$ without being taken less than 1.0.

- Where slots with reinforcement are provided:

$H = 1.0$.

Where openings without reinforcement are provided on solid floors:

- Where slots without reinforcement are provided:

$$H = \left(1 + 0.5\frac{\phi}{d_0}\right)\sqrt{4.0\frac{d_2}{S_1} - 1.0}$$ without being taken less than $1 + 0.5\frac{\phi}{d_0}$

- where slots with reinforcement are provided:

$$H = 1 + 0.5\frac{\phi}{d_0}$$

d_2 : Depth of slots without reinforcement provided at the upper and lower parts of solid floors, in m, whichever is greater.

Table 6 : Coefficient C_2

B_{DB}/ℓ_{DB}	0.4 and under	0.6	0.8	1.0	1.2	1.4	1.6 and over

C'_2	64	38	25	19	15	12	10	9	8	7

4.5 Stringer of double side structure

4.5.1 Net web thickness

The net thickness of stringers in double side structure, in mm, is not to be less than the greater of the value t_1 and t_2 specified in the followings according to each location:

$$t_1 = C_3\frac{|P|S|x - x_c|}{(d_0 - d_1)\,C_{t-pr}\,\tau_{eH}}$$

in which $|x - x_c|$ is to be taken less than or equal to 0.25 ℓ_{DS}.

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 C_{t-pr}\,\tau_{eH}}{C'_3}} - t_1$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}.

S : Breadth of part supported by stringer, in m.

d_0 : Depth of stringers, in m.

d_1 : Depth of opening, if any, at the point under consideration, in m.

ℓ_{DS} : Length of the double side structure between the transverse bulkheads under consideration, in m.

h_{DS} : Height of the double side structure between the upper end of hopper tank and the lower end of topside tank located midway between transverse bulkheads of hold under consideration, in m.

C_3 : Coefficient given in Table 8 depending on h_{DS}/ℓ_{DS}. For intermediate values of h_{DS}/ℓ_{DS}, C_3 is to be obtained by linear interpolation.

a : Depth of stringers at the point under consideration, in m. However, where horizontal stiffeners are fitted on the stringer, a is the distance from the horizontal stiffener under consideration to the side shell plating or the longitudinal bulkhead of double side structure or the distance between the horizontal stiffeners under consideration.

S_1 : Spacing, in m, of transverse stiffeners or web frames.

C'_3 : Coefficient given in Table 9 depending on S_1/a. For intermediate values of S_1/a, C'_3 is to be obtained by linear interpolation.

H : Value obtained from the following formulae:

- Where the stringer is provided with an unreinforced opening:

$$H = 1 + 0.5\frac{\phi}{\alpha}$$

- In other cases:

$H = 1.0$.

Table 8 : Coefficient C_3

h_{DS}/ℓ_{DS}	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over
C_3	0.16	0.23	0.30	0.36	0.41	0.44	0.47	0.50	0.54

Table 9 : Coefficient C'_3

S_1/a	0.3 and under	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.2	1.4 and over
C'_3	64	38	25	19	15	12	10	9	8	7

4.6 Transverse web in double side structure

4.6.1 Net web thickness

The net thickness of transverse webs in double side structure, in mm, is not to be less than the greater of the value t_1 and t_2 specified in the followings according to each location:

$$t_1 = C_4\frac{|P|\ Sh_{DS}}{(d_0 - d_1)\ C_{t-pr}\ \tau_{eH}}\left(1 - 1.75\frac{z - z_{BH}}{h'_{DS}}\right)$$

in which $z - z_{BH}$ is to be taken greater than or equal to $0.4\ h'_{DS}$.

$$t_2 = 1.75\sqrt[3]{\frac{H^2\ a^2\ C_{t-pr}\ \tau_{eH}}{C'_4}t_1}$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], as measured vertically at the upper end of hopper tank, longitudinally at the centre of ℓ_{DS}.

S : Breadth of part supported by transverses, in m.

d_0 : Depth of transverses, in m.

d_1 : Depth of opening at the point under consideration, in m.

C_4 : Coefficient given in Table 10 depending on h_{DS}/ℓ_{DS}. For intermediate values of h_{DS}/ℓ_{DS}, C_4 is to be obtained by linear interpolation.

z_{BH} : Z coordinate, in m, of the upper end of hopper tank with respect to the reference coordinate system defined in Pt 1, Ch 1, Sec 4, [3.6].

h_{DS} : As defined in the requirements of [4.5.1].

h'_{DS} : Height of the double side structure between the upper end of hopper tank and the lower end of topside tank at the position under consideration, in m.

ℓ_{DS} : As defined in the requirements of [4.5.1].

a : Depth of transverses at the point under consideration, in m. However, where vertical stiffeners are fitted on the transverse, a is the distance from the vertical stiffener under consideration to the side shell or the longitudinal bulkhead of double side hull or the distance between the vertical stiffeners under consideration.

S_1 : Spacing, in m, of horizontal stiffeners or stringers.

C'_4 : Coefficient given in Table 11 depending on S_1 /a. For intermediate values of S_1 /a, C'_4 is to be obtained by linear interpolation.

H : Value obtained from the following formulae:

- Where the transverse is provided with an unreinforced opening:

$$H = 1 + 0.5\frac{\phi}{\alpha}$$

- In other cases:

$H = 1.0$.

α : The greater of a or S_1, in m.

Table 10 : Coefficient C_4

h_{DS}/ℓ_{DS}	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over

4.7 Primary supporting member in bilge hopper tanks and topside tanks

4.7.1 Boundary conditions

The requirements of this sub-article apply to primary supporting members considered as clamped at both ends. For boundary conditions deviated from the above, the yielding check is to be considered on a case-by-case basis.

4.7.2 Net section modulus, net shear sectional area and web thickness

The net section modulus Z, in cm^3, the net shear sectional area A_{shr}, in cm^2, and the net web thickness t_w, in mm, subjected to lateral pressure are not to be less than the values obtained from the following formulae:

$$Z = \frac{|P|\ S\ell_{bdg}^{\ 2}}{f_{bdg}\ C_{s-pr}\ R_{eH}}\ 10^3$$

$$A_{shr} = \frac{5\ |P|\ S\ell_{shr}}{C_{t-pr}\ \tau_{eH}}$$

$$t_w = 1.75\ \sqrt[3]{\frac{h_w\ C_{t-pr}\ \tau_{eH}}{10^4\ C_5}\ A_{shr}}$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], calculated at the mid-point of span ℓ of a web frame located midway between transverse bulkheads of holds.

S : Spacing of primary supporting members, in m.

ℓ_{bdg} : Effective bending span, in m, of primary supporting members, measured between the supporting members as defined in Pt 1, Ch 3, Sec 7, [1.1.6].

ℓ_{shr} : Effective shear span, in m, of primary supporting members, measured between the supporting members as defined in Pt 1, Ch 3, Sec 7, [1.1.7].

f_{bdg} : Bending moment factor:

- For continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having as fixed ends and is not to be taken higher than:

  $f_{bdg} = 10$.

- For stiffeners with reduced end fixity, the yield check is to be considered on a case-by-case basis.

C_{s-pr} : Permissible bending stress coefficient for primary supporting members taken equal to:

$C_{s-pr} = 0.70$ for AC-S.

$C_{s-pr} = 0.85$ for AC-SD.

h_w : Web height, in mm.

C_5 : Coefficient defined in Table 12 according to s_1 and d_0. For intermediate values of s_1 / d_0, coefficient C_5 is to be obtained by linear interpolation.

s_1 : Spacing of stiffeners or tripping brackets on web plate, in m.

d_0 : Spacing of stiffeners parallel to shell plate on web plate, in m.

Table 12 : Coefficient C_5

s_1/d_0	0.3 and less	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.5	2.0 and over
C_5	60.0	40.0	26.8	20.0	16.4	14.4	13.0	12.3	11.1	10.2

SECTION 5
CARGO HATCH COVERS

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

P_S : Still water pressure, in kN/m^2, as defined in [4.1].

P_W : Wave pressure, in kN/m^2, as defined in [4.1].

P_C : Pressure acting on the hatch coaming, in kN/m^2, as defined in [6.2].

F_S, F_W : Coefficients taken equal to:
F_S = 0 and F_W = 0.9 for ballast water loads on hatch covers of the ballast hold.

F_S = 1.0 and F_W = 1.0 in other cases.

b_p : Effective breadth, in mm, of the plating attached to the stiffener or primary supporting member, as defined in [3].

A_{shr} : Net shear sectional area, in cm^2, of the stiffener or primary supporting member.

f_{bc} : Boundary coefficient for stiffeners and primary supporting members, taken equal to:

f_{bc} = 8, in the case of stiffeners and primary supporting members simply supported at both ends or supported at one end and clamped at the other end.

f_{bc} = 12, in the case of stiffeners and primary supporting members clamped at both ends.

t_c : Total corrosion addition, in mm, as defined in [1.4].

σ_a, τ_a : Allowable stresses, in N/mm^2, as defined in [1.5].

1 GENERAL

1.1 Application

1.1.1

The requirements in [1] to [8] apply to steel hatch covers in positions 1 and 2 on weather decks, as defined in Pt 1, Ch 1, Sec 4, [3.2].

1.2 Materials

1.2.1 Steel

The formulae for scantlings given in [5] are applicable to steel hatch covers.

Materials used for the construction of steel hatch covers are to comply with the applicable requirements of the Society.

1.2.2 Other materials

The use of materials other than steel is to be considered by the Society on a case-by-case basis, by checking that criteria adopted for scantlings are such as to ensure strength and stiffness equivalent to those of steel hatch covers.

1.3 Net scantlings

1.3.1

All scantlings referred to in this section are net, i.e. they do not include any margin for corrosion.

When calculating the stresses σ and τ in [5.3] and [5.4], the net scantlings are to be used.

The gross scantlings are obtained as specified in Pt 1, Ch 3, Sec 2.

The corrosion additions are given in [1.4].

1.4 Corrosion additions

1.4.1

The total corrosion addition for both sides to be considered for the plating and internal members of hatch covers is equal to the value specified in Table 1.

The corrosion addition for hatch coamings and coaming stays is defined according to Pt 1, Ch 3, Sec 3.

Table 1 : Corrosion addition t_c for hatch covers

Corrosion addition t_c, in mm, for both sides	
Plating and stiffeners of single skin hatch cover	2.0
Top and bottom plating of double skin hatch cover	2.0
Internal structures of double skin hatch cover	1.5

1.5 Allowable stresses

1.5.1

The allowable stresses σ_a and τ_a, in N/mm^2, are to be obtained from Table 2.

Table 2 : Allowable stresses, in N/mm^2

Members of	Subjected to	σ_a, in N/mm^2	τ_a, in N/mm^2
Weathertight hatch cover	External pressure, as defined in [4.1.2]	0.80 R_{eH}	0.46 R_{eH}
Weathertight hatch cover	Other loads, as defined in [4.1.3] to [4.1.6]	0.90 R_{eH}	0.51 R_{eH}

The allowable buckling utilisation factors are given in Table 3:

Table 3 : Allowable buckling utilisation factors

Structural component	Subject to	η_{all}, Allowable buckling utilisation factor
Plates and stiffeners Web of PSM	External pressure, as defined in [4.1.2]	0.80 for load combination: S+D
	Other loads, as defined in [4.1.3] to [4.1.6]	0.80 for load combination: S+D 0.64 for load combination: S

2 ARRANGEMENTS

2.1 Height of hatch coamings

2.1.1

The height of hatch coamings is not to be less than:

- 600 mm in position 1.
- 450 mm in position 2.

2.1.2

The height of hatch coamings in positions 1 and 2 closed by steel covers provided with gaskets and securing devices may be reduced with respect to the above values or the coamings may be omitted entirely, on condition that the Administration is satisfied that the safety of the ship is not thereby impaired in any sea conditions.

In such cases the scantlings of the covers, their gasketing, their securing arrangements and the drainage of recesses in the deck are considered by the Society on a case-by-case basis.

2.2 Hatch covers

2.2.1

The stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

2.2.2

The spacing of primary supporting members parallel to the direction of stiffeners is not to be greater than 1/3 of the span of primary supporting members.

2.2.3

The breadth of the primary supporting member face plate is not to be less than 40% of their depth for laterally unsupported spans greater than 3 m. Tripping brackets attached to the face plate may be considered as a lateral support for primary supporting members.

The face plate outstand is not to exceed 15 times the gross face plate thickness.

2.2.4

Efficient retaining arrangements are to be provided to prevent translation of the hatch cover under the action of the longitudinal and transverse forces exerted by cargoes on the cover, if any. These retaining arrangements are to be located in way of the hatch coaming side brackets.

2.2.5

The width of each bearing surface for hatch covers is to be at least 65 mm.

2.3 Hatch coamings

2.3.1

Coamings, stiffeners and brackets are to be capable of withstanding the local forces in way of the clamping devices and handling facilities necessary for securing and moving the hatch covers as well as those due to cargo stowed on the latter.

2.3.2

Special attention is to be paid to the strength of the fore transverse coaming of the forward hatch and to the scantlings of the closing devices of the hatch cover on this coaming.

2.3.3

Longitudinal coamings are to be extended at least to the lower edge of deck beams.

- Where they are not part of continuous deck girders, the lower edge of longitudinal coamings are to extend for at least two frame spaces beyond the end of the openings.
- Where longitudinal coamings are part of deck girders, their scantlings are to be as required in Pt 1, Ch 6, Sec 6 and Pt 1, Ch 8, Sec 3.

2.3.4

A web frame or a similar structure is to be provided below the deck in line with the transverse coaming. Transverse coamings are to extend below the deck and to be connected with the web frames.

3 WIDTH OF ATTACHED PLATING

3.1 Stiffeners

3.1.1

The width of the attached plating b_p, in mm, to be considered for the check of stiffeners is to be taken as:

- Where the attached plating extends on both sides of the stiffener:

  $b_p = s$

- Where the attached plating extends on one side of the stiffener:

  $b_p = 0.5\ s$

3.2 Primary supporting members

3.2.1

The effective breadth, in mm, of the attached plating to be considered for the yielding and buckling checks of primary supporting members analysed through isolated beam or grillage model is to be taken as:

- Where the plating extends on both sides of the primary supporting member:

  $b_p = b_{p1} + b_{p2}$

- Where the plating extends on one side of the primary supporting member:

  $b_p = b_{p1}$

where:

$b_{p1} = \min(0.165\ \ell_p, S_{p1})$

$b_{p2} = \min(0.165\ \ell_p, S_{p2})$

ℓ_p : Span, in m, of the considered primary supporting member.

S_{p1}, S_{p2} : Half distance, in m, between the considered primary supporting member and the adjacent ones, S_{p1} for one side, S_{p2} for the other side.

For structural evaluations based on isolated beam or grillage models, the areas of stiffeners are not to be included in the idealisation of the attached plating of the primary members.

4 LOAD MODEL

4.1 Lateral pressures and forces

4.1.1 General

The lateral pressures and forces to be considered as acting on hatch covers are given in [4.1.2] to [4.1.6]. When two or more panels are connected by hinges, each individual panel is to be considered separately.

In any case, the sea pressures defined in [4.1.2] are to be considered for hatch covers located on exposed decks.

Additionally, when the hatch cover is intended to carry uniform cargoes, special cargoes or containers, the pressures and forces defined in [4.1.3] to [4.1.6] are to be considered independently from the sea pressures.

4.1.2 Sea pressures

The still water and wave lateral pressures are to be considered and are to be taken equal to:

- Still water pressure: $P_S = 0$.
- Wave pressure $P_W = P_{HC}$, as defined in Pt 1, Ch 4, Sec 5, [5.2].

4.1.3 Internal pressures due to ballast water

If applicable, the internal static and dynamic lateral pressures due to ballast water are to be considered and are defined in Pt 1, Ch 4, Sec 6, [1].

4.1.4 Pressures due to uniform cargoes

If applicable, the static and dynamic pressures due to uniform cargoes are to be considered and are defined in Pt 1, Ch 4, Sec 5, [5.3.1].

4.1.5 Pressures or forces due to special cargoes

In the case of carriage of special cargoes (e.g. pipes, etc) on the hatch covers which may temporarily retain water during navigation, the lateral pressures or forces to be applied are considered by the Society on a case-by-case basis.

4.1.6 Forces due to containers

In the case of carriage of containers on the hatch covers, the concentrated forces under the containers corners are to be determined in accordance with the applicable requirements of the Society.

4.1.7 Self weight

The effect of the hatch cover structure weight is to be included in the static loads but not in the dynamic loads.

4.2 Load point

4.2.1 Wave lateral pressure for hatch covers on exposed decks

The wave lateral pressure to be considered as acting on each hatch cover is to be calculated at a point located:

- Longitudinally, at the hatch cover mid-length.
- Transversely, on the longitudinal plane of symmetry of the ship.
- Vertically, at the top of the hatch cover.

4.2.2 Lateral pressures other than the wave pressure

The lateral pressure is to be calculated at the level of the tight boundary of the cover:

- In way of the geometrical centre of gravity of the plate panel, for plating.
- At mid-span, for stiffeners and primary supporting members.

5 STRENGTH CHECK

5.1 General

5.1.1 Application

The strength check is applicable to rectangular hatch covers subjected to a uniform pressure, designed with primary supporting members arranged in one direction or as a grillage of longitudinal and transverse primary supporting members.

In the latter case, i.e. when the hatch cover is arranged as a grillage of longitudinal and transverse primary supporting members, or when the Society deems it necessary, the stresses in the primary supporting members are to be determined by a grillage or a finite element analysis.

It is to be checked that stresses induced by concentrated loads are in accordance with the criteria in [5.4.4].

When FE analysis is carried out, the buckling assessment as described in [5.2.3], [5.3.4] and [5.4.6] can be made considering only the stresses given by the FE analysis

5.1.2 Hatch covers supporting containers

The scantlings of hatch covers supporting containers are to comply with the applicable requirements of the Society.

5.1.3 Hatch covers subjected to special cargoes

For hatch covers supporting special cargoes, stiffeners and primary supporting members are generally to be checked by direct calculations, taking into account the stiffener arrangements and their relative inertia. It is to be checked that stresses induced by special cargoes are in accordance with the criteria in [5.4.4].

5.2 Plating

5.2.1 Net thickness

The net thickness, in mm, of steel hatch cover top plating is not to be taken less than:

$$t = 0.0158\ F_p b \sqrt{\frac{F_s\ P_s + F_W\ P_W}{0.95\ R_{eH}}}$$

where:

F_p : Factor for combined membrane and bending response, equal to:

$F_p = 1.5$ in general.

$F_p = 1.9\dfrac{\sigma}{\sigma_a}$ for $\sigma \geq 0.8\sigma_a$ for the attached plating of primary supporting members.

σ : Normal stress, in N/mm^2, in the attached plating of primary supporting members, calculated according to [5.4.3] or determined through a grillage analysis or a finite element analysis.

5.2.2 Minimum net thickness

In addition to [5.2.1], the net thickness, in mm, of the plating forming the top of the hatch cover is not to be taken less than the greater of the following values:

$$t = \frac{b}{100}$$

$t = 6$

5.2.3 Buckling strength

The buckling strength of the hatch cover plating subjected to loading conditions as defined in [4.1] is to comply with the following formula:

$\eta_{Plate} \leq \eta_{all}$

where:

η_{Plate} : Maximum plate utilisation factor calculated according to Method A, as defined in Pt 1, Ch 8, Sec 5, [2.2].

- For stresses obtained from beam theory, i.e. not calculated by means of finite element analysis:

- σ_x or σ_y is selected for the uniaxial check of the plate in the direction parallel to the primary supporting member,
- $\tau = 0$.

- For stresses calculated by means of finite element analysis: σ_x, σ_y, τ obtained from FE analysis.

η_{all} : Allowable utilisation factor, as given in Table 3.

5.3 Stiffeners

5.3.1

For flat bar stiffeners, the ratio h_w / t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \leq 15 \sqrt{\frac{235}{R_{eH}}}$$

5.3.2 Minimum net thickness of web

The net thickness, in mm, of the stiffener web is to be taken not less than 4 mm.

5.3.3 Net section modulus and net shear sectional area

The net section modulus Z, in cm^3, and the net shear sectional area A_{shr}, in cm^2, of a stiffener subject to lateral pressure are to be taken not less than given by the following formulae:

$$Z = \frac{(F_S\ P_S + F_W\ P_W)\ s \cdot \ell_s^2}{f_{bc}\ \sigma_a}\ 10^{-3}$$

$$A_{shr} = \frac{5(F_S\ P_S + F_W\ P_W)\ s\ \ell_s}{\tau_a}$$

where:

ℓ_s : Stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all stiffener spans, the stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10% of the gross span, for each bracket.

5.3.4 Buckling strength

The buckling strength of the hatch cover stiffeners subjected to loading conditions as defined in [4.1] is to comply with the following formula:

$\eta_{Stiffener} \leq \eta_{all}$

where:

$\eta_{Stiffener}$: Maximum stiffener utilisation factor calculated according to Pt 1, Ch 8, Sec 5, [2.3].

- For uniaxial stresses obtained by beam theory, i.e. not calculated by means of finite element analysis:
  - σ_x : stiffener axial stress,
  - $\sigma_y = 0$,
  - $\tau = 0$.

- For stresses calculated by means of finite element analysis:
    - σ_x : stiffener axial stress from FE analysis,
    - σ_y : stress perpendicular to the stiffener,
    - τ : shear stress in the attached plate.

η_{all} : Allowable utilisation factor, as given in Table 3.

5.4 Primary supporting members

5.4.1 Application

The requirements in [5.4.3] to [5.4.5] apply to primary supporting members which may be analysed through isolated beam models.

Primary supporting members whose arrangement is of a grillage type and which cannot be analysed through isolated beam models are to be checked by direct calculations, using the checking criteria in [5.4.4].

5.4.2 Minimum net thickness of web

The web net thickness of primary supporting members, in mm, is not to be less than 6 mm.

5.4.3 Normal and shear stress for isolated beam

In case that grillage analysis or finite element analysis are not carried out, according to the requirements in [5.1.1], the maximum normal stress σ and shear stress τ, in N/mm², in the primary supporting members are to be taken as given by the following formulae:

$$\sigma = \frac{s\ (F_S\ P_S + F_W\ P_W)\ \ell_m^2}{f_{bc}\ Z}$$

$$\tau = \frac{5\ s(F_S\ P_S + F_W\ P_W)\ \ell_m}{A_{shr}}$$

where:

ℓ_m : Bending span, in m, of the primary supporting member.

5.4.4 Checking criteria

The normal stress σ and the shear stress τ, calculated according to [5.4.3] or determined through a grillage analysis or finite element analysis, as the case may be, are to comply with the following formulae:

$$\sigma \le \sigma_a$$

$$\tau \le \tau_a$$

5.4.5 Deflection limit

The net moment of inertia of a primary supporting member, when loaded by sea pressure, excluding the self-weight of the structure, is to be such that the deflection does not exceed $\mu\ \ell_{max}$.

where:

μ : Coefficient taken equal to:

μ = 0.0056 for weathertight hatch covers.

ℓ_{max} : Greatest span, in m, of primary supporting members.

5.4.6 Buckling strength of the web panels of the primary supporting members

The web of primary supporting members subject to loading conditions as defined in [4.1] is to be taken as:

$$\eta_{Plate} \le \eta_{all}$$

where:

η_{Plate} : Maximum plate utilisation factor calculated according to Method A, as defined in Pt 1, Ch 8, Sec 5, [2.4].

- Shear stress obtained by beam theory (i.e. calculated according to [5.4.3] or determined through a grillage analysis), or
- σ_x, σ_y, τ obtained by FE analysis.

η_{all} : Allowable utilisation factor, as given in Table 3.

5.4.7 Slenderness criteria

For buckling stiffeners on webs of primary supporting members, the ratio h_w/t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{R_{eH}}}$$

5.5 Stiffeners and primary supporting members of variable cross section

5.5.1

The net section modulus Z, in cm^3, of stiffeners and primary supporting members with a variable cross section is to be taken not less than the greater of the values given by the following formulae:

$$Z = X_{CS}$$

$$Z = \left(1 + \frac{3.2\alpha - \psi - 0.8}{7\psi + 0.4}\right) Z_{CS}$$

where:

Z_{CS} : Net section modulus, in cm^3, for a constant cross section, complying with the checking criteria in [5.4.4].

a : Coefficient taken equal to:

$$\alpha = \frac{\ell_1}{\ell_0}$$

ψ : Coefficient taken equal to:

$$\psi = \frac{Z_1}{Z_0}$$

ℓ_1 : Length of the variable section part, in m, as shown in Figure 1.

ℓ_0 : Span measured, in m, between end supports, as shown in Figure 1.

Z_1 : Net section modulus at end, in cm^3, as shown in Figure 1.

Z_0 : Net section modulus at mid-span, in cm^3, as shown in Figure 1.

Moreover, the net moment of inertia, in cm^4, of stiffeners and primary supporting members with a variable cross section is to be taken not less than the greater of the values given by the following formulae:

$$I = I_{CS}$$

$$I = \left[1 + 8\alpha^3\left(\frac{1-\varphi}{0.2 + 3\sqrt{\varphi}}\right)\right] I_{CS}$$

where:

I_{CS} : Net moment of inertia, in cm^4, with a constant cross section complying with [5.4.5].

φ : Coefficient taken equal to:

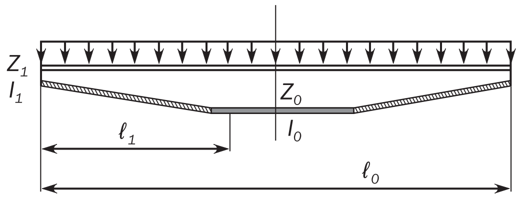
$$\varphi = \frac{I_1}{I_0}$$

I_1 : Net moment of inertia at end, in cm^4, as shown in Figure 1.

I_0 : Net moment of inertia at mid-span, in cm^4, as shown in Figure 1.

The use of these formulae is limited to the determination of the strength of stiffeners and primary supporting members in which abrupt changes in the cross section do not occur along their length.

Figure 1 : Variable cross section stiffener



6 HATCH COAMINGS

6.1 Stiffening

6.1.1

The stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

6.1.2

Coamings are to be stiffened on their upper edges with a stiffener suitably shaped to fit the hatch cover closing appliances.

6.1.3

Where the height of the coaming exceeds 900 mm, additional strengthening may be required.

However, reductions may be granted for transverse coamings in protected areas.

6.1.4

When two hatches are close to each other, under deck stiffeners are to be fitted to connect the longitudinal coamings in order to maintaining the continuity of their strength.

Similar stiffening is to be provided over 2 frame spacings at ends of hatches exceeding 9 frame spacings in length.

In some cases, the Society may require the continuity of coamings to be maintained above the deck.

6.1.5

Where watertight metallic hatch covers are fitted, other arrangements of equivalent strength may be adopted.

6.2 Load model

6.2.1

The wave lateral pressure, P_C in kN/m^2, to be considered as acting on the hatch coamings is defined in [6.2.2] and [6.2.3].

6.2.2

The wave lateral pressure, P_C in kN/m^2, on the No. 1 forward transverse hatch coaming is to be taken equal to:

- P_C = 220, when a forecastle is fitted in accordance with Ch 1, Sec 1, [1].
- P_C = 290, in the other cases.

6.2.3

The wave lateral pressure, P_C in kN/ m^2, on the hatch coamings other than the No. 1 forward transverse hatch coaming is to be taken equal to:

P_C = 220

6.2.4

For cargo holds intended for the carriage of liquid cargoes, the liquid internal pressures applied on hatch coaming is also to be determined according to Pt 1, Ch 4, Sec 6.

6.3 Scantlings

6.3.1 Plating

The net thickness, in mm, of the hatch coaming plate is not to be taken less than the greater value given by the following formulae:

$$t = 0.016b\sqrt{\frac{P_C}{0.95R_{eH}}}$$

t = 9.5

6.3.2 Stiffeners

The net section modulus, Z, in cm^3, of longitudinal or transverse stiffeners fitted on hatch coamings is not to be taken less than:

$$Z = 1.21\frac{P_C\ s\ \ell^2}{f_{bc}\ c_p\ R_{eH}}$$

where:

f_{bc} : Coefficient taken equal to:

f_{bc} = 16 in general.

f_{bc} = 12 for the end span of stiffeners sniped at the coaming corners.

c_p : Ratio of the plastic section modulus to the elastic section modulus of the stiffeners with an attached plate breadth, in mm, equal to 40 t, where t is the plate net thickness.

c_p = 1.16 in the absence of more precise evaluation.

6.3.3 Coaming stays

At the connection with deck, the net section modulus Z, in cm^3, and the net thickness t_w, in mm, of the coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (examples shown in Figure 2 and Figure 3) are to be taken not less than:

$$Z = \frac{s_C\ P_C\ H_C^2}{1.9\ R_{eH}}$$

$$t_w = \frac{s_C \, P_C \, H_C}{0.5 \, h \, R_{eH}}$$

where:

H_C : Stay height, in m.

s_C : Stay spacing, in mm.

h : Stay depth, in mm, at the connection with deck.

Figure 2 : Coaming stay (example 1)

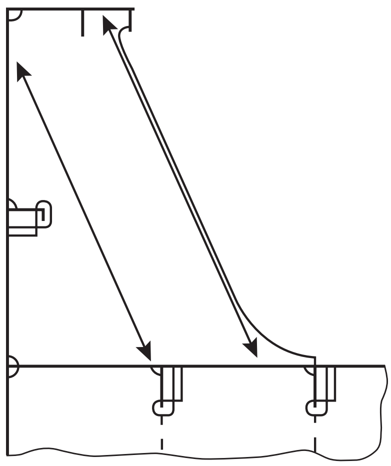


Figure 3 : Coaming stay (example 2)

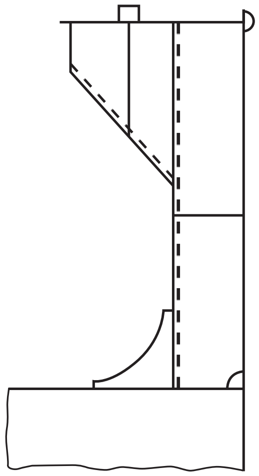

For calculating of offered section modulus of coaming stays, the face plate area may be taken into account only when it is welded with full penetration welds to the deck plating and provided with adequate under deck structure supporting the coaming stay in the deck structure.

For other designs of coaming stays, such as those shown in Figure 4 and Figure 5, the stress levels determined through a grillage analysis or finite element analysis, as the case may be, apply and are to be checked at the highest stressed locations. The stress levels are to comply with the following formulae:

$\sigma \leq 0.95 \; R_{eH}$

$\tau \leq 0.5 \; R_{eH}$

Figure 4 : Coaming stay (example 3)

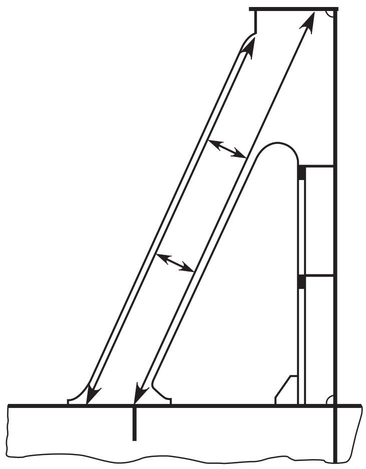

Figure 5 : Coaming stay (example 4)

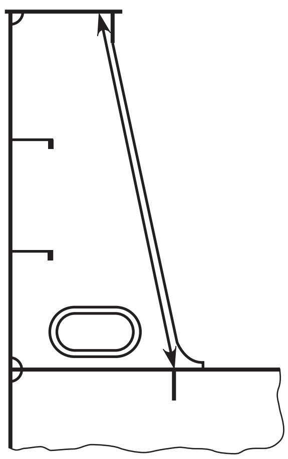

6.3.4 Local details

The design of local details is to comply with the requirements in this section ensuring adequate structural continuity from the hatch covers into the supporting deck structure.

Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

The normal stress σ and the shear stress τ, in N/mm^2, induced in the under deck structures by the loads transmitted by stays are to comply with the following formulae:

$\sigma \leq 0.95\ R_{eH}$

$\tau \leq 0.5\ R_{eH}$

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the requirements of the Society.

Double continuous fillet welding is to be adopted for the connections of stay webs with deck plating and the weld leg length is not to be less than 0.62 t_w, where t_w is the gross thickness of the stay web.

Toes of stay webs are to be connected to the deck plating with partial penetration double bevel welds extending over a distance not less than 15% of the stay width.

7 WEATHERTIGHTNESS, CLOSING ARRANGEMENT, SECURING DEVICES AND STOPPERS

7.1 Weathertightness

7.1.1

Where the hatchway is exposed, the weathertightness is to be ensured by gaskets and clamping devices sufficient in number and quality.

7.1.2

In general, a minimum of two securing devices or equivalent is to be provided on each side of the hatch cover.

7.2 Gaskets

7.2.1

The weight of hatch covers and any cargo stowed thereon, together with inertia forces generated by ship motions, are to be transmitted to the ship's structure through steel to steel contact.

This may be achieved by providing continuous skirt plates on the hatch covers or by means of defined bearing pads.

7.2.2

The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements.

Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and to be made of a corrosion-resistant material.

7.2.3

The gasket and the securing arrangements are to maintain their efficiency when subjected to large relative movements between the hatch cover and the ship's structure or between hatch cover elements.

If necessary, suitable devices are to be fitted to limit such movements.

7.2.4

The gasket material is to be of a quality suitable for all environmental conditions likely to be encountered by the ship, and is to be compatible with the cargoes transported.

The material and form of gasket selected are to be considered in conjunction with the type of hatch cover, the securing arrangement and the expected relative movement between the hatch cover and the ship's structure.

The gasket is to be effectively secured to the hatch cover.

7.2.5

Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

7.2.6

Metallic contact is required to ensure earthing connection between the hatch cover and the hull structures.

7.3 Closing arrangement, securing devices and stoppers

7.3.1 General

Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced along the coamings and between cover elements.

Hatch covers provided with special sealing devices, insulated hatch covers, flush hatch covers and those having coamings of a reduced height according to [2.1.2] are to be considered by the Society on a case-by-case basis.

7.3.2 Arrangements

The securing and stopping devices are to be arranged so as to ensure sufficient compression on gaskets between hatch covers and coamings and between adjacent hatch covers.

Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending on the type and the size of the hatch cover, as well as on the stiffness of the hatch cover edges between the securing devices.

At cross-joints of multi-panel covers, (male/female) vertical guides are to be fitted to prevent excessive relative vertical deflections between loaded/unloaded panels.

The location of stoppers is to be compatible with the relative movements between hatch covers and the ship's structure in order to prevent damage to them. The number of stoppers is to be as small as possible.

7.3.3 Spacing

The spacing of the securing arrangements is not to be greater than 6 m.

7.3.4 Construction

Securing arrangements with reduced scantlings may be accepted provided it can be demonstrated that the possibility of water reaching the deck is negligible.

Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or hatch covers.

Individual securing devices on each hatch cover are to have approximately the same stiffness characteristics.

7.3.5 Area of securing devices

The gross cross area of each securing device is not to be less than the value obtained, in cm^2, from the following formula:

$$A = 1.4\, S_S \left(\frac{235}{R_{eH}}\right)^{\alpha}$$

where:

S_S : Spacing, in m, of securing devices.

α : Coefficient taken equal to:

$\alpha = 0.75$ for $R_{eH} > 235$ N/mm^2.

$\alpha = 1.0$ for $R_{eH} \leq 235$ N/mm^2.

In the above calculations, R_{eH} may not be taken greater than 0.7 R_m.

Between hatch cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by securing devices. For packing line pressures exceeding 5 N/mm, the net cross area A is to be increased in direct proportion. The packing line pressure is to be specified.

In the case of securing arrangements which are particularly stressed due to the unusual width of the hatchway, the net cross area A of the above securing arrangements is to be determined through direct calculations.

7.3.6 Inertia of edges elements

The hatch cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices.

The moment of inertia of edge elements is not to be less than the value obtained, in cm^4, from the following formula:

$I = 6\ P_L\ S_S^4$

where:

P_L : Packing line pressure, in N/mm, to be taken not less than 5.

S_S : Spacing, in m, of securing devices.

7.3.7 Diameter of rods or bolts

Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m^2 in area.

7.3.8 Stoppers

Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.

With the exclusion of No. 1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

No. 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 if a forecastle is fitted in accordance with Ch 1, Sec 1, [1].

The equivalent stress in stoppers, their supporting structures and calculated in the throat of the stopper welds is to be equal to or less than the allowable value, equal to 0.8 R_{eH}.

7.4 Cleats

7.4.1

Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

7.4.2

Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

8 DRAINAGE

8.1 Arrangement

8.1.1

Drainage is to be arranged inside the line of gaskets by means of a gutter bar or vertical extension of the hatch side and end coaming.

8.1.2

Drain openings are to be arranged at the ends of drain channels and are to be provided with efficient means for preventing ingress of water from outside, such as non-return valves or equivalent.

8.1.3

Cross-joints of multi-panel hatch covers are to be arranged with drainage of water from the space above the gasket and a drainage channel below the gasket.

8.1.4

If a continuous outer steel contact is arranged between the cover and the ship's structure, drainage from the space between the steel contact and the gasket is also to be provided.

SECTION 6
ADDITIONAL CLASS NOTATION GRAB

SYMBOLS

M_{GR} : Mass of unladen grab, in t.

1 GENERAL

1.1 Application

1.1.1

The additional class notation GRAB [X] is assigned, in accordance with Pt 1, Ch 1, Sec 1, [3.2.2], to ships with holds designed for loading/unloading by grabs having a maximum mass of unladen grab, in tons up to [X] tons, in compliance with the requirements of this section.

1.1.2

It is to be noted that this additional class notation does not negate the use of heavier grabs, but the owner and operators are to be made aware of the increased risk of local damage and possible early renewal of inner bottom plating if heavier grabs are used regularly or occasionally to discharge cargo.

2 SCANTLINGS

2.1 Plating

2.1.1 General

The net thickness of plating of inner bottom and vertical sloped cargo hold; excluding bilge wells, is to be taken as the greater of the following values:

- t, as obtained according to requirements in Pt 1, Ch 6 and Pt 1, Ch 7.
- t_{GR}, as defined in [2.1.2] and [2.1.3].

2.1.2 Inner bottom plating

The net thickness t_{GR}, in mm, of the inner bottom plating is to be obtained from the following formula:

$$t_{GR} = 0.62\sqrt{bk}\left(\frac{M_{GR}}{20}\right)^{0.25}$$

2.1.3 Vertical and sloped cargo hold boundaries

The net thickness t_{GR}, in mm, as defined in this sub-section apply to the following structural elements.

- Hopper tank sloped plating.
- Transverse lower stool plating.
- Transverse plane bulkhead plating.
- Face plates of transverse corrugated bulkheads without lower stool.
- Inner hull.

Up to a height of 3.0 m above, the lowest point of the inner bottom is to be obtained from the following formula:

$$t_{GR} = 0.55\sqrt{bk}\left(\frac{M_{GR}}{20}\right)^{0.25}$$

PART 2 CHAPTER 2

OIL TANKERS

Table of Contents

SECTION 1
GENERAL ARRANGEMENT DESIGN

1 GENERAL

1.1 General

1.1.1

This section covers the general structural arrangement requirements for oil tankers, which are based on national and international regulations.

2 SEPARATION OF CARGO TANKS

2.1 General

2.1.1

The cargo pump room, cargo tanks, slop tanks and cofferdams are to be positioned forward of machinery spaces. Main cargo control stations, control stations, accommodation and service spaces are to be positioned aft of cargo tanks, slop tanks and spaces which isolate cargo or slop tanks from machinery spaces, but not necessary aft of the oil fuel bunker tanks and ballast tanks.

2.1.2

A cofferdam is to be provided to separate the cargo tanks from the machinery space. Pump room, ballast tanks or fuel oil tanks may be considered as cofferdam for this purpose.

3 DOUBLE HULL ARRANGEMENT

3.1 General

3.1.1

All oil tankers are to be provided with double bottom tanks and spaces, and double side tanks and spaces, in accordance with Pt 1, Ch 2, Sec 3. The double bottom and double side tanks and spaces, protect the cargo tanks or spaces, and are not to be used for the carriage of oil cargoes.

3.1.2

Cargo tanks are to be of a size and arrangement that hypothetical oil outflow from side and bottom damage, anywhere in the length of the ship, is limited.

4 ACCESS ARRANGEMENTS

4.1 Special requirements for oil tankers

4.1.1

Where a duct keel or pipe tunnel is fitted, provision is to be made for at least two exits to the open deck arranged at a maximum distance from each other. The duct keel or pipe tunnel is not to pass into machinery

spaces. The aft access may lead from the pump room to the duct keel. Where an aft access is provided from the pump room to the duct keel, the access opening from the pump room to the duct keel is to be provided with an oil-tight cover plate or a watertight door.

Mechanical ventilation is to be provided and such spaces are to be sufficiently ventilated prior to entry. A notice board is to be fitted at each entrance to the pipe tunnel stating that before any attempt is made to enter, the ventilating fan must have been in operation for a sufficient period. In addition, the atmosphere in the tunnel is to be sampled by a gas monitor, and where an inert gas system is fitted in cargo tanks, an oxygen monitor is to be provided.

4.1.2

Where a watertight door is fitted in the pump room for access to the duct keel, the scantlings of the watertight door are to comply with the requirements of the individual Society and the following additional requirements:

a) The watertight door is to be capable of being manually closed from outside the main pump room entrance, in addition to bridge operation. A means of indicating whether the door is open or closed is to be provided locally and on the bridge.

b) A notice is to be affixed at each operating position to the effect that the watertight door is to be kept closed during normal operations of the ship, except when access to the pipe tunnel is required.

4.1.3

Special consideration is to be given to any proposals to fit permanent repair/maintenance access openings with oil-tight covers in cargo tank bulkheads. Attention is drawn to the relevant national regulations concerning load line and oil outflow aspects of such arrangements.

SECTION 2
STRUCTURAL DESIGN PRINCIPLES

1 CORROSION PROTECTION

1.1 General

1.1.1 Cathodic protection systems in cargo tanks

Cathodic protection systems, if fitted in cargo tanks, are to comply with [1.2].

1.1.2 Paint containing aluminium

Paint containing aluminium, when used in cargo tanks, is to comply with [1.3].

1.2 Internal cathodic protection systems

1.2.1

When a cathodic protection system is to be fitted to steel structures in tanks used for liquid cargo with flash point below 60°C, a plan of the fitting arrangement is to be submitted for approval. The arrangements are to be considered for safety against fire and explosion. This approval also applies to adjacent tanks.

1.2.2

Permanent anodes in tanks made of, or alloyed with magnesium are not acceptable, except in tanks solely intended for water ballast that are not adjacent to cargo tanks.

Impressed current systems are not to be used in cargo tanks due to the development of chlorine and hydrogen that can result in an explosion.

Aluminium anodes are accepted, however, in tanks with liquid cargo with flash point below 60°C and in adjacent ballast tanks, aluminium anodes are to be located so a kinetic energy of not more than 275 J is developed in the event of their loosening and becoming detached.

1.2.3

Aluminium anodes are to be located in such a way that they are protected from falling objects. They are not to be located under tank hatches or Butterworth openings unless protected by adjacent structure.

1.2.4

Tanks, in which anodes are installed, are to have sufficient holes for the circulation of air to prevent gas from collecting in pockets.

1.3 Paint containing aluminium

1.3.1

The use of aluminium coatings containing greater than 10% aluminium by weight in the dry film is prohibited in cargo tanks, cargo tank deck area, pump rooms, cofferdams or any other area where cargo vapour may accumulate unless it has been shown by appropriate tests that the paint to be used does not increase the incendiary sparking hazard. Tests need not be performed for coatings with less than 10% aluminium by weight.

1.3.2

Aluminised pipes may be permitted in ballast tanks, in inerted cargo tanks and, provided the pipes are protected from accidental impact, in hazardous areas on open deck.

SECTION 3
HULL LOCAL SCANTLING

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

S : Primary supporting member spacing as defined in Pt 1, Ch 3, Sec 7, [1.2.2], in m.

$C_{t\text{-}pr}$: Permissible shear stress coefficient for primary supporting members taken equal to:

$C_{t\text{-}pr}$ = 0.70 for AC-S.

$C_{t\text{-}pr}$ = 0.85 for AC-SD.

$C_{s\text{-}pr}$: Permissible bending stress coefficient for primary supporting members taken equal to:

$C_{s\text{-}pr}$ = 0.70 for AC-S.

$C_{s\text{-}pr}$ = 0.85 for AC-SD.

s_{cg} : Half pitch length of corrugation, in mm. See Figure 4.

ℓ_{cg} : Length of corrugation, in m, which is defined as the distance between the lower stool and the upper stool. Where no lower or upper stool is fitted, ℓ_{cg} is to be measured to lower or upper end as shown in Figure 4.

1 PRIMARY SUPPORTING MEMBERS IN CARGO HOLD REGION

1.1 General

1.1.1

The following requirements relate to the determination of scantlings of the primary supporting members within 0.4 L amidships and those outside 0.4 L amidships provided that the geometry and fixation of primary supporting member is similar with those amidships.

1.1.2

The section modulus and shear area criteria for primary supporting members contained in this sub-section apply to structural configurations shown in Pt 1, Ch 1, Sec 1, Figure 3 and are applicable to the following structural elements:

a) Floors and girders within the double bottom,

b) Deck transverses,

c) Side transverses within double side structure,

d) Vertical web frames on longitudinal bulkheads with or without cross ties,

e) Horizontal stringers on transverse bulkheads, except those fitted with buttresses or other intermediate supports,

f) Cross ties in wing cargo and centre cargo tanks.

1.1.3

Floors, horizontal stringers, side transverses and vertical webs adjacent to transverse bulkheads which get additional supports by horizontal stringers or buttresses are excluded from the application of this section.

1.1.4

Webs of the primary supporting members are to be stiffened in accordance with Pt 1, Ch 8, Sec 2, [4].

1.1.5

Webs of the primary supporting members are to have a depth of not less than given by the requirements of [1.5.1], [1.7.1] and [1.8.1], as applicable.

1.1.6

In any case, primary supporting members that have open slots for stiffeners are to have a depth not less than 2.5 times the depth of the slots if slots are not closed.

1.1.7

Where it is impracticable to fit a primary supporting member with the required web depth, then it is permissible to fit a member with reduced depth provided that the fitted member has equivalent moment of inertia or deflection to the required member. The required equivalent moment of inertia is to be based on an equivalent section given by the effective width of plating at mid span with required plate thickness, web of required depth and thickness and face plate of sufficient width and thickness to satisfy the required mild steel section modulus.

The equivalent moment of inertia may be also demonstrated by an equivalent member having the same deflection as the required member.

All other rule requirements, such as minimum thicknesses, slenderness ratio, section modulus and shear area, are to be satisfied for the member of reduced depth.

1.2 Design load sets

1.2.1

The design load sets for the evaluation of primary supporting members are given in Table 1.

Table 1 : Design load sets for primary supporting members

Item	Design load set (1) (5) (6)	Load component	Draught	Design load	Loading condition
Double bottom floors and girders (3)	SEA-1	P_{ex}	$0.9T_{sc}$ (2)	S+D	Sea pressure only
	SEA-2	P_{ex}	T_{SC}	S	
	OT-4	$P_{in} - P_{ex}$	$0.6T_{sc}$	S+D	Net pressure difference between cargo pressure and sea pressure
	OT-5	$P_{in} - P_{ex}$	(4)	S	
Side transverses (3)	SEA-1	P_{ex}	$0.9T_{sc}$	S+D	Sea pressure only
	SEA-2	P_{ex}	T_{sc}	S	
	OT-1	P_{in}	T_{SC}	S+D	Cargo pressure only
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	

Item	Design load set (1) (5) (6)	Load component	Draught	Design load	Loading condition
Deck transverses	SEA-1	P_{ex}	T_{sc}	S+D	Green sea pressure only or other loads on deck
	OT-1	P_{in}	T_{SC}	S+D	Cargo pressure only
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Vertical web frames on longitudinal bulkheads	OT-1	P_{in}	T_{SC}	S+D	Pressure from one side only. Full cargo tank with adjacent cargo tank empty
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Horizontal stringers on transverse bulkhead	OT-1	P_{in}	T_{SC}	S+D	Pressure from one side only. Full cargo tank with adjacent forward or aft cargo tank empty.
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Cross ties in centre tanks	OT-1	$\dfrac{P_{in-pt}+P_{in-stb}}{2}$	T_{SC}	S+D	Full wing cargo tanks, centre tank empty.
	OT-2	$\dfrac{P_{in-pt}+P_{in-stb}}{2}$	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Cross ties in wing tanks	OT-6	$\dfrac{P_{in}+P_{ex}}{2}$	T_{sc}	S+D	Full centre tank, wing cargo tanks empty.
	OT-7	$\dfrac{P_{in}+P_{ex}}{2}$	$0.6T_{sc}$	S+D	
	OT-8	$\dfrac{P_{in}+P_{ex}}{2}$	T_{sc}	S	

where:

P_{in-pt} : Design pressure from port side wing cargo tank, in kN/m^2.

P_{in-stb} : Design pressure from starboard side wing cargo tank, in kN/m^2.

(1) The static and dynamic load components are to be determined in accordance with Pt 1, Ch 4, Sec 7, Table 1.

(2) If the loading condition where the combination of an empty cargo tank and a mean ship's draught greater than 0.9 T_{sc} is included in ship's loading manual, the maximum corresponding draught is to be considered.

(3) Draughts specified for bottom floors, girders and side transverses are based on operational limits specified in Pt 1, Ch 4, Sec 8, [2] and Pt 1, Ch 4, Sec 8, [3]. Where the optional loading conditions exceed the minimum Rule required loading conditions, the draughts will be subject to special consideration.

(4) For tankers with two oil-tight longitudinal bulkheads, the draught is to be taken as 0.25 T_{sc}. For tankers with a centreline bulkhead, the draught is to be taken as 0.33 T_{sc}.

(5) When the ship's configuration cannot be described by the structural members or structural configurations identified above, then the applicable Design Load Sets to determine the scantling requirements of primary supporting member are to be selected so as to specify all applicable cases from the following:

- A full tank on one side of the member with the tank or space on the other side empty.
- A full tank on one side of the member with the external pressure minimised.
- External pressure maximised with the adjacent tank or space empty.

The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the net pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected.

(6) For a void or dry space, the pressure component from the void side is to be ignored.

1.3 Floors in double bottom

1.3.1 Structural arrangement

Plate floors are to be arranged in way of transverse bulkheads and bulkhead stools.

1.3.2 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of the floors at any position in the floor is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\ \tau_{eH}}$$

where:

Q : Design shear force, in kN.

$$Q = f_{shr}\, P\, S\, \ell_{shr}$$

f_{shr} : Shear force distribution factor:

$$f_{shr} = f_{shr-i}\left(1 - \frac{2y_i}{\ell_{shr}}\right)$$ but not to be taken as less than 0.2.

$f_{shr\text{-}i}$: Shear force distribution factor at the end of the span, ℓ_{shr}, as given in Table 2.

ℓ_{shr} : Effective shear span, of the double bottom floor, in m, as shown in Figure 2. In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in Pt 1, Ch 3, Sec 7, [1.1.7]. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in Figure 2.

y_i : Distance from the considered cross section of the floor to the nearest end of the effective shear span, ℓ_{shr} in m.

P : Design pressure given in Table 1 for the design load set being considered, calculated at mid point of effective shear span, ℓ_{shr} of a floor located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m^2.

Table 2 : Shear force distribution factors of floors

Structural configuration	Centre tank (f_{shr3} in Figure 1)	Wing tank	
		At inboard end (f_{shr2} in Figure 1)	At hopper knuckle end (f_{shr1} in Figure 1)
Ships with centreline longitudinal bulkhead	-	0.40	0.60
Ships with two longitudinal bulkheads	0.5	0.50	0.65

Figure 1 : Shear force distribution factors of floors

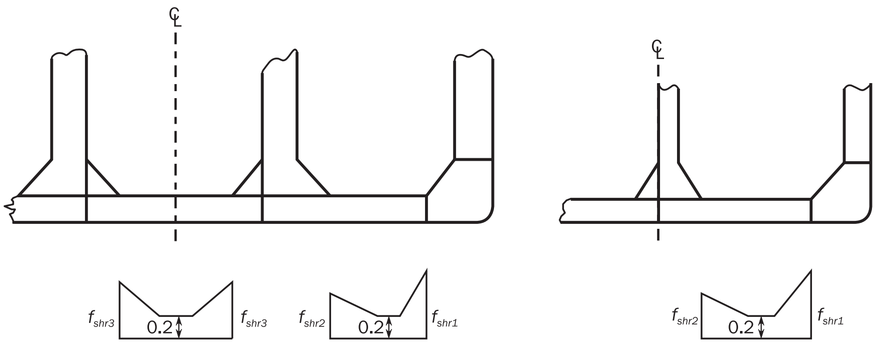

Figure 2 : Effective shear span of floors

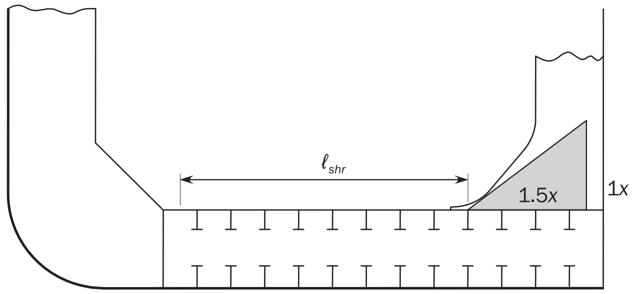
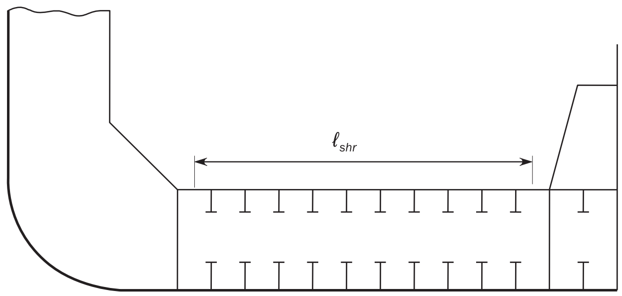


Typical arrangement with hopper and end bracket



Typical arrangement with hopper and stool

1.4 Girders in double bottom

1.4.1 Structural arrangement

Continuous double bottom girders are to be arranged at the centreline or duct keel, at the hopper side and in way of longitudinal bulkheads and bulkhead stools.

1.4.2 Net shear area of centre girders

For double bottom centre girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr\text{-}n50}$ in cm^2, of the double bottom centre girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\,\tau_{eH}}$$

where:

Q : Design shear force, in kN, taken as:

$$Q = 0.21\, n_1\, n_2\, P\, \ell_{shr}^2$$

ℓ_{shr} : Effective shear span as defined in [1.3.2].

P : Design pressure, in kN/m^2, as defined in [1.3.2].

n_1 : Coefficient taken as:

$$n_1 = 0.00935\left(\frac{\ell_{shr}}{S}\right)^2 - 0.163\left(\frac{\ell_{shr}}{S}\right) + 1.289$$

n_2 : Coefficient taken as:

$$n_2 = 1.3 - \left(\frac{S}{12}\right)$$

1.4.3 Net shear area of side girders

For double bottom side girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr\text{-}n50}$ in cm^2, of the double bottom side girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\ \tau_{eH}}$$

where:

Q : Design shear force, in kN.

$$Q = 0.14\ n_3\ n_4\ P\ \ell_{shr}^2$$

n_3 : Coefficient taken as:

$$n_3 = 1.072 - 0.0357\left(\frac{\ell_{shr}}{S}\right)$$

n_4 : Coefficient taken as:

$$n_4 = 1.2 - \left(\frac{S}{18}\right)$$

ℓ_{shr} : Effective shear span as defined in [1.3.2].

P : Design pressure, in kN/m^2, as defined in [1.3.2].

1.5 Deck transverses

1.5.1 Web depth

The web depth of under deck transverses is not to be less than:

- 0.20 $\ell_{bdg\text{-}dt}$ for deck transverses in the wing cargo tanks of ships with two longitudinal bulkheads.
- 0.13 $\ell_{bdg\text{-}dt}$ for deck transverses in the centre cargo tanks of ships with two longitudinal bulkheads. The web depth of deck transverses in the centre cargo tank is not to be less than 90% of that of the deck transverses in the wing cargo tank.
- 0.10 $\ell_{bdg\text{-}dt}$ for the deck transverses of ships with a centreline longitudinal bulkhead.
- The web height required in [1.1.6].

The web depth of above deck transverses is not to be less than:

- 0.10 $\ell_{bdg\text{-}dt}$
- The web height required in [1.1.6].

where:

$\ell_{bdg\text{-}dt}$: Effective bending span, in m, as defined in [1.5.2].

1.5.2 Net section modulus of deck transverses fitted below the upper deck

The net section modulus of deck transverses fitted below the upper deck, in cm^3, is not to be less than $Z_{in\text{-}n50}$ and $Z_{ex\text{-}n50}$ as given by the following formulae.

The net section modulus of the deck transverses fitted below the upper deck in the wing cargo tanks is also not to be less than required for the deck transverses fitted below the upper deck in the centre tanks.

$$Z_{in-n50} = \frac{850\ M_{in}}{C_{s-pr}\ R_{eH}}$$

$$Z_{ex-n50} = \frac{850\ M_{ex}}{C_{s-pr}\ R_{eH}}$$

where:

M_{in} : Design bending moment due to cargo pressure, in kNm, taken as:

- For deck transverses in wing cargo tanks of ships with two longitudinal bulkheads, and for deck transverses in cargo tanks of ships with a centreline longitudinal bulkhead:

  $M_{in} = 0.042\ \varphi_t\ P_{in-dt}\ S\ \ell_{bdg-dt}^2 + M_{st}$ but is not to be taken as less than M_0.

- For deck transverses in centre cargo tank of ships with two longitudinal bulkheads:

  $M_{in} = 0.042\ \varphi_t\ P_{in-dt}\ S\ \ell_{bdg-dt}^2 + M_{vw}$ but is not to be taken as less than M_0.

M_{st} : Bending moment transferred from the side transverse, in kNm:

$$M_{st} = c_{st}\ \beta_{st}\ P_{in-st}\ S\ \ell_{bdg-st}^2$$

where a cross tie is fitted in a wing cargo tank and $\ell_{bdg-st-ct}$ is greater than 0.7 ℓ_{bdg-st}, then ℓ_{bdg-st} in the above formula may be taken as $\ell_{bdg-st-ct}$.

M_{vw} : Bending moment transferred from the vertical web frame on the longitudinal bulkhead, in kNm:

$$M_{vw} = c_{vw}\ \beta_{vw}\ P_{in-vw}\ S\ \ell_{bdg-vw}^2$$

where $\ell_{bdg-vw-ct}$ is greater than 0.7 ℓ_{bdg-vw}, then ℓ_{bdg-vw} in the above formula may be taken as $\ell_{bdg-vw-ct}$. For vertically corrugated bulkheads, M_{vw} is to be taken equal to bending moment in upper end of corrugation over the spacing between deck transverses.

M_0 : Minimum bending moment, in kNm.

$$M_0 = 0.083\ P_{in-dt}\ S\ \ell_{bdg-dt}^2$$

M_{ex} : Design bending moment due to green sea pressure, in kNm.

$$M_{ex} = 0.067\ P_{ex-dt}\ S\ \ell_{bdg-dt}^2$$

P_{in-dt} : Design cargo pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, ℓ_{bdg-dt} of the deck transverse located at mid tank, in kN/m^2.

P_{in-st} : Corresponding design cargo pressure in wing cargo tank given in Table 1 for the design load set being considered, calculated at the mid-point of effective bending span, ℓ_{bdg-st} of the side transverse located at mid-tank, in kN/m^2.

P_{in-vw} : Corresponding design cargo pressure in the centre cargo tank of ships with two longitudinal bulkheads given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, ℓ_{bdg-vw} of the vertical web frame on the longitudinal bulkhead located at mid-tank, in kN/m^2.

P_{ex-dt} : Design green sea pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, ℓ_{bdg-dt} of the deck transverse located at mid tank, in kN/m^2.

φ_t : Coefficient taken as:

$\varphi_t = 1 - 5\left(\frac{y_{toe}}{\ell_{bdg-dt}}\right)$ but not taken less than 0.6.

y_{toe} : Distance from the end of effective bending span, ℓ_{bdg-dt} to the toe of the end bracket of the deck transverse, in m.

β_{st} : Coefficient taken as:

$$\beta_{st} = 0.9\left(\frac{\ell_{bdg-st}}{\ell_{bdg-dt}}\right)\left(\frac{I_{dt-n50}}{I_{st-n50}}\right)$$ but not taken less than 0.10 or greater than 0.65.

β_{vw} : Coefficient taken as:

$$\beta_{vw} = 0.9\left(\frac{\ell_{bdg-vw}}{\ell_{bdg-dt}}\right)\left(\frac{I_{dt-n50}}{I_{vw-n50}}\right)$$ but not taken less than 0.10 or greater than 0.50.

ℓ_{bdg-dt} : Effective bending span of the deck transverse, in m, see Pt 1, Ch 3, Sec 7, [1.1.6] and Figure 3, but is not to be taken as less than 60% of the breadth of the tank at the location being considered.

ℓ_{bdg-st} : Effective bending span of the side transverse, in m, between the deck transverse and the bilge hopper, see Pt 1, Ch 3, Sec 7, [1.1.6] and Figure 3.

$\ell_{bdg-st-ct}$: Effective bending span of the side transverse, in m, between the deck transverse and the mid depth of the cross tie, where fitted in wing cargo tank, see Pt 1, Ch 3, Sec 7, [1.1.6].

ℓ_{bdg-vw} : Effective bending span of the vertical web frame on the longitudinal bulkhead, in m, between the deck transverse and the bottom structure, see Pt 1, Ch 3, Sec 7, [1.1.6] and Figure 3.

$\ell_{bdg-vw-ct}$: Effective bending span of the vertical web frame on longitudinal bulkhead, in m, between the deck transverse and the mid depth of the cross tie, see Pt 1, Ch 3, Sec 7, [1.1.6].

I_{dt-n50} : Net moment of inertia of the deck transverse at mid-span with an effective breadth of attached plating specified in Pt 1, Ch 3, Sec 7, [1.3.2], in cm^4.

I_{st-n50} : Net moment of inertia of the side transverse at mid-span with an effective breadth of attached plating specified in Pt 1, Ch 3, Sec 7, [1.3.2], in cm^4.

I_{vw-n50} : Net moment of inertia of the longitudinal bulkhead vertical web frame at mid-span with an effective breadth of attached plating specified in Pt 1, Ch 3, Sec 7, [1.3.2], in cm^4.

c_{st} : Coefficient given in Table 3.

c_{vw} : Coefficient given in Table 3.

Table 3 : Values of c_{st} and c_{vw} for deck transverses

Structural configuration			c_{st}	c_{vw}
Ships with centreline longitudinal bulkhead			0.056	-
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M_{vw} based on $\ell_{bdg-vw-ct}$	-	0.044
		M_{st} based on ℓ_{bdg-st} or M_{vw} based on ℓ_{bdg-vw}	0.044	0.016
	Cross ties in wing cargo tanks	M_{st} based on $\ell_{bdg-st-ct}$ or M_{vw} based on $\ell_{bdg-vw-ct}$	0.044	0.044
		M_{st} based on ℓ_{bdg-st} or M_{vw} based on ℓ_{bdg-vw}	0.041	0.015

1.5.3 Net shear area of deck transverses fitted below the upper deck

The net shear area of deck transverses fitted below the upper deck, in cm^2, is not to be less than $A_{shr-in-n50}$ and $A_{shr-ex-n50}$ as given by:

$$A_{shr-in-n50} = \frac{8.5Q_{in}}{C_{t-pr}\ \tau_{eH}}$$

$$A_{shr-ex-n50} = \frac{8.5Q_{ex}}{C_{t-pr}\ \tau_{eH}}$$

where:

Q_{in} : Design shear force due to cargo pressure, in kN.

$$Q_{in} = 0.65\ P_{in-dt}\ S\ \ell_{shr} + c_1\ D\ b_{ctr}\ S\ \rho_L\ g$$

Q_{ex} : Design shear force due to green sea pressure, in kN.

$$Q_{ex} = 0.65\ P_{ex-dt}\ S\ \ell_{shr}$$

$P_{in\text{-}dt}$: Design pressure in kN/m^2, defined in [1.5.2].

$P_{ex\text{-}dt}$: Design pressure in kN/m^2, defined in [1.5.2].

$\ell_{bdg\text{-}dt}$: Effective span, in m, defined in [1.5.2].

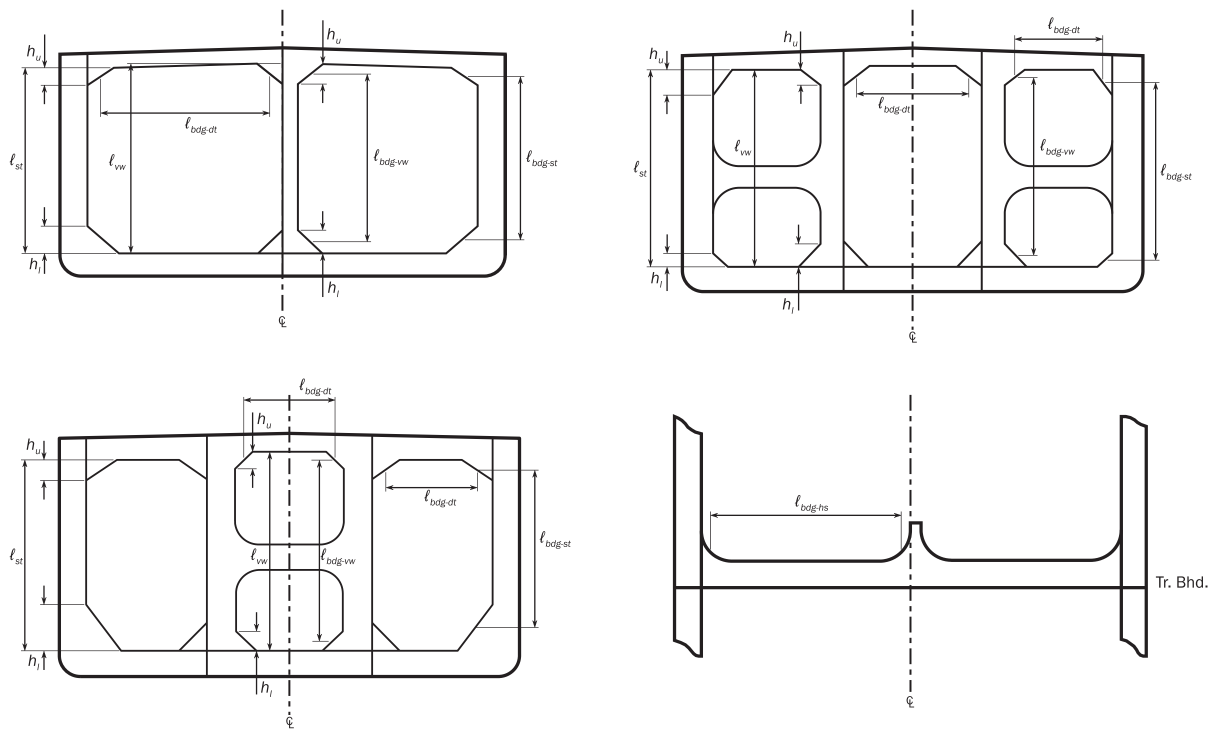
ℓ_{shr} : Effective shear span, of the deck transverse, in m, see Pt 1, Ch 3, Sec 7, [1.1.7].

c_1 : Coefficient taken as:

- c_1 = 0.04 in way of wing cargo tanks of ships with two longitudinal bulkheads.
- c_1 = 0.00 in way of centre tank of ships with two longitudinal bulkheads.
- c_1 = 0.00 for ships with a centreline longitudinal bulkhead.

b_{ctr} : Breadth of the centre tank, in m.

Figure 3 : Definition of spans of deck, side transverses, vertical web frames on longitudinal bulkheads and horizontal stringers on transverse bulkheads



1.5.4 Deck transverses fitted above the upper deck

When deck transverses are fitted above the upper deck, the net section modulus and shear area of deck transverses are not to be less than Z_{n50} and $A_{shr\text{-}n50}$, in cm^3 and cm^2 respectively, as given by the following formulae. The required section modulus and shear area are to be maintained over the full length of span.

$$z_{n50} = \frac{850\ |P| S \ell_{bdg}^2}{f_{bdg} C_{s-pr} R_{eH}}$$

$$A_{shr-n50} = \frac{8.5\ f_{shr} |P| S \ell_{shr}}{C_{t-pr}\ \tau_{eH}}$$

where:

P : Design pressure given in Table 1 for the design load set being considered, calculated at midpoint of effective bending span, ℓ_{bdg} of the deck transverse located at mid tank, in kN/m^2.

f_{bdg} : Coefficient taken as:

f_{bdg} = 12 for design load set OT-1, OT-2 and OT-3 as defined in Table 1.

f_{bdg} = 15 for design load set SEA-1 as defined in Table 1.

f_{shr} : Coefficient taken as:

f_{shr} = 0.5

l_{bdg} : Effective bending span of the deck transverse fitted above upper deck, in m, measured from inner hull welded to deck to longitudinal bulkhead, or upper stool plating where upper stool is fitted

l_{shr} : Effective shear span of the deck transverse fitted above upper deck, in m, measured from inner hull welded to deck to longitudinal bulkhead, or upper stool plating where upper stool is fitted

As an alternative, the required section modulus and shear area may be obtained by finite element method in accordance with Pt 1, Ch 7 and with in consideration of loading patterns A1, A2 or B1, B2 as defined in Pt 1, Ch 4, Sec 8, [3.2.9] with draught equal to T_{sc} and cargo density of 1.025 t/m^3.

1.5.5 Deck transverse adjacent to transverse bulkhead

The scantling of deck transverse adjacent to the transverse bulkhead is to comply with the requirements of [1.5.2] to [1.5.4] for design green sea pressure only.

1.6 Side transverses

1.6.1 Net shear area

The net shear area, $A_{shr-n50}$, in cm^2, of side transverses is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\ \tau_{eH}}$$

where:

Q : Design shear force as follows, in kN:

$Q = Q_u$ for upper part of the side transverse.

$Q = Q_l$ for lower part of the side transverse.

Q_u : Shear force, in kN, taken as:

$$Q_u = S\,[c_u\ \ell_{st}\,(P_u + P_l) - h_u\ P_u]$$

where a cross tie is fitted in a wing cargo tank and ℓ_{st-ct} is greater than 0.7 ℓ_{st}, then ℓ_{st} in the above formula is taken as ℓ_{st-ct}.

Q_l : Shear force, in kN, taken as the greater of the following:

- $S\,[c_l\ \ell_{st}\,(P_u + P_l) - h_l\ P_l]$
- $0.35\,c_l\,S\,\ell_{st}\ (P_u + P_l)$
- $1.2\,Q_u$

where a cross tie is fitted in a wing cargo tank and ℓ_{st-ct} is greater than 0.7 ℓ_{st}, then ℓ_{st} in the above formula is taken as ℓ_{st-ct}.

P_u : Design pressure given in Table 1 for the design load set being considered, in kN/m^2, calculated at mid length of tank and at mid height of h_u.

P_l : Design pressure given in Table 1 for the design load set being considered, calculated at mid height h_l located at mid length of tank, in kN/m^2.

ℓ_{st} : Length of the side transverse, in m, taken as follows:

- Where deck transverses are fitted below deck, ℓ_{st} is the length between the flange of the deck transverse and the inner bottom, see Figure 3.
- Where deck transverses are fitted above deck, ℓ_{st} is the length between the elevation of the deck at side and the inner bottom.

$\ell_{st\text{-}ct}$: Length of the side transverse, in m, taken as follows:

- Where deck transverses are fitted below deck, $\ell_{st\text{-}ct}$ is the length between the flange of the deck transverse and mid depth of cross tie, where fitted in wing cargo tank.
- Where deck transverses are fitted above deck, $\ell_{st\text{-}ct}$ is the length between the elevation of the deck at side and mid depth of the cross tie, where fitted in wing cargo tank.

h_u : Effective length of upper bracket of the side transverse, in m, taken as follows:

- Where deck transverses are fitted below deck, h_u is as shown in Figure 3.
- Where deck transverses are fitted above deck:
  - When an inner hull longitudinal bulkhead is arranged with a top wing structure as follows, h_u is taken as the distance between the deck at side and the lower end of slope plate of the top wing structure:
    - The breadth at top of the wing structure is greater than 1.5 times the breadth of the double side and.
    - The angle along a line between the point at base of the slope plate at its intersection with the inner hull longitudinal bulkhead and the point at the intersection of top wing structure and deck is 30 deg or more to vertical.
  - In the other cases: h_u is taken as 0.

h_l : Height of bilge hopper, in m, as shown in Figure 3.

c_u : Coefficient defined in Table 4.

c_l : Coefficient defined in Table 4.

Table 4 : Values of c_u and c_l for side transverses

<table>
<tr><th colspan="3">Structural configuration</th><th colspan="2">c_u</th><th colspan="2">c_l</th></tr>

</table>

1.6.2 Shear area over the length of the side transverse

The shear area over the length of the side transverse is to comply with the following. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

a) The required shear area for the upper part is to be maintained over the upper 0.2 ℓ_{shr}.

b) The required shear area for the lower part is to be maintained over the lower 0.2 ℓ_{shr}.

c) Where Q_u and Q_l are determined based on $\ell_{st\text{-}ct}$, the required shear area for the lower part is also to be maintained below the cross tie.

d) For ships without cross ties in the wing cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid-span.

e) For ships with cross ties in the wing cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts.

where:

ℓ_{shr} : Effective shear span of the side transverse, in m.

$\ell_{shr} = \ell_{st} - h_u - h_l$ where Q_u and Q_l are determined based on ℓ_{st}.

$\ell_{shr} = \ell_{st-ct} - h_u$ where Q_u and Q_l are determined based on $\ell_{st\text{-}ct}$.

ℓ_{st}, $\ell_{st\text{-}ct}$, h_u, h_l, Q_u, Q_l : Parameters defined in [1.6.1].

1.7 Vertical web frames on longitudinal bulkhead

1.7.1 Web depth

The web depth of the vertical web frame on the longitudinal bulkhead is not to be less than:

- 0.14 $\ell_{bdg\text{-}vw}$ for ships with a centreline longitudinal bulkhead.
- 0.09 $\ell_{bdg\text{-}vw}$ for ships with two longitudinal bulkheads.
- The web height required in [1.1.6].

where:

$\ell_{bdg\text{-}vw}$: Effective bending span, in m, defined in [1.7.2].

1.7.2 Net section modulus

The net section modulus, Z_{n50} in cm^3, of the vertical web frame is not to be less than:

$$Z_{n50} = \frac{850M}{C_{s-pr}\, R_{eH}}$$

where:

M : Design bending moment, in kNm, as follows:

$M = c_u\, P\, S\, \ell_{bdg-vw}^2$ for upper part of the web frame.

$M = c_l\, P\, S\, \ell_{bdg-vw}^2$ for lower part of the web frame.

where a cross tie is fitted and $\ell_{bdg\text{-}vw\text{-}ct}$ is greater than 0.7 $\ell_{bdg\text{-}vw}$, then $\ell_{bdg\text{-}vw}$ in the above formula is to be taken as $\ell_{bdg\text{-}vw\text{-}ct}$.

P : Design pressure given in Table 1 for the design load set being considered, calculated at mid-point of the effective bending span, $\ell_{bdg\text{-}vw}$ of the vertical web frame located at mid tank, in kN/m^2.

$\ell_{bdg\text{-}vw}$: Effective bending span of the vertical web frame on the longitudinal bulkhead, between the deck transverse and the bottom structure, in m, see Figure 3.

$\ell_{bdg\text{-}vw\text{-}ct}$: Effective bending span of the vertical web frame on longitudinal bulkhead, between the deck transverse and mid-depth of the cross tie on ships with two longitudinal bulkheads, in m.

c_u : Coefficient defined in Table 5.

c_l : Coefficient defined in Table 5.

Table 5 : Values of c_u and c_l for vertical web frame on longitudinal bulkheads

Structural configuration			c_u	c_l
Ships with a centreline longitudinal bulkhead			0.057	0.071
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M based on $\ell_{bdg\text{-}vw\text{-}ct}$	0.057	0.071
		M based on $\ell_{bdg\text{-}vw}$	0.012	0.028
	Cross ties in wing cargo tanks	M based on $\ell_{bdg\text{-}vw\text{-}ct}$	0.057	0.071
		M based on $\ell_{bdg\text{-}vw}$	0.016	0.032

1.7.3 Section modulus over the length of the vertical web frame

The section modulus over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

a) The required section modulus for the upper part is to be maintained over the upper 0.2 $\ell_{bdg\text{-}vw}$ or 0.2 $\ell_{bdg\text{-}vw\text{-}ct}$ as applicable.

b) The required section modulus for the lower part is to be maintained over the lower 0.2 $\ell_{bdg\text{-}vw}$ or 0.2 $\ell_{bdg\text{-}vw\text{-}ct}$ as applicable.

c) Where the required section modulus is determined based on $\ell_{bdg\text{-}vw\text{-}ct}$, the required section modulus for the lower part is also to be maintained below the cross tie.

d) The required section modulus between the upper and lower parts is to be reduced linearly to 70% of the required section modulus for the lower part at mid-span.

where:

$\ell_{bdg\text{-}vw}$, $\ell_{bdg\text{-}vw\text{-}ct}$: Effective bending span, in m, defined in [1.7.2].

1.7.4 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of the vertical web frame is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\ \tau_{eH}}$$

where:

Q : Design shear force as follows, in kN:

$Q = Q_u$ for upper part of the web frame.

$Q = Q_l$ for lower part of the web frame.

Q_u : Shear force, in kN, taken as:

$$Q_u = S\,[c_u\ \ell_{vw}\,(P_u + P_l) - h_u\ P_u]$$

where a cross tie is fitted in a centre or wing cargo tank and $\ell_{vw\text{-}ct}$ is greater than 0.7 ℓ_{vw}, then ℓ_{vw} in the above formula is to be taken as $\ell_{vw\text{-}ct}$.

Q_l : Shear force, in kN, taken as the greater of the following:

- $S\,[c_l\ \ell_{vw}(P_u + P_l) - h_l\ P_l]$
- $c_w\ S\ c_l\ \ell_{vw}(P_u + P_l)$
- $1.2\ Q_u$

where a cross tie is fitted in a centre or wing cargo tank and $\ell_{vw\text{-}ct}$ is greater than 0.7 ℓ_{vw}, then ℓ_{vw} in the above formula is to be taken as $\ell_{vw\text{-}ct}$.

P_u : Design pressure given in Table 1 for the design load set being considered, calculated at mid-height of upper bracket of the vertical web frame, h_u located at mid tank, in kN/m^2.

P_l : Design pressure given in Table 1 for the design load set being considered, calculated at mid-height of lower bracket of the vertical web frame, h_l located at mid tank, in kN/m^2.

ℓ_{vw} : Length of the vertical web frame, in m, between the flange of the deck transverse and the inner bottom, see Figure 3.

$\ell_{vw\text{-}ct}$: Length of the vertical web frame, in m, between the flange of the deck transverse and mid-depth of the cross tie, where fitted.

h_u : Effective length of upper bracket of the vertical web frame, in m, as shown in Figure 3.

h_l : Effective length of lower bracket of the vertical web frame, in m, as shown in Figure 3.

c_u : Coefficient defined in Table 6.

c_l : Coefficient defined in Table 6.

c_w : Coefficient taken as:

- c_w = 0.57 for ships with a centreline longitudinal bulkhead,
- c_w = 0.50 for ships with two longitudinal bulkheads.

Table 6 : Values of c_u and c_l for vertical web frame on longitudinal bulkhead

Structural configuration		c_u	c_l
Ships with a centreline longitudinal bulkhead		0.17	0.28
Ships with two longitudinal bulkheads	Q_u or Q_l based on $\ell_{vw\text{-}ct}$		
	Q_u or Q_l based on ℓ_{vw}	0.075	0.18

1.7.5 Shear area over the length of the vertical web frame

The shear area over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

a) The required shear area for the upper part is to be maintained over the upper 0.2 ℓ_{shr}.

b) The required shear area for the lower part is to be maintained over the lower 0.2 ℓ_{shr}.

c) Where Q_u and Q_l are determined based on $\ell_{vw\text{-}ct}$, the required shear area for the lower part is also to be maintained below the cross tie.

d) For ships without cross ties in the wing or centre cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid-span.

e) For ships with cross ties in the wing or centre cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts.

where:

ℓ_{shr} : Effective shear span of the vertical web frame, in m.

$\ell_{shr} = \ell_{vw} - h_u - h_l$ where Q_u and Q_l are determined based on ℓ_{vw}.

$\ell_{shr} = \ell_{vw-ct} - h_u$ where Q_u and Q_l are determined based on $\ell_{vw\text{-}ct}$.

ℓ_{vw}, $\ell_{vw\text{-}ct}$, h_u, h_l, Q_u, Q_l : Parameters defined in [1.7.4].

1.8 Horizontal stringers on transverse bulkheads

1.8.1 Web depth

The web depth of horizontal stringers on transverse bulkhead is not to be less than:

- 0.28 $\ell_{bdg\text{-}hs}$ for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads.
- 0.20 $\ell_{bdg\text{-}hs}$ for horizontal stringers in centre tanks of ships with two longitudinal bulkheads, but the web depth of horizontal stringers in centre tank is not to be less than required depth for a horizontal stringer in wing cargo tanks.
- 0.20 $\ell_{bdg\text{-}hs}$ for horizontal stringers of ships with a centreline longitudinal bulkhead.
- The web height required in [1.1.6].

where:

$\ell_{bdg\text{-}hs}$: Effective bending span, in m, defined in [1.8.2].

1.8.2 Net section modulus

The net section modulus, Z_{n50} in cm^3, of the horizontal stringer over the end 0.2 $\ell_{bdg\text{-}hs}$ is not to be less than:

$$Z_{n50} = \frac{850M}{C_{s-pr}\ R_{eH}}$$

where:

M : Design bending moment, in kNm.

$$M = c\ P\ S\ \ell_{bdg-hs}^2$$

P : Design pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, $\ell_{bdg\text{-}hs}$ and at mid-point of the spacing, S of the horizontal stringer, in kN/m^2.

$\ell_{bdg\text{-}hs}$: Effective bending span of the horizontal stringer, in m, but is not to be taken as less than 50% of the breadth of the tank at the location being considered, see Figure 3.

c : Coefficient taken as:

- c = 0.073 for horizontal stringers in cargo tanks of ships with a centreline bulkhead.
- c = 0.083 for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads.
- c = 0.063 for horizontal stringers in the centre tank of ships with two longitudinal bulkheads.

1.8.3 Section modulus over the length of horizontal stringers

The required section modulus at mid effective bending span is to be taken as 70% of that required at the ends, intermediate values are to be obtained by linear interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

1.8.4 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of the horizontal stringer over the end 0.2 ℓ_{shr} is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\ \tau_{eH}}$$

where:

Q : Design shear force, in kN.

$$Q = 0.5P\ S_{hs}\ \ell_{shr}$$

P : Design pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, $\ell_{bdg\text{-}hs}$ and at mid-point of the spacing, S of the horizontal stringer, in kN/m².

S_{hs} : Spacing, in m, defined in [1.8.2].

ℓ_{shr} : Effective shear span of the horizontal stringer, in m.

1.8.5 Shear area at mid effective shear span

The required shear area at mid effective shear span is to be taken as 50% of that required in the ends, intermediate values are to be obtained by linear interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

1.9 Cross ties

1.9.1 Maximum applied design axial load

The maximum applied design axial load on cross ties, W_{ct} is to be less than or equal to the permissible load, $W_{ct\text{-}perm}$ as given by:

$$W_{ct} \le W_{ct-perm}$$

where:

W_{ct} : Applied axial load, in kN.

$$W_{ct} = P\, b_{ct}\, S$$

$W_{ct\text{-}perm}$: Permissible load, in kN.

$$W_{ct-perm} = 0.12\, A_{ct-n50}\, \eta_{all}\, \sigma_{cr}$$

P : Maximum design pressure for all the applicable design load sets being considered given in Table 1, calculated at centre of the area supported by the cross tie located at mid tank, in kN/m².

b_{ct} : Span, in m, taken as:

- Cross tie fitted in centre cargo tank: $b_{ct} = 0.5\, \ell_{bdg\text{-}vw}$
- Cross ties fitted in wing cargo tanks:
  - $b_{ct} = 0.5\, \ell_{bdg\text{-}vw}$ for design cargo pressure from the centre cargo tank.
  - $b_{ct} = 0.5\, \ell_{bdg\text{-}st}$ for design sea pressure.

$\ell_{bdg\text{-}vw}$: Effective bending span, in m, defined in [1.5.2].

$\ell_{bdg\text{-}st}$: Effective bending span, in m, defined in [1.5.2].

η_{all} : Allowable buckling utilisation factor as defined in Pt 1, Ch 8, Sec 1, [3.3].

σ_{cr} : Critical buckling stress in compression of the cross tie, in N/mm², as calculated using the net sectional properties in accordance with Pt 1, Ch 8, Sec 5, [3.1.1].

$A_{ct\text{-}n50}$: Net cross sectional area of the cross tie, in cm².

1.9.2 Welded connections

Special attention is to be paid to the adequacy of the welded connections for the transmission of the forces, and also to the stiffening arrangements, in order to provide effective means for transmission of the compressive forces into the webs.

Particular attention is to be paid to the welding at the toes of all end brackets of the cross ties.

1.9.3 Horizontal stiffeners

Horizontal stiffeners are to be located in line with, and attached to, the longitudinals at the ends of the cross ties.

2 VERTICALLY CORRUGATED BULKHEADS

2.1 Application

2.1.1

In addition to the requirements of Pt 1, Ch 6, Sec 4, [1], vertically corrugated bulkheads of oil tankers are also to comply with the requirements of [2.2].

2.2 Scantling requirements

2.2.1 Net plate thickness over the height

The net plate thicknesses as required by [2.2.3] and [2.2.4] are to be maintained for two thirds of the corrugation length, ℓ_{cg} from the lower end. Above that, the net plate thickness may be reduced by 20% from the net thickness required in [2.2.3] for the mid part of the corrugation provided that the net section modulus of the upper end of the corrugation complies with [2.2.4].

2.2.2 Net web plating thickness over the height

The net web plating thickness of the lower 15% of the corrugation, t_w in mm, is to be taken as the greatest value calculated for all applicable design load sets, as given in Pt 1, Ch 6, Sec 2, [2], and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool.

$$t_w = \frac{1000|Q_{cg}|}{d_{cg}\ C_{t-cg}\ \tau_{eH}}$$

where:

Q_{cg} : Design shear force imposed on the web plating at the lower end of the corrugation, in kN.

$$Q_{cg} = \frac{s_{cg}\ \ell_{cg}|3P_l + P_u|}{8000}$$

P_l : Design pressure given in Table 1 for the design load set being considered, calculated at the lower end of the corrugation, in kN/m^2.

P_u : Design pressures given in Table 1 for the design load set being considered, calculated at the upper end of the corrugation, in kN/m^2.

d_{cg} : Depth of corrugation, in mm, see Figure 4.

C_{t-cg} : Permissible shear stress coefficient:

C_{t-cg} = 0.75 for acceptance criteria set AC-S.

C_{t-cg} = 0.90 for acceptance criteria set AC-SD.

2.2.3 Net thicknesses of the flanges over the height

The net thicknesses of the flanges of corrugated bulkheads, t_f in mm, for two thirds of the corrugation length from the lower end are to be taken as the greatest value calculated for all applicable design load sets, as given in Pt 1, Ch 6, Sec 2, [2], and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool.

$$t_f = \frac{6.57\, b_{f-cg} \sqrt{\sigma_{bdg-max}}}{C_f} 10^{-3}$$

where:

$\sigma_{bdg-max}$: Maximum value of the vertical bending stresses in N/mm^2 in the flange. The bending stress is to be calculated at the lower end and at the mid span of the corrugation length.

$$\sigma_{bdg-max} = \frac{M_{cg}}{Z_{cg-act}} 10^3$$

M_{cg} : Vertical bending moment, in kNm, as defined in [2.2.4].

$Z_{cg\text{-}act}$: Actual net section modulus at the lower end and at the mid length of the corrugation, in cm^3.

$b_{f\text{-}cg}$: Breadth of flange plating, in mm. See Figure 4.

$b_{w\text{-}cg}$: Breadth of web plating, in mm. See Figure 4.

C_f : Coefficient taken as:

$$C_f = 7.65 - 0.26\left(\frac{b_{w-cg}}{b_{f-cg}}\right)^2$$

2.2.4 Net section modulus over the height

The net section modulus at the lower and upper ends and at the mid length of the corrugation (ℓ_{cg} / 2) of a unit corrugation, Z_{cg} are to be taken as the greatest value calculated for all applicable design load sets, as given in Pt 1, Ch 6, Sec 2, [2] and given by the following.

$$Z_{cg} = \frac{1000\ M_{cg}}{C_{s-cg}\ R_{eH}}$$

where:

M_{cg} : Vertical bending moment in kNm.

$$M_{cg} = \frac{C_i |P| s_{cg}\ \ell_0^2}{12000}$$

P : Averaged pressure in kN/m^2.

$$P = \frac{P_u + P_l}{2}$$

P_l, P_u : Design pressure given in Table 1 for the design load set being considered, calculated at the lower and upper ends of the corrugation, respectively, in kN/m^2:

- For transverse corrugated bulkheads, the pressures are to be calculated at a section located at b_{tk} / 2 from the longitudinal bulkheads of each tank.
- For longitudinal corrugated bulkheads, the pressures are to be calculated at the ends of the tank, i.e. the intersection of the forward and aft transverse bulkheads and the longitudinal bulkhead.

b_{tk} : Maximum breadth of tank under consideration measured at the bulkhead, in m.

ℓ_o : Effective bending span of the corrugation, in m, measured from the mid depth of the lower stool to the mid depth of the upper stool. Where no lower or upper stool is fitted, ℓ_{cg} is to be measured to lower or upper end. See Figure 4.

C_i : Bending moment coefficient given in Table 7.

$C_{s\text{-}cg}$: Permissible bending stress coefficient at the mid-length of the corrugation length, ℓ_{cg}:

$C_{s\text{-}cg} = c_e$ but not to be taken as greater than 0.75 for acceptance criteria set AC-S.

$C_{s\text{-}cg} = c_e$ but not to be taken as greater than 0.90 for acceptance criteria set AC-SD.

At the lower and upper ends of the corrugation length, ℓ_{cg}:

$C_{s\text{-}cg}$ = 0.75 for acceptance criteria set AC-S.

$C_{s\text{-}cg}$ = 0.90 for acceptance criteria set AC-SD.

c_e : Coefficient taken as:

$$c_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \quad \text{for } \beta \geq 1.25$$

$$c_e = 1.0 \quad \text{for } \beta < 1.25$$

β : Coefficient taken as:

$$\beta = \frac{b_{f-cg}}{t_f}\sqrt{\frac{R_{eH}}{E}}$$

$b_{f\text{-}cg}$: Breadth of flange plating, in mm, see Figure 4.

t_f : Net thickness of the corrugation flange, in mm.

Table 7 : Values of C_i

Bulkhead	At lower end of ℓ_{cg}	At mid-length of ℓ_{cg}	At upper end of ℓ_{cg}
Transverse bulkhead	C_1	C_{m1}	0.65 C_{m1}
Longitudinal bulkhead	C_3	C_{m3}	0.65 C_{m3}

where:

C_1 : Coefficient taken as:

$$C_1 = a_1 + b_1\sqrt{\frac{A_{dt}}{b_{dk}}} \quad \text{but taken not less than 0.60.}$$

$$C_1 = a_1 - b_1\sqrt{\frac{A_{dt}}{b_{dk}}} \quad \text{for transverse bulkhead with no lower stool, but taken less than 0.55.}$$

a_1 : Coefficient taken as:

$$a_1 = 0.95 - \frac{0.41}{R_{bt}}$$

$a_1 = 1.0$ for transverse bulkhead with no lower stool.

b_1 : Coefficient taken as:

$$b_1 = -0.20 + \frac{0.078}{R_{bt}}$$

$b_1 = 0.13$ for transverse bulkhead with no lower stool.

C_{m1} : Coefficient taken as:

$$C_{m1} = a_{m1} + b_{m1}\sqrt{\frac{A_{dt}}{b_{dk}}} \quad \text{but not taken less than 0.55.}$$

$$C_{m1} = a_{m1} - b_{m1}\sqrt{\frac{A_{dt}}{b_{dk}}} \quad \text{for transverse bulkhead with no lower stool, but not taken less than 0.60.}$$

a_{m1} : Coefficient taken as:

$$a_{m1} = 0.63 + \frac{0.25}{R_{bt}}$$

$a_{m1} = 0.85$ for transverse bulkhead with no lower stool.

b_{m1} : Coefficient taken as:

$$b_{m1} = -0.25 - \frac{0.11}{R_{bt}}$$

$b_{m1} = 0.34$ for transverse bulkhead with no lower stool.

C_3 : Coefficient taken as:

$$C_3 = a_3 + b_3 \sqrt{\frac{A_{dl}}{\ell_{dk}}}$$ but not taken less than 0.60.

$$C_3 = a_3 - b_3 \sqrt{\frac{A_{dl}}{\ell_{dk}}}$$ for longitudinal bulkhead with no lower stool, but not taken less than 0.55.

a_3 : Coefficient taken as:

$$a_3 = 0.86 - \frac{0.35}{R_{bl}}$$

$a_3 = 1.0$ for longitudinal bulkhead with no lower stool.

b_3 : Coefficient taken as:

$$b_3 = -0.17 + \frac{0.10}{R_{bl}}$$

$b_3 = 0.13$ for longitudinal bulkhead with no lower stool.

C_{m3} : Coefficient taken as:

$$C_{m3} = a_{m3} + b_{m3} \sqrt{\frac{A_{dl}}{\ell_{dk}}}$$ but not taken less than 0.55.

$$C_{m3} = a_{m3} - b_{m3} \sqrt{\frac{A_{dl}}{\ell_{dk}}}$$ for longitudinal bulkhead with no lower stool, but not taken less than 0.60.

a_{m3} : Coefficient taken as:

$$a_{m3} = 0.32 + \frac{0.24}{R_{bl}}$$

$a_{m3} = 0.85$ for longitudinal bulkhead with no lower stool.

b_{m3} : Coefficient taken as:

$$b_{m3} = -0.12 - \frac{0.10}{R_{bl}}$$

$b_{m3} = 0.19$ for longitudinal bulkhead with no lower stool.

R_{bt} : Coefficient taken as:

$$R_{bt} = \frac{A_{bt}}{b_{ib}}\left(1 + \frac{\ell_{ib}}{b_{ib}}\right)\left(1 + \frac{b_{av-t}}{h_{st}}\right)$$ for transverse bulkheads.

R_{bl} : Coefficient taken as:

$$R_{bl} = \frac{A_{bl}}{l_{ib}}\left(1 + \frac{\ell_{ib}}{b_{ib}}\right)\left(1 + \frac{b_{av-l}}{h_{sl}}\right)$$ for longitudinal bulkheads.

A_{dt} : Cross sectional area enclosed by the moulded lines of the transverse bulkhead upper stool, in m^2.

$A_{dt} = 0$ if no upper stool is fitted.

A_{dl} : Cross sectional area enclosed by the moulded lines of the longitudinal bulkhead upper stool, in m^2.

$A_{dl} = 0$ if no upper stool is fitted.

A_{bt} : Cross sectional area enclosed by the moulded lines of the transverse bulkhead lower stool, in m^2.

A_{bl} : Cross sectional area enclosed by the moulded lines of the longitudinal bulkhead lower stool, in m^2.

$b_{av\text{-}t}$: Average width of transverse bulkhead lower stool, in m. See Figure 4.

$b_{av\text{-}l}$: Average width of longitudinal bulkhead lower stool, in m. See Figure 4.

h_{st} : Height of transverse bulkhead lower stool, in m. See Figure 4.

h_{sl} : Height of longitudinal bulkhead lower stool, in m. See Figure 4.

b_{ib} : Breadth of cargo tank at the inner bottom level between hopper tanks, or between the hopper tank and centreline lower stool, in m. See Figure 4.

b_{dk} : Breadth of cargo tank at the deck level between upper wing tanks, or between the upper wing tank and centreline deck box or between the corrugation flanges if no upper stool is fitted, in m. See Figure 4.

ℓ_{ib} : Length of cargo tank at the inner bottom level between transverse lower stools, in m. See Figure 4.

ℓ_{dk} : Length of cargo tank at the deck level between transverse upper stools or between the corrugation flanges if no upper stool is fitted, in m. See Figure 4.

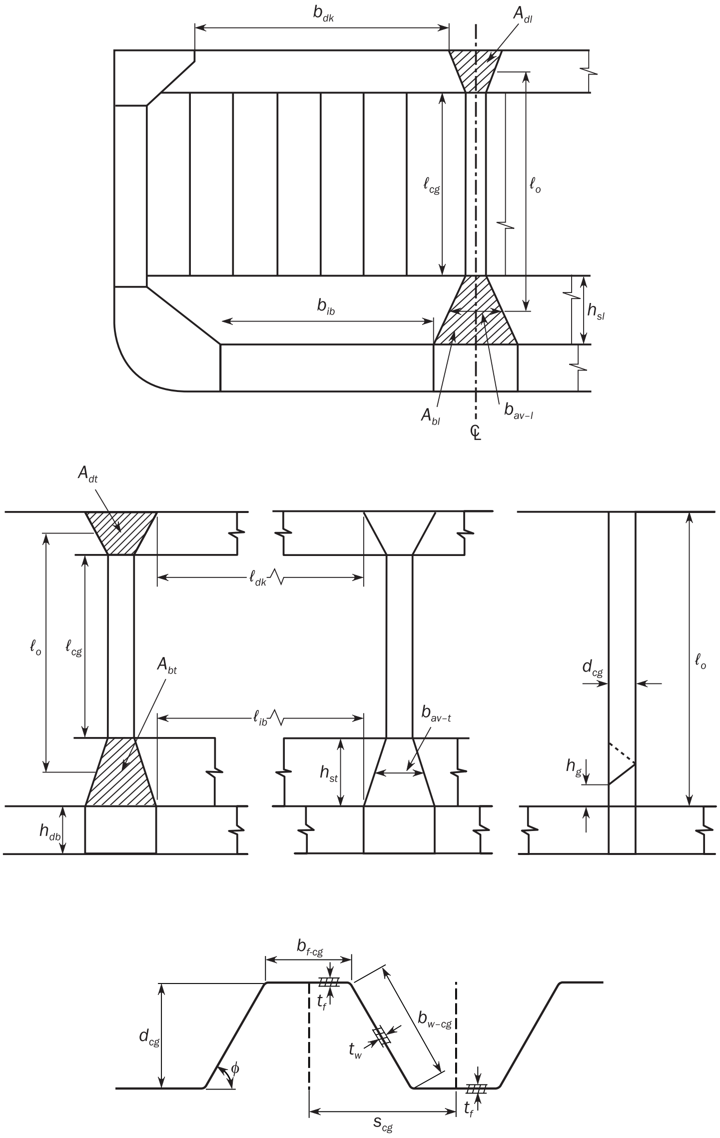
(Tankers with longitudinal bulkhead at centreline)



SECTION 4
HULL OUTFITTING

1 SUPPORTING STRUCTURES FOR COMPONENTS USED IN EMERGENCY TOWING ARRANGEMENTS

1.1 General

1.1.1

Emergency towing arrangements are to be fitted at both the bow and stern of every tanker with a deadweight of 20,000 tonnes or more, as required by SOLAS.

1.1.2

The design and construction of the towing arrangements is to be approved by the Flag Administration.

1.2 Documents to be submitted

1.2.1

Plans showing details of the supporting structure for the emergency towing arrangement, including the connection to the deck, are to be provided for approval. Information on emergency towing arrangement showing sufficient detail to enable the position and direction of load actions to be ascertained is to be submitted for reference.

1.3 Structural arrangement

1.3.1 Continuity of strength

The structural arrangement is to provide continuity of strength.

1.3.2 Stress concentrations

The structural arrangement of the ship's structure in way of the emergency towing equipment is to be such that, abrupt changes of shape or section are to be avoided in order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in high stress areas.

1.4 Minimum thickness requirements

1.4.1 Deck plating

The deck in way of strong-points and fairleads is to have a minimum gross thickness of 15 mm.

1.5 Loads

1.5.1 Safe working loads

Safe working load of emergency towing arrangements is not to be taken less than:

- 1,000 kN for tankers having a deadweight greater than or equal to 20,000 t, but less than 50,000 t.
- 2,000 kN for tankers having a deadweight greater than or equal to 50,000 t.

The position and direction of load actions to be ascertained is to be submitted for reference.

1.5.2 Load case

The design load for the connection of the strong-point and fittings to the deck and its supporting structure is to be taken as twice the safe working load. Information on lines of action of the applied design load provided in emergency towing arrangement plan is to be taken into account.

1.6 Scantling requirements

1.6.1 General

The scantlings of the support structure are to be dimensioned to ensure that for the load cases specified in [1.5.2], the calculated stresses in the support structure do not exceed the permissible stress levels specified in [1.6.3].

The capacity of the structure to resist buckling failure is also to be assured.

1.6.2 Calculation procedure

These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two dimensional grillage or finite element analysis using gross scantlings.

1.6.3 Permissible stresses

For the design load given in [1.5.2], the shear stresses and normal stresses, including bending stresses induced in the supporting structure and welds, in way of strong-points and fairleads, are not to be exceed the permissible values given below based on the gross thickness of the structure:

- Normal stress, 1.00 R_{eH}.
- Shear stress, 0.58 R_{eH}.

2 MISCELLANEOUS DECK ATTACHMENTS

2.1 Cargo manifolds

2.1.1 Cargo manifold support

The design of the cargo manifold support is to be such as to distribute the loads imposed on the pipework into the ship structure in seagoing or in harbour operations during loading and unloading. To achieve this, the connection of the cargo manifold support to the deck is to be arranged to align with stiffening members of the main hull structure or stiffening is to be fitted in order to avoid the creation of hard points. Attention is to be paid to the detail design of the structure forming the deck attachment in order to minimise the effects of change of section. The arrangement of such details and their approval is considered on a case-by-case basis by the Society.

3 GUARD RAILS AND BULWARKS

3.1 General

3.1.1

Generally, open guard rails are to be fitted on the upper deck. Plate bulwarks, with a 230 mm high continuous opening, at the lower edge, may be accepted provided the arrangement allows for the acceptable handling of spillage on deck and minimises the possibility for accumulation of volatile gas.

3.1.2

Deck spills are to be prevented from spreading to the accommodation and service areas and from discharge into the sea by a permanent continuous coaming with a minimum height of 100 mm surrounding the cargo deck. Along the sides at the aft end of the cargo deck of oil tankers, the coaming is to have a minimum height of 300 mm extending a minimum of 4.5 m forward from each corner. At the aft end of the cargo deck, the coaming is to have a minimum height of 300 mm and is to extend from side to side of the ship.

3.1.3

Scupper plugs of mechanical type are to be provided. Means of draining or removing oil or oily water within the coaming are also to be provided.
